alaAutoFabricPortSPBProtocolStatus
alaAutoFabricPortMVRPProtocolStatus
**auto-fabric config-save interval**

Configures the time interval for saving the automatically discovered configuration to the switch configuration file.

**auto-fabric config-save interval** *seconds*

---

**Syntax Definitions**

- **seconds**
  
  The amount of time between automatic saves of the discovered configuration. Range is 60 - 3600 seconds.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>300</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

The automatic save time interval specified with this command is only valid when the automatic configuration save status is enabled. This is done through the **auto-fabric config-save admin-state** command.

---

**Examples**

```
-> auto-fabric config-save interval 600
```

---

**Release History**

Release 7.3.2; command introduced.
Related Commands

- **auto-fabric config-save admin-state**
  Enables or disables automatically saving of the discovered configuration to the switch configuration file.

- **show auto-fabric config**
  Displays the Automatic Fabric configuration.

MIB Objects

- **alaAutoFabricGlobalConfigSaveTimer**
**auto-fabric config-save admin-state**

Enables or disables automatically saving of the discovered configuration to the switch configuration file.

```
auto-fabric config-save admin-state {enable | disable}
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables automatically saving the discovered configuration to the switch configuration file.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables automatically saving the discovered configuration to the switch configuration file.</td>
</tr>
</tbody>
</table>

**Defaults**

By default, automatically saving the discovered configuration is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When this function is enabled, the amount of time specified through the `auto-fabric config-save interval` command is active. An automatic save is performed whenever the specified amount of time elapses.

**Examples**

```
-> auto-fabric config-save admin-state disable
```

**Release History**

Release 7.3.2; command introduced.

**Related Commands**

- **auto-fabric config-save interval** Configures the amount of time to wait between automatic saves of the discovered configuration.
- **show auto-fabric config** Displays the Automatic Fabric configuration.

**MIB Objects**

- `alaAutoFabricGlobalConfigSaveTimerStatus`
auto-fabric discovery-interval

Configures when the switch will automatically start the Automatic Fabric discovery process.

**auto-fabric discovery-interval minutes**

### Syntax Definitions

**minutes** The discovery interval time. The valid range is 2–3600 minutes.

### Defaults

By default, the discovery interval timer is set to zero (disabled).

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>Yes</td>
</tr>
<tr>
<td>6465</td>
<td>Yes</td>
</tr>
<tr>
<td>6560</td>
<td>Yes</td>
</tr>
<tr>
<td>6570M</td>
<td>Yes</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
</tr>
<tr>
<td>6860N</td>
<td>No</td>
</tr>
<tr>
<td>6865</td>
<td>Yes</td>
</tr>
<tr>
<td>6900</td>
<td>Yes</td>
</tr>
<tr>
<td>6900 V72/C32</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When a switch boots up without a configuration file, discovery is automatically started for a one-time, initial run even when the interval timer is disabled.

- Set the value of this timer to more than two times the value of the switch MAC address aging time. This will allow time for inactive MAC addresses to age out on Automatic Fabric ports before the next discovery interval is started.

### Examples

`-> auto-fabric discovery-interval 60`

### Release History

- Release 7.3.2; command introduced.
- Release 7.3.4; timer default value changed to zero (disabled).

### Related Commands

- **show auto-fabric config** Displays the Automatic Fabric configuration.

### MIB Objects

- *alaAutoFabricGlobalDiscoveryTimer*
**auto-fabric protocols spb default-profile**

Configures the default Service Access Point (SAP) profile that the Universal Network Profile (UNP) feature uses to dynamically create SAPs for traffic received on UNP access ports.

```
auto-fabric protocols spb default-profile {single-service | auto-vlan}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>single-service</td>
<td>Dynamically creates a SAP profile only for untagged traffic on the UNP access port.</td>
</tr>
<tr>
<td>auto-vlan</td>
<td>Dynamically creates a SAP for each VLAN tag received on a UNP access port. When this option is selected, the <code>single-service</code> option is automatically triggered for untagged traffic.</td>
</tr>
</tbody>
</table>

### Defaults

By default, the switch is set to use the `auto-vlan` option.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- A SAP is a logical service entity (also referred to as a virtual port) that binds an access port to an SPB service ID and specifies the type of customer traffic (untagged or tagged) to encapsulate and tunnel through the SPB network infrastructure.
- Once the SPB adjacencies and UNP access ports are configured through Automatic Fabric discovery, traffic received on UNP access ports triggers the switch to dynamically create a SAP for the traffic based on the SAP profile selected with this command.

### Examples

```
-> auto-fabric protocols spb default-profile single-service
-> auto-fabric protocols spb default-profile auto-vlan
```

### Release History

Release 7.3.4; command introduced.
Related Commands

**auto-fabric protocols spb set-profile**
Configures the default SAP profile for a specific port or range of ports on the switch.

**show auto-fabric config**
Displays the global Automatic Fabric configuration.

**show auto-fabric config interface**
Displays Automatic Fabric configuration applied on interfaces.

MIB Objects

alaAutoFabricSPBDefaultProfile
**auto-fabric protocols spb set-profile**

Configures the default SAP profile for a specific port or range of ports on the switch.

```
auto-fabric protocols spb set-profile {single-service | auto-vlan} interface chassis/slot/port[-port2]
```

### Syntax Definitions

- **single-service**
  
  Defines single default service SAP profile. Only untagged traffic on the UNP port is learned in this profile.

- **auto-vlan**
  
  The incoming traffic is automatically learned. The SAP bindings for the concerned VLANs are automatically created based on the traffic sensed.

- **chassis**
  
  The chassis identifier.

- **slot/port[-port2]**
  
  The slot and port number (3/1) on which the SAP profile will be enabled. Use a hyphen to specify a range of ports (3/1-8).

### Defaults

By default, the **auto-vlan** option is used for Automatic Fabric ports.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The SAP profile configured for the specified port or range of ports overrides the default SAP profile configured for the switch.

### Examples

```
-> auto-fabric protocols spb set-profile single-service interface 1/1/1
-> auto-fabric protocols spb set-profile auto-vlan interface 1/2/1-4
```

### Release History

Release 7.3.4; command introduced.

20   IP Commands

This chapter details Internet Protocol (IP) commands for the switch. IP is a network-layer (Layer 3) protocol that contains addressing information and some control information that enables packets to be forwarded. IP is documented in RFC 791 and is the primary network-layer protocol in the Internet protocol suite. Along with the Transmission Control Protocol (TCP), IP represents the heart of the Internet protocols.

IP is enabled on the switch by default and there are few options that can, or need to be, configured. This chapter provides instructions for basic IP configuration commands. It also includes commands for several Layer 3 and Layer 4 protocols that are associated with IP:

- **Address Resolution Protocol (ARP)—** Used to match the IP address of a device with its physical (MAC) address.

- **Internet Control Message Protocol (ICMP)—** Specifies the generation of error messages, test packets, and informational messages related to IP. ICMP supports the **ping** command that is used to determine if hosts are online.

- **Transmission Control Protocol (TCP)—** A major data transport mechanism that provides reliable, connection-oriented, full-duplex data streams. While the role of TCP is to add reliability to IP, TCP relies upon IP to do the actual delivering of datagrams.

- **User Datagram Protocol (UDP)—** A secondary transport-layer protocol that uses IP for delivery. UDP is not connection-oriented and does not provide reliable end-to-end delivery of datagrams. But some applications can safely use UDP to send datagrams that do not require the extra overhead added by TCP.

The IP commands also include protection from Denial of Service (DoS) attacks. The goal of this feature is to protect a switch from well-known DoS attacks and to notify the administrator or manager when an attack is underway. Also, notifications can be sent when port scans are being performed.

**Note.** If all devices are on the same VLAN or if the IP interfaces are created on multiple VLANs to enable routing of packets, packets can be forwarded using IP. However, IP routing requires one of the IP routing protocols: Routing Information Protocol (RIP) or Open Shortest Path First (OSPF). See the following chapters for the appropriate CLI commands: Chapter 20, “IP Commands,” Chapter 27, “OSPF Commands.” For more information on VLANs and RIP, see the applicable chapters in the Configuration Guide. For more information on OSPF, see the “Configuring OSPF” chapter in the *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide.*
MIB information for the IP commands is as follows:

- **Filename:** IP-FORWARD-MIB.mib
  - **Module:** ipForward

- **Filename:** IP-MIB.mib
  - **Module:** ipMIB

- **Filename:** ALCATEL-IND1-IP-MIB.mib
  - **Module:** alcatelIND1IPMIB

- **Filename:** ALCATEL-IND1-IPRM-MIB.mib
  - **Module:** alcatelIND1IPRMMIB

A summary of the available commands is listed here:

```
IP
  ip interface
  ip interface rtr-port
  ip interface tunnel
  ip interface dhcp-client

- **show ip dos arp-poison**
- **show ip arp utilization**
- **show arp filter**
- **show arp send-gratuitous-arp**

## ICMP
- **icmp type**
- **icmp unreachable**
- **icmp echo**
- **icmp timestamp**
- **icmp addr-mask**
- **icmp messages**
- **show arp send-gratuitous-arp**
- **show icmp statistics**
## IP Commands

### TCP
- `ip tcp half-open-timeout`
- `ip tcp time-stamp-response`
- `show tcp statistics`
- `show tcp ports`
- `show ip tcp half-open-timeout`
- `show ip tcp time-stamp-response`

### UDP
- `show udp statistics`
- `show udp ports`

### Denial of Service (DoS)
- `ip dos scan close-port-penalty`
- `ip dos scan tcp open-port-penalty`
- `ip dos scan udp open-port-penalty`
- `ip dos scan threshold`
- `ip dos trap`
- `ip dos scan decay`
- `ip dos type`
- `show ip dos config`
- `show ip dos statistics`
**ip interface**

Configures an IP interface to enable IP routing on a VLAN or allow remote access. Without an IP interface, traffic is bridged within the VLAN or across connections to the same VLAN on other switches.

```
ip interface {if_name | emp | master emp | local chassis-id chassis} [{address | vip-address} ip_address] [mask subnet_mask] [admin-state [enable | disable]] [vlan vlan_id | service service_id] [forward | no forward] [local-proxy-arp | no local-proxy-arp] [e2 | snap] [primary | no primary]
no ip interface if_name
```

### Syntax Definitions

- **if_name**
  - Text string of the interface name. Use quotes around string if description contains multiple words with spaces between them (for example, “ALE Marketing”). This value is case sensitive.

- **emp**
  - Modifies the shared EMP port IP address.

- **master emp**
  - Modifies the EMP port IP address of the master chassis when operating in virtual chassis mode.

- **local chassis-id chassis**
  - Modifies the EMP port IP address of the local chassis.

- **address ip_address**
  - An IP host address (for example, 10.0.0.1, 171.15.0.20) to specify the IP router network.

- **vip-address ip_address**
  - An IP host address for a Virtual IP (VIP) VLAN.

- **subnet_mask**
  - A valid IP address mask (for example, 255.0.0.0, 255.255.0.0) to identify the IP subnet for the interface.

- **enable**
  - Enables the administrative status for the IP interface.

- **disable**
  - Disables the administrative status for the IP interface.

- **vlan_id**
  - An existing VLAN ID number (1–4094).

- **service_id**
  - An existing Shortest Path Bridging (SPB) or L2 GRE tunneling service ID number (1–32767). This parameter is supported only on the OmniSwitch 6860N, OmniSwitch 6900-X48C6/T48C6, OmniSwitch 6900-X48C4E, and OmniSwitch 9900.

- **forward**
  - Enables forwarding of IP frames to other subnets.

- **no forward**
  - Disables forwarding of IP frames. The router interface still receives frames from other hosts on the same subnet.

- **local-proxy-arp**
  - Enables Local Proxy ARP on the specified interface.

- **no local-proxy-arp**
  - Disables Local Proxy ARP on the specified interface.

- **e2**
  - Enter e2 or ethernet2 to specify Ethernet-II encapsulation.

- **snap**
  - SNAP encapsulation.

- **primary**
  - Designates the specified IP interface as the primary interface for the VLAN.

- **no primary**
  - Removes the configured primary IP interface designation for the VLAN. The first interface bound to the VLAN becomes the primary by default.

</table>

Usage Guidelines

- Use the no form of this command to remove an IP interface.
- IP multinetting is supported on VLANs. As a result, it is possible to configure up to 16 IP interfaces per VLAN. Each interface is configured with a different subnet, thus allowing traffic from each configured subnet to coexist on the same VLAN.
- When local proxy ARP is enabled for any one IP router interface associated with a VLAN, the feature is applied to the entire VLAN. It is not necessary to enable it for each interface. However, if the IP interface that has this feature enabled is moved to another VLAN, Local Proxy ARP is enabled for the new VLAN and must be enabled on another interface for the old VLAN.
- When Local Proxy ARP is enabled, all traffic is routed instead of bridged within the VLAN. ARP requests return the MAC address of the IP router interface. The same MAC address is assigned to each interface configured for a VLAN.
- Local Proxy ARP takes precedence over any switch-wide ARP or Proxy ARP function. It is not necessary to have Proxy ARP configured to use Local Proxy ARP. The two features are independent of each other.
- By default, the first interface bound to a VLAN becomes the primary interface for that VLAN. Use the primary keyword with this command to configure a different IP interface as the primary. Note that this option is not supported with interfaces bound to an SPB service, as multinetting is not supported on a service. There is only one IP interface per service allowed.
To create an IP interface for network management purposes, specify **Loopback0** (case sensitive) as the name of the interface. The Loopback0 interface is not bound to any VLAN, so it always remains operationally active.

Specify the **service** parameter to create a service-based interface that is used to provide in-line routing for SPB and L2 GRE tunneling services. When creating an IP interface for an SPB service or an L2 GRE tunneling service, consider the following:

- The service ID specified must already exist in the switch configuration.
- VLAN translation is automatically enabled when a service is assigned to an IP interface regardless of whether or not VLAN translation is enabled for the service; the VLAN translation status is no longer configurable as long as the service is bound to an IP interface.
- When the last IP interface is removed from a service, the VLAN translation status will return to its previous state. For example, if the administrative status was previously disabled, the status will revert to a disabled state when there are no more IP interfaces assigned to that service.
- Mixing switches with VLAN translation enabled on some and disabled on other switches in the same network is not recommended. Make sure all switches have VLAN translation enabled, especially if a switch with a service-based interface is added to the network.
- The same SPB service ID can be assigned to an IPv4 and an IPv6 interface as long as both interface types are in the same VRF instance.
- See the “IP over SPBM” section in the “Configuring Shortest Path Bridging” chapter in the OmniSwitch AOS Release 8 Network Configuration Guide for more information.

Configure an IP interface on an SPB control BVLAN to support in-band management access in the SPBM domain. When creating an IP interface on a control BVLAN, consider the following:

- The IP interface must be configured only on the Control BVLAN. Only IPv4 interface is supported.
- Only one Control BVLAN can be configured on a switch. This IP interface is considered operationally active when the underlying Control BVLAN becomes operationally up and all underlying configuration is considered valid.
- Whenever the IP interface is operationally down due to an unsupported configuration, the **show ip interface** command will display "Operational State Reason" as "invalid-config".
- ISIS-SPB is the only protocol supported in the IP BVLAN domain for exchanging or advertising IP routing information. No other routing protocol (including VRRP) is supported.
- Multi-netting of IP interfaces on a BVLAN is not supported. Only one IP interface must be configured on the Control BVLAN.
- STP is not allowed on BVLANs, and all broadcast packets will be restricted on this IP interface. Hence, explicit ARP/ND resolution is not supported. ISIS-SPB will provide the MAC-to-IP address mappings, to avoid broadcast packets in the SPBM backbone domain.
- The ARPs learned with ISIS-SPB on the Control BVLAN will be shown as static ARPs, but these ARPs will have bit "M" (Managed ARP) set in the ARP flags, and displayed as “M” in the “Flags” field of the **show arp** command display.
- Static routes can be configured to route packets to destinations outside of the IP BVLAN subnet or management network routes can be redistributed into ISIS-SPB at one or more SPB Backbone Edge Bridges (BEBs) that connect to a management station. ISIS-SPB then advertises the management network routes, along with the locally configured IP Looback0 address and IP BVLAN address, to all SPB nodes in the network.
- Dynamic routing protocols are not supported on this IP interface.
- The IP BVLAN domain will operate in IP unicast mode, hence IP Multicast is not supported.
- SPB in-band management is not supported on the OmniSwitch 6360, OmniSwitch 6465,
OmniSwitch 6560 and OmniSwitch 6570M.
  – See the “Configuring Shortest Path Bridging” chapter in the OmniSwitch AOS Release 8 Network Configuration Guide for more information.

Examples

-> ip interface Marketing
-> vrf 100 ip interface “Payroll address” 18.12.6.3 vlan 255
-> ip interface “Human Resources” 10.200.12.101 vlan 500 no forward snap
-> ip interface Distribution 11.255.14.102 vlan 500 local-proxy-arp primary
-> no ip interface Marketing
-> vrf 100 no ip interface “Payroll address”

-> ip interface l3-vpn address 10.1.1.1/24 service 10
-> service 10 vlan-xlation disable
ERROR: Modify vlan translation currently not allowed for service (10)
-> vrf 100 ip interface l3-vpn100 address 100.1.1.1/24 service 20
-> no ip interface l3-vpn
-> vrf 100 no ip interface l3-vpn100

Release History

Release 7.1.1; command introduced
Release 8.4.1.R03; service parameter added to support binding an SPB service to an IP interface.
Release 8.5R4; service parameter support for binding an L2 GRE tunneling service to an IP interface added. Support for an IP interface on an SPB Control BVLAN added.

**ip interface rtr-port**

Configures an IP routed-port interface by associating an IP interface with a port or link aggregate and a VLAN.

```
ip interface if_name address ip_address/mask vlan vlan_id rtr-port {port chassis/slot/port | linkagg agg_id} {tagged | untagged}
```

### Syntax Definitions

- **if_name**: A unique name for the IP interface. Use quotes around the string if the name contains multiple words with spaces between them (for example, “ALE Marketing”). This value is case sensitive.
- **ip_address**: IP host address to specify this IP interface.
- **mask**: IP mask to specify this IP interface.
- **vlan_id**: An unused VLAN ID to which this IP interface is associated.
- **chassis/slot/port**: The chassis ID, slot, and port number (1/1/3) of the physical port to bind to the IP interface.
- **agg_id**: The link aggregate ID to bind to the IP interface.
- **tagged**: Whether the assigned port or link aggregate is tagged for the specified VLAN.
- **untagged**: Whether the assigned port or link aggregate is untagged for the specified VLAN.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- In a single step, this command creates the specified VLAN, configures an IP interface for the VLAN, and assigns a port or link aggregate (tagged or untagged) to the VLAN.

- Configuring an IPv4 and IPv6 routed-port interface for the same VLAN ID is supported if the following conditions are met:
  - The VLAN ID, port, and the tagged/untagged port status for both interfaces is the same (for example, IPv4 and IPv6 routed interfaces are both bound to VLAN 850 with port 1/1/2 tagged).
  - Both interfaces are configured in the same VRF instance.
• Make sure the specified VLAN ID does not already exist in the switch configuration or is only used as a routed-port VLAN for an IPv4 interface. This VLAN will serve as a routing-only VLAN with a single port or link aggregate (Layer 2 functionality is not supported).

• Make sure the specified port or link aggregate is not already assigned to a VLAN that is not a routed-port VLAN. However, the port or link aggregate can be assigned to other routed-port VLANs.

• Attempting to add more ports or link aggregates to the routed-port VLAN or attempting to delete the VLAN is not allowed. The VLAN can only be removed by deleting the associated IPv4 and, if configured, the associated IPv6 interface.

• The same VLAN cannot be used for both a routed-port interface and a non-routed-port interface.

• Once configured, an IP routed-port interface is operationally equivalent to an IP VLAN interface. Routing protocols and other switch features that use IP are configured and operate on an IP routed-port interface in the same manner as on a regular IP interface.

Examples

-> ip interface "rp-vlan30" 10.0.0.1/8 vlan 30 rtr-port port 1/1/1 tagged
-> ip interface "rp-vlan40" 20.0.0.1/8 vlan 40 rtr-port port 1/1/2 untagged
-> ip interface "rp-vlan50" 30.0.0.1/8 vlan 40 rtr-port linkagg 6 tagged
-> ip interface "rp-vlan60" 40.0.0.1/8 vlan 50 rtr-port linkagg 7 untagged

-> vlan 70
-> ip interface rp-vlan70 rtr-port port 1/1/13 untagged vlan 70
ERROR: vlan 70 already present

-> ip interface rpv4-vlan rtr-port port 1/1/11 tagged vlan 300
-> ipv6 interface rpv6-vlan rtr-port port 1/1/11 tagged vlan 300

-> no ipv6 interface rpv6-vlan
-> ipv6 interface rpv6-vlan rtr-port port 1/1/13 untagged vlan 300
ERROR: Configuration conflict with IPv4 routed port interface rpv4-vlan

ip interface tunnel

Configures the end points for a GRE or IPIP tunnel.

```
ip interface if_name tunnel [source ip_address] [destination ip_address] [protocol {ipip | gre}]
```

### Syntax Definitions

- **if_name**: Text string. Use quotes around string if description contains multiple words with spaces between them (for example, “ALE Marketing”). This value is case sensitive.
- **source ip_address**: Source IP address of the tunnel.
- **destination ip_address**: Destination IP address of the tunnel.
- **ipip**: Specifies the tunneling protocol as IPIP.
- **gre**: Specifies the tunneling protocol as GRE.

### Defaults

**ip interface dhcp-client**

Configures a DHCP client IP interface that is to be assigned an IP address from a DHCP server.

```
ip interface dhcp-client [vlan vlan_id] [vsi-accept-filter filter-string] [server-preference] [release | renew] [option-60 opt60_string] [admin {enable | disable}] [local-proxy-arp | no local-proxy-arp]
no ip interface dhcp-client
```

**Syntax Definitions**

- **dhcp-client**: Reserved IP interface name indicating this interface use DHCP to obtain an IP address from a DHCP server.
- **vlan_id**: An existing VLAN ID number (1–4094).
- **filter-string**: String that matches with option-43 filed of the DHCPACK to prefer the desired OXO server. By default the filter-string will be empty string (“ “).
- **server-preference**: Enables DHCP server precedence logic. The DHCP server preference logic is mutually exclusive with vsi-accept-filter.
- **release**: Releases the DHCP server assigned IP address.
- **renew**: Renews the DHCP server assigned IP address.
- **opt60_string**: The option-60 field value to be included in DHCP discover/request packets.
- **enable**: Enables the administrative status for the IP interface.
- **disable**: Disables the administrative status for the IP interface.
- **local-proxy-arp**: Enables Local Proxy ARP on the specified interface.
- **no local-proxy-arp**: Disables Local Proxy ARP on the specified interface.

**Defaults**

<table>
<thead>
<tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the `no` form of this command to remove the DHCP-client IP interface.
- Only one DHCP client IP interface can be assigned per switch but it can belong to any VLAN and any VRF instance.
- The time zone and the system name of the OmniSwitch is set according to the time zone (DHCP Option-2) and system name (DHCP Option-12) assigned by the DHCP server. DHCP server sets the Option-2 and Option-12 values only when they are set to their default values on bootup or they are already set by the DHCP. Once the user configures these values to non-default values, DHCP does not set them.
  - **TimeZone (DHCP Option-2)**
    - The system time zone, if configured by the user (through CLI, WebView, SNMP) will always override the one obtained through Option-2.
    - The ‘show system’ command output shows the current time zone that is effective.
    - On deletion of the DHCP client IP interface, the timezone will move back to the default time zone of UTC.
    - If the user configured timezone is deleted using ‘system timezone’ command, then the time zone obtained through DHCP is considered, if any. Otherwise, it will move back to the default timezone of UTC.
    - Setting of time zone by DHCP option-2 is independent of NTP. NTP does not manage timezones, instead it manages all time information based on UTC.
    - Option-2 value will be set by DHCP only if it corresponds to the timezone supported by AOS. Otherwise, this offset will be silently ignored. Refer to the *OmniSwitch AOS Release 8 Switch Management Guide* for a list of supported time zone.
  - **System name (DHCP Option-12)**
    - The system name, if configured by the user (through CLI, WebView, SNMP) will always override the one obtained through Option-12.
    - The configuration snapshot will not change, if the system name is already explicitly configured by the user.
    - The ‘show system’ command shows the current system name that is effective.
    - On deletion of the DHCP client IP interface, the system name will move back to the default system name.
    - If the user configured system name is deleted using ‘system name’ command, then the system name obtained through DHCP is considered, if any. Otherwise, it will move back to the default system name.
- The minimum lease time accepted on the DHCP-client interface is 5 minutes.
• The VSI filter-string once configured cannot be deleted. It can be overwritten or modified. It can be configured as empty string (“ ”).

• The VSI accept filter is case-sensitive. The maximum length of a vsi-accept-filter can be of 64 character length.

• In order to retain the same OXO server which was configured before RCL, the VSI filter must match the hard coded string “alcatel.a4400.0”.

• DHCP client preference to obtain the lease from the highest priority server among the multiple offers received can be enabled using the server-preference option.

• Server preference option can also be set without specifying VLAN ID, provided the dhcp-client interface is associated with a VLAN prior to setting the server preference.

• The server-preference option is mutually exclusive with vsi-accept-filter option.

• Use the no server-preference option to remove the server preference.

Examples

-> ip interface dhcp-client vlan 100
-> ip interface dhcp-client admin enable
-> ip interface dhcp-client release
-> ip interface dhcp-client renew
-> ip interface dhcp-client option-60 OmniSwitch
-> no ip interface dhcp-client
-> ip interface dhcp-client vsi-accept-filter “alcatel.a4400.0”
-> ip interface dhcp-client vlan 1 server-preference
-> ip interface dhcp-client server-preference
-> ip interface dhcp-client no server-preference

Release History

ip router primary-address

Configures the router primary IP address. By default, the router primary address is derived from the first IP interface that becomes operational on the router.

**Syntax Definitions**

`ip_address`  
32-bit IP address.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The router primary address must be a valid IP unicast host address.
- The router primary IP address is used by BGP to derive its unique BGP Identifier, if the router router-id is not a valid IP unicast address.
- It is recommended that the primary address be explicitly configured on dual CMM chassis.

**Examples**

```
-> ip router primary-address 172.22.2.115
```

**Release History**

Release 7.1.1; command introduced

**Related Commands**

- `ip router router-id`  
  Configures the router ID for the router.

**MIB Objects**

alaDcrTmConfig

alaDrcTmIpRouterPrimaryAddress
**ip router router-id**

Configures the router ID for the router. By default, the router primary address of the router is used as the router ID. However, if a primary address has not been explicitly configured, the router ID defaults to the address of the first IP interface that becomes operational.

**ip router router-id ip_address**

---

**Syntax Definitions**

```
ip_address
```

32-bit IP address.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The router ID can be any 32-bit number.
- If the router ID is not a valid IP unicast host address, the BGP identifier is derived from the router primary address.
- It is recommended that the router ID be explicitly configured on dual CMM chassis.
- The router ID is used by OSPF and BGP for unique identification of the router in the network.

**Examples**

```
-> ip router router-id 172.22.2.115
```

**Release History**

Release 7.1.1; command introduced
Related Commands

```

```
Configures the router primary IP address.

MIB Objects

```
alaDcrTmConfig
  alaDrcTmIpRouterId
```
**ip static-route**

Creates or deletes an IP static route. Static routes are user-defined; they carry a higher priority than routes created by dynamic routing protocols. By default, static routes carry a higher priority than the dynamic routes.

```
ip static-route ip_address [mask mask] [gateway {gateway_address | null}] [tag num] [name string] | interface interface_name | follows ip_address] [metric metric]
```

```
no ip static-route ip_address [mask mask] [gateway {gateway_address | null}] | interface interface_name | follows ip_address] [metric metric]
```

**Syntax Definitions**

- `ip_address` Destination IP address of the static route.
- `mask` Subnet mask corresponding to the destination IP address.
- `gateway gateway_address` IP address of the next hop used to reach the destination IP address.
- `gateway null` Use this option to configure an IPv4 blackhole route.
- `tag num` Tag to be used for route.
- `name string` Name to be used for route.
- `interface interface_name` Interface of the next hop used to reach the destination IP address.
- `follows ip_address` The recursive static route follows this IP address. The recursive route uses the same gateway (and interface) or nexthop that is used to reach this host address.
- `metric` Metric or cost (hop count) for the static route. You can set a priority for the static route by assigning a metric value. The lower the metric value, the higher the priority. Valid range is 1–15.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>metric</td>
<td>1</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Usage Guidelines

- By default, static routes have a higher priority over dynamic routes; however, it can be changed using the `ip route-pref` command.

- Static routes do not age out of the routing tables; however, they can be deleted. Use the no form of this command to delete a static route.

- A static route is active if the interface it is using is “UP”.

- The subnet mask is not required if you want to use the natural subnet mask. By default, the switch imposes a natural mask on the IP address.

- If directly connected, NAT routers interface name can be used instead of gateway IP address, provided the router is enabled for proxy-ARP to handle ARP requests for the route addresses.

- Use the `null` option to configure IPv4 blackhole routes. A blackhole route is used to forward unwanted traffic to a blackhole.
  - Redistribution of blackhole routes is supported. Dynamic routing protocols may advertise these routes, but the gateway associated with the route(s) will be an address on the router advertising them.
  - Leaking of blackhole routes across SPB service backbones is supported. However, blackhole routes cannot be leaked between VRFs. Blackhole routes need to be explicitly configured using the `ip static-route` command in any/all VRFs.
  - Blackhole routes are created and installed through static route commands. Dynamic Routing protocols shall not install blackhole IP routes.
  - Blackhole routes shall never be part of ECMP.
  - Blackhole routes cannot be enabled for BFD support.

- Alternatively, the gateway address ‘0.0.0.0’ can be used to create an IPv4 blackhole route.

Examples

-> ip static-route 171.11.1.0/24 gateway 171.11.2.1
-> ip static-route 171.11.1.0/24 interface Int1
-> ip static-route 12.0.0.0/8 interface Int1
-> ip static-route 171.11.1.0/24 follows 192.168.10.1
-> ip static-route 55.0.0.0/8 gateway null
-> ip static-route 55.0.0.0/8 gateway 0.0.0.0

Release History

<td>Yes</td>
</tr>
<tr>
<td>6900 V72/C32</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When there are static routes configured in the switch, BFD is enabled to track the gateway.
- If the route is not reachable, it will be moved to the inactive database.

### Examples

```
-> ip static-route all bfd-state enable
-> ip static-route all bfd-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- **ip static-route bfd-state** Enables BFD for a specific static route.
- **show ip router database** Displays a list of all routes (static and dynamic) that exist in the IP router database.

### MIB Objects

- alaIprmConfig
- alaIprmStaticAllBfd
ip static-route bfd-state

Enables or disables BFD for a specific IPv4 static route.

```
ip static-route ipv4_prefix/pfx_length gateway ipv4_host_address bfd-state {enable| disable}
```

**Syntax Definitions**

- `ipv4_prefix` The destination IPv4 address.
- `pfx_length` The prefix length for the destination IP address.
- `ipv4_host_address` The gateway IPv4 address.
- `enable` Enables BFD for the IPv4 static route.
- `disable` Disables BFD for the IPv4 static route.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

BFD is enabled to track the gateway of static routes.

**Examples**

```
-> ip static-route 192.100.1.0/24 gateway 100.1.1.10 bfd-state enable
-> ip static-route 192.100.1.0/24 gateway 100.1.1.10 bfd-state disable
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `ip static-route all bfd-state` Enables BFD for all static routes.
- `show ip router database` Displays a list of all routes (static and dynamic) that exist in the IP router database.

**ip route-pref**

Configures the route preference of a router.

```
[vrf vrf_name] ip route-pref {spb-mgmt | static | ospf | isisl2 | isisl1 | rip | ebgp | ibgp | import} value
```

### Syntax Definitions

- **vrf name**: The alphanumeric name (1–20 characters) assigned to the VRF instance.
- **static**: Configures the route preference for static routes.
- **ospf**: Configures the route preference for OSPF routes.
- **isisl1**: Configures the route preference for ISIS L1 routes.
- **isisl2**: Configures the route preference for ISIS L2 routes.
- **rip**: Configures the route preference for RIP routes.
- **spb-mgmt**: Configures the route preference for SPB management routes.
- **ebgp**: Configures the route preference for external BGP routes.
- **ibgp**: Configures the route preference for internal BGP routes.
- **import**: Configures the route preference for the routes that are imported.

**value**: Route preference value.

### Defaults

<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Usage Guidelines

- Route preference of local routes cannot be changed.
- Make sure the route preference configured for SPB management (SPB-MGMT) routes does not conflict with the route preference configured for any other protocols.

Note. When using ISSU to upgrade the switch, ISSU will automatically change the SPB-MGMT route preference to the next lowest value below 150 if there is a conflict with another protocol previously configured with the same route preference value. After an ISSU upgrade, use the write memory command to ensure any changes are retained.

Examples

- ip route-pref ebgp 20
- ip route-pref rip 60
- ip route-pref import 210

Release History

Release 7.1.1; command introduced
Release 7.3.1; vrf and import parameters added.
Release 8.7R2; spb-mgmt parameter added.

Related Commands

show ip route-pref Displays the configured route-preference of a router.

MIB Objects

alaIprmRtPrefTable
  alaIprmRtPrefEntryType
  alaIprmRtPrefEntryValue
**ip default-ttl**

Configures the Time To Live (TTL) for IP packets. The TTL value is the maximum number of hops an IP packet travels before being discarded.

```plaintext
ip default-ttl hops
```

**Syntax Definitions**

`hops`  
TTL value, in hops. Valid range is 1–255.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>hops</td>
<td>64</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This value represents the default value inserted into the TTL field of the IP header for datagrams originating from this switch whenever a TTL value is not supplied by the transport layer protocol.

**Examples**

```plaintext
-> ip default-ttl 30
```

**Release History**

Release 7.1.1; command introduced

**Related Commands**

| show ip config | Displays IP configuration parameters. |

**MIB Objects**

IpDefaultTTL
ping

Tests whether an IP destination can be reached from the local switch. This command sends an ICMP echo request to a destination and then waits for a reply. To ping a destination, enter the `ping` command and enter either the IP address or hostname of the destination. The switch pings the destination using the default frame count, packet size, interval, and timeout parameters (6 frames, 64 bytes, 1 second, and 5 seconds respectively). You can also customize any or all of these parameters as described below.

```
ping {ip_address | hostname} [source-interface ip_interface] [count count] [size packet_size] [interval seconds] [timeout seconds] [data-pattern string] [dont-fragment] [tos tos_val]
```

**Syntax Definitions**

- **ip_address**
  IPv4 address of the system to ping.

- **hostname**
  DNS name of the system to ping.

- **source-interface ip_interface**
  IP address or interface name to use as the source IP for the ping packets.

- **count**
  Number of frames to be transmitted.

- **packet_size**
  Size of the data portion of the packet sent for this ping, in bytes. Valid range is 1–65507.

- **interval seconds**
  Polling interval. The switch polls the host at time intervals specified in seconds.

- **timeout seconds**
  Number of seconds the program waits for a response before timing out.

- **data-pattern string**
  The data pattern to be used in the data field of the ping packets.

- **dont-fragment**
  Sets the don't-fragment bit in the IP packet.

- **tos tos_val**
  Type of Service field in the IP header.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>6</td>
</tr>
<tr>
<td>packet_size</td>
<td>64</td>
</tr>
<tr>
<td>interval seconds</td>
<td>1</td>
</tr>
<tr>
<td>timeout seconds</td>
<td>5</td>
</tr>
<tr>
<td>dont-fragment</td>
<td>0</td>
</tr>
<tr>
<td>tos tos_val</td>
<td>0</td>
</tr>
<tr>
<td>data-pattern string</td>
<td>Repeating sequence of ASCII characters 0x4 onwards to 0xff</td>
</tr>
</tbody>
</table>
Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

If you change the default values, they are only applied to the current ping. The next time you use the ping command, the default values are used unless you again enter different values.

Examples

-> ping 10.255.11.242

PING 10.255.11.242: 56 data bytes
64 bytes from 10.255.11.242: icmp_seq=0. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=1. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=2. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=3. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=4. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=5. time=0. ms
-----10.255.11.242 PING Statistics-----
6 packets transmitted, 6 packets received, 0% packet loss
round-trip (ms) min/avg/max = 0/0/0

-> ping 10.0.0.1 source-interface mgmt
-> ping 10.0.0.1 tos 1
-> ping 10.0.0.1 timeout 10
-> ping 10.0.0.1 interval 10
-> ping 10.0.0.1 dont-fragment
-> ping 10.0.0.1 data-pattern AB

Related Commands

traceroute

Finds the path taken by an IP packet from the local switch to a specified destination.

MIB Objects

N/A
**traceroute**

Finds the path taken by an IP packet from the local switch to a specified destination. This command displays the individual hops to the destination as well as some timing information.

```
traceroute {ip_address | hostname} [max-hop max_hop_count] [min-hop min_hop_count] [source-interface ip_interface] [probes probe_count] [timeout seconds] [port port_number_value]
```

**Syntax Definitions**

- `ip_address` IPv4 address of the host whose route you want to trace.
- `hostname` DNS name of the host whose route you want to trace.
- `max_hop_count` Maximum hop count for the trace. The valid range is 1–255.
- `min_hop_count` Minimum hop count for the trace. The valid range is 1–30.
- `ip_interface` Source IP interface to be used in the traceroute packets.
- `probe_count` The number of packets (retry) sent for each hop-count. The valid range is 1–10000.
- `seconds` The time to wait for the response of each probe packet.
- `port_number_value` The destination port number to be used in the probing packets.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>max-hop</code> <code>max_hop_count</code></td>
<td>30</td>

* N/A
ip directed-broadcast

Enables or disables IP directed broadcasts routed through the switch. An IP directed broadcast is an IP datagram that has all zeros or all 1s in the host portion of the destination address. The packet is sent to the broadcast address of a subnet to which the sender is not directly attached.

[vrf vrf_name] ip directed-broadcast {enable | disable}

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf_name</td>
<td>The name of an existing VRF instance.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables IP directed broadcasts.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables IP directed broadcasts.</td>
</tr>
</tbody>
</table>

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Yes</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td></td>
</tr>
<tr>
<td>6465</td>
<td></td>
</tr>
<tr>
<td>6560</td>
<td></td>
</tr>
<tr>
<td>6570M</td>
<td></td>

<td></td>
</tr>
<tr>
<td>6900V72/C32</td>
<td></td>
</tr>
<tr>
<td>9900</td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Directed broadcasts are used in denial-of-service attacks. In a DoS attack, a continuous stream of ping requests are sent from a falsified source address to a directed broadcast address. This results in a large stream of replies, which can overload the host of the source address. By default, the switch drops directed broadcasts. Directed broadcasts must not be enabled.

- When IP directed broadcast is enabled, by default, it is enabled on the 'default' VRF.

### Examples

- `-> ip directed-broadcast enable`
- `-> ip directed-broadcast disable`

### Release History

Release 7.1.1; command introduced
Related Commands

show ip directed-broadcast  Displays the status of the directed broadcast configuration and trusted source IP address configuration.

MIB Objects

alaIpDirectedBroadcast
**ip directed-broadcast trusted-source-ip**

Specify the source IP address, destination IP address and destination VLAN information to broadcast the packets in controlled manner. The specified information is considered as the trusted information to broadcast the packets received from the defined parameters, and the remaining broadcast packets are dropped.

```bash
[vrf vrf_name] ip directed-broadcast trusted-source-ip {ip_address/mask | ip_address mask
subnet_mask} [destination-ip {ip_address/mask | ip_address destination-mask subnet_mask}] [destination-vlan {vlan_id | vlan_id|vlan_id}]
```

```bash
[vrf vrf_name] no ip directed-broadcast trusted source-ip ip_address {ip_address/mask | ip_address mask subnet_mask}
```

**Syntax Definitions**

- `vrf_name` (The name of an existing VRF instance.)
- `trusted-source-ip ip_address` (Source IP address from which the broadcast packets are received.)
- `destination-ip ip_address` (Destination address to which the packets must be directed.)
- `subnet_mask` (The source mask from which the broadcast packets are received.)
- `destination-mask subnet_mask` (The destination mask to which the packets must be directed.)
- `vlan_id` (Existing VLAN ID to which the packets are to be directed.)

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip_address</code></td>
<td>0.0.0.0</td>
</tr>
<tr>
<td><code>subnet_mask</code></td>
<td>IP address class/0.0.0.0</td>
</tr>
<tr>
<td><code>vlan_id</code></td>
<td>None</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` command to remove the trusted information configured with the source IP address for controlled IP directed broadcast.
- IP directed broadcast must be enabled for the controlled IP directed broadcast to work.
- When controlled IP directed broadcast is enabled, by default, it is enabled on the ‘default’ VRF.
- The trusted information must have the source IP with optional destination IP address or VLAN ID.
- Ensure that the configured address/mask combination (source/destination IP address) configuration is not a subset of an already existing address/mask.
- If the source IP matches, then the packets are broadcasted in the particular destination IP interface or VLAN interfaces. The remaining packets are dropped.
- When the packet received matches with the source IP and if the destination IP or destination VLAN information are not defined by the user, then the packet will be forwarded based on the routing information in the switch.
- If no source IP is provided as trusted, by default, all the packets are forwarded.
- If the destination IP or VLAN is defined by the user, then the destination address of the packet will be matched with the user defined list and routes the packets if the destination IP matches. If the VLAN information is defined, then the packets will be routed if the destination VLAN matches a VLAN in the configured allowed VLAN list. If neither the destination IP or VLAN matches the ones configured, the packet are dropped.
- If the destination IP is not reachable or if the destination subnet is not directly connected, packet will be dropped.
- If the directed broadcast is set to controlled mode and the user does not specify any trusted information, all the broadcast packets will be dropped. This case is equivalent to disabled state of directed-broadcast.
- 32 source IP addresses can be defined, and each source IP address can have 30 destination IP addresses and 30 destination VLAN IDs.
- If IP directed broadcasts is disabled using the command `ip directed-broadcast disable`, which also is the default, all packets with subnet broadcast, will be dropped.

**Examples**

- `ip directed-broadcast trusted-source-ip 30.0.0.0 mask 255.255.255.0`
- `vrf test123 ip directed-broadcast trusted-source-ip 30.0.0.0 mask 255.255.255.0 destination-ip 10.0.0.255 destination-mask 255.255.255.255`
- `ip directed-broadcast trusted-source-ip 30.0.0.0/24 destination-ip 10.0.0.255/24`
- `ip directed-broadcast trusted-source-ip 30.0.0.0 mask 255.255.255.0 destination-vlan 10`
- `ip directed-broadcast trusted-source-ip 30.0.0.0/24 destination-vlan 10-15`
- `no ip directed-broadcast trusted-source-ip 30.0.0.0/24`
- `no ip directed-broadcast trusted-source-ip 30.0.0.0 mask 255.255.255.0`

**Release History**

Release 8.5R2; command introduced.
Related Commands

**ip directed-broadcast**  Enables or disables IP directed broadcasts routed through the switch.

**ip directed-broadcast clear**  Clears all the trusted information configured.

**show ip directed-broadcast**  Displays the status of the directed broadcast configuration and trusted source IP address configuration.

```
**output definitions**

<table>
<thead>
<tr>
<th>Source-IP/Mask</th>
<th>Trusted source IP address and mask configured in a controlled manner.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destination-IP/Mask</td>
<td>Trusted destination IP address and mask configured in a controlled manner.</td>
</tr>
<tr>
<td>Vlan</td>
<td>Trusted VLAN ID configured for directed broadcast in a controlled manner.</td>
</tr>
</tbody>
</table>

**Release History**

Release 8.5R2; command introduced.

**Related Commands**

- `ip directed-broadcast` Enables or disables IP directed broadcasts routed through the switch.
- `ip directed-broadcast trusted-source-ip` Specify the source IP address, destination IP address and destination VLAN information to broadcast the packets in controlled manner.

**MIB Objects**

N/A
ip service

Enables (opens) or disables (closes) well-known or user-defined TCP/UDP service ports. Selectively enabling or disabling these types of ports provides an additional method for protecting against unauthorized switch access or Denial of Service (DoS) attacks.

[vrf vrf_name] ip service {all | service_name | port service_port} admin-state {enable | disable}

Syntax Definitions

<table>
<thead>
<tr>
<th>vrf_name</th>
<th>The name of an existing VRF instance in which services are to be enabled or disabled.</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Configures access to all TCP/UDP ports.</td>
</tr>
<tr>
<td>service_name</td>
<td>The name of the TCP/UDP service to enable or disable. (Refer to the table in the “Usage Guidelines” section for a list of supported service names.)</td>
</tr>
<tr>
<td>service_port</td>
<td>A TCP/UDP service port number. Configures access by port number rather than by service name. (Refer to the table in the “Usage Guidelines” section for a list of well-known port numbers.) If a user-defined port number is specified, the valid range is 20000–20999.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables access to the service.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables access to the service.</td>
</tr>
</tbody>
</table>

Defaults

All TCP/UDP ports are open by default.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- This command only applies to TCP/UDP service ports opened by default. It does not affect ports that are opened by applications, such as RIP, BGP, and so on.
- Use the all option with this command to configure access to all well-known TCP/UDP service ports.
- To designate which port to enable or disable, specify either the name of a service or the well-known port number associated with that service. Specifying a name and a port number in a single command line is not supported.
- When using service names, it is possible to specify more than one service in a single command line by entering each service name separated by a space. See the “Example” section for more information.
- When specifying a service port number, the `port` keyword is required and that only one port number is allowed in a single command.

- The following table lists the `ip service` command options for specifying TCP/UDP services and also includes the well-known port number associated with each service:

<table>
<thead>
<tr>
<th>service name</th>
<th>port</th>
</tr>
</thead>
<tbody>
<tr>
<td>ftp</td>
<td>21</td>
</tr>
<tr>
<td>ssh</td>
<td>22</td>
</tr>
<tr>
<td>telnet</td>
<td>23</td>
</tr>
<tr>
<td>http</td>
<td>80</td>
</tr>
<tr>
<td>https</td>
<td>443</td>
</tr>
<tr>
<td>ntp</td>
<td>123</td>
</tr>
<tr>
<td>snmp</td>
<td>161</td>
</tr>
</tbody>
</table>

- If a VRF is specified, the service is enabled or disabled in the specified VRF. By default, the services are enabled in the ‘default’ VRF.

**Examples**

- `-> ip service all admin-state disable`
- `-> ip service ftp admin-state enable`
- `-> ip service port 20000 admin-state enable`
- `-> vrf vrf1 ip service ftp admin-state enable`

**Release History**

Release 7.1.1; command introduced
Release 7.3.1; `vrf` parameter added.

**Related Commands**

- `ip service port` Configures a user-defined TCP/UDP port for the specified service.
- `show ip service` Displays the IP service TCP/UDP port configuration and status.

**MIB Objects**

- `alaIpServiceTable`
  - `alaIpServiceType`
  - `alaIpServicePort`
  - `alaIpServiceStatus`
- `alaIpPortServiceTable`
  - `alaIpPortServicePort`
  - `alaIpPortServiceStatus`
**ip service port**

Configures a user-defined TCP/UDP service port for the specified service.

```
ip service {service_name} port {default | service_port}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>service_name</th>
<th>The name of the TCP/UDP service to enable or disable. (Refer to the table in the “Usage Guidelines” section for a list of supported service names.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_port</td>
<td>A TCP/UDP service port number (Refer to the table in the “Usage Guidelines” section for a list of supported service names.) Valid range is the default service port number or 20000-20999.</td>
</tr>
<tr>
<td>default</td>
<td>Sets the port back to the well-known port for the specified service.</td>
</tr>
</tbody>
</table>

### Defaults

By default, the service uses the well-known TCP/UDP port number for that service.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `default` parameter with this command to set the port for the specified service back to the well-known default port for that service. For example, if the FTP port was previously changed to “20000”, then the `ip service ftp port default` command would set the FTP port back to “21”.

- The following table lists the `ip service port` command options for specifying TCP/UDP services and also includes the default well-known port number associated with each service:

<table>
<thead>
<tr>
<th>service name</th>
<th>port</th>
</tr>
</thead>
<tbody>
<tr>
<td>ftp</td>
<td>21</td>
</tr>
<tr>
<td>ssh</td>
<td>22</td>
</tr>
<tr>
<td>telnet</td>
<td>23</td>
</tr>
<tr>
<td>http</td>
<td>80</td>
</tr>
<tr>
<td>https</td>
<td>443</td>
</tr>
</tbody>
</table>

The `ntp` and `snmp` services are not supported with the `ip service port` command.
• Use the `ip service` command to enable or disable the status for a well-known or user-defined TCP/UDP service port.

**Examples**

-> ip service ftp port 20000  
-> ip service ftp port default  
-> ip service telnet port 20003  
-> ip service telnet port default

**Release History**

Release 7.1.1; command introduced

**Related Commands**

- `ip service` Enables or disables well-known or user-defined service ports.
- `show ip service` Displays the IP service TCP/UDP port configuration and status.

**MIB Objects**

- `alaIpServiceTable`
  - `alaIpServiceType`
  - `alaIpServicePort`
  - `alaIpServiceStatus`
# ip service source-ip

Configures a user-defined source IP address as the outgoing IP interface for the IP service.

```
[vrf vrf_name] ip service source-ip {Loopback0 | interface_name} [tftp] [telnet] [tacacs] [swlog] [ssh] [snmp] [sflow] [radius] [ntp] [ldap] [ftp] [dns] [all]
```

```
[vrf vrf_name] no ip service source-ip {Loopback0 | interface_name} [tftp] [telnet] [tacacs] [swlog] [ssh] [snmp] [sflow] [radius] [ntp] [ldap] [ftp] [dns] [all]
```

## Syntax Definitions

**vrf_name**
Name of the VRF.

**Loopback0**
Uses the Loopback0 interface as the source IP for the IP service.

**interface_name**
Specifies the name of the interface.

**tftp**
Configures the source IP address to be used by TFTP.

**telnet**
Configures the source IP address to be used by TELNET.

**tacacs**
Configures the source IP address to be used by TACACS.

**swlog**
Configures the source IP address to be used by SWLOG.

**ssh**
Configures the source IP address to be used by SSH.

**snmp**
Configures the source IP address to be used by SNMP.

**sflow**
Configures the source IP address to be used by sFlow. *This parameter is supported on both default VRF and non-default VRF instance.*

**radius**
Configures the source IP address to be used by RADIUS.

**ntp**
Configures the source IP address to be used by NTP.

**ldap**
Configures the source IP address to be used by the LDAP server.

**ftp**
Configures the source IP address to be used by FTP.

**dns**
Configures the source IP address to be used by DNS. *This parameter is supported only in the default VRF instance.*

**all**
Configures the source IP address to be used by all the applications.

## Defaults

By default, the outgoing interface is taken as the source IP address for all the applications.

## Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

- If for a particular application, specific source IP address is configured and the “all” option is also set, the configured source IP address for the application is used as the outgoing interface.
- Use the **no** form of this command to revert to the default behavior.
- Configuring a source IP address for an IP service is supported in non-default VRF instances; however, the DNS feature is not supported in a non-default VRF, so only configure it in the default VRF.

**Examples**

```plaintext
-> ip service source-ip loopback0 telnet
-> ip service source-ip ipVlan100 ftp

-> vrf create vrf-1
vrf-1::-> ip service source-ip v-200 all
WARNING: SFLOW and DNS are not supported for non-default VRF, vrf-1
```

**Release History**

- Release 7.3.4; command introduced
- Release 8.5R4; **ntp** option deprecated.
- Release 8.6R2; **ntp** option re-introduced.
- Release 8.9R1; non-default VRF support for source-ip on sFlow added.

**Related Commands**

- `show ip service source-ip` Displays the IP service TCP/UDP port configuration and status.

**MIB Objects**

- `alaIpServiceSourceIPTable`  
  - `AlaIpServiceSourceIPAppIndex`  
  - `alaIpServiceSourceIPName`
### ip redist

Controls the conditions for redistributing IPv4 routes between different protocols.

```
[vrf vrf_name] ip redist [local | static | rip | ospf | isis | bgp | spb-mgmt | import] into {rip | ospf | isis | bgp | spb-mgmt} {all-routes | route-map route_map_name} [admin-state {enable | disable}]
```

```
no ip redist [local | static | rip | ospf | isis | bgp | spb-mgmt | import] into {rip | ospf | isis | bgp | spb-mgmt} {all-routes | route-map | route_map_name}
```

### Syntax Definitions

- **vrf_name**: The name of an existing VRF instance.
- **local**: Redistributes local routes.
- **static**: Redistributes static routes.
- **rip**: Specifies RIP as the source or destination (into) protocol.
- **ospf**: Specifies OSPF as the source or destination (into) protocol.
- **isis**: Specifies IS-IS as the source or destination (into) protocol.
- **bgp**: Specifies BGP as the source or destination (into) protocol.
- **spb-mgmt**: Specifies SPB management routes as the source or destination (into) protocol.
- **import**: Redistributes imported routes to other routing protocols.
- **all-routes**: Redistributes all routes. This option does not allocate route-map resources.
- **route_map_name**: Name of an existing route map that controls the redistribution of routes between the source and destination protocol.
- **enable**: Enables the administrative status of the redistribution configuration.
- **disable**: Disables the administrative status of the redistribution configuration.

### Defaults

If a VRF name is not specified with this command, routes are redistributed within the context of the active VRF instance.

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>enable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900 V72/C32</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>

<td>Yes</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Usage Guidelines

- Use the `no` form of this command to remove a route map redistribution configuration. If a route map name is not specified, all route maps associated with the redistribution configuration are removed.

- The source and destination protocols must be loaded and enabled before redistribution occurs.

- When configuring in-band management access to an SPB network domain:
  - Specify `spb-mgmt` as the source protocol to redistribute SPB management routes into dynamic routing protocols.
  - Specify `spb-mgmt` as the destination protocol to redistribute routes into ISIS-SPB.

- If the metric calculated for the redistributed route is greater than 15 (RIP_UNREACHABLE) or greater than the metric of an existing pure RIP route, the new route is not redistributed.

- Use the `ip route-map` commands described in this chapter to create a route map. Refer to the “Configuring IP” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.

Examples

```bash
-> ip redist rip into bgp route-map rip-to-bgp1
-> ip redist rip into bgp route-map rip-to-bgp2
-> no ip redist rip into bgp route-map rip-to-bgp2
-> ip redist ospf into rip route-map ospf-to-rip
-> ip redist ospf into rip route-map ospf-to-rip admin-state disable
-> ip redist import into ospf route-map R1 admin-state enable
-> ip redist spb-mgmt into ospf all-routes
-> ip redist ospf into spb-mgmt all-routes
```

Release History

Release 7.1.1; command introduced
Release 7.3.1; `vrf` and `import` parameters added.
Release 7.3.2; `all-routes` parameter added.
Release 8.7R2; `spb-mgmt` parameter added.

Related Commands

- `show ip redist` Displays the route map redistribution configuration.
- `ip route-map action` Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
- `ip import` Configures a route map to import routes from GRT to the destination VRF.
- `show ip import` Displays the import route configuration details.

ip access-list

Creates an access list for adding multiple IPv4 addresses to route maps.

ip access-list access_list_name
no ip access-list access_list_name

Syntax Definitions

access_list_name    Name of the access list (up to 20 characters).

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **no** form of this command to delete the address from the access list.
- The **access_list_name** must exist before you add multiple addresses to the list.
- The **action** parameters (**permit** and **deny**) determine if a route that matches the **redist-control** configuration for the IP address is allowed or denied.
- The `redist-control` parameters (all-subnets, no-subnets, and aggregate) defines the criteria used to determine if a route matches an address in the access list.

- Configuring the combination of `redist-control aggregate` with `action deny` is not allowed.

- Use this command multiple times with the same access list name to add multiple addresses to the existing access list.

**Examples**

```plaintext
-> ip access-list access1 address 10.0.0.0/8 action permit
-> ip access-list access1 address 11.1.0.0/16 action permit
-> ip access-list access1 address 10.1.1.0/24 redist-control aggregate
-> no ip access-list access1 address 10.0.0.0/8
```

**Release History**

Release 7.1.1; command introduced

**Related Commands**

- **ip access-list**
  
  Creates an access list for adding multiple IPv4 addresses to route maps.

- **show ip access-list**
  
  Displays the contents of an IPv4 access list.

**MIB Objects**

- ```plaintext
  alaRouteMapAccessListTable
  alaRouteMapAccessListIndex
  alaRouteMapAccessListAddress
  alaRouteMapAccessListAddressType
  alaRouteMapAccessListPrefixLength
  alaRouteMapAccessListAction
  alaRouteMapAccessListRedistControl
  alaRouteMapAccessListRowStatus
```
**ip route-map action**

Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.

```
ip route-map route_map_name [sequence-number number] action {permit | deny}
no ip route-map route_map_name [sequence-number number]
```

---

**Syntax Definitions**

- `route_map_name`: The name of the route map (up to 20 characters).
- `number`: A number that links together the route maps. The range is 1–100.
- `permit`: Selects a route.
- `deny`: Filters a route.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>number</code></td>
<td>50</td>
</tr>
<tr>
<td><code>permit</code></td>
<td>permit</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Use the `no` form of this command to delete the entire route map by specifying only the `route_map_name`.
- Use the `no` form of this command to delete a specific sequence in the route map by specifying the `sequence-number`.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- Use this command to change the status of an existing route map to permit or deny.

---

**Examples**

```
-> ip route-map route1 sequence-number 10 action permit
-> no ip route-map route1
```
**Release History**

Release 7.1.1; command introduced

**Related Commands**

**show ip route-map**

Displays the configured IP route maps.

**MIB Objects**

alaRouteMapSequenceTable
  alaRouteMapSequenceIndex
  alaRouteMapSequenceNumber
  alaRouteMapSequenceAction
  alaRouteMapSequenceRowStatus
**ip route-map match ip address**

Matches the route with the specified IPv4 address or an address defined in the specified IPv4 access list.

```
ip route-map route_map_name [sequence-number number] match ip-address {access_list_name | ip_address/prefixLen [redist-control {all-subnets | no-subnets | aggregate}] [permit | deny]}
```

```
no ip route-map route_map_name [sequence-number number] match ip-address {access_list_name | ip_address/prefixLen [redist-control {all-subnets | no-subnets | aggregate}] [permit | deny]}
```

---

**Syntax Definitions**

- `route_map_name`: The name of the route map.
- `number`: A number that links together the route maps. The range is 1–100.
- `access_list_name`: The name of an IPv4 access list that contains IPv4 addresses to match.
- `ip_address/prefixLen`: The destination IP address along with the prefix length of the routes to be selected.
- `all-subnets`: Selects all the subnet routes that match the network portion of the IP address as specified by the mask length.
- `no-subnets`: Selects only those routes that exactly match the IP address and the mask length.
- `aggregate`: Creates an aggregate route if there are one or more routes that match the IP address.
- `permit`: Permits a route based on the IP address or prefix constrained by redist-control.
- `deny`: Denies a route based on the IP address or prefix constrained by redist-control.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>50</td>
</tr>
<tr>
<td>permit</td>
<td>deny</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---
**Usage Guidelines**

- Use the no form of this command to delete the **match ip-address redist-control** parameter in the route map.

- Specify either the name of an existing IPv4 access list or an IPv4 address/prefix length with this command.

- Configuring the combination of **redist-control aggregate** with **deny** is not allowed.

- Multiple addresses in the same route map sequence are matched using the longest prefix match.

- If the best matching address is type **deny**, then the route is not selected. If the best matching address is type **permit** and the route map action is **deny**, the route is not selected.

- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.

- The **route_map_name**, **sequence-number**, and **access_list_name** (if used) must exist before you configure this **match** criteria.

**Examples**

```
-> ip route-map 3 match ip-address 10.1.1.1/8 redist-control no-subnets deny
-> no ip route-map 3 match ip-address 10.1.1.1 redist-control no-subnets deny
-> ip route-map routel sequence-number 10 match ip-address list1
-> no ip route-map routel sequence-number 10 match ip-address list1
```

**Release History**

Release 7.1.1; command introduced

**Related Commands**

# ip route-map match ipv6 address

Matches the route with the specified IPv6 address or an address defined in the specified IPv6 access list.

```plaintext
ip route-map route_map_name [sequence-number number] match ipv6-address {access_list_name | ipv6_address/prefixLen [redist-control {all-subnets | no-subnets | aggregate}] [permit | deny]
```

```plaintext
no ip route-map route_map_name [sequence-number number] match ipv6-address ipv6_address/prefixLen [redist-control {all-subnets | no-subnets | aggregate}] [permit | deny]
```

## Syntax Definitions

- `route_map_name` - The name of the route map (up to 20 characters).
- `number` - A number that links together the route maps. The range is 1–100.
- `access_list_name` - The name of an IPv6 access list that contains IPv6 addresses to match.
- `ipv6_address/prefixLen` - The destination IPv6 address along with the prefix length of the routes to be selected.
- `all-subnets` - Selects all the subnet routes that match the network portion of the IP address as specified by the mask length.
- `no-subnets` - Selects only those routes that exactly match the IP address and the mask length.
- `aggregate` - Creates an aggregate route if there are one or more routes that match the IPv6 address.
- `permit` - Permits a route based on the IPv6 address or prefix constrained by redist-control.
- `deny` - Denies a route based on the IPv6 address or prefix constrained by redist-control.

## Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>number</code></td>
<td>50</td>
</tr>
<tr>
<td>`permit</td>
<td>deny`</td>
</tr>
</tbody>
</table>

## Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>
Usage Guidelines

- Use the no form of this command to delete the match ipv6-address redist-control parameter in the route map.
- Specify either the name of an existing IPv6 access list or an IPv6 address/prefix length with this command.
- Configuring the combination of redist-control aggregate with deny is not allowed.
- Multiple addresses in the same route map sequence are matched using the longest prefix match.
- If the best matching address is type deny, then the route is not selected. If the best matching address is type permit and the route map action is deny, the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The route_map_name and sequence-number must exist before you configure this match criteria.

Examples

- ip route-map 3 match ipv6-address 2001::1/64 redist-control no-subnets deny
- no ip route-map 3 match ipv6-address 2001::1/64 redist-control no-subnets deny
- ip route-map route1 sequence-number 10 match ipv6-address list1
- no ip route-map route1 sequence-number 10 match ipv6-address list1

Release History

Release 7.1.1; command introduced

Related Commands

**ip route-map match ip-nexthop**

Matches any routes that have a next-hop router address permitted by the specified access list name or the IP address specified in the route map.

```
ip route-map route_map_name [sequence-number number] match ip-nexthop {access_list_name | ip_address/prefixLen [permit | deny]}
```

```
no ip route-map route_map_name [sequence-number number] match ip-nexthop {access_list_name | ip_address/prefixLen [permit | deny]}
```

### Syntax Definitions

- **route_map_name**
  - The name of the route map.
- **number**
  - A number that links together the route maps. The range is 1–100.
- **access_list_name**
  - The access list that matches the route nexthop IP address.
- **ip_address/prefixLen**
  - The IP address along with the prefix length that matches any nexthop IP address within the specified subnet.
- **permit**
  - Permits a route based on the IP nexthop.
- **deny**
  - Denies a route based on the IP nexthop.

### Defaults

<table>
<thead>
<tr>

**ip route-map match ipv6-nexthop**

Matches any routes that have an IPv6 next-hop router address permitted by the specified access list name or the IPv6 address specified in the route map.

```
ip route-map route_map_name [sequence-number number] match ipv6-nexthop {access_list_name | ipv6_address/prefixLen [permit | deny]}
no ip route-map route_map_name [sequence-number number] match ipv6-nexthop {access_list_name | ipv6_address/prefixLen [permit | deny]}
```

**Syntax Definitions**

- `route_map_name`: The name of the route map.
- `number`: A number that links together the route maps. The range is 1–100.
- `access_list_name`: The access list that matches the route nexthop IPv6 address.
- `ipv6_address/prefixLen`: The IPv6 address along with the prefix length that matches any nexthop IP address within the specified subnet.
- `permit`: Permits a route based on the IPv6 nexthop.
- `deny`: Denies a route based on the IPv6 nexthop.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>50</td>
</tr>
<tr>
<td>permit</td>
<td>deny</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

Displays the configured IP route maps.

**MIB Objects**

alaRouteMapTable
  - alaRouteMapIndex
  - alaRouteMapSequence
  - alaRouteMapType
  - alaRouteMapValue
  - alaRouteMapRowStatus
ip route-map match route-type

Matches the specified route type with actual route type of the route.

```
ip route-map route_map_name [sequence-number number] match route-type {internal | external [type1 | type2] | level1 | level2}
no ip route-map route_map_name [sequence-number number] match route-type {internal | external [type1 | type2] | level1 | level2}
```

### Syntax Definitions

- **route_map_name**: The name of the route map.
- **number**: A number that links together the route maps. The range is 1–100.
- **internal**: Matches OSPF/BGP internal routes.
- **external**: Matches OSPF/BGP external routes.
- **type1**: Matches OSPF external Type-1 routes, which gives the full metric calculation for the complete path including internal as well as external cost.
- **type2**: Matches OSPF external Type-2 routes, which gives the external redistribution metric only to the ASBR.
- **level1**: Matches IS-IS Level-1 routes only.
- **level2**: Matches IS-IS Level-2 routes only.

### Defaults

### Usage Guidelines

- Use the **no** form of this command to delete the `match name` parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The `route_map_name` and `sequence-number` must exist before you configure this `match` criteria.

### Examples

- `-> ip route-map routel sequence-number 10 match name Route-Bldgl`
- `-> no ip route-map routel sequence-number 10 match name Route-Bldgl`

### Release History

Release 7.3.1; command introduced
### Related Commands

**ip route-map action**

Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.

**show ip route-map**

Displays the configured IP route maps.

</tbody>
</table>
ip route-map set metric

Configures the metric value of the route being distributed.

```
ip route-map route_map_name [sequence-number number] set metric metric [effect {add | subtract | replace | none}]
no ip route-map route_map_name [sequence-number number] set metric metric [effect {add | subtract | replace | none}]
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>route_map_name</td>
<td>The name of the route map.</td>
</tr>
<tr>
<td>number</td>
<td>A number that links together the route maps. The range is 1–100.</td>
</tr>
<tr>
<td>metric</td>
<td>Configures the metric value of the route. A value of 0 is not allowed.</td>
</tr>
<tr>
<td>add</td>
<td>Adds the configured metric value to the actual metric value.</td>

**MIB Objects**

alaRouteMapTable
  - alaRouteMapIndex
  - alaRouteMapSequence
  - alaRouteMapType
  - alaRouteMapValue
  - alaRouteMapRowStatus
**ip route-map set metric-type**

Configures the metric type for the redistributed route.

```
ip route-map route_map_name [sequence-number number] set metric-type {internal | external [type1 | type2]}
no ip route-map route_map_name [sequence-number number] set metric-type {internal | external [type1 | type2]}
```

**Syntax Definitions**

- **route_map_name**: The name of the route map.
- **number**: A number that links together the route maps. The range is 1–100.
- **internal**: Sets the metric type to internal for routes redistributed into BGP.
- **external**: Sets the metric type to external for routes redistributed into BGP.
- **type1**: Sets the metric type to external type1 for routes redistributed into OSPF, which gives the full metric calculation for the complete path including internal as well as external cost.
- **type2**: Sets the metric type to external type2 for routes redistributed into OSPF, which gives the external redistribution metric only to the ASBR.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>50</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>

**ip route-map set community**

Configures the community name of the route being redistributed into BGP.

```
ip route-map route_map_name [sequence-number number] set community community_string
no ip route-map route_map_name [sequence-number number] set community community_string
```

**Syntax Definitions**

- `route_map_name`: The name of the route map.
- `number`: A number that links together the route maps. The range is 1–100.
- `community_string`: Defines a community for an aggregate route. Community names range from 0 to 70 characters.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>50</td>
</tr>

ip route-map set local-preference

Configures the local preference value for a route being distributed into BGP.

```
ip route-map route_map_name [sequence-number number] set local-preference value
no ip route-map route_map_name [sequence-number number] set local-preference value
```

**Syntax Definitions**

- `route_map_name`: The name of the route map.
- `number`: A number that links together the route maps. The range is 1–100.
- `value`: Configures the local-preference value for routes being redistributed in to BGP. The value is between 0 and 4294967295.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>50</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

vrf

Configures and selects a virtual routing and forwarding (VRF) instance on the switch.

vrf [create] [vrf_name | default] [profile {max | low}]
no vrf vrf_name

Syntax Definitions

create
Creates a new VRF instance with the specified VRF name.

vrf_name
The alphanumeric name (1–20 characters) assigned to the VRF instance.

default
Optional. Selects the default VRF instance.

max
Creates a VRF with the maximum profile capabilities.

low
Creates a VRF with the minimum (lowest) capabilities. Low profile VRFs use less system resources.

Defaults

A default VRF instance exists in the switch configuration. All applications that are not VRF aware belong to this instance.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf_name</td>
<td>default VRF instance</td>
</tr>
<tr>
<td>max</td>
<td>max profile</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- To create a new VRF instance, use the create parameter with this command. For example, vrf create IpOne creates a new “IpOne” VRF instance. When a new instance is created, that instance automatically becomes the current CLI context.

- If the create keyword is not specified, then this command will select the specified VRF name as the current CLI context. If the VRF instance does not exist, an error message is displayed.

- Use the no form of this command to delete a VRF instance. Deleting the default instance is not allowed. In addition, any interfaces configured for a VRF instance are automatically removed when the instance is deleted.
• To return to the default VRF instance from within the context of another instance, enter the `vrf` command with or without the optional `default` parameter (for example, `vrf` or `vrf default`).

• Configuring a VRF instance name is case sensitive. Use the `show vrf` command to verify the VRF instance configuration before selecting, adding, or removing instances.

• If the name of an existing instance is specified with this command, VRF changes the command prompt to reflect the specified instance name. All CLI commands entered at this point are applied within the context of the active VRF instance.

• It is also possible to configure other instances from within the CLI context of the default VRF instance by entering the `vrf` command followed by the instance name. For example, entering `vrf IpOne ip interface intf100 address 100.1.1.1/24 vlan 100` is applied to the IpOne instance even though IpOne is not the active CLI context.

• The type of profile assigned to a VRF instance determines the routing protocols and capabilities supported within that instance. For example:
  – Low profile VRFs only support IPv4 and VRRP with routing capabilities restricted to static and imported routes. In addition, limiting low profiles to 9 routes and 3 IP interfaces is highly recommended.
  – IPv6 routing protocols (such as BGP, IS-IS, PIM, RIPng, OSPFv3, and VRRPv3) are only supported on max profile VRFs.

• Profiles are not configurable for the default VRF, which provides full routing capabilities.

• Changing the profile for an existing VRF instance is not allowed. To change the profile, first delete the VRF then create it again with a different profile.

**Examples**

The following command examples create new VRF instances:

```
-> vrf create IpOne
IpOne:: ->
```

```
IpOne:: -> vrf create IpTwo
IpTwo:: ->
```

```
-> vrf create IpThree profile low
IpThree::->
```

The following command examples select a VRF instance to change the CLI context:

```
-> vrf IpTwo
IpTwo:: ->
```

```
-> vrf IpFour
ERROR: VRF IpFour does not exist.
```

The following command examples return the CLI context to the default VRF instance:

```
IpTwo:: -> vrf
->
```

```
IpTwo:: -> vrf default
->
```

The following command example configures an IP interface for the “IpOne” VRF instance from within the context of the default VRF instance:

```
-> vrf IpOne ip interface intf100 address 100.1.1.1/24 vlan 100
```
Release History

Release 7.1.1; command was introduced.
Release 7.3.2; max and low parameters added to define VRF profiles.
Release 8.4.1.R03; create parameter added.

Related Commands

  - alaVirtualRouterName
  - alaVirtualRouterNameIndex
  - alaVirtualRouterNameRowStatus
  - alaVirtualRouterProfile
### ip export

Exports routes from the source VRF to the Global Routing Table (GRT) or to all VRF instances. All routes are exported or a route map can be specified to filter exported routes

```
[vrf vrf_name] ip export {all-routes | route-map route_map_name} to-all-vrfs {all-routes | route-map route_map_name}
```

```
[vrf vrf_name] no ip export
```

#### Syntax Definitions

- **vrf_name**
  - The name of an existing VRF instance. Routes are exported from this source VRF to the GRT.

- **all-routes**
  - Exports all routes from the source VRF to the GRT. This option does not allocate route-map resources.

- **route_map_name**
  - The name of an existing route-map to use for filtering routes that are exported from the source VRF to the GRT.

- **to-all-vrfs all-routes**
  - Exports all routes to all of the other VRF instances, except to VRFs that already have an import configured for the source (export) VRF.

- **to-all-vrfs route-map route_map_name**
  - The name of an existing route map to use for filtering routes that are exported from the source VRF to all other VRF instances.

#### Defaults

- If a source VRF name is not specified with this command, routes are exported from within the context of the active VRF instance to the GRT.

- If there are no VRF instances configured on the switch, the routes are exported from the default VRF to the GRT.

#### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

- Use the `no` form of this command to disable exporting of routes from the VRF to GRT.

- The route map name specified with this command must already exist in the switch configuration. See the `ip route-map` commands in this guide and the “Configuring IP” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.
A route map created to filter exported VRF routes can contain any of the following match and set options:
- Match options: ip-address, ip-next-hop, tag, protocol, ipv4-interface, metric, route-type, name
- Set options: tag, metric
A route map with redist control of aggregate is supported when exporting IP routes, but it is not supported when importing IP routes.
Only one route map per source VRF or ISID is allowed for filtering exported routes.
Only those FDB (Forwarding Routing Database) routes that match the conditions of the route map are exported to GRT.
Modifying a route map that is assigned to a VRF or ISID through the `ip import` or `ip export` command is supported.

**Examples**
The following commands export routes from the current VRF routing table (or from the default VRF if there are no other VRFs configured) to the GRT:

```bash
-> ip export route-map R1
-> ip export all-routes
-> ip export to-all-vrfs all-routes
-> ip export to-all-vrfs route-map R2
-> no ip export
```

The following commands export routes from the “vrf2” routing table to the GRT even though the command line is operating within the context of the default VRF instance:

```bash
-> vrf vrf2 ip export route-map R1
-> vrf vrf2 ip export all-routes
-> vrf vrf2 ip export to-all-vrfs all-routes
-> vrf vrf2 ip export to-all-vrfs route-map R2
-> no vrf vrf2 ip export
```

The following commands first change the command line context to the “vrf1” instance so that all subsequent commands export routes from “vrf1” without having to specify the VRF name with each command:

```bash
-> vrf vrf1
vrf1::-> ip export route-map R1
vrf1::-> ip export all-routes
vrf1::-> ip export to-all-vrfs all-routes
vrf1::-> ip export to-all-vrfs route-map R2
vrf1::-> no ip export
```

**Release History**
Release 7.3.1; command introduced.
Release 7.3.2; `all-routes` and `to-all-vrfs` parameters added.
### Related Commands

### MIB Objects

- alaIprmExportRouteMap
- alaIprmExportToAllVrfsRouteMap
ip import

Imports VRF or Shortest Path Bridging (SPB) service instance identifier (ISID) routes from the GRT to the destination VRF. All routes are imported or a route map can be specified to filter imported routes.

```plaintext
[vrf dest_vrf_name] ip import {vrf {src_vrf_name | default} | isid instance_id} {all-routes | route-map route_map_name}
```

```plaintext
[vrf dest_vrf_name] no ip import {vrf {src_vrf_name | default} | isid instance_id}
```

### Syntax Definitions

- **dest_vrf_name**
  The name of the destination VRF instance into which routes are imported from the GRT.

- **src_vrf_name**
  The name of the source VRF instance from which routes were exported to the GRT. Routes from this instance are imported from the GRT into the specified destination VRF instance.

- **default**
  Default VRF. The routes are imported from the default VRF instance.

- **instance_id**
  An existing ISID number that identifies an SPB service in a provider backbone bridge (PBB) network. The routes for this ISID number are imported from the GRT into the current or specified VRF instance.

- **all-routes**
  Imports all routes from the source VRF instance. Imported routes are not filtered.

- **route_map_name**
  The name of an existing route map to use for filtering routes that are imported from the GRT to the destination VRF. Imported routes are filtered based on the options defined in the route map.

### Defaults

If a destination VRF name is not specified with this command, routes are imported from the GRT into the context of the active VRF instance.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>

### Usage Guidelines

- Use the **no** form of this command to remove the IP import routes configuration for the specified VRF instance or ISID.

- The route map name specified with this command must already exist in the switch configuration. See the **ip route-map** commands in this guide and the “Configuring IP” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.
A route map created to filter imported VRF or ISID routes can contain any of the following match and set parameter options:
- Match options: ip-address, ip-next-hop, tag, metric
- Set options: tag, metric

A route map with redist control of aggregate is supported when exporting IP routes, but it is not supported when importing IP routes.

Only one route map per source (imported) VRF or ISID is allowed.

Modifying a route map that is assigned to a VRF or ISID through the `ip import` or `ip export` command is supported.

Leaked routes are only for forwarding. If a local route is leaked, that interface is not accessible in the importing VRF. Another switch will not be able to ping the interface in the import VRF.

**Examples**

-> ip import vrf V1 route-map R2
-> ip import vrf V2 all-routes
-> ip import isid 1500 route-map R1
-> ip import isid 2000 all-routes
-> no ip import vrf V1
-> no ip import isid 1500

**Release History**

Release 7.3.1; command introduced.
Release 7.3.2; `isid` and `all-routes` parameters added.

**Related Commands**

- `vrf` Configures and selects a virtual routing and forwarding (VRF) instance on the switch.
- `ip route-map action` Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
- `ip route-map match protocol` Matches the protocol specified in the route map with the protocol of the route.
- `show ip import` Displays the import route configuration details.
- `show ip global-route-table` Displays the GRT for all the routes that are exported from the VRFs.
- `show ip route-map` Displays the configured IP route maps.
MIB Objects

alaIprmImportVrfTable

  alaIprmImportVrfRouteMap
  alaIprmImportVrfRowStatus
alaIprmImportIsidTable
  alaIprmImportIsid
  alaIprmImportIsidRouteMap
  alaIprmImportIsidRowStatus
**show ip export**

Displays the export route configuration details.

```
[vrf vrf_name] show ip export
```

### Syntax Definitions

- **vrf_name**  
The name of an existing VRF instance.

### Defaults

By default, the export route configuration for the active VRF instance is displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If a VRF is specified, the export route configuration for that VRF is displayed.

### Examples

```
-> show ip export  
Export Route Map: leak-out

-> vrf vrf1 show ip export  
Export Route Map: none (all-routes)

vrf2:-> show ip export  
Export Route Map: none (all-routes) -> To All VRFs
```

### Release History

Release 7.3.1; command introduced.
Related Commands

ip export
Exports routes from the source VRF to the Global Routing Table (GRT) or to all VRF instances.

MIB Objects

alaIprmExportRouteMap
alaIprmExportToAllVrfsRouteMap
show ip import

Displays the import route configuration details.

[vrf vrf_name] show ip import

Syntax Definitions

vrf_name The name of an existing VRF instance.

Defaults

By default, the import route configuration for the active VRF instance is displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

  - `alaIprmImportIsid`
  - `alaIprmImportIsidRouteMap`
  - `alaIprmImportIsidRowStatus`
show ip global-route-table

Displays the contents of the Global Routing Table (GRT) for all the routes that are exported from VRF instances or from Shortest Path Bridging service instance identifiers (ISIDs). This command is only available within the context of the default VRF instance.

show ip global-route-table [export-vrf vrf_name]

Syntax Definitions

vrf_name

The alphanumeric name (1–20 characters) assigned to the VRF instance.

Defaults

By default, exported routes are displayed for all VRF instances and ISIDs.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the export-vrf parameter to display exported routes for a specific VRF instance.

Examples

```
-> show ip global-route-table
Type  Source               Destination        Gateway         Metric  Tag
-----+--------------------+------------------+---------------+----------+----------
vrf  Customer1         10.0.0.0/8        12.1.1.2        1         100
vrf  Customer2         11.0.0.0/8        12.1.1.3        2         0
isid 1000              12.0.0.0/8        12.1.1.4        1         2
```

output definitions

<table>
<thead>
<tr>
<th>Type</th>
<th>The type of exported route (vrf or isid).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>The name of the VRF instance or the Shortest Path Bridging service instance identifier (ISID) from which routes are exported to the GRT.</td>
</tr>
<tr>
<td>Destination</td>
<td>The address of the route.</td>
</tr>
<tr>
<td>Gateway</td>
<td>The next hop for the destination address.</td>
</tr>
<tr>
<td>Metric</td>
<td>The metric of the exported route.</td>
</tr>
<tr>
<td>Tag</td>
<td>The tag of the exported route.</td>
</tr>
</tbody>
</table>
Release History

Release 7.3.1; command introduced.
Release 7.3.2; VRF Name and Description fields renamed Type and Source, exported ISID route entries added to the table.

Related Commands

**ip export**
Configures a route map to export routes from the source VRF to Global Routing Table (GRT).

**show ip export**
Displays the export route configuration details.

MIB Objects

alaGrtRouteTable
  alaGrtRouteDistinguisher
  alaGrtRouteDest
  alaGrtRouteMaskLen
  alaGrtRouteNextHop
  alaGrtRouteMetric
  alaGrtRouteTag
  alaGrtRouteVrfName
  alaGrtRouteIsid
arp

Adds a permanent entry to the ARP table. To forward packets, the switch dynamically builds an ARP Table to match the IP address of a device with its physical (MAC) address. These entries age out of the table when the timeout value is exceeded. This command is used to add a permanent entry to the table. Permanent entries do not age out of the table.

```
arp ip_address mac_address [alias] [name] [interface interface_name] [port chassis/slot/port] [linkagg agg_id]
```

```
no arp ip_address [alias]
```

**Syntax Definitions**

- **ip_address**  
  IP address of the device you are adding to the ARP table.

- **mac_address**  
  MAC address of the device in hexadecimal format (for example, 00.00.39.59.f1.0c).

- **alias**  
  Specifies that the switch will act as an alias (or proxy) for this IP address. When the alias option is used, the switch responds to all ARP requests for the specified IP address with its own MAC address. *This parameter is not supported on the OmniSwitch 9900.*

  The proxy feature can also be enabled for an IP interface using the **ip interface** command. When enabled, ARP requests return the MAC address of the IP router interface and all traffic within the VLAN is routed.

- **name**  
  The name to assign to this ARP entry.

- **interface_name**  
  Name of the interface to be used for ARP resolution.

- **chassis/slot/port**  
  The chassis ID, slot, and port number (1/1/3).

- **agg_id**  
  The link aggregate ID number.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to delete a permanent ARP entry.
• Configuring a permanent ARP entry with a multicast address is also supported. This is done by specifying a multicast address for the \texttt{ip-address} parameter instead of a unicast address.

• Using the \texttt{arp alias} command is not related to proxy ARP as defined in RFC 925. Instead, \texttt{arp alias} is similar to the Local Proxy ARP feature, except that it is used to configure the switch as a proxy for only one IP address.

• As most hosts support the use of address resolution protocols to determine cache address information (called dynamic address resolution), it is not required to specify permanent ARP cache entries.

• Only the IP address is required when deleting an ARP entry from the table.

\textbf{Examples}

\begin{verbatim}
-> arp 171.11.1.1 00:05:02:c0:7f:11
-> arp 171.11.1.1 00:05:02:c0:7f:11 interface int1
-> no arp 171.11.1.1
\end{verbatim}

\textbf{Release History}

Release 7.1.1; command was introduced.
Release 7.3.4; \texttt{interface} parameter added.

\textbf{Related Commands}

\begin{verbatim}
\texttt{clear arp-cache} \hspace{1cm} Deletes all dynamic entries from the ARP table.
\texttt{ip interface} \hspace{1cm} Enables or disables the Local Proxy ARP feature for an IP interface. When enabled, all traffic within the VLAN is routed. ARP requests return the MAC address of the IP router interface.
\texttt{show arp} \hspace{1cm} Displays the ARP table.
\end{verbatim}

\textbf{MIB Objects}

\begin{verbatim}
\texttt{ipNetToMediaTable}
  ipNetToMediaIfIndex
  ipNetToMediaNetAddress
  ipNetToMediaPhyAddress
  ipNetToMediaType
\texttt{alaIpNetToMediaTable}
  alaIpNetToMediaPhyAddress
  alaIpNetToMediaProxy
\end{verbatim}
ip distributed-arp admin-state

Enables or disables the distributed ARP feature.

`ip distributed-arp admin-state {enable | disable}`

**Syntax Definitions**

<table>
<thead>
<tr>
<th>enable</th>
<th>Dynamically assigns a Network Interface (NI) as the designated-NI for all the ARP entries on an IP interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables the distributed ARP feature.</td>
</tr>
</tbody>
</table>

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

Not supported in this release.

**Usage Guidelines**

- Use this feature to dynamically assign a Network Interface (NI) as the designated-NI for all the ARP entries. The NI with maximum number of active ports for that IP subnet is assigned.
- To reset or update the dynamically assigned NI, the feature must be disabled and then enabled.

**Examples**

-> ip distributed-arp admin-state enable
-> ip distributed-arp admin-state disable

**Release History**

Release 7.3.4; command introduced;
Release 8.6R2; command deprecated.

**Related Commands**

- `show ip arp utilization` Displays the designated NIs for the interfaces and the NI utilization.
- `show ip interface` Displays the configuration and status of IP interfaces.

**MIB Objects**

- `alaIpDistributedArp`
arp send-gratuitous-arp

Enables or disables the outgoing Gratuitous ARP packets.

`arp send-gratuitous-arp {enable | disable}`

**Syntax Definitions**

- **enable**: The Gratuitous ARP packets are periodically sent from the switch.
- **disable**: The outgoing Gratuitous ARP packets are blocked.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use this feature to block the outgoing Gratuitous ARP packets from the switch.
- The incoming Gratuitous ARP packets can be blocked or allowed using the `ip dos type` CLI command.
- The configuration status of the outgoing Gratuitous ARP packets can be viewed using the `show arp send-gratuitous-arp` CLI command.

**Examples**

- `-> arp send-gratuitous-arp enable`
- `-> arp send-gratuitous-arp disable`

**Release History**

Release 8.7 R1; command introduced;

**Related Commands**

- `show arp send-gratuitous-arp` Displays if outgoing gratuitous ARP packets are enabled or disabled.
MIB Objects

alaIpArpSendGratuitous
clear arp-cache

Deletes all dynamic entries from the ARP table.

Syntax Definitions
N/A

Defaults
N/A

Platforms Supported
This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- This command only clears dynamic entries. If permanent entries have been added to the table, they must be removed using the no form of the ip service command.
- Dynamic entries remain in the ARP table until they time out. The switch uses the MAC Address table timeout value as the ARP timeout value. Use the mac-learning aging-time command to set the timeout value.

Examples

-> clear arp-cache

Release History

Release 7.1.1; command introduced

Related Commands

- ip service
  Adds a permanent entry to the ARP table.
- show arp
  Displays the ARP table.

MIB Objects

- alaIpClearArpCache
**ip dos arp-poison restricted-address**

Adds or deletes an ARP Poison restricted address.

```plaintext
ip dos arp-poison restricted-address ip_address
no ip dos arp-poison restricted-address ip_address
```

---

**Syntax Definitions**

`ip_address` 32-bit IP address.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

Use the `no` form of the command to remove an already configured ARP Poison restricted address.

---

**Examples**

```plaintext
-> ip dos arp-poison restricted-address 192.168.1.1
-> no ip dos arp-poison restricted-address 192.168.1.1
```

---

**Release History**

Release 7.1.1; command introduced

---

**Related Commands**

- `ip service` Adds a permanent entry to the ARP table.
- `show arp` Displays the ARP table.

---

**MIB Objects**

- `alaDoSArpPoisonTable`
  - `alaDoSArpPoisonIpAddr`
  - `alaDoSArpPoisonRowStatus`
arp filter

Configures an ARP filter that determines if ARP Request packets containing a specific IP address are processed by the switch or discarded.

**arp filter** *ip_address* [*mask ip_mask*] [*vlan_id*] [*sender | target*] [*allow | block*]

**no arp filter** *ip_address*

---

**Syntax Definitions**

- **ip_address**: The IP address to use for filtering ARP packet IP addresses.
- **ip_mask**: An IP mask that identifies which part of the ARP packet IP address is examined for filtering (for example, mask 255.0.0.0 filters on the first octet of the ARP packet IP address).
- **vlan_id**: A VLAN ID that specifies that only ARP packets for a specific VLAN are filtered.
- **sender**: The sender IP address in the ARP packet is used for ARP filtering.
- **target**: The target IP address in the ARP packet is used for ARP filtering.
- **allow**: ARP packets that meet filter criteria are processed.
- **block**: ARP packets that meet filter criteria are discarded.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan_id</td>
<td>0 (no VLAN)</td>
</tr>
<tr>
<td>ip_mask</td>
<td>255.255.255.255</td>
</tr>
<tr>
<td>sender</td>
<td>target</td>
</tr>
<tr>
<td>allow</td>
<td>block</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Use the **no** form of this command to delete an ARP filter.
- If there are no filters configured for the switch, all ARP Request packets received are processed.
- Up to 200 filters are allowed on each switch.
• If sender or target IP address in an ARP Request packet does not match any filter criteria, the packet is processed by the switch.

• ARP filtering is used in conjunction with the Local Proxy ARP application; however, ARP filtering is available for use on its own and/or with other applications.

**Examples**

-> arp filter 171.11.1.1
-> arp filter 172.0.0.0 mask 255.0.0.0
-> arp filter 198.0.0.0 mask 255.0.0.0 sender
-> arp filter 198.172.16.1 vlan 200 allow
-> no arp filter 171.11.1.1

**Release History**

Release 7.1.1; command introduced

**Related Commands**

- **clear arp filter** Clears all ARP filters from the filter database.
- **ip interface** Enables or disables the Local Proxy ARP feature on an IP interface. When enabled, all traffic within the VLAN is routed. ARP requests return the MAC address of the IP router interface.
- **show ip arp utilization** Displays the ARP filter configuration.

**MIB Objects**

alaIpArpFilterTable
  alaIpArpFilterIpAddr
  alaIpArpFilterIpMask
  alaIpArpFilterVlan
  alaIpArpFilterMode
  alaIpArpFilterType
clear arp filter

Clears the ARP filter database of all entries.

**clear arp-filter**

---

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command clears all ARP filters configured on the switch. To remove an individual filter entry, use the `no` form of the `arp filter` command.

**Examples**

```
-> clear arp filter
```

**Release History**

Release 7.1.1; command introduced

**Related Commands**

- **arp filter**
  Configures an ARP filter to allow or block the processing of specified ARP Request packets.
- **show ip arp utilization**
  Displays the ARP filter configuration.

**MIB Objects**

- `alaIpClearArpFilter`
icmp type

Enables or disables a specific type of ICMP message, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

**Syntax**

```
icmp type type code code {enable | disable | min-pkt-gap gap}
```

**Syntax Definitions**

- **type**: The ICMP packet type. This is conjunction with the ICMP code that determines the type of ICMP message being specified.
- **code**: The ICMP code type. This is conjunction with the ICMP type that determines the type of ICMP message being specified.
- **enable**: Enables the specified ICMP message.
- **disable**: Disables the specified ICMP message.
- **gap**: The number of microseconds required between ICMP messages of this type.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
<tr>
<td>gap</td>
<td></td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command allows the user to enable or disable all types of ICMP messages, and set the minimum packet gap between messages of the specified type.

- Enabling **Host unreachable** and **Network unreachable** messages are not recommended as it can cause the switch instability due to high-CPU conditions depending upon the volume of traffic required by these messages.

- While this command can be used to enable or disable all ICMP message, some of the more common ICMP messages have their own CLI commands, as described in the pages below. The following ICMP messages have specific commands to enable and disable:
ICMP Message | Command
---|---
Network unreachable (type 0, code 3) | icmp unreachable
Host unreachable (type 3, code 1) | icmp unreachable
Protocol unreachable (type 3, code 2) | icmp unreachable
Port unreachable (type 3, code 3) | icmp unreachable
Echo reply (type 0, code 0) | icmp echo
Echo request (type 8, code 0) | icmp echo
Timestamp request (type 13, code 0) | icmp timestamp
Timestamp reply (type 14, code 0) | icmp timestamp
Address Mask request (type 17, code 0) | icmp addr-mask
Address Mask reply (type 18, code 0) | icmp addr-mask

**Examples**

-> icmp type 4 code 0 enabled
-> icmp type 4 code 0 min-pkt-gap 40
-> icmp type 4 code 0 disable

**Release History**

Release 7.1.1; command introduced

**Related Commands**

* icmp messages* Enables or disables all ICMP messages.
* show arp send-gratuitous-arp* Allows the viewing of the ICMP control settings.

### icmp unreachable

Enables or disables ICMP messages pertaining to unreachable destinations, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

```
icmp unreachable [net-unreachable | host-unreachable | protocol-unreachable | port-unreachable] {{enable | disable} | min-pkt-gap gap}
```

#### Syntax Definitions

- **net-unreachable**: Sets the unreachable network ICMP message.
- **host-unreachable**: Sets the unreachable host ICMP message.
- **protocol-unreachable**: Sets the unreachable protocol ICMP message.
- **port-unreachable**: Sets the unreachable port ICMP message.
- **enable**: Enables the specified ICMP message.
- **disable**: Disables the specified ICMP message.
- **gap**: The number of microseconds required between ICMP messages of this type.

#### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>enable</td>
</tr>
<tr>
<td>disable</td>
<td>disable</td>
</tr>
<tr>
<td>gap</td>
<td>0</td>
</tr>
</tbody>
</table>

#### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

- This command enables ICMP messages relating to unreachable destinations. Unreachable networks, hosts, protocols, and ports can all be specified.
- Enabling **host-unreachable** and **net-unreachable** messages are not recommended as it can cause the switch instability due to high-CPU conditions depending upon the volume of traffic required by these messages.
- The unreachable ICMP messages can also be enabled, disabled, and modified using the `icmp type` command. See the `icmp type` command information on the type and code for the unreachable ICMP messages.
Examples

-> icmp unreachable net-unreachable enable
-> icmp unreachable host-unreachable enable
-> icmp unreachable protocol-unreachable enable
-> icmp unreachable port-unreachable enable
-> icmp unreachable port-unreachable min-pkt-gap 50

Release History

alaIcmpCtrlPktGap
**icmp echo**

Enables or disables ICMP echo messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

\[ \text{icmp echo } [\text{request} | \text{reply}] \{\{\text{enable} | \text{disable}\} | \text{min-pkt-gap} \text{ } \text{gap}\} \]

---

### Syntax Definitions

- **request**: Specifies the echo request ICMP message.
- **reply**: Specifies the echo reply ICMP message.
- **enable**: Enables the specified ICMP message.
- **disable**: Disables the specified ICMP message.
- **gap**: The number of microseconds required between ICMP messages of this type.

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>enable</td>
</tr>
<tr>
<td>disable</td>
<td>disable</td>
</tr>
<tr>
<td>gap</td>
<td>0</td>
</tr>
</tbody>
</table>

---

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command sets the ICMP echo messages. An echo request is sent to a destination, and must be responded to with an echo reply message that contains the original echo request.
- Using this command without specifying a request or reply enables, disables, or sets the minimum packet gap for both types.
- The echo ICMP messages can also be enabled, disabled, and modified using the `icmp type` command. See the `icmp type` command information on the type and code for the echo ICMP messages.

### Examples

- `> icmp echo reply enable`
- `> icmp echo enable`
- `> icmp echo request enable`
- `> icmp echo request min-pkt-gap 50`

**icmp timestamp**

Enables or disables ICMP timestamp messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

```
icmp timestamp [request | reply] [{enable | disable} | min-pkt-gap gap]
```

### Syntax Definitions

- **request** Specifies timestamp request messages.
- **reply** Specifies timestamp reply messages.
- **enable** Enables the specified ICMP message.
- **disable** Disables the specified ICMP message.
- **gap** The number of microseconds required between ICMP messages of this type.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>enable</td>
</tr>
<tr>
<td>disable</td>
<td>enable</td>
</tr>
<tr>
<td>gap</td>
<td>0</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The data received (a timestamp) in the message is returned in the reply together with an additional timestamp. The timestamp is 32 bits of milliseconds since midnight UT. The Originate timestamp is the time the sender last touched the message before sending it, the Receive timestamp is the time the echoer first touched it on receipt, and the Transmit timestamp is the time the echoer last touched the message on sending it.

- Using this command without specifying a request or reply enables, disables, or sets the minimum packet gap for both types.

- The timestamp ICMP messages can also be enabled, disabled, and modified using the `icmp type` command. See the `icmp type` command information on the type and code for the timestamp ICMP messages.
Examples

-> icmp timestamp reply enable
-> icmp timestamp enable
-> icmp timestamp request enable
-> icmp timestamp request min-pkt-gap 50

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- A gateway receiving an address mask request must return it with the address mask field set to the 32-bit mask of the bits identifying the subnet and network, for the subnet on which the request was received.

- Using this command without specifying a request or reply enables, disable, or set the minimum packet gap for both types.

- The address mask ICMP messages can also be enabled, disabled, and modified using the `icmp type` command. See the `icmp type` command information on the type and code for the address mask ICMP messages.

---

**Examples**

- `-> icmp addr-mask reply enable`
- `-> icmp addr-mask enable`
-> icmp addr-mask request enable
-> icmp addr-mask request min-pkt-gap 50

**ip dos scan close-port-penalty**

Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP or UDP packet is received on a closed port.

**ip dos scan close-port-penalty penalty_value**

### Syntax Definitions

**penalty_value**

A penalty value added to the penalty scan value. This value can be any non-negative integer.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>penalty_value</td>
<td>10</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

### MIB Objects

- **alaDoSConfig**
alaDoSPortScanTcpOpenPortPenalty
ip dos scan udp open-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a UDP packet is received on an open port.

`ip dos scan udp open-port-penalty penalty_value`

### Syntax Definitions

| `penalty_value` | A penalty value added to the penalty scan value. This value can be any non-negative integer. |

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>penalty_value</code></td>
<td>0</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</tbody>
</table>

### Usage Guidelines

- This command creates a point value that is added to the total port scan penalty value when a UDP packet is received that is destined for an open port.
- The switch does not distinguish between a legal UDP packet and a port scan packet.

### Examples

```
-> ip dos scan udp open-port-penalty 15
```

### Release History

Release 7.1.1; command introduced

### Related Commands

- `ip dos scan threshold` Sets the threshold for the port scan value, at which a DoS attack is recorded.
- `ip dos trap` Sets whether the switch generates SNMP DoS traps when an attack is detected.

### MIB Objects

`alaDoSConfig`
alaDoSPortScanUdpOpenPortPenalty
### ip dos scan threshold

Sets the threshold for the port scan value, at which a DoS attack is recorded.

**ip dos scan threshold** *threshold_value*

---

**Syntax Definitions**

*threshold_value* A numerical value representing the total acceptable penalty before a DoS attack is noted. This value can be any non-negative integer.

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>threshold_value</em></td>
<td>1000</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If the total port scan penalty value exceeds this value, a port scan attack is recorded.
- The penalty value is incremented by recording TCP or UDP packets that are bound for open or closed ports. Such packets are given a penalty value, which are added. The commands for setting the packet penalty value are the *ip dos scan close-port-penalty*, *ip dos scan tcp open-port-penalty*, and *ip dos scan udp open-port-penalty* commands.

**Examples**

- `-> ip dos scan threshold 1200`

**Release History**

Release 7.1.1; command introduced
**Related Commands**

- `ip dos scan close-port-penalty`  
  Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP or UDP packet is received on a closed port.

- `ip dos scan tcp open-port-penalty`  
  Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP packet is received on an open port.

- `ip dos scan udp open-port-penalty`  
  Assigns a penalty value to be added to the Denial of Service penalty scan value when a UDP packet is received on an open port.

- `show ip dos config`  
  Displays the configuration parameters of the DoS scan for the switch.

**MIB Objects**

- `alaDoSConfig`  
  `alaDoSPortScanThreshold`
**ip dos trap**

Sets whether or not the switch generates SNMP DoS traps when an attack is detected.

```
ip dos trap {enable | disable}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the generation of DoS traps.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the generation of DoS traps.</td>
</tr>
</tbody>
</table>

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command controls whether the switch generates an SNMP trap when a DoS attack is detected. It is assumed a DoS attack has occurred when the port scan penalty threshold is exceeded. This value is set using the `ip dos scan threshold` command.

### Examples

```
-> ip dos trap enable
-> ip dos trap disable
```

### Release History

Release 7.1.1; command introduced

### Related Commands

- `ip dos scan threshold` Sets the threshold for the port scan value, at which a DoS attack is recorded.
- `show ip dos config` Displays the configuration parameters of the DoS scan for the switch.
**MIB Objects**

alaDoSConfig

alaDoSTrapCnt1
ip dos scan decay

Sets the decay speed of the port scan penalty value for the switch when calculating DoS attacks.

**ip dos scan decay decay_value**

---

**Syntax Definitions**

- **decay_value**: The decay value amount for reducing the port scan penalty. This value can be any non-negative integer.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>decay_value</td>
<td>2</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The port scan penalty value is reduced every minute by dividing by the amount set in using this command. For example, if the decay value is set to 10, every minute the total port scan penalty value is divided by 10.

**Examples**

```
-> ip dos scan decay 10
```

**Release History**

Release 7.1.1; command introduced

**Related Commands**

- **ip dos scan threshold**: Sets the threshold for the port scan value, at which a DoS attack is recorded.
- **show ip dos config**: Displays the configuration parameters of the DoS scan for the switch.

**MIB Objects**

- **alaDoSConfig**
**ip dos type**

Enables or disables detection for the specified type of DoS attack.

```
ip dos type {port-scan | ping-of-death | land | loopback-src | invalid-ip | invalid-multicast | unicast-ip-mcast-mac | ping-overload | arp-flood | arp-poison | gratuitous-arp | ipoptions-filter} admin-state {enable | disable}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port-scan</td>
<td>Detects port scans by monitoring TCP or UDP packets sent to open or closed ports.</td>
</tr>
<tr>
<td>ping-of-death</td>
<td>Detects the number of ICMP Ping-of-Death attacks (the switch receives ping packets that exceed the largest IP datagram size of 65535 bytes).</td>
</tr>
<tr>
<td>land</td>
<td>Detects the number of Land attacks (the switch receives spoofed packets with the SYN flag set on any open port that is listening).</td>
</tr>
<tr>
<td>loopback-src</td>
<td>Detects the number of loopback source attacks (the switch receives packets with 127.0.0.0/8 as the IP source address).</td>
</tr>
<tr>
<td>invalid-ip</td>
<td>Detects invalid IP packets (the switch receives packets with an invalid source or destination IP address).</td>
</tr>
<tr>
<td>invalid-multicast</td>
<td>Detects invalid Multicast packets (the switch receives packets with an invalid multicast address).</td>
</tr>
<tr>
<td>unicast-ip-mcast-mac</td>
<td>Detects a unicast IP and multicast MAC mismatch (the switch receives IP packets with multicast/broadcast source mac-address, non-matching destination IP and mac-address).</td>
</tr>
<tr>
<td>ping-overload</td>
<td>Detects a ping overload attack (the switch is flooded with a large number of ICMP packets).</td>
</tr>
<tr>
<td>arp-flood</td>
<td>Detects ARP flooding (the switch is flooded with a large number of ARP requests).</td>
</tr>
<tr>
<td>arp-poison</td>
<td>Detects ARP poisoning (the switch receives replies to an ARP request generated by the switch for a user-specified restricted address).</td>
</tr>
<tr>
<td>gratuitous-arp</td>
<td>Detects the Gratuitous ARP packets entering the switch. The incoming Gratuitous ARP packets can be allowed or blocked.</td>
</tr>
<tr>
<td>ipoptions-filter</td>
<td>Detects the packets with the IP option entering the switch. The incoming IP option packets can be allowed or dropped.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables DoS attack detection.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables DoS attack detection.</td>
</tr>
</tbody>
</table>

### Defaults

By default, detection is enabled for all the specified IP DoS attack types, except for ping overload and gratuitous-arp.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Usage Guidelines

- When detection is enabled for ping overload, the attack is not detected until the number of ICMP packets received exceeds 100 packets-per-second.

- ARP flooding is rate limited to 500 packets-per-second on the switch. As a result, ARP flooding is not detected until the number of ARP requests exceeds 500 packets-per-second.

- When detection is enabled for unicast IP/multicast MAC mismatches (unicast-ip-mcast-mac), ping overload attacks (ping-overload), or ARP flooding attacks (arp-flood), packets are not dropped when the attack is detected.

Examples

- ip dos type ping-overload admin-state enable
- ip dos type land admin-state disable
- ip dos type gratuitous-arp admin-state disable
- ip dos type ipoptions-filter admin-state enable

Release History

- Release 7.1.1; command introduced
- Release 8.7 R1: gratuitous-arp parameter added.
- Release 8.7 R2: ipoptions-filter parameter added.

Related Commands

Usage Guidelines

- The statistics show the cumulative totals since the last time the switch was powered on or since the last reset of the switch was executed.
- Packets received on a port that is a member of the UserPorts group are dropped if they contain a source IP network address that does not match the IP subnet for the port. This is done to block spoofed IP traffic. If the UserPorts group function is active and spoofed traffic was detected and blocked, the output display of this command includes statistics regarding the spoofed traffic.
- The presence of spoofing event statistics in the output display of this command indicates that an attack was prevented, not that the switch is currently under attack.
- If statistics for spoofed traffic are not displayed, then a spoofing attempt has not occurred since the last time this command was issued.

Examples

-> show ip traffic

Summary:
Datagrams received
  Total received = 621883,
  IP header error = 0,
  Destination IP error = 51752,
  Unknown protocol = 0,
  Local discards = 0,
  Delivered to users = 567330,
  Reassemble needed = 0,
Reassembled = 0,
Reassemble failed = 0

Datagrams sent
Forwarded = 2801,
Generated = 578108,
Local discards = 0,
No route discards = 9,
Fragmented = 2801,
Fragment failed = 0,
Fragments generated = 0

output definitions

Total
Total number of input datagrams received including the datagrams received in the error.

IP header error
Number of IP datagrams discarded due to errors in the IP header (for example, bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discarded in processing IP options).

Destination IP error
Number of IP datagrams discarded because the IP header destination field contained an invalid address. This count includes invalid addresses (for example, 0.0.0.0) and addresses of unsupported classes (for example, Class E).

Unknown protocol
Number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.

Local discards
Number of IP datagrams received that were discarded, even though they had no errors to prevent transmission (for example, lack of buffer space). This does not include any datagrams discarded while awaiting reassembly. This value must be zero.

Delivered to users
Total number of datagrams received that were successfully delivered to IP user protocols (including ICMP).

Reassemble needed
Number of IP fragments received that needed to be reassembled.

Reassembled
Number of IP datagrams received that were successfully reassembled.

Reassemble failed
Number of IP failures detected by the IP reassembly algorithm for all reasons (for example, timed out, error). This is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.

Fragmented
Number of successfully fragmented IP datagrams.

Fragment failed
Number of packets received and discarded by IP that were not fragmented. This situation can happen if a large packet has the “Don’t Fragment” flag set.

Forwarded
Number of IP datagrams forwarded by the switch.

Generated
Total number of IP datagrams that local IP user protocols (including ICMP) generated in response to requests for transmission. This does not include any datagrams counted as “Forwarded.”

Local discards
Number of output IP datagrams that were discarded, even though they had no errors to prevent transmission (for example, lack of buffer space). This number includes datagrams counted as “Forwarded” if the packets are discarded for these reasons.
### Output Definitions (Continued)

<table>
<thead>
<tr>
<th>Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No route discards</td>
<td>Number of IP datagrams received and discarded by IP because no route could be found to transmit them to their destination. This includes any packets counted as “Forwarded” if the packets are discarded for these reasons. It also includes any datagrams that a host cannot route because all of its default routers are down.</td>
</tr>
<tr>
<td>Fragments generated</td>
<td>The number of IP datagram fragments generated as a result of fragmentation.</td>
</tr>
<tr>
<td>Routing entry discards</td>
<td>Number of packets received and discarded by IP even though no problems were encountered to prevent their transmission to their destination (for example, discarded because of lack of buffer space).</td>
</tr>
</tbody>
</table>

### Release History

Release 7.1.1; command introduced

### Related Commands

- **Show icmp statistics**
  - Displays ICMP statistics and errors.

### MIB Objects

- N/A
**show ip interface**

Displays the configuration and status of IP interfaces.

```
show ip interface [if_name | vlan vlan_id | dhcp-client]
```

**Syntax Definitions**

- **if_name**: The name associated with the IP interface.
- **vlan_id**: VLAN ID (displays a list of IP interfaces associated with a VLAN).
- **dhcp-client**: Displays the configuration and status of a DHCP Client interface.

**Defaults**

By default, all IP interfaces are displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the optional **vlan** parameter to display a list of interfaces configured for the specified VLAN.
- Use the optional **if_name** parameter to display detailed information about an individual interface.
- Use the optional **dhcp-client** parameter to display detailed information about an interface that has been configured to obtain an IP address from a DHCP server.
- In a virtual chassis environment this command does not accurately reflect the status of the EMP IP interface on other chassis when entered on a Slave chassis.

**Examples**

```
-> show ip interface
Total 13 interfaces
  Flags (D=Directly-bound)

### output definitions (continued)

| **Primary (config/actual)** | Indicates if the interface is the configured and/or actual primary interface for the device (VLAN, EMP, Loopback). If the actual status is set to `yes` and the config status is set to `no`, the interface is the default interface for the VLAN. Configured through the `ip interface` command. |
| **Directly bound port** | Displays the physical port or link aggregate that is directly bound to the interface. Configured through the `ip interface rtr-port` command. This field displays only when the interface is configured as an IP routed port interface. |
| **ARP Count** | Displays the number of ARP entries in the NI. |
| **DHCP-Client Parameter Details** | (The following parameters are only applicable to the ‘dhcp-client’ interface. Configured through the `ip interface dhcp-client` command.) |
| **Dhcp Prefer Server** | Indicates if the DHCP server preference option is enabled or disabled. |
| **Client Status** | DHCP Client Status (**In-active, Active**) |
| **Server IP** | The IP address of the DHCP server. |
| **Router Address** | The IP address of the DHCP router. |
| **Lease Time Remaining** | The lease time remaining for the DHCP client IP address. |
| **Option-60** | The option-60 string that will be included in DHCP discover or request packets. |
| **HostName** | The system name of the OmniSwitch. |

<td>The Maximum Transmission Unit size set for the interface. Configured through the <code>vlan mtu-ip</code> command.</td>
</tr>
</tbody>
</table>

**Release History**

- Release 7.1.1; command introduced
- Release 7.3.4; output modified to display *Designated NI* and *ARP Count*.
- Release 8.5R1; *Dhcp prefer server* field added in output.
**Related Commands**

**ip interface**

Configures an IP interface to enable IP routing on a VLAN. Without an IP interface, traffic is bridged within the VLAN or across connections to the same VLAN on other switches.

**ip interface tunnel**

Configures the end points for the GRE and IPIP tunnels.

**show ip emp-interfaces**

Displays the configuration and status of the Ethernet Management Port (EMP) interface.

**show icmp statistics**

Displays ICMP statistics and errors.

**MIB Objects**

**show ip emp-interfaces**

Displays the configuration and status of the Ethernet Management Port (EMP) interface.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show ip emp-routes` to display IP routes associated with the EMP interface.

**Examples**

```
-> show ip emp-interfaces
Total 1 interfaces
  Flags (D=Directly-bound)

<table>
<thead>
<tr>
<th>Name</th>
<th>IP Address</th>
<th>Subnet Mask</th>
<th>Status</th>
<th>Forward</th>
<th>Device</th>
<th>Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMP-CMMA-CHAS1</td>
<td>3.3.3.25</td>
<td>255.0.0.0</td>
<td>DOWN</td>
<td>NO</td>
<td>EMP</td>
<td></td>
</tr>
</tbody>
</table>
```

**Name**

Interface name. `EMP-CMMA-CHAS1` refers to the Ethernet Management Port.

**IP Address**

IP address of the interface. Configured through the `ip interface` command.

**Subnet Mask**

IP subnet mask for the interface IP address. Configured through the `ip interface` command.

**Status**

Interface status:
- **UP**—Interface is ready to pass packets.
- **DOWN**—Interface is down.

**Forward**

Indicates whether the interface is actively forwarding packets (YES or NO).
**Device**
- **EMP**—The Ethernet Management Port is bound to the interface.

**Flags**
- N/A for EMP interfaces.

**Release History**
Release 7.3.3; command introduced.

**Related Commands**
- **show ip interface**
  Displays the status and configuration of IP interfaces.

**MIB Objects**
- N/A
show ip routes

Displays the IP Forwarding table.

[vrf vrf_name] show ip routes [summary]

Syntax Definitions

vrf_name The alphanumeric name (1–20 characters) assigned to the VRF instance.

summary Displays a summary of routing protocols that appear in the IP Forwarding table.

Defaults

By default, all routes are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>6900 X48C4E/V48C8/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The IP Forwarding table includes static routes as well as all routes learned through routing protocols (for example, RIP, OSPF).

- Use the optional summary keyword to display a list of routing protocols and the number of routes for each protocol that appear in the IP Forwarding table.

- The imported routes are also displayed under the protocol field as IMPORT in the show output.

Examples

-> show ip routes

+ = Equal cost multipath routes

Total 7 routes

<table>
<thead>
<tr>
<th>Dest Address</th>
<th>Gateway Addr</th>
<th>Age</th>
<th>Protocol</th>
</tr>

<td>0</td>
</tr>
<tr>
<td>Other</td>
<td>0</td>
</tr>
<tr>
<td>TOTAL</td>
<td>3</td>
</tr>
</tbody>
</table>

**Output Definitions**

- **Dest Addr**: Destination IP address/mask length.
- **Gateway Addr**: IP address of the gateway from which this address was learned. Gateway address `0.0.0.0` indicates an IPv4 blackhole route.
- **Age**: Age of the entry. If the entry is less than a day old, it is displayed in hh/mm/ss format. If it is more than a day old, it is displayed in dd/hh format (for example, a route that is 2 days and 12 hours old is displayed as 2d12h).
- **Protocol**: Protocol by which this IP address was learned (for example, RIP). “Local” indicates a local interface.
- **Route Count**: The number of routes that appear in the IP Forwarding table for each protocol type listed.

**Release History**

- Release 7.1.1; command introduced
- Release 7.3.1; vrf parameter added.
- Release 8.7R2; “SPB-MGMT” protocol added to the output display.

**Related Commands**

- **ping**: Used to test whether an IP destination can be reached from the local switch.
- **traceroute**: Used to find the path taken by an IP packet from the local switch to a specified destination.
- **show ip router database**: Displays a list of all routes (static and dynamic) that exist in the IP router database.
**MIB Objects**

ipCidrRouteTable
  ipCidrRouteDest
  ipCidrRouteMask
  ipCidrRouteTos
  ipCidrRouteNextHop

  ipCidrRouteMetric2
  ipCidrRouteMetric3
  ipCidrRouteMetric4
  ipCidrRouteMetric5
  ipCidrRouteStatus
show ip route-pref

Displays the IPv4 routing preferences of a router.

[vrf vrf_name] show ip route-pref

Syntax Definitions

vrf_name

The alphanumeric name (1–20 characters) assigned to the VRF instance.

 Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

By default, ISIS Level 1 routes are preferred over ISIS Level 2 routes and EBGP routes will carry a higher precedence than IBGP routes.

Examples

-> show ip route-pref

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Route Preference Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local</td>
<td>1</td>
</tr>
<tr>
<td>Static</td>
<td>2</td>
</tr>
<tr>
<td>OSPF</td>
<td>110</td>
</tr>
<tr>
<td>ISISL1</td>
<td>115</td>
</tr>
<tr>
<td>ISISL2</td>
<td>118</td>
</tr>
<tr>
<td>RIP</td>
<td>120</td>
</tr>
<tr>
<td>SPB-MGMT</td>
<td>150</td>
</tr>
<tr>
<td>EBGP</td>
<td>190</td>
</tr>
<tr>

</tr>
<tr>
<td>Import</td>
<td>210</td>
</tr>
</tbody>
</table>

Release History

Release 7.1.1; command introduced
Release 7.3.1; vrf parameter added.
Release 8.7R2; “SPB-MGMT” protocol added to the output display.
**Related Commands**

*ip route-pref*  
Configures the route preference of a router.

**MIB Objects**

alaIprmRtPrefTable

alaIprmRtPrefEntryType
alaIprmRtPrefEntryValue
show ip redist

Displays the IPv4 route map redistribution configuration.

[vrf vrf_name] show ip redist [rip | ospf | isis | bgp]

Syntax Definitions

vrf_name
The alphanumeric name (1–20 characters) assigned to the VRF instance.

rip
Displays route map redistribution configurations that use RIP as the destination (into) protocol.

ospf
Displays route map redistribution configurations that specify OSPF as the destination (into) protocol.

isis
Displays route map redistribution configurations that specify ISIS as the destination (into) protocol.

bgp
Displays the route map redistribution configurations that specify BGP as the destination (into) protocol at this time.

Defaults

By default, all route map redistribution configurations are shown.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6</th>
<th>6900X48C8/C32E/T24C2</th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

Specify a destination protocol with this command to display only those configurations that redistribute routes into the specified protocol.

Examples

-> show ip redist

<table>
<thead>
<tr>
<th>Source</th>
<th>Destination</th>
<th>Protocol</th>
<th>Admin State</th>
<th>Route Map</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCAL4</td>
<td>OSPF</td>

<td></td>
</tr>
<tr>
<td>SPB-MGMT</td>
<td>OSPF</td>
<td>Enabled</td>
<td>none (all-routes)</td>
<td></td>
</tr>
<tr>
<td>IMPORT</td>
<td>RIP</td>
<td>Enabled</td>
<td>ipv4rm</td>
<td></td>
</tr>
</tbody>
</table>
-> show ip redist rip

<table>
<thead>
<tr>
<th>Source Protocol</th>
<th>Destination Protocol</th>
<th>Status</th>
<th>Route Map</th>
</tr>
</thead>
<tbody>
<tr>
<td>BGP</td>
<td>RIP</td>
<td>Enabled</td>
<td>ipv4rm</td>
</tr>
<tr>
<td>IMPORT</td>
<td>RIP</td>
<td>Enabled</td>
<td>ipv4rm</td>
</tr>
</tbody>
</table>

**output definitions**

- **Source Protocol**: The protocol from which the routes are learned.
- **Destination Protocol**: The protocol into which the source protocol routes are redistributed.
- **Status**: The administrative status (**Enabled** or **Disabled**) of the route map redistribution configuration.
- **Route Map**: The name of the route map that is applied with this redistribution configuration.

**Release History**

- Release 7.1.1; command introduced
- Release 7.3.1; vrf parameter added.
- Release 8.7R2; “SPB-MGMT” route redistribution included in the output display.

**Related Commands**

- `ip redist` Controls the conditions for redistributing different IPv4 routes between protocols.
- `show ip redist-routes` Displays all of the IPv6 routes that have been redistributed.

**MIB Objects**

- `alaRouteMapRedistProtoTable`
  - `alaRouteMapRedistSrcProtoId`
  - `alaRouteMapRedistDestProtoId`
  - `alaRouteMapRedistRouteMapIndex`
  - `alaRouteMapRedistStatus`
  - `alaRouteMapRedistAddressType`
  - `alaRouteMapRedistRowStatus`

---

**Usage Guidelines**

If the **route_map_name** is not specified in this command, all the route maps are displayed.

---

**Examples**

```
-> show ip route-map
Route Maps: configured: 1 max: 200
Route Map: Route_map1 Sequence Number: 50 Action permit
  match ip address 10.0.0.0/8 redist-control all-subnets permit
  set metric 100 effect replace
```

---

**Release History**

Release 7.1.1; command introduced

---

**Related Commands**

**ip route-map action**

Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
**MIB Objects**

- `alaRouteMapRedistProtoTable`
  - `alaRouteMapRedistRouteMapIndex`
- `alaRouteMapTable`
  - `alaRouteMapIndex`
  - `alaRouteMapSequence`
  - `alaRouteMapType`
  - `alaRouteMapValue`
  - `alaRouteMapRowStatus`
show ip router database

Displays a list of all routes (static and dynamic) that exist in the IP router database. This database serves as a central repository where routes are first processed and where duplicate routes are compared to determine the best route for the Forwarding Routing Database. If a route does not appear in the IP router database list, then the switch does not know about it. In the case of dynamically learned routes, this could indicate that the route was never received by the switch.

[vrf vrf_name] show ip router database [protocol type | gateway ip_address | dest {ip_address/prefixlen | ip_address}]

Syntax Definitions

vrf_name The alphanumeric name (1–20 characters) assigned to the VRF instance.
type Routing protocol type (local, static, import, OSPF, RIP, BGP, ISIS, or SPB-MGMT).
ip_address Destination IP address.
ip_address/prefixlen The destination IP address along with the prefix length of the routes processed for redistribution.

Defaults

By default, all routes are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Command options are not mutually exclusive. You can use them on the same command line to narrow and/or customize the output display of this command. For example, use the protocol and dest options to display only those routes that are of a specific protocol type and have the specified destination network.

- The IP forwarding table is derived from IP router database processing performed by the switch and contains only unique routes that the switch currently uses. Use the show ip route command to view the forwarding table.

- If an expected route does not appear in the IP forwarding table, use the show ip router database command to see if the switch knows about the route and/or if a duplicate route with a higher precedence was selected instead.

- The switch compares the protocol of duplicate routes to determine which one to use. Regardless of whether a route has a higher priority metric value, protocol determines precedence. Local routes are...
given the highest level of precedence followed by static, OSFP, RIP, then BGP routes. As a result, a route that is known to the switch does not appear in the IP forwarding table if a duplicate route with a higher protocol precedence exists.

- A list of inactive static routes is also included in the `show ip router database` output display. A route becomes inactive if the interface for its gateway goes down. Inactive routes are unable to get to their destination and further investigation is warranted to determine why their gateway is unavailable.

- Static routes that appear as inactive are not included in the main IP router database listing. If an inactive route becomes active, however, it is removed from the inactive list and added to the active route list.

- The imported routes are also displayed under the protocol field as IMPORT in the show output.

**Examples**

```
-> show ip router database
Legend: + indicates routes in-use  
b indicates BFD-enabled static route  
i indicates interface static route  
r indicates recursive static route, with following address in brackets

Total IPRM IPv4 routes: 9

</table>
```

**output definitions**

- **Destination**: Destination IP address. Also includes the mask prefix length notation after the address to indicate the subnet mask value. For example, `/24` indicates the destination IP address has a 24-bit mask (255.255.255.0).

- **Gateway**: IP address of the gateway from which this route was learned. Gateway address ‘0.0.0.0’ indicates an IPv4 blackhole route.

- **Interface**: The interface associated with the gateway.

show ip emp-routes

Displays the IP routes associated with the Ethernet Management Port (EMP).

show ip emp-routes

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- This command displays the routes that are connected to the Ethernet Management Port (EMP).
- The EMP cannot handle routing protocols such as RIP or OSPF.
- The default route for the switch cannot be set up on the EMP.
- There is no dedicated routing table for the EMP interface. All management interfaces use the same routing table with EMP and non-EMP routes.

Examples

`-> show ip emp-routes`

<table>
<thead>
<tr>
<th>Dest Address</th>
<th>Subnet Mask</th>
<th>Gateway Addr</th>
<th>Age</th>
<th>Protocol</th>
</tr>
</thead>
<tbody>
<tr>

**Release History**

Release 7.1.1; command introduced

**Related Commands**

- **arp** Adds a permanent entry to the ARP table.
- **clear arp-cache** Deletes all dynamic entries from the ARP table.

**MIB Objects**

- `ipNetToMediaTable`
  - `ipNetToMediaIfIndex`
  - `ipNetToMediaNetAddress`
  - `ipNetToMediaPhyAddress`
  - `ipNetToMediaType`
- `ipNetToMediaAugTable`
  - `ipNetToMediaSlot`
  - `ipNetToMediaPort`
- `alaIpNetToMediaTable`
  - `alaIpNetToMediaPhyAddress`
  - `alaIpNetToMediaProxy`
  - `alaIpNetToMediaVRRP`
  - `alaIpNetToMediaAuth`
**show ip arp utilization**

Displays the designated NIs for the interfaces and the NI utilization.

**show ip arp utilization [slot chassis/slot | interfaces]**

---

**Syntax Definitions**

- **chassis/slot**: The chassis ID and slot number of the interface. The output is displayed specific to the slot.
- **interfaces**: Displays the ARP utilization of the designated-NI on all the configured interfaces.

---

**Defaults**

N/A

---

**Platforms Supported**

Not supported in this release.

---

**Usage Guidelines**

Use the basic command (**show ip arp utilization**) to view all of the entries in the table. Enter a specific chassis and slot number to view a specific entry.

---

**Examples**

```
-> show ip arp utilization
Distributed ARPs: Enabled

<table>

**Output definitions**

- **NI**: The chassis ID and slot number of the designated-NI.
- **Max**: The maximum number of ARP entries supported on the NI.
- **ARP count**: ARP count in the NI for the NI or interface.
- **HW Usage**: The amount of table space used up in the ASIC.
- **HW ARPS**: The number of ARPs in the ASIC.
- **%**: The percentage of ARP utilization on that designated-NI.
- **VRF**: The name of the VRF associated to the interface.
- **Interface**: The interface to which the entry belongs.

**Release History**

Release 7.3.4; command introduced

**Related Commands**

- **ip distributed-arp admin-state**: Enables or disables the distributed ARP feature.

**MIB Objects**

- **alaDistArpNiTable**
  - **alaDistArpItfTable**
**show arp filter**

Displays a list of ARP filters configured for the switch.

```
show arp filter [ip_address]
```

### Syntax Definitions

- `ip_address` IP address of the filter entry you want to view.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- If an IP address is not specified with this command, a list of all ARP filters is displayed.
- Enter a specific IP address to view the configuration for an individual filter.

### Examples

```
-> show arp filter
IP Addr   IP Mask   Vlan  Type    Mode
----------------+---------+-----+--------+-------
171.11.1.1     255.255.255.255  0    target block
172.0.0.0      255.0.0.0       0    target block
198.0.0.0      255.0.0.0       0    sender block
198.172.16.1   255.255.255.255 200  target allow

-> show arp filter 198.172.16.1
IP Addr   IP Mask   Vlan  Type    Mode
----------------+---------+-----+--------+-------
198.0.0.0      255.0.0.0       0    sender block
198.172.16.1   255.255.255.255 200  target allow
```

### Output Definitions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Addr</td>
<td>The ARP packet IP address to which the filter is applied.</td>
</tr>
<tr>
<td>IP Mask</td>
<td>The IP mask that specifies which part of the IP address to which the filter is applied.</td>
</tr>
</tbody>
</table>
**output definitions (continued)**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vlan</td>
<td>A VLAN ID. The filter is applied only to ARP packets received on ports associated with this VLAN.</td>
</tr>
<tr>
<td>Type</td>
<td>Indicates which IP address in the ARP packet (sender or target) is used to identify if a filter exists for that address.</td>
</tr>
<tr>
<td>Mode</td>
<td>Indicates whether to block or allow a switch response to an ARP packet that matches the filter.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command introduced

**Related Commands**

- **arp filter**
  Adds a permanent entry to the ARP table.

- **clear arp filter**
  Deletes all dynamic entries from the ARP table.

**MIB Objects**

- alaIpArpFilterTable
  - alaIpArpFilterIpAddr
  - alaIpArpFilterIpMask
  - alaIpArpFilterVlan
  - alaIpArpFilterMode

**output definitions**

**Name**

The name of the ICMP message.

**Type**

The ICMP message type. This along with the ICMP code specifies the ICMP message.

**Code**

The ICMP message code. This along with the ICMP type specifies the ICMP message.

**Status**

Whether this message is **Enabled** or **Disabled**.

**min-pkt-gap**

The minimum packet gap, in microseconds, for this ICMP message.

The minimum packet gap is the amount of time that must pass between ICMP messages of like types.

---

**Release History**

Release 7.1.1; command introduced

**Related Commands**

- **icmp type**
  
  Enables or disables a specific type of ICMP message, and sets the minimum packet gap.

- **icmp unreachable**
  
  Enables or disables ICMP messages pertaining to unreachable destinations, and sets the minimum packet gap.

- **icmp echo**
  
  Enables or disables ICMP echo messages, and sets the minimum packet gap.

- **icmp timestamp**
  
  Enables or disables ICMP timestamp messages, and sets the minimum packet gap.

- **icmp addr-mask**
  
  Enables or disables ICMP address mask messages, and sets the minimum packet gap.

- **icmp messages**
  
  Enables or disables all ICMP messages.

**MIB Objects**

N/A
show icmp statistics

Displays Internet Control Message Protocol (ICMP) statistics and errors. ICMP is a network layer protocol within the IP protocol suite that provides message packets to report errors and other IP packet processing information back to the source. ICMP generates several kinds of useful messages, including Destination Unreachable, Echo Request and Reply, Redirect, Time Exceeded, and Router Advertisement and Solicitation. If an ICMP message cannot be delivered, no second one is generated. This is to avoid an endless flood of ICMP messages.

show icmp [statistics]

Syntax Definitions

statistics Optional syntax.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>

Address mask reply                     0           0
output definitions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total</td>
<td>Total number of ICMP messages the switch received or attempted to send. This counter also includes all the messages that were counted as errors.</td>
</tr>
<tr>
<td>Error</td>
<td>Number of ICMP messages the switch sent/received but was unable to process because of ICMP-specific errors (for example, bad ICMP checksums, bad length).</td>
</tr>
<tr>
<td>Destination unreachable</td>
<td>Number of “destination unreachable” messages that were sent/received by the switch.</td>
</tr>
<tr>
<td>Time exceeded</td>
<td>Number of “time exceeded” messages that were sent/received by the switch. These messages occur when a packet is dropped because the TTL counter reaches zero. When a large number of these messages occur, it is a symptom that packets are looping, that congestion is severe, or that the TTL counter value is set too low. These messages also occur when all the fragments trying to be reassembled do not arrive before the reassembly timer expires.</td>
</tr>
<tr>
<td>Parameter problem</td>
<td>Number of messages sent/received which indicate that an illegal value has been detected in a header field. These messages can indicate a problem in the sending IP software of the host or gateway.</td>
</tr>
<tr>
<td>Source quench</td>
<td>Number of messages sent/received that tell a host that it is sending too many packets. A host must attempt to reduce its transmissions upon receiving these messages.</td>
</tr>
<tr>
<td>Redirect</td>
<td>Number of ICMP redirect messages sent/received by the switch.</td>
</tr>
<tr>
<td>Echo request</td>
<td>Number of ICMP echo messages sent/received by the switch to see if a destination is active and unreachable.</td>
</tr>
<tr>
<td>Echo reply</td>
<td>Number of echo reply messages received by the switch.</td>
</tr>
<tr>
<td>Time stamp request</td>
<td>Number of time stamp request messages sent/received by the switch.</td>
</tr>
<tr>
<td>Time stamp reply</td>
<td>Number of time stamp reply messages sent/received by the switch.</td>
</tr>
<tr>
<td>Address mask request</td>
<td>Number of address mask request messages that were sent/received by the switch in an attempt to determine the subnet mask for the network.</td>
</tr>
<tr>
<td>Address mask reply</td>
<td>Number of address mask reply messages that were sent/received by the switch.</td>
</tr>
</tbody>

`show tcp statistics`

---

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

N/A

**Examples**

```
-> show tcp statistics
Total segments received = 235080,
Error segments received = 0,
Total segments sent = 363218,
Segments retransmitted = 38,
Reset segments sent = 97,
Connections initiated = 57185,
Connections accepted = 412,
Connections established = 1,
Attempt fails = 24393,
Established resets = 221
```

**output definitions**

- **Total segments received**: Total number of segments received, including the segments received in the error. This count includes segments received on currently established connections.
- **Error segments received**: Total number of segments received in error (for example, bad TCP checksums).
- **Total segments sent**: Total number of segments sent, including those on current connections but excluding those containing only retransmitted octets.
- **Segments retransmitted**: Number of TCP segments transmitted containing one or more previously transmitted octets.
**output definitions (continued)**

<table>
<thead>
<tr>
<th>Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reset segments sent</td>
<td>Number of TCP segments containing the reset flag.</td>
</tr>
<tr>
<td>Connections initiated</td>
<td>Number of connections attempted.</td>
</tr>
<tr>
<td>Connections accepted</td>
<td>Number of connections allowed.</td>
</tr>
<tr>
<td>Connections established</td>
<td>Number of successful connections.</td>
</tr>
<tr>
<td>Attempt fails</td>
<td>Number of times attempted TCP connections have failed.</td>
</tr>
<tr>
<td>Established resets</td>
<td>Number of times TCP connections have been reset from the &quot;Established&quot; or &quot;Close Wait&quot; state to the “Closed” state.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command introduced

**Related Commands**

- **show icmp statistics** Displays ICMP statistics and errors.
- **show tcp ports** Displays the TCP connection table.

**MIB Objects**

N/A
### show tcp ports

Displays the TCP connection table.

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

show udp statistics

Displays UDP errors and statistics.

show udp statistics

Syntax Definitions
N/A

Defaults
N/A

Platforms Supported
This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>output</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines
This command displays cumulative statistics since the last time the switch was powered on or since the last reset of the switch.

Examples

-> show udp statistics

Total datagrams received = 214937,
Error datagrams received = 0,
No port datagrams received = 32891,
Total datagrams sent = 211884

output definitions

<table>
<thead>
<tr>
<th>Total datagrams received</th>
<th>Total number of UDP datagrams delivered to UDP applications.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error datagrams received</td>
<td>Number of UDP datagrams that could not be delivered for any reason.</td>
</tr>
<tr>
<td>No port datagrams received</td>
<td>Number of UDP datagrams that could not be delivered for reasons other than lack of application at the destination.</td>
</tr>
<tr>
<td>Total datagrams sent</td>
<td>Total number of UDP datagrams sent from this switch.</td>
</tr>
</tbody>
</table>

Release History
Release 7.1.1; command introduced
Related Commands

show udp ports
Displays the UDP Listener table.

MIB Objects

N/A
show udp ports

Displays the UDP Listener table. The table shows the local IP addresses and the local port number for each UDP listener.

show udp ports

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- An IP address of zero (0.0.0.0) indicates that it is listening on all interfaces.
- This table contains information about the UDP end-points on which a local application is currently accepting datagrams.

Examples

-> show udp ports

Local Address   Local Port
-------------+------------
0.0.0.0       67
0.0.0.0       161
0.0.0.0       520

output definitions

<tbody>
<tr>
<td>Local IP address for this UDP connection.</td>
<td>Local port number for this UDP connection.</td>
</tr>
</tbody>
</table>

Release History

Release 7.1.1; command introduced
Related Commands

show udp statistics Displays UDP errors and statistics.

MIB Objects

N/A
show ip dos config

Displays the DoS scan configuration for the switch.

show ip dos config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

This command allows the user to view the configuration parameters of the DoS scan. The scan keeps a record of the penalties incurred by certain types of packets on TCP and UDP ports. When the set penalty threshold is reached, it is assumed a DoS attack is in progress, and a trap is generated to inform the system administrator.

Examples

-> show ip dos config

<table>
<thead>
<tr>
<th>DoS type</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>port scan</td>
<td>enabled</td>
</tr>
<tr>
<td>ping of death</td>
<td>enabled</td>
</tr>
<tr>
<td>loopback-src</td>
<td>enabled</td>
</tr>
<tr>
<td>invalid-ip</td>
<td>enabled</td>
</tr>
<tr>
<td>invalid-multicast</td>
<td>enabled</td>
</tr>
<tr>
<td>unicast dest-ip/multicast-mac</td>
<td>enabled</td>
</tr>
<tr>
<td>ping overload</td>
<td>disabled</td>
</tr>
<tr>
<td>arp flood</td>
<td>enabled</td>
</tr>
<tr>
<td>arp poison</td>
<td>enabled</td>
</tr>
<tr>
<td>anti-spoof</td>
<td>disabled</td>
</tr>
<tr>
<td>gratuitous-arp</td>
<td>disabled</td>
</tr>
<tr>
<td>ip-options-filter</td>
<td>enabled</td>
</tr>
<tr>
<td>DoS trap generation</td>
<td>= enabled,</td>
</tr>
<tr>
<td>DoS port scan threshold</td>
<td>= 1000,</td>
</tr>
<tr>
<td>DoS port scan decay</td>
<td>= 2,</td>
</tr>
</tbody>
</table>
DoS port scan close port penalty = 10,
DoS port scan TCP open port penalty = 0,
DoS port scan UDP open port penalty = 0,
Dos Maximum Ping Rate = 100
Dos Maximum ARP Request Rate = 500

output definitions

| DoS Type | The type of DoS attack. |
| Status | Whether or not detection for this type of DoS attack is enabled. Configured through the ip dos type command. |
| DoS trap generation | Displays the status of DoS trap generation. It is either ENABLED or DISABLED. Configured through the ip dos trap command. |
| DoS port scan threshold | The penalty threshold setting. When enough packets have increased the penalty number to this setting, a trap is generated to warn the administrator that a DoS attack is in progress. Configured through the ip dos scan threshold command. |
| DoS port scan decay | The decay value for the switch. The penalty value of the switch is decreased by this number every minute. Configured through the ip dos scan decay command. |
| DoS port scan close port penalty | The penalty value for packets received on closed UDP and TCP ports. The penalty number for the switch is increased by this amount every time a packet is received on a closed UDP or TCP port. Configured through the ip dos scan close-port-penalty command. |
| DoS port scan TCP open port penalty | The penalty value for packets received on open TCP ports. The penalty number for the switch is increased by this amount every time a packet is received on an open TCP port. Configured through the ip dos scan tcp open-port-penalty command. |
| DoS port scan UDP open port penalty | The penalty value for packets received on open UDP ports. The penalty number for the switch is increased by this amount every time a packet is received on an open UDP port. Configured through the ip dos scan udp open-port-penalty command. |

Release History

Release 7.1.1; command introduced
Release 8.7 R1; gratuitous-arp output field included.
Release 8.7 R2; ip-options-filter output field included.

Related Commands

- show ip dos statistics Displays the statistics for detected DoS attacks on the switch.

<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- This command displays the number of attacks the switch has detected for several types of DoS attacks.
- If an attack is detected and reported, it does not necessarily mean that an attack occurred. The switch assumes a DoS attack is underway anytime the penalty threshold is exceeded. It is possible for this threshold to be exceeded when no attack is in progress.
- Statistics for the “unicast dest-ip/multicast-mac” DoS type are not reported for the multicast MAC address attack. In this case, the packet is dropped at a lower level so IP never sees the attack. IP only collects and reports statistics for IP attacks.

Examples

-> show ip dos statistics

<table>
<thead>
<tr>
<th>DoS type</th>
<th>Attacks detected</th>
</tr>

show vrf

Displays the Multiple VRF instance configuration for the switch.

`show vrf [vrf_name | default]`

**Syntax Definitions**

- `vrf_name` The name of an existing VRF instance.
- `default` Selects the default VRF instance.

**Defaults**

By default, a list of all VRF instances is displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6</th>
<th>6900X48C4E/V48C8</th>
<th>6900C32E/T24C2</th>
<th>6900X24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `vrf_name` parameter to display route-map resource information for a specific VRF instance.
- Use the `default` parameter to display route-map resource information for the default VRF instance.
- The type of profile (low or max) assigned to a VRF determines the routing capabilities and the amount of route-map resources available for that specific VRF instance.

**Examples**

```
-> show vrf
  Virtual Routers    Profile Protocols
-------------------------------------------------
  default           default BGP PIM VRRP
  customer1         max   RIP OSPF
  customer2         max   RIP OSPF
  customer3         low

Total Number of Virtual Routers: 4
```

**output definitions**

- **Virtual Routers**: The name of the VRF instance.
- **Profile**: The type of profile applied to this instance (`low` or `max`).
- **Protocols**: The protocols loaded within the context of this instance.
-> show vrf customer1
Legend: in use/max
route-maps : 3/30,
sequences : 5/60,
vlvs : 8/100,
access-lists : 0/20,
address blocks : 0/40,
macth interfaces : 3/100

-> show vrf customer3
Legend: in use/max
route-maps : 0/10,
sequences : 0/20,
vlvs : 0/20,
access-lists : 0/10,
address blocks : 0/10,
macth interfaces : 0/10

-> show vrf default
Legend: in use/max
route-maps : 0/200,
sequences : 0/400,
vlvs : 0/1000,
access-lists : 0/200,
address blocks : 0/500,
macth interfaces : 0/2000

**output definitions**

- **route-maps**
  The number of route maps used and the maximum allowed.

- **sequences**
  The number of route map sequences used and the maximum allowed.

- **vlvs**
  The number of TLV blocks used and the maximum allowed. The TLV blocks contain the route-map match and set clauses.

- **access-lists**
  The number of route-map access lists used and the maximum allowed.

- **address blocks**
  The number of address blocks used and the maximum allowed. The address blocks hold access list addresses.

- **match interfaces**
  The number of route-map interfaces used in match clauses and the maximum allowed.

**Release History**

Release 7.1.1; command was introduced.
Release 7.3.2; **Profile** field added, option to display route-map resources for a specific VRF instance.

**Related Commands**

- **vrf**
  Configures a Multiple VRF instance for the switch.

- **show vrf-profiles**
  Displays a summary of VRF profile usage and route map resources.

- **show ip protocols**
  Displays switch routing protocol information and status.

**Usage Guidelines**

This command also provides an estimate of the number of low profile VRFs that can be created.

**Examples**

```plaintext```
-> show vrf-profiles
EST: Estimated number of low profile VRFs that can be created
RM: Maximum route-maps
SEQ: Maximum sequences
TLV: Maximum TLVs (used to hold match and set clauses)
AL: Maximum access-lists
AB: Maximum address blocks (used to hold addresses)
ITF: Maximum route-map interfaces used in match clauses

<table>

21 IPv6 Commands

This chapter details Internet Protocol Version 6 (IPv6) commands for the switch. IPv6 (documented in RFC 2460) is designed as a successor to IPv4. The changes from IPv4 to IPv6 fall primarily into the following categories:

**Expanded Routing and Addressing Capabilities** - IPv6 increases the IP address size from 32 bits to 128 bits, to support more levels of addressing hierarchy and a much greater number of addressable nodes, and simpler auto-configuration of addresses. The scalability of multicast routing is improved by adding a "scope" field to multicast addresses.

**Header Format Simplification** - Some IPv4 header fields were dropped or made optional, to reduce the common-case processing cost of packet handling and to keep the bandwidth cost of the IPv6 header as low as possible despite the increased size of the addresses. Even though the IPv6 addresses are four times longer than the IPv4 addresses, the IPv6 header is only twice the size of the IPv4 header.

**Anycast Addressing** - A new type of address called a "anycast address" is defined, to identify sets of nodes where a packet sent to an anycast address is delivered to one of the nodes. The use of anycast addresses in the IPv6 source route allows nodes to control the path on which their traffic flows.

**Improved Support for Options** - Changes in the way IP header options are encoded allows for more efficient forwarding, less stringent limits on the length of options, and greater flexibility for introducing new options in the future.

**Authentication and Privacy Capabilities** - IPv6 includes the definition of extensions which provide support for authentication, data integrity, and confidentiality. This is included as a basic element of IPv6 and will be included in all implementations.

MIB information for the IPv6 and RIPng commands is as follows:

- **Filename**: IPV6-MIB.mib
  **Module**: Ipv6MIB

- **Filename**: ALCATEL-IND1-IPV6-MIB.mib
  **Module**: alcatelIND1Ipv6MIB

- **Filename**: ALCATEL-IND1-IPRMV6-MIB.mib
  **Module**: alcatelIND1IPRMV6MIB
A summary of the IPv6 commands is listed here:

**ipv6 interface**

Configures an IPv6 VLAN, IPv6 tunnel, or Loopback0 interface.

```
ipv6 interface if_name [vlan vlan_id | service service_id | tunnel {tunnel_id | 6to4 | loopback0} admin-state [enable | disable] [base-reachable-time time] [ra-send {yes | no}] [ra-max-interval interval] [ra-managed-config-flag {true | false}] [ra-other-config-flag {true | false}] [ra-reachable-time time] [ra-retrans-timer time] [ra-default-lifetime time | no ra-default-lifetime] [ra-min-interval interval | no ra-min-interval] [ra-clock-skew time] [ra-preference {medium | low | high}] [ra-send-mtu] {yes | no} [ra-send-dnssl] {yes | no} [ra-send-rdns] {yes | no} [mtu size] [retrans-timer time] [dad-transmits count] [ra-hop-limit count] [[no] local-proxy-nd] [neighbor-limit count | no neighbor-limit] [retrans-backoff backoff] [retrans-max max]
```

```
no ipv6 interface if_name
```

### Syntax Definitions

- **if_name**  
  IPv6 interface name.
- **vlan_id**  
  VLAN ID number to identify a VLAN interface.
- **service_id**  
  An existing Shortest Path Bridging (SPB) service ID number (1–32767) to identify a service interface. *This parameter is supported only on the OmniSwitch 6860N, OmniSwitch 6900-X48C6/T48C6, OmniSwitch 6900-X48C4E, and OmniSwitch 9900.*
- **tunnel_id**  
  Tunnel ID number to identify a configured tunnel interface (not supported on the OmniSwitch 6465, OmniSwitch 6560 or the OmniSwitch 6570M).
- **6to4**  
  Identifies the 6to4 tunnel interface (not supported on the OmniSwitch 6465, OmniSwitch 6560 or the OmniSwitch 6570M).
- **loopback0**  
  Identifies a Loopback0 interface.
- **enable**  
  Administratively enable the interface.
disable

Administratively disable the interface.

base-reachable-time time

Base value used to compute the reachable time for neighbors reached through this interface.

ra-send {yes | no}

Specifies whether the router advertisements are sent on this interface.

ra-max-interval interval

Maximum time, in seconds, allowed between the transmission of unsolicited multicast router advertisements in this interface. The range is 4–1,800.

ra-managed-config-flag {true | false}

Value to be placed in the managed address configuration flag field in router advertisements sent on this interface.

ra-other-config-flag {true | false}

Value to be placed in the other stateful configuration flag in router advertisements sent on this interface.

ra-reachable-time time

Value, in milliseconds, to be placed in the reachable time field in router advertisements sent on this interface. The value zero indicates that the time is unspecified by the router.

ra-retrans-timer time

Value, in milliseconds, to be placed in the retransmit timer field in router advertisements sent on this interface. The value zero indicates that the time is unspecified by the router.

ra-default-lifetime time

Value, in seconds, to be placed in the router lifetime field in router advertisements sent on this interface. The time must be zero or between the value of ra-max-interval and 9,000 seconds. A value of zero indicates that the router is not to be used as a default router. The no ra-default-lifetime option will calculate the value using the formula (3 * ra-max-interval).

ra-min-interval interval

Value, in seconds, allowed between the transmission of unsolicited multicast router advertisements on this interface. The interval must be a minimum of 3 and not more than .75 times the value of ra-max-interval. The no ra-min-interval option will calculate the value using the formula (.33 * ra-max-interval).

ra-clock-skew time

Value, in seconds. The router advertisement clock skew allows the link propagation delays and poorly synchronized clocks on routers participating in router discover over this interface. The timer differences that fall within the clock skew value are treated as valid times.

ra-preference

Specify the router preference.

ra-send-mtu {yes | no}

Specifies whether the MTU option is included in the router advertisements sent on the interface.

ra-send-dnssl {yes | no}

Specifies whether the DNS Search List (DNSSL) option is included in the router advertisements sent on the interface.

ra-send-rdnss {yes | no}

Specifies whether the Recursive DNS Server (RDNSS) option is included in the router advertisements sent on the interface.

mtu size

The maximum transmission unit for a tunnel interface. Use the vlan command’s mtu-ip to set for a VLAN.

retrans-timer time

The amount of time, in milliseconds, between retransmission of a neighbor solicitation during neighbor discovery.

dad-transmits count

The number of neighbor solicitations to send during Duplicate Address Detection.
**ra-hop-limit** *count*

The value placed in the current hop limit field of router advertisements sent on this interface.

**[no]** local-proxy-nd

Enable or disable Local Proxy Neighbor Discovery (LPND) on the interface. The default value is no. **LPND can only be enabled on IPv6 VLAN interfaces and is not supported on the OmniSwitch 6465, OmniSwitch 6560 or the OmniSwitch 6570M.**

**neighbor-limit** *count*

Sets the neighbor cache limit for the interface. The range for this value is platform dependent:
- 16–64 on the OmniSwitch 6465.
- 16–128 on the OmniSwitch 6560 and OmniSwitch 6570M.
- 10–32000 on all other supported OmniSwitch platforms. If this value is not set, then no limit is enforced.

**no neighbor-limit**

Sets the neighbor cache limit back to the default value (64 for OmniSwitch 6465, 128 for OmniSwitch 6560 and OmniSwitch 6570M, and no limit is enforced for all other supported OmniSwitch platforms).

**retrans-backoff** *backoff*

Sets the Neighbor Unreachability Detection (NUD) exponential back-off base value. The configurable values are 1, 2 or 3. The default value is 1. This allows the exponentially increase of the interval between retransmissions of the Neighbor Solicitation (NS), providing a longer interval over which the neighbor can respond.

**retrans-max** *max*

Sets the maximum number of neighbor solicitations to be sent during ND and NUD. The range is from 1 to 10 with a default value of 3. This allows the number of neighbor solicitations sent for neighbor discovery to be increased.

<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the `no` form of this command to delete an interface.
- When you create an IPv6 interface, it is enabled by default.
- All IPv6 VLAN, service, and tunnel interfaces must have a unique name.
- When creating an IPv6 interface for a VLAN, service, or a configured tunnel, specifying a VLAN ID, service ID, or a Tunnel ID is required. When modifying or deleting an interface, you do not need to specify one of these options unless the name assigned to the interface is being changed. If it is present with a different value from when the interface was created, the command will be in error.
- Specify the `service` parameter to create a service-based interface that is used to provide in-line routing for IPv6 over SPB. When creating an IPv6 interface for an SPB service, consider the following:
  - The SPB service ID specified must already exist in the switch configuration.
  - VLAN translation is automatically enabled when a service is assigned to an IPv6 interface regardless of whether or not VLAN translation is enabled for the service; the VLAN translation status is no longer configurable as long as the service is bound to an IPv6 interface.
  - When the last IPv6 interface is removed from a service, the VLAN translation status will return to its previous state. For example, if the administrative status was previously disabled, the status will revert to a disabled state when there are no more IP interfaces assigned to that service.
  - Mixing switches with VLAN translation enabled on some and disabled on other switches in the same network is not recommended. Make sure all switches have VLAN translation enabled, especially if a switch with a service-based interface is added to the network.
  - The same SPB service ID can be assigned to an IPv4 and an IPv6 interface as long as both interface types are in the same VRF instance.
  - See the “IP over SPBM” section in the “Configuring Shortest Path Bridging” chapter in the OmniSwitch AOS Release 8 Network Configuration Guide for more information.
- A default 6to4 tunnel named “tunnel_6to4” is automatically created in the default VRF instance. The tunnel status and configuration can be changed, but the tunnel itself cannot be deleted.
- The 6to4 tunnel interface and the Loopback0 interface do not send router advertisements (`ra-send` is always set to `no`).

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>local-proxy-nd</td>
<td>no</td>
</tr>
<tr>
<td>retrans-backoff</td>
<td>1</td>
</tr>
<tr>
<td>retrans-max</td>
<td>3</td>
</tr>
</tbody>
</table>
Before a 6to4 tunnel or Loopback0 interface can be enabled, at least one address must be assigned to the interface.

To enable IPv6 routing you must first create a VLAN, then create an IPv6 interface on the VLAN. See Chapter 5, “VLAN Management Commands,” for information on creating VLANs.

To route IPv6 traffic over an IPv4 network, you must create an IPv6 tunnel using the `ipv6 interface` command.

Use the `no` option to disable the Local Proxy Neighbor Discovery on the interface.

Consistency checks are performed between the configured RA parameters and those present in received RAs. In the case of a discrepancy between the value in a received RA and the value configured on the switch, an informational message will be written to the SWLog log file. The messages are not logged on the console.

The `ra-managed-config-flag` and `ra-other-config flag` parameters specify the values to be present in RAs sent by the switch when the DHCPv6 server is disabled. If the DHCPv6 server is enabled, the M and O flags in RAs sent by the switch will always be true.

Before enabling the router advertisement option (MTU, DNSSL, and RDNSS) ensure the router advertisement (ra-send) is enabled on the switch.

**Examples**

```
-> ipv6 interface Test vlan 1
-> ipv6 interface Test_Tunnel tunnel 2
-> ipv6 interface Mgmt_intf loopback0
-> ipv6 interface vpn1 service 10
-> service 10 vlan-xlation disable
ERROR: Modify vlan translation currently not allowed for service (10)
-> ipv6 interface Test vlan 2 ra-send-dnssl yes
-> ipv6 interface Test vlan 2 ra-send-mtu yes ra-send-rdnss yes ra-send-dnssl yes
```

**Release History**

Release 7.1.1; command was introduced.
Release 7.3.4; `loopback0` parameter added.
Release 8.7 R1; `ra-send-dnssl` and `ra-send-rdnss` parameter added.

**ipv6 interface rtr-port**

Configures an IPv6 routed-port interface by associating an IPv6 interface with a port or link aggregate and a VLAN.

```
ipv6 interface if_name rtr-port {port chassis/slot/port | linkagg agg_id} {tagged | untagged} vlan vlan_id
```

**Syntax Definitions**

- `if_name` A unique name for the IPv6 interface. Use quotes around the string if the name contains multiple words with spaces between them (for example, “ALE Marketing”). This value is case sensitive.
- `chassis/slot/port` The chassis, slot, and port number (1/2/1) of the physical port to bind to the IPv6 interface.
- `agg_id` The link aggregate ID to bind to the IP Interface.
- `tagged` Whether the assigned port or link aggregate is tagged for the specified VLAN.
- `untagged` Whether the assigned port or link aggregate is untagged for the specified VLAN.
- `vlan_id` An unused VLAN ID to which this IPv6 interface is associated.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- In a single step, this command creates the specified VLAN, configures an IPv6 interface for the VLAN, and assigns a port or link aggregate (tagged or untagged) to the VLAN. The `ipv6 address` command is then used to assign and IPv6 address to the routed-port interface.

- Configuring an IPv4 and IPv6 routed-port interface for the same VLAN ID is supported if the following conditions are met:
  - The VLAN ID, port, and the tagged/untagged port status for both interfaces is the same (for example, IPv4 and IPv6 routed interfaces are both bound to VLAN 850 with port 1/1/2 tagged).
  - Both interfaces are configured in the same VRF instance.
• Make sure the specified VLAN ID does not already exist in the switch configuration or is only used as a routed-port VLAN for an IPv4 interface. This VLAN will serve as a routing-only VLAN with a single port or link aggregate (Layer 2 functionality is not supported).

• Make sure the specified port or link aggregate is not already assigned to a VLAN that is not a routed-port VLAN. However, the port or link aggregate can be assigned to other routed-port VLANs.

• Attempting to add more ports or link aggregates to the routed-port VLAN or attempting to delete the VLAN is not allowed. The VLAN can only be removed by deleting the associated IPv6 and, if configured, the associated IPv4 interface.

• The same VLAN cannot be used for both a routed-port interface and a non-routed port interface.

• Once configured, an IPv6 routed port interface is operationally equivalent to an IPv6 VLAN interface. Routing protocols and other switch features that use IPv6 are configured and operate on an IPv6 routed port interface in the same manner as on a regular IPv6 interface.

**Examples**

`-> ipv6 interface rp-vlan30 rtr-port port 1/1/1 tagged vlan 30`

`-> ipv6 interface rp-vlan40 rtr-port port 1/1/2 untagged vlan 40`

`-> ipv6 interface rp-vlan50 rtr-port linkagg 6 tagged vlan 50`

`-> ipv6 interface rp-vlan60 rtr-port linkagg 7 untagged vlan 60`

`-> ipv6 interface rp-vlan50 rtr-port port 1/1/3 untagged vlan 60`

**ERROR:** Routed port interface rp-vlan60 VLAN and/or port configuration cannot be changed

`-> no ipv6 interface rp-vlan60`

`-> vlan 70`

`-> ipv6 interface rp-vlan70 rtr-port port 1/1/15 untagged vlan 70`

**ERROR:** VLAN 70 already exists

`-> ip interface rpv4-port rtr-port port 1/1/2 tagged vlan 850`

`-> ipv6 interface rpv6-port rtr-port port 1/1/2 tagged vlan 850`

`-> no ipv6 interface rpv6-port`

`-> ipv6 interface rpv6-port rtr-port port 1/1/2 untagged vlan 850`

**ERROR:** Configuration conflict with IPv4 routed port interface rp-port

**Release History**

Release 8.6R2; command introduced

**Related Commands**

- `show ipv6 interface` Displays the status and configuration of IPv6 interfaces.

**MIB Objects**

- `alaIPv6InterfaceTable`
  - `alaIPv6InterfaceName`
  - `alaIPv6InterfaceRoutedPortIfIndex`
  - `alaIPv6InterfaceRoutedPortTag`
ipv6 interface tunnel source destination

Configures the source and destination IPv4 addresses for a configured tunnel.

```
ipv6 interface if_name tunnel {source ipv4_source destination ipv4_destination}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>if_name</code></td>
<td>Name assigned to the tunnel interface.</td>
</tr>
<tr>
<td><code>ipv4_source</code></td>
<td>Source IPv4 address for the configured tunnel.</td>
</tr>
<tr>
<td><code>ipv4_destination</code></td>
<td>Destination IPv4 address for the configured tunnel.</td>
</tr>
</tbody>
</table>

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `ipv6 interface` command to create an IPv6 tunnel interface.
- A configured tunnel interface cannot be enabled until both its IPv4 source and destination addresses have been specified.

### Examples

```
-> ipv6 interface Test tunnel 2 source 192.0.2.1 destination 198.51.100.1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- `ipv6 interface`: Creates an IPv6 tunnel interface.
- `show ipv6 tunnel configured`: Displays IPv6 tunnel information.

### MIB Objects

</tr>
</tbody>
</table>
**ipv6 address**

Configures an IPv6 address for an IPv6 interface. There are different formats for this command depending on the address type.

```
ipv6 address ipv6_address/prefix_length {if_name | loopback}
```

```
no ipv6 address ipv6_address {if_name | loopback}
```

```
ipv6 address ipv6_prefix eui-64 {if_name | loopback}
```

```
no ipv6 address ipv6_prefix eui-64 {if_name | loopback}
```

**Syntax Definitions**

- `ipv6_address` IPv6 address.
- `/prefix_length` The number of bits that are significant in the IPv6 address (mask). (3..128).
- `eui-64` Append an EUI-64 identifier to the prefix.
- `if_name` Name assigned to the interface.
- `loopback` Configures an IPv6 address for the loopback interface.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Support</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to delete an address.
- You can assign multiple IPv6 addresses to an IPv6 interface.
- No default value for prefix length. However, the prefix for the loopback or the user-defined Loopback0 interface must always be /128.
- Make sure that only 6to4 addresses are assigned to a 6to4 tunnel interface.
- The “eui” form of the command is used to add or remove an IPv6 address for a VLAN or configured tunnel using an EUI-64 interface ID in the low order 64 bits of the address.
- When JITC mode is enabled, Site-Local addresses of range FEC0::/10 cannot be configured. This consists of all the addresses that begin with FEC, FED, FEE, and FEF. Refer to the “AAA Commands”
chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide* for more information on enabling JITC mode.

**Examples**

-> ipv6 address 2001:db8:4132:86::19a/64 Test_Lab
-> ipv6 address 2002:c633:6489::35/64 Test_6to4
-> ipv6 address 2001:db8:6489::36/128 loopback
-> ipv6 interface Test_Loopback0 loopback0
-> ipv6 address 2001:db8:6489::37/128 Test_Loopback0

**Release History**

Release 7.1.1; command was introduced.
Release 8.4.1: *anycast* keyword deprecated.

**Related Commands**

*show ipv6 interface* Displays IPv6 Interface Table.

**MIB Objects**

IPv6IfIndex
alaIPv6InterfaceAddressTable
  alaIPv6InterfaceAddress
    alaIPv6InterfaceEUI64AddressPrefixLength
    alaIPv6InterfaceEUI64AddressRowStatus

For EUI-64 Addresses:
alaIPv6InterfaceEUI64AddressesTable
  alaIPv6InterfaceEUI64Address
  alaIPv6InterfaceEUI64AddressPrefixLength
  alaIPv6InterfaceEUI64AddressRowStatus
### ipv6 address global-id

Automatically generates or allows a new global ID to be entered.

```
ipv6 address global-id {generate | globalID}
```

#### Syntax Definitions

- **generate**: Automatically generates the global ID.
- **globalID**: A 5-byte global ID value specified in the form hh:hh:hh:hh:hh

#### Defaults

By default, the IPv6 global ID is set to all zeros.

#### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

- Global ID needs to be automatically generated or configured explicitly.
- A 40-bit global identifier is used to make the local IPv6 address prefixes globally unique.
- The global ID will be generated the first time a local unicast address is added through the `ipv6 address local-unicast` command or when the `ipv6 address global-id` command is executed.

#### Examples

- `ipv6 address global-id generate`
- `ipv6 address global-id 32:57a3:8fed`

#### Release History

Release 7.1.1; command was introduced.
**Related Commands**

- `ipv6 address local-unicast` Creates a IPv6 local unicast address using the configured global ID.
- `ipv6 bgp unicast` Enables or disables unicast IPv6 updates for the BGP routing process.
- `show ip bgp` Displays the current global settings for the local BGP speaker.

**MIB Objects**

- `alaIPv6GlobalID`
**ipv6 address local-unicast**

Creates a IPv6 local unicast address using the configured global ID.

```
ipv6 address local-unicast [global-id globalID] [subnet-id subnetID] [interface-id interfaceID | eui-64] [prefix-length prefixLength] {if_name | loopback}
```

```
no ipv6 address local-unicast [global-id globalID] [subnet-id subnetID] [interface-id interfaceID | eui-64] [prefix-length prefixLength] {if_name | loopback}
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>globalID</td>
<td>A 5-byte global ID value specified in the form hh:hhhh:hhhh.</td>
</tr>
<tr>
<td>subnetID</td>
<td>A 2-byte Subnet ID specified in the form 0xhhhh. The valid range is 0x0000-0xffff or 0-65535.</td>
</tr>
<tr>
<td>eui-64</td>
<td>Automatically-generated EUI-64 value to be used for interface identifier.</td>
</tr>
<tr>
<td>prefixLength</td>
<td>The number of bits that are significant in the IPv6 address (mask). The valid range is 0-128; however, the default value must rarely be overridden.</td>
</tr>
<tr>
<td>if_name</td>
<td>The name assigned to the interface.</td>
</tr>
<tr>
<td>loopback</td>
<td>The loopback for the loopback interface.</td>
</tr>
</tbody>
</table>

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefixLength</td>
<td>64</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to delete the local unicast address. However, addresses are normally deleted using the `ipv6 address` command.
- If the global ID value is not explicitly specified, the default global ID set by the `ipv6 address global-id` command is used.
- If the global ID value is explicitly configured using the `ipv6 address local-unicast` command, the address’ global ID will not be changed if the `ipv6 address global-id` command is executed.
The use of a double-colon abbreviation for the interface identifier, similar to that used for full IPv6 addresses, is allowed.

**Examples**

```
-> ipv6 address local-unicast global-id 0073:110:255 subnet-id 23 interface-id 215:60ff:fe7a:adc0 prefix-length 64 loopback
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `ipv6 address global-id` Automatically generates or allows a new global ID to be entered.
- `show ipv6 information` Displays IPv6 information.

**MIB Objects**

- `alaIPv6LocalUnicastGlobalID`
- `alaIPv6LocalUnicastSubnetID`
- `alaIPv6LocalUnicastInterfaceID`
- `alaIPv6LocalUnicastEUI64`
- `alaIPv6LocalUnicastPrefixLength`
ipv6 dad-check

Runs a Duplicate Address Detection (DAD) check on an address that was marked as duplicated.

ipv6 dad-check ipv6_address if_name

**Syntax Definitions**

- *ipv6_address* IPv6 address.
- *if_name* Name assigned to the interface.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The switch performs DAD check when an interface is attached and its VLAN first enters the active state. Use this command to rerun a DAD check on an address that was marked as duplicated.

**Examples**

- `-> ipv6 dad-check 2001:db8::1/32 Test_Lab`

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

N/A

**MIB Objects**

alaIPv6InterfaceAddressTable
  - alaIPv6InterfaceAddressDADStatus
ipv6 hop-limit

Configures the value placed in the hop limit field in the header of all IPv6 packets that are originated by the switch. It also configures the value placed in the hop limit field in router advertisements.

ipv6 hop-limit value

no ipv6 hop-limit

Syntax Definitions

value Hop limit value. The range is 0 - 255.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>64</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to return the hop limit to its default value.
- Inputting the value 0 (zero) will result in the default (64) hop-limit.

Examples

-> ipv6 hop-limit 64

**ipv6 neighbor stale-lifetime**

Configures the minimum lifetime for neighbors in the unconfirmed state.

**ipv6 neighbor stale-lifetime**

---

**Syntax Definitions**

- **stale-lifetime**: Minimum lifetime for neighbor entries in the stale state (5–2800).

---

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>stale-lifetime</td>
<td>10</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>

- `show ipv6 information` Displays IPv6 information.

---

**MIB Objects**

- `IPv6IfIndex`
- `alaIPv6NeighborTable` `alaIPv6NeighborStaleLifetime`
**ipv6 neighbor**

Configures a static entry in the IPv6 Neighbor Table.

```
ipv6 neighbor ipv6_address hardware_address {if_name} {port chassis/slot/port | linkagg agg_id}
no ipv6 neighbor ipv6_address {if_name}
```

### Syntax Definitions

- **ipv6_address**: IPv6 address that corresponds to the hardware address.
- **hardware_address**: MAC address in hex format (e.g., 00:00:39:59:F1:0C).
- **if_name**: Name assigned to the interface on which the neighbor resides.
- **chassis**: The chassis identifier.
- **slot/port**: The slot and port number of the port used to reach the neighbor.
- **agg_id**: The link aggregate ID number of the link aggregate used to reach the neighbor.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900 V72/C32</th>

<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `no` form of this command to remove an entry from IPv6 Neighbor Table.

### Examples

```
-> ipv6 neighbor 4132:86::203 00:d0:c0:86:12:07 Test port 1/1
```

### Release History

Release 7.1.1; command was introduced.

**ipv6 neighbor limit**

Configures the system-wide maximum limit for the number of neighbor entries in the cache.

**ipv6 neighbor limit** *count*

no ipv6 neighbor limit

---

**Syntax Definitions**

- **count**
  
  The system-wide maximum limit for the number of neighbor entries in the cache. The valid range for this value is platform dependent:
  
  - 16–64 on the OmniSwitch 6465.
  - 16–128 on the OmniSwitch 6560 and OmniSwitch 6570M.
  - 200–32000 on all other supported OmniSwitch platforms. If this value is not set, then no limit is enforced.

---

**Defaults**

By default, the maximum number of neighbor entries is set to 64 on the OmniSwitch 6465 and 128 on the OmniSwitch 6560 and OmniSwitch 6570M. On all other supported OmniSwitch platforms, there is no enforced limit.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

**ipv6 neighbor vrf-limit**

Configures the maximum limit for the number of neighbor entries in a VRF's cache.

**ipv6 neighbor vrf-limit count**

**no ipv6 neighbor vrf-limit**

---

**Syntax Definitions**

`count` The maximum limit for the number of VRF neighbor entries in the cache. The valid range for this value is platform dependent:
- 16–64 on the OmniSwitch 6465.
- 16–128 on the OmniSwitch 6560.
- 200–32000 on all other supported OmniSwitch platforms. If this value is not set, then no limit is enforced.

---

**Defaults**

By default, the maximum number of neighbor entries is set to 64 on the OmniSwitch 6465 and 128 on the OmniSwitch 6560. On all other supported OmniSwitch platforms, there is no enforced limit.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>

MIB Objects

alaIPv6NeighborTable
  alaIPv6NeighborVRFLimit
**ipv6 ra-filter**

Configures the status of Router Advertisement (RA) filtering on IPv6 VLAN interfaces. When RA filtering is enabled on an interface, RAs received on any port or linkagg will be discarded. If one or more trusted ports or link aggregates are configured, RAs received on them will be accepted and sent on to any connected IPv6 nodes.

```
ipv6 ra-filter if-name [admin-state {enable | disable}]
no ipv6 ra-filter if-name
```

**Syntax Definitions**

- **if-name** Specify the name of the IPv6 VLAN interface.
- **enable** Enables RA filtering on the specified interface.
- **disable** Disables RA filtering on the specified interface.

**Defaults**

By default, the administrative status of RA filtering on an IPv6 VLAN interface is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `no` form of this command to return the RA filtering status to the default value (disabled).

**Examples**

```
-> ipv6 ra-filter vlan-23 admin-state enable
-> ipv6 ra-filter vlan-23 admin-state disable
-> no ipv6 ra-filter vlan-23
```

**Release History**

Release 8.1.1; command introduced.
Release 8.5R2; OmniSwitch 6560 support for IPv6 RA Filtering added.
**Related Commands**

- **ipv6 ra-filter trusted**
  - Configures trusted ports or link aggregates on which RAs are accepted when RA filtering is enabled.

- **ipv6 interface**
  - Creates an IPv6 interface.

- **show ipv6 interface**
  - Displays IPv6 Interface Table.

- **show ipv6 ra-filter**
  - Displays the RA filter configuration for an IPv6 interface.

**MIB Objects**

- **alaIPv6RAFilterInterfaceTable**
  - **alaIPv6RAFilterInterfaceAdminStatus**
  - **alaIPv6RAFilterInterfaceRowStatus**
**ipv6 ra-filter trusted**

Configures trusted sources (ports or link aggregates) on which Router Advertisements (RAs) are accepted and sent on to any connected IPv6 nodes. When RA filtering is enabled on an IPv6 VLAN interface, RAs received on any port or linkagg will be discarded, except on trusted ports or link aggregates.

**ipv6 ra-filter** if-name trusted {port chassis/slot/port | linkagg agg_id}

**no ipv6 ra-filter** if-name trusted {port chassis/slot/port | linkagg agg_id}

---

**Syntax Definitions**

- **if-name** Specify the name of the IPv6 VLAN interface on which RA filtering is enabled or disabled.
- **chassis/slot/port** The chassis ID, slot, and port number (3/1/1) for a trusted port.
- **agg_id** A trusted link aggregate ID number.

**Defaults**

By default all ports and link aggregates are untrusted.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to return a port or linkagg to an untrusted state.
- Use the **ipv6 ra-filter** command to enable or disable the RA filtering status for an IPv6 VLAN interface.

**Examples**

- `-> ipv6 ra-filter vlan-23 trusted port 1/1/22`
- `-> ipv6 ra-filter vlan-23 trusted linkagg 10`
- `-> no ipv6 ra-filter vlan-23 trusted port 1/1/22`
- `-> no ipv6 ra-filter vlan-23 trusted linkagg 10`

**Release History**

Release 8.1.1; command introduced.
Release 8.5R2; OmniSwitch 6560 support for IPv6 RA Filtering added.

- `alaIPv6RAFilterTrustedSourceRowStatus`
**ipv6 prefix**

Configures an IPv6 prefix on an interface. Used for configuring prefixes for router advertisements.

```
ipv6 prefix ipv6_address /prefix_length if_name [valid-lifetime time] [preferred-lifetime time] [on-link-flag {true | false} [autonomous-flag {true | false}]] if_name
```

```
no ipv6 prefix ipv6_address /prefix_length if_name
```

**Syntax Definitions**

- **ipv6_address**: IPv6 address of the interface.
- **/prefix_length**: The number of bits that are significant in the IPv6 address (mask). (1...127).
- **valid-lifetime time**: Length of time, in seconds, that this prefix will remain valid (i.e. time until deprecation). A value of 4,294,967,295 represents infinity.
- **preferred-lifetime time**: Length of time, in seconds, that this prefix will remain preferred (i.e. time until deprecation). A value of 4,294,967,295 represents infinity.
- **on-link-flag {true | false}**: On-link configuration flag. When “true” this prefix can be used for on-link determination.
- **autonomous-flag {true | false}**: Autonomous address configuration flag. When “true”, indicates that this prefix can be used for autonomous address configuration (i.e., can be used to form a local interface address).
- **if_name**: Name assigned to the interface.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>valid-lifetime time</td>
<td>2,592,000</td>
</tr>
<tr>
<td>preferred-lifetime time</td>
<td>604,800</td>
</tr>
<tr>
<td>on-link-flag</td>
<td>true</td>
</tr>
<tr>
<td>autonomous-flag</td>
<td>true</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

  allaIPv6vInterfacePrefixRowStatus
**ipv6 static-route**

Configures an IPv6 static route. Static routes are user-defined; they carry a higher priority than routes created by dynamic routing protocols. By default, static routes carry a higher priority than dynamic routes.

```
ipv6 static-route ipv6_prefix/prefix_length gateway {ipv6_address | null} [tag num] [name string] [if_name] [emp] [metric metric]
```

```
no ipv6 static-route ipv6_prefix/prefix_length gateway {ipv6_address | null} [if_name] [emp]
```

**Syntax Definitions**

- `ipv6_prefix` IPv6 network that is the destination of this static route.
- `/prefix_length` The number of bits (0...128) that are significant in the IPv6 address (mask).
- `gateway ipv6_address` IPv6 address of the next hop used to reach the destination IPv6 address.
- `gateway null` Use this option to configure an IPv6 blackhole route.
- `num` Tag to be used for route.
- `string` Name to be used for route.
- `if_name` If the next hop is a link-local address, the name of the interface used to reach it.
- `emp` Represents the EMP interface.
- `metric` Metric or cost (hop count) for the static route. You can set a priority for the static route by assigning a metric value. The lower the metric value, the higher the priority. Valid range is 1–15.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>metric</td>
<td>1</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

|       | 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900 V72/C32 | 6900 X48C6/T48C6 | X48C4E/V48C8/C32E/T24C2 | X24C2 | 9900 |
|-------|------|------|------|-------|------|-------|------|------|-------------|------------------|----------------|$ | |
|       | Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes          | Yes              | Yes             | Yes             |

**Usage Guidelines**

- Use the `no` form of this command to remove a static route.
- By default, static routes have a higher priority over dynamic routes; however, it can be changed using the `ipv6 route-pref` command.
• To create an IPv6 static route with gateway pointing to an EMP interface, specify the keyword `emp` for the interface name field instead of specifying the exact interface name of the EMP interface (for example, EMP-CMMA-CHAS1).

• If IPv6 address is configured on the EMP port on a VC or chassis setup, ensure to configure the IPv6 address on all the VC elements or CMM.

• Static route with default gateway towards EMP interface is not allowed.

• Use the `null` option to configure IPv6 blackhole routes. A blackhole route is used to forward unwanted traffic to a blackhole.
  
  – Redistribution of blackhole routes is supported. Dynamic routing protocols may advertise these routes, but the gateway associated with the route(s) will be an address on the router advertising them.
  
  – Leaking of blackhole routes across SPB service backbones is supported. However, blackhole routes cannot be leaked between VRFs. Blackhole routes need to be explicitly configured using the `ip static-route` command in any/all VRFs.
  
  – Blackhole routes are created and installed through static route commands. Dynamic Routing protocols shall not install blackhole IPv6 routes.
  
  – Blackhole routes shall never be part of ECMP.
  
  – Blackhole routes cannot be enabled for BFD support.

• Alternatively, the gateway address `::` can be used to create an IPv6 blackhole route.

**Examples**

-> ipv6 static-route 212:95:5::/64 gateway fe80::2d0:95ff:fe6a:f458 v6if-137 metric 3

Static route with gateway towards EMP interface:

-> ipv6 static-route 212:95:5::/64 gateway 2001::205 emp

or

-> ipv6 static-route 212:95:5::/64 gateway 2001::205 EMP-CMMA-CHAS1

Static route with default gateway towards EMP interface is not allowed.

-> ipv6 static-route ::/0 gateway 2001::205 EMP-CMMA-CHAS1

ERROR: Default routes with gateway on EMP port not allowed

Configuring a static blackhole route.

-> ipv6 static-route 212:95:5::/64 gateway null

-> ipv6 static-route 22::/64 gateway ::

**Release History**

Release 7.1.1; command was introduced.
Release 7.3.4; `tag` and `name` parameters included.
Release 8.4.1; `emp` parameter added.
Release 8.6R1; `null` keyword added.
**Related Commands**

- **modify boot parameters**
  This command is used to configure IPv6 EMP interface.

- **show ipv6 routes**
  Displays IPv6 Forwarding Table.

- **show ipv6 router database**
  Displays a list of all routes (static and dynamic) that exist in the IPv6 router database.

- **show ipv6 route-pref**
  Displays the IPv6 routing preference of the router.

**MIB Objects**

- `alaIprmv6StaticRouteTable`
  - `alaIprmv6StaticRouteDest`
  - `alaIprmv6StaticRoutePrefixLength`
  - `alaIprmv6StaticRouteNextHop`
  - `alaIprmv6StaticRouteTag`
  - `alaIprmv6StaticRoute_Name`
  - `alaIprmv6StaticRouteIfIndex`
  - `alaIprmv6StaticRouteMetric`
  - `alaIprmv6StaticRouteRowStatus`
**ipv6 static-route all bfd-state**

Enables BFD for all IPv6 static routes.

```bash
disable enable
```

**Syntax Definitions**

- `enable`: Enables BFD for all IPv6 static routes.
- `disable`: Disables BFD for all IPv6 static routes.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When there are static routes configured in the switch, BFD is enabled to track the gateway.
- If the route is not reachable, it will be moved to the inactive database.

**Examples**

```bash
-> ipv6 static-route all bfd-state enable
-> ipv6 static-route all bfd-state disable
```

**Release History**

Release 8.4.1.R03; command was introduced.

**Related Commands**

- `ipv6 static-route bfd-state`: Enables BFD for a specific static route.
- `show ipv6 router database`: Displays a list of all routes (static and dynamic) that exist in the IP router database.

**MIB Objects**

- `alaIprmV6Config`
- `alaIprmV6StaticAllBfd`
**ipv6 static-route bfd-state**

Enables or disables BFD for a specific IPv6 static route.

`ipv6 static-route ipv6_prefix/pfx_length gateway ipv6_host_address bfd-state {enable| disable}`

### Syntax Definitions

- `ipv6_prefix` The destination IPv6 address.
- `pfx_length` The prefix length for the destination IPv6 address.
- `ipv6_host_address` The gateway IPv6 address.
- `enable` Enables BFD for the IPv6 static route.
- `disable` Disables BFD for the IPv6 static route.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

BFD is enabled to track the gateway of static routes.

### Examples

```
-> ipv6 static-route 195:35::/64 gateway fe80::2d0:95ff:fe12:f470 bfd-state enable
-> ipv6 static-route 195:35::/64 gateway fe80::2d0:95ff:fe12:f470 bfd-state disable
```

### Release History

Release 8.4.1.R03; command was introduced.

### Related Commands

- `ipv6 static-route all bfd-state` Enables BFD for all static routes.
- `show ipv6 router database` Displays a list of all routes (static and dynamic).
### MIB Objects

- `alaIprmV6StaticRouteTable`
- `alaIprmV6StaticRouteDest`
- `alaIprmV6StaticRoutePfxLength`
- `alaIprmV6StaticRouteNextHop`
- `alaIprmV6StaticRouteIfIndex`
- `alaIprmV6StaticRouteBfdStatus`
- `alaIprmV6StaticRouteType`
**ipv6 route-pref**

Configures the route preference of a router.

```
ipv6 route-pref {static | ospf | rip | ebgp | ibgp | isisl1 | isisl2 | import} value
```

### Syntax Definitions

- **static**
  - Configures the route preference of static routes.

- **ospf**
  - Configures the route preference of OSPF3 routes. *(OSPF3 is not supported on the OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 6570M).*

- **rip**
  - Configures the route preference of RIPng routes.

- **ebgp**
  - Configures the route preference of external BGP routes. *(the IPv6 version of BGP is not supported on the OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 6570M).*

- **ibgp**
  - Configures the route preference of internal BGP routes. *(the IPv6 version of BGP is not supported on the OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 6570M).*

- **isisl1**
  - Configures the route preference of IS-IS L1 routes. *(IS-IS is not supported on the OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 6570M or OmniSwitch 9900).*

- **isisl2**
  - Configures the route preference of IS-IS L2 routes. *(IS-IS is not supported on the OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6570M or OmniSwitch 9900).*

- **import**
  - Configures the route preference for the routes that are imported from another VRF instance.

- **value**
  - Route preference value. The valid range is 1–255.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>static value</td>
<td>2</td>
</tr>
<tr>
<td>ospf value</td>
<td>110</td>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Route preference of local routes cannot be changed.

**Examples**

- `-> ipv6 route-pref ospf 20`
- `-> ipv6 route-pref rip 60`

**Release History**

Release 7.1.1; command was introduced.  
Release 8.5R1; `import` parameter added.

**Related Commands**

`show ipv6 route-pref`  
Displays the configured route preference of a router.

**MIB Objects**

- `alaIprmV6RtPrefTable`
- `alaIprmV6RtPrefEntryType`
- `alaIprmV6RtPrefEntryValue`
**ipv6 virtual-source-mac**

Configures the source MAC to be used for packets being sent from a VRRP instance.

```
ipv6 virtual-source-mac {on | off}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>virtual-source-mac</td>
<td>off</td>
</tr>
</tbody>
</table>

#### on

The switch will use the VRRP virtual MAC address for all packets.

#### off

The switch will use the physical MAC address for all packets except VRRP advertisements.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use this command to change which MAC address the switch will use as the source MAC when sending packets from a VRRP instance.
- This command has no affect on VRRP advertisements, the VRRP virtual MAC will always be used.

### Examples

```
-> ipv6 virtual-source-mac on
-> ipv6 virtual-source-mac off
```

### Release History

Release 7.2.1; command was introduced.
**Related Commands**

`show ipv6 route-pref` Displays the configured route preference of a router.

**MIB Objects**

N/A
ipv6 echo

Configures the switch to reply or ignore echo requests in response to an echo request sent to a multicast or anycast IPv6 address. Use no option to ignore reply to anycast or multicast echo requests.

ipv6 echo {anycast | multicast}
no ipv6 echo {anycast | multicast}

Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>anycast</td>
<td>Ignore (when no option is used) or reply to anycast echo requests.</td>
</tr>
<tr>
<td>multicast</td>
<td>Ignore (when no option is used) or reply to multicast echo requests.</td>
</tr>
</tbody>
</table>

Defaults

By default, the switch will reply to multicast or anycast echo requests.

- alaIPv6IgnoreMcastEchos
ipv6 icmp rate-limit

Configures the rate-limiting of ICMPv6 error messages.

ipv6 icmp rate-limit [interval number] [burst number]

no ipv6 icmp rate-limit

**Syntax Definitions**

interval number The minimum interval between the ICMPv6 error messages. Valid range is 0 to 10000 in milliseconds.

burst number The maximum number of ICMPv6 error messages that may be sent in a single burst regardless of the interval. Valid range is 1 to 50.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval number</td>
<td>10ms</td>
</tr>
<tr>
<td>burst number</td>
<td>10</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>

<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>X</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use no option to disable the ICMPv6 error message rate limiting.

**Examples**

- -> ipv6 icmp rate-limit interval 100
- -> ipv6 icmp rate-limit burst 20
- -> no ipv6 icmp rate-limit

**Release History**

Release 8.4.1; command introduced.
Related Commands

show ipv6 information  Displays IPv6 information.

MIB Objects

alaIPv6IcmpRateLimitInterval
alaIPv6IcmpRateLimitBurst
**ping6**

Tests whether an IPv6 destination can be reached from the local switch. This command sends an ICMPv6 echo request to a destination and then waits for a reply. To ping a destination, enter the `ping6` command and enter either the destination’s IPv6 address or hostname. The switch will ping the destination using the default frame count, packet size, and interval (6 frames, 64 bytes, and 1 second respectively). You can also customize any or all of these parameters as described below.

`ping6 {ipv6_address | hostname} [if_name] [count count] [size data_size] [interval seconds]`

### Syntax Definitions

- **ipv6_address**
  - The IP address of the system to ping.

- **hostname**
  - DNS name of the system to ping.

- **if_name**
  - If the target is a link-local address, the name of the interface used to reach it.

- **count**
  - Number of packets to be transmitted.

- **size**
  - Size of the data portion of the packet sent for this ping, in bytes.

- **seconds**
  - Interval, in seconds, at which ping packets are transmitted.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>6</td>
</tr>
<tr>
<td>size</td>
<td>8</td>
</tr>
<tr>
<td>interval seconds</td>
<td>1</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- If you change the default values, they will only apply to the current ping. The next time you use the `ping` command, the default values will be used unless you again enter different values.

- When the next hop address is a local link address, the name of the interface used to reach the destination must be specified.

### Examples

```
-> ping6 2001:db8:302::44
```
-> ping6 fe80::2d0:95ff:fe6a:f458 vlanif-23

**Release History**

**traceroute6**

Finds the path taken by an IPv6 packet from the local switch to a specified destination. This command displays the individual hops to the destination as well as some timing information.

```
traceroute6 {ipv6_address | hostname} [if_name] [max-hop hop_count] [dest-port port_number] [probe-count probe] [size size] [host-names {yes | no}]
```

**Syntax Definitions**

- **ipv6_address**: Destination IPv6 address. IPv6 address of the host whose route you want to trace.
- **hostname**: DNS name of the host whose route you want to trace.
- **if_name**: If the target is a link-local address, the name of the interface used to reach it.
- **hop_count**: Maximum hop count for the trace.
- **port_number**: Specific UDP port destination. By default, the destination port is chosen by traceroute6.
- **probe**: Number of probes to be sent to a single hop.
- **size**: The initial size for the probe packet. During the trace the packet size will be adjusted downward as path MTU information is received. The default and maximum value is 24,000 bytes with a minimum of 1,280 bytes.
- **host-names {yes | no}**: Specify whether each hop must be shown as an IPv6 address or the host name corresponding to the address.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>hop_count</td>
<td>32</td>

Yes  Yes  Yes  Yes  Yes  Yes  Yes  Yes  Yes  Yes  Yes
**Usage Guidelines**

- When using this command, you must enter the name of the destination as part of the command line (either the IPv6 address or hostname).
- Use the optional **max-hop** parameter to set a maximum hop count to the destination. If the trace reaches this maximum hop count without reaching the destination, the trace stops.

**Examples**

```
-> traceroute6 41EA:103::65C3
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **ping6**
  Tests whether an IPv6 destination can be reached from the local switch.

**MIB Objects**

| N/A |
modify boot parameters

This command is used to configure IPv6 EMP interface.

modify boot parameters

Syntax Definitions

N/A

Defaults

By default, the EMP interface will have the following configuration.

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>baudrate</td>
<td>9600</td>
</tr>
<tr>
<td>parity</td>
<td>none</td>
</tr>
<tr>
<td>wordsize</td>
<td>8</td>
</tr>
<tr>
<td>stopbits</td>
<td>1</td>
</tr>
<tr>
<td>mode</td>
<td>modemControlOff</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- You must be on the system console to modify the system boot parameters. Enter `modify boot parameters` command. This enters the `boot` mode. IPv6 EMP interface parameters like the unique IP address and mask, baudrate, priority, and so on can be configured after entering the boot mode.
- Only one IPv6 EMP interface is allowed per physical EMP port in the default VRF.
- It is required to configure an unique IPv6 Address that does not conflict with any other IPv6 interface configured in the system.
- It is required to reload the switch for the modified interface configuration to come into effect.

Examples

```
-> modify boot parameters
Please wait...
Type '?' for help, 'exit' to exit the boot param parser.
Boot > ?
boot empipaddr  <ip address>
boot empmasklength <number of bits in mask>
```
IPv6 Commands

modify boot parameters

IPv6 Commands modify boot parameters

`boot serialbaudrate` <1200, 2400, 4800, 9600, 19200, 38400, 57600, 76800, 115200>
`boot serialparity` <none, even, odd>
`boot serialwordsize` <7, 8>
`boot serialstopbits` <1, 2>
`boot serialmode` <modemControlOn, modemControlOff>
`boot empipv6addr` <ipv6 address>
`boot empipv6masklength` <number of bits in mask>

'`show'` - Display the edit buffer
'`commit boot'` - Commit the changes to non volatile memory for future boots
'`commit system'` - Commit the changes to running system ONLY
Note: EMP changes will only take effect on a future boot
'`exit'` - Exit (quit)

`show` command displays the existing configuration of EMP interface.

Boot > show
EMP IP Address : 10.200.105.21/24
Serial (console) baud : 9600
Serial (console) parity : none
Serial (console) wordsize : 8
Serial (console) stopbits : 1
Serial (console) mode : modemControlOff
EMP IPV6 Address : /

To Configure IPv6 EMP interface, configure the IP address and mask:

Boot > boot empipv6masklength 64
Boot > show
EMP IP Address : 10.200.105.21/24
Serial (console) baud : 9600
Serial (console) parity : none
Serial (console) wordsize : 8
Serial (console) stopbits : 1
Serial (console) mode : modemControlOff
EMP IPV6 Address : /64

Boot > boot empipv6addr 2001::205
Boot > show
EMP IP Address : 10.200.105.21/24

**Release History**

Release 8.4.1; command introduced.
**Related Commands**

- `show ipv6 interface`: Displays IPv6 interface configuration.
- `show ipv6 emp-interface`: Displays the IPv6 EMP interface configuration.
- `show ipv6 emp-routes`: Displays the IPv6 routes targeted to EMP port/IPv6 EMP interface configuration.

**MIB Objects**

N/A
**show ipv6 icmp statistics**

Displays IPv6 ICMP statistics.

`show ipv6 icmp statistics [if_name]`

**Syntax Definitions**

*if_name*  
Display statistics only for this interface.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the ICMP table to monitor and troubleshoot the switch.

**Examples**

```plaintext
-> show ipv6 icmp statistics
Message                      Current | Previous | Change
----------------------------+----------+----------+----------
Received Total                857      | 0        | 857      
    Errors                    0        | 0        | 0        
    Destination Unreachable  0        | 0        | 0        
    Packet Too Big            0        | 0        | 0        
    Time Exceeded             0        | 0        | 0        
    Parameter Problems        0        | 0        | 0        
    Echo Requests             0        | 0        | 0        
    Echo Replies               0        | 0        | 0        
    Group Membership Queries  0        | 0        | 0        
    Group Membership Responses 0       | 0        | 0        
    Group Membership Reductions 0       | 0        | 0        
    Router Solicitations      9        | 0        | 9        
    Router Advertisements     847      | 0        | 847      
    Neighbor Solicitations    1        | 0        | 1        
    Neighbor Advertisements   0        | 0        | 0        
    Redirects                 0        | 0        | 0

show ipv6 interface

Displays the configuration and status of IPv6 interfaces.

show ipv6 interface [if_name | loopback]

Syntax Definitions

*if_name*  
Interface name. Limits the display to a specific interface.

*loopback*  
Limits display to loopback interfaces.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- If an interface name is not specified, all IPv6 interfaces are displayed.
- Specify an interface name (e.g., VLAN 12) to obtain a more detailed information about a specific interface.

Examples

```
-> show ipv6 interface
Name                      IPv6 Address/Prefix Length     Status     Device
------------------------------------------------------------------------------------------------------
smbif-5                    fe80::2d0:95ff:fe12:f470/64      Active     VLAN 955
                            212:95:5::35/64
                            212:95:5::/64
if-200                     fe80:::eae7:32ff:fe4:6321/64      Inactive   VLAN 200

### Release History

- **Release 7.1.1**: command was introduced.
- **Release 8.4.1**: EMP interface information added.
- **Release 8.5R4**: service-based interface information added.
- **Release 8.6R2**: “Device” and “Routed Port” fields added.
- **Release 8.7R1**: “RA send DNSSL option” and “RA send RDNSS option” fields added.

### Related Commands

- **ipv6 address**: Configures an IPv6 address for an IPv6 interface.
- **ipv6 interface**: Configures an IPv6 interface.
- **ipv6 interface rtr-port**: Configures an IPv6 routed-port interface.
- **modify boot parameters**: Configures the IPv6 EMP interface.

Usage Guidelines

N/A

Examples

-> show ipv6 pmtu table

1-PMTU Entry
PMTU entry minimum lifetime = 10m

<table>
<thead>
<tr>
<th>Destination Address</th>
<th>MTU</th>
<th>Expires</th>
</tr>
</thead>
<tbody>
<tr>
<td>fe80::02d0:c0ff:fe86:1207</td>
<td>1280</td>
<td>1h 0m</td>
</tr>
</tbody>
</table>

output definitions

- Destination Address: IPv6 address of the path's destination.
- MTU: Path's MTU.
- Expires: Minimum remaining lifetime for the entry.

Release History

Release 7.1.1; command was introduced.
**Related Commands**

`ipv6 pmtu-lifetime`  
Configures the minimum lifetime for entries in the path MTU Table.

**MIB Objects**

alaIPv6ConfigTable
alaIPv6PMTUDest
alaIPv6PMTUexpire
**show ipv6 ra-filter**

Displays the RA filter configuration for an IPv6 interface.

`show ipv6 ra-filter [if-name]`

### Syntax Definitions

`if_name` IPV6 interface name.

### Defaults

By default, the RA filter configuration is displayed for all IPv6 VLAN interfaces.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `if-name` parameter to display information for a specific IPv6 interface.

### Examples

```
-> show ipv6 ra-filter
Interface                        Status   Trusted Ports
--------------------------------+--------+----------------------------------------
vlan-23                          Enabled  1/1/22, agg 7
vlan-24                          Enabled  none
```

**output definitions**

- **Interface**: Displays the IPv6 VLAN interface on which RA filtering is configured.
- **Status**: Displays the status of RA filtering on the interface. The interfaces on which the RA filtering is disabled are displayed only if one or more trusted ports are configured for the interface.
- **Trusted Ports**: Displays the RA filtering trusted sources for the interface. A '+' will appear at the end of the list to indicate that there are more trusted sources configured which cannot be displayed in a single line. To view the full list of configured trusted sources, specify the interface name in the `show` command as recommended.

```
-> show ipv6 ra-filter vlan-23
RA Filtering: Enabled
Trusted ports: 1/1/22
 agg 7
```
output definitions

<table>
<thead>
<tr>
<th>RA Filtering</th>
<th>Indicates if RA filtering is enabled or disabled on the IPv6 VLAN interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trusted ports</td>
<td>Shows the RA filtering trusted ports (chassis/slot/port) or link aggregates (linkagg ID) for the interface. Displays none if there are no trusted ports.</td>
</tr>
</tbody>
</table>

Release History

Release 8.1.1; command introduced.
Release 8.5R2; OmniSwitch 6560 support for IPv6 RA Filtering added.

Related Commands

ipv6 ra-filter Enables or disables the status of RA filtering on IPv6 VLAN interfaces. When enabled, any RAs received on associated ports and link aggregates are discarded.

ipv6 ra-filter trusted Configures the RA filtering trust status for ports and link aggregates associated with the IPv6 VLAN interface. When a port or link aggregate is trusted, it can accept RAs received when the RA filtering status is enabled.

MIB Objects

IPv6IfIndex

alaIPv6RAFilterTrustedChassis
alaIPv6RAFilterTrustedSlot

**show ipv6 neighbors**

Displays IPv6 Neighbor Table.

```
show ipv6 neighbors [ipv6_prefix/prefix_length | if_name | hw hardware_address | static]
```

### Syntax Definitions

**ipv6_prefix/prefix_length**
IPv6 prefix. Restricts the display to those neighbors starting with the specified prefix.

**if_name**
Interface name. Restricts the display to those neighbors reached through the specified interface.

**hardware_address**
MAC address. Restricts the display to the specified MAC address.

**static**
Restricts display to statically configured neighbors.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you do not specify an option (e.g., if_name), all IPv6 neighbors are displayed.

### Examples

```
-> show ipv6 neighbors
Total 4 neighbors

IPv6 Address           Hardware Address  Reachability Lifetime Port  Interface
-----------------------+-----------------+------------+--------+--------------+---------
2001:db8:9::88         00:d0:95:01:0a:ec Confirmed       5m 5s 1/3/7          vlan_7

</tr>
</tbody>
</table>

**Usage Guidelines**

`show ipv6 routes` does not include the EMP interface included in the total routes count.

**Examples**

```
-> show ipv6 routes
Legend: Flags: U=Up, G=Gateway, H=Host, S=Static, C=Cloneable, B=Discard, E=ECMP

Total 5 routes

Destination Prefix | Gateway Address | Interface    | Age           | Protocol | Flags
--------------------|-----------------|--------------|---------------|----------|--------
::/0                | 2002:d468:8a89::137 | v6if-6to4-137 | 18h 47m 26s  | Static   | UGS
137:35:35::/64     | fe80::2d0:95ff:fe12:f470 | v6if-tunnel-137 | 18h 51m 55s  | Local    | UC
195:35::/64        | fe80::2d0:95ff:fe12:f470 | v6if-to-eagle  | 18h 51m 55s  | Local    | UC
212:95:5::/64      | fe80::2d0:95ff:fe12:f470 | smbif-5       | 18h 51m 55s  | Local    | UC
55::/64            | ::               | loopback      | 00:00:13      | STATIC   | UBS
```

**output definitions**

- **Destination Prefix**: IPv6 destination address and prefix.
- **Gateway Address**: IPv6 address of the gateway used to reach the destination network. Gateway address ‘::’ indicates an IPv6 blackhole route.
- **Interface**: The device the interface is using (e.g., VLAN 6to4tunnel); or loopback.

**Usage Guidelines**

The IPv6 version of BGP is not supported on the OmniSwitch 6560, OmniSwitch 6570M or OmniSwitch 6465.

**Examples**

```
-> show ipv6 route-pref
   Protocol       Route Preference Value
   -------------------------------
    Local              1
    Static             2
    OSPF               110
    ISISL1             115
    ISISL2             118
    RIP                 120
    EBGP               190
    IBGP               200
    Import             210
```

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

```
ipv6 route-pref
```

Configures the IPv6 route preference of a router.

**MIB Objects**

```
N/A
```
show ipv6 router database

Displays a list of all routes (static and dynamic) that exist in the IPv6 router database. This database serves as a central repository where routes are first processed for redistribution and where duplicate routes are compared to determine the best route to use. If a route does not appear in the IPv6 router database list, then the switch does not know about it. In the case of dynamically learned routes, this could indicate that the route was never received by the switch.

```
show ipv6 router database [protocol type | gateway ipv6_address | dest ipv6_prefix/prefix_length]
```

**Syntax Definitions**

- **type**: Routing protocol type (local, static, OSPF, RIP, BGP, IS-IS, or IMPORT).
- **ipv6_address**: IPv6 address of the next hop used to reach the destination IPv6 address.
- **ipv6_prefix**: IPv6 network that is the destination of this static route.
- **/prefix_length**: The number of bits that are significant in the IPv6 address (mask). (0...128).

**Defaults**

By default, all routes are displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The IPv6 forwarding table is derived from IPv6 router database processing performed by the switch and contains only unique routes that the switch currently uses. Use the `show ipv6 routes` command to view the forwarding table.

- If an expected route does not appear in the IPv6 forwarding table, use the `show ipv6 router database` command to see if the switch knows about the route and/or if a duplicate route with a higher precedence was selected instead.

- The switch compares the protocol of duplicate routes to determine which one to use. Regardless of whether or not a route has a higher priority metric value, protocol determines precedence. Local routes are given the highest level of precedence followed by static, OSFP, RIP, then BGP routes. As a result, a route that is known to the switch may not appear in the IP forwarding table if a duplicate route with a higher protocol precedence exists.
- A list of inactive static routes is also included in the **show ipv6 router database** output display. A route becomes inactive if the interface for its gateway goes down. Inactive routes are unable to get to their destination and further investigation is warranted to determine why their gateway is unavailable.

- Routes that appear as inactive are not included in the main IP router database listing. If an inactive route becomes active, however, it is removed from the inactive list and added to the active route list.

**Examples**

```bash
-> show ipv6 router database
Legend: + indicates routes in use
       b indicates BFD-enabled static route

Total IPRM IPv6 routes: 4

<table>

</tr>
</tbody>
</table>
```

**output definitions**

- **Destination/Prefix**: IPv6 destination address and prefix.
- **Gateway Address**: IPv6 address of the gateway used to reach the destination network. Gateway address '::' indicates an IPv6 blackhole route.
- **Interface**: The device the interface is using (e.g., VLAN 6to4tunnel); or loopback.
- **Protocol**: Protocol by which this IPv6 address was learned: LOCAL, STATIC, OSPF, RIP, BGP).
- **Metric**: RIP metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.
- **VLAN**: The VLAN on which the route was learned, not forwarded. Note that N/A appears in this field for static routes as they are not learned on a VLAN.

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **show ipv6 routes**: Displays the IPv6 Forwarding Table.

**MIB Objects**

show ipv6 traffic

Displays IPv6 traffic statistics.
show ipv6 traffic [if_name]

Syntax Definitions

if_name  Interface name. Restricts the display to the specified interface instead of global statistics.

Defaults

N/A.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

**output definitions**

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total</td>
<td>Total number of input packets received, including those received in error.</td>
</tr>
<tr>
<td>Header errors</td>
<td>Number of input packets discarded due to errors in their IPv6 headers (e.g., version number mismatch, other format errors, hop count exceeded, and errors discovered in processing their IPv6 options).</td>
</tr>
<tr>
<td>Too big</td>
<td>Number of input packets that could not be forwarded because their size exceeded the link MTU of the outgoing interface.</td>
</tr>
<tr>
<td>No route</td>
<td>Number of input packets discarded because no route could be found to transmit them to their destination.</td>
</tr>
<tr>
<td>Address errors</td>
<td>Number of input packets discarded because the IPv6 address in their IPv6 header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., ::0) and unsupported addresses (e.g., addresses with unallocated prefixes).</td>
</tr>
<tr>
<td>Unknown protocol</td>
<td>Number of locally-addressed packets received successfully but discarded because of an unknown or unsupported protocol.</td>
</tr>
<tr>
<td>Truncated packets</td>
<td>Number of input packets discarded because the packet frame did not carry enough data.</td>
</tr>
<tr>
<td>Local discards</td>
<td>Number of input IPv6 packets for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any packets discarded while awaiting re-assembly.</td>
</tr>
<tr>
<td>Delivered to users</td>
<td>Total number of packets successfully delivered to IPv6 user protocols (including ICMP).</td>
</tr>
<tr>
<td>Reassembly needed</td>
<td>Number of IPv6 fragments received that needed to be reassembled.</td>
</tr>
<tr>
<td>Reassembly failed</td>
<td>Number of failures detected by the IPv6 reassembly algorithm (for whatever reason: timed out, errors, etc.).</td>
</tr>
<tr>
<td>Multicast packets</td>
<td>Number of multicast packets received.</td>
</tr>
<tr>
<td>Forwarded</td>
<td>Number of output packets that this entity received and forwarded to their final destinations.</td>
</tr>
<tr>
<td>Generated</td>
<td>Total number of IPv6 packets that local IPv6 user-protocols (including ICMP) supplied to IPv6 in requests for transmission. Note that this counter does not include any packets counted by the Forwarded statistic.</td>
</tr>
<tr>
<td>Local discards</td>
<td>Number of output IPv6 packets for which no problem was encountered to prevent their transmission to their destination, but were discarded (e.g., for lack of buffer space). Note that this counter would include packets counted by the Forwarded statistic if any such packets met this (discretionary) discard criterion.</td>
</tr>
<tr>
<td>Fragmented</td>
<td>Number of IPv6 packets successfully fragmented.</td>
</tr>
<tr>
<td>Fragmentation failed</td>
<td>Number of IPv6 packets discarded because they needed to be fragmented but could not be.</td>
</tr>
<tr>
<td>Fragments generated</td>
<td>Number of output packet fragments generated as a result of fragmentation.</td>
</tr>
<tr>
<td>Multicast packets</td>
<td>Number of multicast packets transmitted.</td>
</tr>
</tbody>
</table>

`alaIPv6NeighborStaleLifetime`
ipv6 redist

Controls the conditions for redistributing IPv6 routes between different protocols.

```
ipv6 redist {local | static | rip | ospf | isis | bgp | import} into {rip | ospf | isis | bgp} {all-routes | route-map route_map_name} [admin-state {enable | disable}]
```

```
no ipv6 redist {local | static | ospf | isis | bgp | import} into {rip | ospf | isis | bgp} {all-routes | route-map route_map_name}
```

---

**Syntax Definitions**

- **local**: Redistributes local IPv6 routes.
- **static**: Redistributes static IPv6 routes.
- **rip**: Specifies RIP as the source or destination (into) protocol.
- **ospf**: Specifies OSPF as the source or destination (into) protocol.
- **isis**: Specifies IS-IS as the source or destination (into) protocol.
- **bgp**: Specifies BGP as the source or destination (into) protocol.
- **import**: Redistributes imported routes to other routing protocols.
- **all-routes**: Redistributes all routes. This option does not allocate route-map resources.
- **route_map_name**: Name of an existing route map that will control the redistribution of routes between the source and destination protocol.
- **enable**: Enables the administrative status of the redistribution configuration.
- **disable**: Disables the administrative status of the redistribution configuration.

---

**Usage Guidelines**

- Use the **no** form of this command to remove a route map redistribution configuration. Note that if a route map name is not specified, all route maps associated with the redistribution configuration are removed.
- The source and destination protocols must be loaded and enabled before redistribution occurs.
- The IPv6 version of BGP is not supported in the current release.
- Use the `ip route-map` commands described in the “IP Commands” chapter of this guide to create a route map. Refer to the “Configuring IP” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.

**Examples**

```
-> ipv6 redist rip into ospf route-map rip-to-ospf1
-> ipv6 redist rip into ospf route-map rip-to-ospf2
-> no ipv6 redist rip into ospf route-map rip-to-ospf2
-> ipv6 redist local into rip route-map local-to-rip
-> ipv6 redist local into rip route-map local-to-rip disable
```

**Release History**

Release 7.1.1; command was introduced.
Release 7.3.2; `all-routes` parameter added.
Release 8.5R1; `import` parameter added.

**Related Commands**

- `show ipv6 redist` Displays the route map redistribution configuration.

**MIB Objects**

- `alaRouteMapRedistProtoTable`
- `alaRouteMapRedistSrcProtoId`
- `alaRouteMapRedistDestProtoId`
- `alaRouteMapRedistRouteMapIndex`
- `alaRouteMapRedistStatus`
- `alaRouteMapRedistAddressType`
- `alaRouteMapRedistRowStatus`
ipv6 access-list

Creates an IPv6 access list that is used to specify multiple IPv6 addresses for a route map configuration.

ipv6 access-list access_list_name

no ipv6 access-list access_list_name

Syntax Definitions

access_list_name Name of the IPv6 access list (up to 20 characters).

Defaults
N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the no form of this command to delete the access list.

Examples

- -> ipv6 access-list access1
- -> no ipv6 access-list access1

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 access-list address Adds IPv6 addresses to an existing IPv6 access list.

show ipv6 access-list Displays the contents of an IPv6 access list.

MIB Objects

alaRouteMapAccessListNameTable
alaRouteMapAccessListName
alaRouteMapAccessListNameIndex
alaRouteMapAccessListNameAddressType
**ipv6 access-list address**

Adds IPv6 addresses to the specified IPv6 access list.

```
ipv6 access-list access_list_name address address/prefixLen [action {permit | deny}] [redist-control {all-subnets | no-subnets | aggregate}]
```

```
no ipv6 access-list access_list_name address address/prefixLen
```

---

### Syntax Definitions

- **access_list_name**: Name of the IPv6 access list (up to 20 characters).
- **address/prefixLen**: IPv6 address along with the prefix length to be added to the access list.
- **permit**: Permits the IPv6 address for redistribution.
- **deny**: Denies the IPv6 address for redistribution.
- **all-subnets**: Redistributes or denies all the subnet routes that match the network portion of the IP address as specified by the mask length.
- **no-subnets**: Redistributes or denies only those routes that exactly match the IP address and the mask length.
- **aggregate**: Redistributes an aggregate route if there are one or more routes that match or are subnets of this address.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>permit</td>
<td>deny</td>
</tr>
<tr>
<td>all-subnets</td>
<td>no-subnets</td>
</tr>
</tbody>
</table>

---

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to delete the address from the access list.
- The `access_list_name` should exist before you add multiple IPv6 addresses to the IPv6 access list.
- The `action` parameters (perm [mit and deny]) determine if a route that matches the `redist-control` configuration for the IP address is allowed or denied redistribution.
- The `redist-control` parameters (all-subnets, no-subnets, and aggregate) defines the criteria used to determine if a route matches an address in the access list.

- Note that configuring the combination of `redist-control aggregate` with `action deny` is not allowed.

- Use this command multiple times with the same access list name to add multiple addresses to the existing IPv6 access list.

**Examples**

```
-> ipv6 access-list access1 address 2001::1/64 action permit
-> ipv6 access-list access1 address 2001::1/64 redist-control aggregate
-> no ipv6 access-list access1 address 2001::1/64
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `ipv6 access-list` Creates an IPv6 access list that is used to specify multiple IPv6 addresses for a route map configuration.

- `show ipv6 access-list` Displays the contents of an IPv6 access list.

**MIB Objects**

alaRouteMapAccessListTable
  alaRouteMapAccessListIndex
  alaRouteMapAccessListAddress
  alaRouteMapAccessListAddressType
  alaRouteMapAccessListPrefixLength
  alaRouteMapAccessListAction
  alaRouteMapAccessListRedistControl
  alaRouteMapAccessListRowStatus
show ipv6 redist

Displays the IPv6 route map redistribution configuration.

show ipv6 redist [rip | ospf | bgp]

**Syntax Definitions**

- **rip**
  Displays the route map redistribution configurations that specify RIP as the destination (into) protocol.

- **ospf**
  Displays the route map redistribution configurations that specify OSPF as the destination (into) protocol.

- **bgp**
  Displays the route map redistribution configurations that specify BGP as the destination (into) protocol.

**Defaults**

By default all route map redistribution configurations are shown.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Specify a destination protocol with this command to display only those configurations that redistribute routes into the specified protocol.

- The IPv6 version of BGP is not supported in the current release.

**Release History**

Release 7.1.1; command was introduced.

**Examples**

```
-> show ipv6 redist

Source       Destination  Status    Route Map
Protocol     Protocol     
------------+------------+---------+-------------------
localIPv6    RIPng       Enabled   ipv6rm
RIPng        OSPFv3      Enabled   ipv6rm
```
-> show ipv6 redist ospf

<table>
<thead>
<tr>
<th>Source</th>
<th>Destination</th>
<th>Protocol</th>
<th>Protocol</th>
<th>Status</th>
<th>Route Map</th>
</tr>
</thead>
<tbody>
<tr>
<td>RIPng</td>
<td>OSPFv3</td>
<td>Enabled</td>
<td>ipv6rm</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**output definitions**

- **Source Protocol**: The protocol from which the routes are learned.
- **Destination Protocol**: The protocol into which the source protocol routes are redistributed.
- **Status**: The administrative status (Enabled or Disabled) of the route map redistribution configuration.
- **Route Map**: The name of the route map that is applied with this redistribution configuration.

**Related Commands**

- **ipv6 redist**: Controls the conditions for redistributing IPv6 routes between different protocols.
- **show ipv6 redist-routes**: Displays all of the IPv6 routes that have been redistributed.

**MIB Objects**

- alaRouteMapRedistProtoTable
  - alaRouteMapRedistSrcProtoId
  - alaRouteMapRedistDestProtoId
  - alaRouteMapRedistRouteMapIndex
  - alaRouteMapRedistStatus
  - alaRouteMapRedistAddressType
  - alaRouteMapRedistRowStatus
**show ipv6 redist-routes**

Displays all of the IPv6 routes that have been redistributed.

```
[vrf vrf_name] show ipv6 redist-routes
```

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `show ipv6 redist` command to display the IPv6 route redistribution configuration.

### Examples

```
-> show ipv6 redist-routes
Route Map  Route          Gateway    Source   Dest Metric RtType Tag    LocalPref Community
---------------------------------------------------------------------------------------------------------
None        1601::/16      1701::2    OSPF     RIP       5 INT        0
BgpMap      1801:1::/32    1901::2    OSPF     BGP       1 EXT        0         10 no-export
```

### output definitions

- **Route Map**: The name of the route map that is applied with this redistribution configuration.
- **Route**: The redistributed route.
- **Gateway**: IPv6 address of the gateway on which this route was learned.
- **Source**: The source protocol.
- **Dest**: The destination protocol.
- **Metric**: RIP metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.
show ipv6 redist-routes

output definitions

RtType  The type of route:
  • NONE—No route type.
  • INTERNAL—OSPF/BGP internal routes.
  • EXTERNAL—OSPF/BGP external routes.
  • TYPE1—OSPF external Type-1 routes.
  • TYPE2—OSPF external Type-2 routes.
  • LEVEL1—IS-IS Level-1 routes only.
  • LEVEL2—IS-IS Level-2 routes only.

Tag  The tag value of the route.

LocalPref  The local route preference of a route being redistributed into BGP.

Community  The community name of a route being redistributed into BGP.

Release History

Release 8.4.1.R03; command introduced.

Related Commands

ipv6 redist  Controls the conditions for redistributing different IPv4 routes between protocols.

show ipv6 redist  Displays the route map redistribution configuration.

MIB Objects

N/A
**show ipv6 access-list**

Displays the contents of the specified IPv6 access list.

**show ipv6 access-list** [access_list_name]

---

**Syntax Definitions**

access_list_name  
Name of the IPv6 access list.

---

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6865N</th>
<th>6865</th>
<th>6900</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6</th>
<th>6900X48C4E/V48C8/C32E/T24C2</th>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

If the *access_list_name* is not specified in this command, all the access lists will be displayed.

---

**Examples**

```
-> show ipv6 access-list

<table>
<thead>
<tr>
<th>Name</th>
<th>Address / Prefix Length</th>
<th>Redistribution</th>
</tr>
</thead>
<tbody>
<tr>
<td>al_3</td>
<td>128::/64</td>
<td>permit all-subnets</td>
</tr>
<tr>
<td>al_4</td>
<td>124::/64</td>
<td>permit no-subnets</td>
</tr>
</tbody>
</table>
```

```
-> show ipv6 access-list 4

<table>
<thead>
<tr>
<th>Name</th>
<th>Address / Prefix Length</th>
<th>Redistribution</th>
</tr>
</thead>
<tbody>
<tr>
<td>al_4</td>
<td>124::/64</td>
<td>permit no-subnets</td>
</tr>
</tbody>
</table>
```

---

**output definitions**

- **Name**: Name of the IPv6 access list.
- **Address/Prefix Length**: IPv6 address that belongs to the access list.
output definitions

| Effect | Indicates whether the IPv6 address is permitted or denied for redistribution. |
| Redistribution Control | Indicates the conditions specified for redistributing the matched routes. |

Release History

Release 7.1.1; command was introduced

Related Commands

ipv6 access-list

Creates an IPv6 access list for adding multiple IPv6 addresses to route maps.

ipv6 access-list address

Adds multiple IPv6 addresses to the IPv6 access list.

MIB objects

alaRouteMapAccessListAddress
alaRouteMapAccessListPrefixLength
alaRouteMapAccessListAction
alaRouteMapAccessListRedistControl
### ipv6 export

Exports IPv6 routes from the source VRF to the Global Routing Table (GRT) or to all VRF instances. All routes are exported or a route map can be specified to filter exported routes.

```
[vrf vrf_name] ipv6 export {all-routes | route-map route_map_name | to-all-vrfs {all-routes | route-map route_map_name}}
```

```
[vrf vrf_name] no ipv6 export
```

#### Syntax Definitions

- **vrf_name**
  - The name of an existing VRF instance. Routes are exported from this source VRF to the GRT.

- **all-routes**
  - Exports all routes from the source VRF to the GRT. This option does not allocate route-map resources.

- **route_map_name**
  - The name of an existing route-map to use for filtering routes that are exported from the source VRF to the GRT.

- **to-all-vrfs all-routes**
  - Exports all routes to all of the other VRF instances, except to VRFs that already have an import configured for the source (export) VRF.

- **to-all-vrfs route-map route_map_name**
  - The name of an existing route map to use for filtering routes that are exported from the source VRF to all other VRF instances.

#### Defaults

- If a source VRF name is not specified with this command, routes are exported from within the context of the active VRF instance to the GRT.

- If there are no VRF instances configured on the switch, the routes are exported from the default VRF to the GRT.

#### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

- Use the **no** form of this command to disable exporting of routes from the VRF to GRT.

- To leak IPv6 routes between VRF instances, IPv6 must be available in both instances. It is important to note that IPv6 route leaking is supported only in max profile VRFs.

- IPv6 route leaking supports configured tunnel routes, but 6to4 tunnel and loopback routes are not supported.
• Routes that were leaked into a VRF instance cannot be exported from that instance to another VRF.

• The route map name specified with this command must already exist in the switch configuration. See the \texttt{ip route-map} commands in the “IP Commands” chapter of this guide and the “Configuring IP” chapter in the \emph{OmniSwitch AOS Release 8 Network Configuration Guide} for more information about how to create a route map.

• A route map created to filter exported VRF IPv6 routes can contain any of the following match and set options:
  – Match options: ipv6-address, ipv6-next-hop, tag, protocol, ipv6-interface, metric, route-type, name
  – Set options: tag, metric

• A route map with redist control of aggregate is supported when exporting IPv6 routes, but it is not supported when importing IPv6 routes.

• Only one route map per source VRF is allowed for filtering exported routes.

• Only those FDB (Forwarding Routing Database) routes that match the conditions of the route map are exported to GRT.

• Modifying a route map that is assigned to a VRF through the \texttt{ipv6 import} or \texttt{ipv6 export} command is supported.

\textbf{Examples}

The following commands export IPv6 routes from the current VRF routing table (or from the default VRF if there are no other VRFs configured) to the GRT:

\begin{verbatim}
-> ipv6 export route-map R1
-> ipv6 export all-routes
-> ipv6 export to-all-vrfs all-routes
-> ipv6 export to-all-vrfs route-map R2
-> no ipv6 export
\end{verbatim}

The following commands export IPv6 routes from the “vrf2” routing table to the GRT even though the command line is operating within the context of the default VRF instance:

\begin{verbatim}
-> vrf vrf2 ipv6 export route-map R1
-> vrf vrf2 ipv6 export all-routes
-> vrf vrf2 ipv6 export to-all-vrfs all-routes
-> vrf vrf2 ipv6 export to-all-vrfs route-map R2
-> no vrf vrf2 ipv6 export
\end{verbatim}

The following commands first change the command line context to the “vrf1” instance so that all subsequent commands export routes from “vrf1” without having to specify the VRF name with each command:

\begin{verbatim}
-> vrf vrf1
vrf1::-> ipv6 export route-map R1
vrf1::-> ipv6 export all-routes
vrf1::-> ipv6 export to-all-vrfs all-routes
vrf1::-> ipv6 export to-all-vrfs route-map R2
vrf1::-> no ipv6 export
\end{verbatim}

\textbf{Release History}

Release 8.5R1; command introduced.
**Related Commands**

- **vrf**
  Configures and selects a virtual routing and forwarding (VRF) instance on the switch.

- **ip route-map action**
  Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.

- **ip route-map match protocol**
  Matches the protocol specified in the route map with the protocol of the route.

- **show ipv6 export**
  Displays the export route configuration details.

- **show ipv6 global-route-table**
  Displays the GRT for all the routes that are exported from the VRFs.

- **show ip route-map**
  Displays the configured IP route maps.

**MIB Objects**

- aIprmV6ExportRouteMap
- aIprmV6ExportToAllVrfsRouteMap
**ipv6 import**

Imports VRF IPv6 routes from the GRT to the destination VRF. All routes are imported or a route map can be specified to filter imported routes.

```
[vrf dest_vrf_name] ipv6 import {vrf {src_vrf_name | default} | isid instance_id} {all-routes | route-map route_map_name}

[vrf dest_vrf_name] no ipv6 import vrf {src_vrf_name | default}
```

---

**Syntax Definitions**

- **dest_vrf_name**: The name of the destination VRF instance into which routes are imported from the GRT.
- **src_vrf_name**: The name of the source VRF instance from which routes were exported to the GRT. Routes from this instance are imported from the GRT into the specified destination VRF instance.
- **default**: Default VRF. The routes are imported from the default VRF instance.
- **instance_id**: An existing ISID number that identifies an SPB service in a provider backbone bridge (PBB) network. The routes for this ISID number are imported from the GRT into the current or specified VRF instance.
- **all-routes**: Imports all routes from the source VRF instance. Imported routes are not filtered.
- **route_map_name**: The name of an existing route map to use for filtering routes that are imported from the GRT to the destination VRF. Imported routes are filtered based on the options defined in the route map.

---

**Defaults**

If a destination VRF name is not specified with this command, routes are imported from the GRT into the context of the active VRF instance.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>Platform</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>6465</td>
</tr>
<tr>
<td>6560</td>
<td>6570M</td>
</tr>
<tr>

<td>6860N</td>
</tr>
<tr>
<td>6900</td>
<td></td>
</tr>
<tr>
<td>6900 V72/C32</td>
<td></td>
</tr>
<tr>
<td>6900 X48C6/T48C6/</td>
<td></td>
</tr>
<tr>
<td>6900 X48C4E/V48C8/</td>
<td></td>
</tr>
<tr>
<td>6900 C32E/T24C2/</td>
<td></td>
</tr>
<tr>
<td>6900 X24C2</td>
<td></td>
</tr>
</tbody>
</table>

| 9900 |                        |

---

**Usage Guidelines**

- Use the **no** form of this command to remove the IP import routes configuration for the specified VRF or ISID instance.
- To leak IPv6 routes between VRF instances, IPv6 must be available in both instances. It is important to note that IPv6 route leaking is supported only in max profile VRFs.
• IPv6 route leaking supports configured tunnel routes, but 6to4 tunnel and loopback routes are not supported.

• Routes that were leaked into a VRF instance cannot be exported from that instance to another VRF.

• The route map name specified with this command must already exist in the switch configuration. See the ip route-map commands in the “IP Commands” chapter of this guide and the “Configuring IP” chapter in the OmniSwitch AOS Release 8 Network Configuration Guide for more information about how to create a route map.

• A route map created to filter imported VRF or ISID IPv6 routes can contain any of the following match and set parameter options:
  – Match options: ipv6-address (no aggregates), ipv6-next-hop, tag, metric
  – Set options: tag, metric

• A route map with redist control of aggregate is supported when exporting IPv6 routes, but it is not supported when importing IPv6 routes.

• Only one route map per source (imported) VRF or ISID is allowed.

• Modifying a route map that is assigned to a VRF or ISID through the ipv6 import or ipv6 export command is supported.

• Leaked routes are only for forwarding. If a local route is leaked, that interface is not accessible in the importing VRF. Another switch will not be able to ping the interface in the import VRF.

Examples

-> ipv6 import vrf V1 route-map R2
-> ipv6 import vrf V2 all-routes
-> no ipv6 import vrf V1

-> vrf V3 ipv6 import vrf V2 route-map import-map
-> vrf V3 no ipv6 import vrf V2

-> ipv6 import isid 1500 route-map R1
-> ipv6 import isid 2000 all-routes
-> no ipv6 import isid 1500

-> vrf V4 ipv6 import isid 2500 route-map import-map
-> vrf V4 no ipv6 import isid 2500

Release History

Release 8.5R1; command introduced.
Release 8.5R2; isid parameter added.
**Related Commands**

**vrf**
Configures and selects a virtual routing and forwarding (VRF) instance on the switch.

**ip route-map action**
Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.

**ip route-map match protocol**
Matches the protocol specified in the route map with the protocol of the route.

**show ipv6 import**
Displays the import route configuration details.

**show ipv6 global-route-table**
Displays the GRT for all the routes that are exported from the VRFs.

**show ip route-map**
Displays the configured IP route maps.

**MIB Objects**

`alaIprmV6ImportVrfTable`

`alaIprmV6ImportVrfName`

`alaIprmV6ImportVrfRouteMap`

`alaIprmV6ImportISid`

`alaIprmV6ImportVrfRowStatus`
show ipv6 export

Displays the export route configuration details.

[vrf vrf_name] show ipv6 export

Syntax Definitions

vrf_name The name of an existing VRF instance.

Defaults

By default, the export route configuration for the active VRF instance is displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

If a VRF is specified, the export route configuration for that VRF is displayed.

Examples

-> show ipv6 export
Export Route Map: leak-out

-> vrf vrf1 show ipv6 export
Export Route Map: none (all-routes)

vrf2:-> show ipv6 export
Export Route Map: none (all-routes) -> To All VRFs

Release History

Release 8.5R1; command introduced.
**Related Commands**

**ipv6 export**

Exports IPv6 routes from the source VRF to the Global Routing Table (GRT) or to all VRF instances.

**MIB Objects**

alaIprmV6ExportRouteMap
alaIprmV6ExportToAllVrfsRouteMap
show ipv6 import

Displays the import route configuration details.

[vrf vrf_name] show ipv6 import

Syntax Definitions

vrf_name

The name of an existing VRF instance.

Defaults

By default, the import route configuration for the active VRF instance is displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

If a VRF is specified, the import route configuration for that VRF is displayed.

Examples

-> show ipv6 import
Type Source RouteMap
-----------------------------+-----------------------------
vrf Customer1 leak-in
vrf Customer2 none (all-routes)
isid 1000 isid1000-filter

output definitions

<table>
<thead>
<tr>
<th>Type</th>
<th>The type of imported route (vrf or isid).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>The name of the VRF instance from which IPv6 routes are imported to the VRF.</td>
</tr>
<tr>
<td>RouteMap</td>
<td>The name of the route map filter or none (all-routes).</td>
</tr>
</tbody>
</table>

Release History

Release 8.5R1; command introduced.
Release 8.5R2; imported ISID route entries added to the table.
**Related Commands**

`ipv6 import`  
Imports VRF IPv6 routes from the GRT to the destination VRF.

**MIB Objects**

`alaIprmV6ImportVrfTable`
- `alaIprmV6ImportVrfName`
- `alaIprmV6ImportIsid`
- `alaIprmV6ImportVrfRouteMap`
- `alaIprmV6ImportIsidRouteMap`
- `alaIprmV6ImportVrfRowStatus`
**show ipv6 global-route-table**

Displays the contents of the Global Routing Table (GRT) for all the IPv6 routes that are exported from VRF or from Shortest Path Bridging service instance identifiers (ISIDs). This command is only available within the context of the default VRF instance.

**show ipv6 global-route-table [export-vrf vrf_name]**

---

### Syntax Definitions

**vrf_name**

The alphanumeric name (1–20 characters) assigned to the VRF instance.

---

### Defaults

By default, exported routes are displayed for all VRF instances and ISIDs.

---

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

### Usage Guidelines

Use the `export-vrf` parameter to display exported routes for a specific VRF instance.

---

### Examples

```
-> show ipv6 global-route-table
```

<table>
<thead>
<tr>
<th>Type</th>
<th>Source</th>
<th>Destination</th>
<th>Gateway</th>
<th>Metric</th>
<th>Tag</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf</td>
<td>Customer2</td>
<td>1601::/16</td>
<td>1701:ffff:0001::1</td>
<td>1</td>
<td>100</td>
</tr>
<tr>
<td>vrf</td>
<td>Customer2</td>
<td>1111::/16</td>
<td>1111::1</td>
<td>2</td>
<td>5</td>
</tr>
<tr>
<td>vrf</td>
<td>Customer3</td>
<td>2808:3456::/32</td>
<td>3939::2</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>isid</td>
<td>1000</td>
<td>1801::/16</td>
<td>2222::2</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

---

### output definitions

- **Type**: The type of exported route (vrf or isid).
- **Source**: The name of the VRF instance or the Shortest Path Bridging service instance identifier (ISID) from which IPv6 routes are exported to the GRT.
- **Destination**: The address of the route.
- **Gateway**: The next hop for the destination address.
- **Metric**: The metric of the exported route.
- **Tag**: The tag of the exported route.
**Release History**

Release 8.5R1; command introduced.
Release 8.5R2; exported ISID route entries added to the table.

**Related Commands**

`ipv6 export`  
Configures a route map to export routes from the source VRF to Global Routing Table (GRT).

`show ipv6 export`  
Displays the export route configuration details.

22 IPsec Commands

IPsec is a suite of protocols for securing IP communications by authenticating and/or encrypting each IP packet in a data stream. IPsec provides security services such as Encrypting traffic, Integrity validation, Authenticating the peers, and Anti-replay.

IPsec protocols operate at network layer using appropriate security protocols, cryptographic algorithms, and cryptographic keys. The security services are provided through use of two security protocols, the Authentication Header (AH) and the Encapsulating Security Payload (ESP), and through the use of cryptographic key management procedures and protocols.

There are two modes of IPsec operation: transport mode and tunnel mode. In transport mode, only the data you transfer (payload) in the IP packet is encrypted and/or authenticated and only the payloads that are originated and destined between two intermediate systems are processed with IPsec. In tunnel mode, the entire IP packet with both the data and the message headers is encrypted and/or authenticated. In tunnel mode, all the IP packets that pass through the endpoints are processed by IPsec. The current implementation of IPsec supports only the transport mode.

The pre-configured Security Policy determines the traffic that is to be rendered with IPsec protection. A Security Association (SA) specifies the actual IPsec actions to be performed (e.g. encryption using 3DES, authentication with HMAC-SHA1). A security association is bundle of algorithms and parameters (such as keys) that is being used to encrypt and authenticate a particular flow in one direction. Security Associations can be manually configured or negotiated through IKE. The current implementation of IPsec does not support the negotiation of SA through IKE and SAs need to be configured manually.

Note. In the current implementation IPv4 supports only management service.

<table>
<thead>
<tr>
<th>Filename: ALCATEL-IND1-IPSEC-MIB.mib</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module: alcatelIND1IPsecMIB</td>
</tr>
</tbody>
</table>

A summary of the available commands is listed here:

```
ipsec key
ipsec security-key
ipsec policy
ipsec policy rule
ipsec sa
ipsec default-discard
show ipsec policy
show ipsec sa
show ipsec key
show ipsec statistics
```
**ipsec key**

Adds, modifies or deletes the authentication and encryption keys for a manually configured IPsec SA.

```
ipsec key name {sa-authentication | sa-encryption} [encrypted] key
no ipsec key name {sa-authentication | sa-encryption}
```

---

**Syntax Definitions**

- **name**: The name of this key (maximum 20 characters).
- **sa-authentication**: Indicates that the key value is used for Authentication Header.
- **sa-encryption**: Indicates that the key value is used for Encapsulated Security Payload.
- **encrypted**: Not user configured, used only by switch in config file.
- **key**: Specifies the key value. The key value can be either in the hexadecimal format or as a string.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- The **name** parameter must be same as the name of the manually configured SA that uses this SA authentication and encryption key.

- The length of the key value must match the value that is required by the encryption or authentication algorithm that uses the key. The required key length for the supported algorithm are as follows:

<table>
<thead>
<tr>
<th>algorithm</th>
<th>key length</th>
</tr>
</thead>
<tbody>
<tr>
<td>3des-cbc</td>
<td>192 bits</td>
</tr>
<tr>
<td>aes-cbc</td>
<td>128, 192, or 256 bits</td>
</tr>
<tr>
<td>hmac-md5</td>
<td>128 bits</td>
</tr>
<tr>
<td>hmac-sha1</td>
<td>160 bits</td>
</tr>
<tr>
<td>hmac-sha2 -256</td>
<td>256 bits</td>
</tr>
<tr>
<td>hmac-sha2-384</td>
<td>384 bits</td>
</tr>
</tbody>
</table>
The combination of the key's name and type must be unique.

The encrypted option is used when the key commands are written to the boot.cfg or other snapshot file. This option can not be specified by the user when entering CLI commands.

**Examples**

```
-> ipsec key sa_md5_in sa-authentication takd03c9@skL68L%
```

**Release History**

Release 7.1.1; command introduced.
Release 8.7 R1; HMAC-SHA256, HMAC-SHA384 and HMAC-SHA512 algorithm support for authentication added.

**Related Commands**

- **ipsec sa**
  Adds, modifies, or deletes a manually configured IPsec Security Association (SA).

- **show ipsec key**
  Displays the keys for the manually configured IPsec SA.

**MIB Objects**

AlaIPsecKeyTable
  - alaIPsecKeyName
  - alaIPsecKeyType
  - alaIPsecKeyEncrypted
  - alaIPsecKey

<table>
<thead>
<tr>
<th>algorithm</th>
<th>key length</th>
</tr>
</thead>
<tbody>
<tr>
<td>hmac-sha2-512</td>
<td>512 bits</td>
</tr>
<tr>
<td>aes-xcbc-mac</td>
<td>128</td>
</tr>
</tbody>
</table>
**ipsec security-key**

Sets the master security key for the switch. The master security key is used to encrypt and decrypt the configured SA keys.

```
ipsec security-key [old_key] new_key
```

### Syntax Definitions

- **old_key**: The current master security key. The key can be specified either in the hexadecimal format or as a string.
- **new_key**: The new key value. The key can be specified either in the hexadecimal format or as a string.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The `old_key` parameter must always be specified when you modify an existing key. Setting the key for first time does not require the `old_key`.
- If the value of the `old_key` is incorrect, the attempt to set a new key fails.
- While the SA keys can be configured without a master security key; the configured SA keys are written to the configuration file unencrypted, and a warning is logged.
- The security key must be 16 characters or 16 bytes if in hex form (32 hex digits).
- If the master security key is reset using `debug clear ipsec security-key` command, the currently configured SA keys are deleted.

### Examples

```
-> ipsec security-key "old key value ab" 0xa38d901bde77af091a2485ce0a14a8cc
```

### Release History

Release 7.1.1; command introduced.
Related Commands

**ipsec key**  
Adds, modifies or deletes the authentication and encryption keys for a manually configured IPsec SA.

MIB Objects

**AlaIPsecSecurityKeyTable**
- **alaIPsecSecurityKeyCurrent**
- **alaIPsecSecurityKeyNew**
ipsec policy

Adds, modifies, or removes a security policy.

```
ipsec policy name [service {telnet | ftp | ssh | snmp | http | https}] [priority priority] [source {ipv6_address[/prefix_length] | ipv4_address[/prefix_length]}] [source port] [destination {ipv6_address[/prefix_length] | ipv4_address[/prefix_length]}] [destination port] [protocol {any | icmp6 [type type] | tcp | udp | ospf | vrrp | number protocol}] [in | out] [discard | ipsec | none] [description description] [admin-state {enable | disable}]
```

no ipsec policy name

---

**Syntax Definitions**

- **name**: The name for the policy.
- **service**: The management service. This can be specified to restrict the policy to traffic from a specific service.
- **priority**: The priority for the policy. Values may range from 1 to 1000. The lower the value, the higher the priority.
- **source**: Specifies the source address of the IPv6 or IPv4 traffic that is covered by the policy.
- **source /prefix_length**: Specifies the prefix length of the source address of the IPv6 or IPv4 traffic that is covered by the policy.
- **source port**: Specifies the source port of the IPv6 traffic that is covered by the policy. The value 0 can be specified to match packets originated from any port.
- **destination**: Specifies the destination address of the IPv6 or IPv4 traffic that is covered by the policy.
- **destination /prefix-length**: Specifies the prefix length of the destination address of the IPv6 or IPv4 traffic that is covered by the policy.
- **destination port**: Specifies the destination port of the IPv6 or IPv4 traffic that is covered by the policy. The value 0 can be specified to match packets destined to any port.
- **protocol**: Specifies that the particular protocol specific traffic to be covered by the policy (Refer to the table in the “Usage Guidelines” section below for various protocol options). This option is supported only for IPv4 traffic on the management service.
- **in**: Specifies that the policy is applied to the inbound IPv6 or IPv4 traffic.
- **out**: Specifies that the policy is applied to the outbound IPv6 or IPv4 traffic.
- **discard**: Specifies the policy to discard the IPv6 or IPv4 packet, if it matches the criteria.
- **ipsec**: Specifies the policy to send the IPv6 or IPv4 packet for IPsec processing, if it matches the criteria.
- **none**: Specifies IPsec should not process the packet.
- **description**: The detailed description of the policy.
- **enable**: Administratively enables the policy.
- **disable**: Administratively disables the policy.
**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>100</td>
</tr>
<tr>
<td>port</td>
<td>0</td>
</tr>
<tr>
<td>any</td>
<td>icmp6</td>
</tr>
<tr>
<td>icmp6 type</td>
<td>not present</td>
</tr>
<tr>
<td>discard</td>
<td>ipsec</td>
</tr>
<tr>
<td>admin-state</td>
<td>enable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

- If two policies can cover the same traffic, the policy with the highest priority is applied. If two policies have the same priority, the one configured first has precedence.

- The following table lists the various protocol options in this command:

<table>
<thead>
<tr>
<th>protocol</th>
</tr>
</thead>
<tbody>
<tr>
<td>any</td>
</tr>
<tr>
<td>icmp6[type type]</td>
</tr>
<tr>
<td>tcp</td>
</tr>
<tr>
<td>udp</td>
</tr>
<tr>
<td>ospf</td>
</tr>
<tr>
<td>vrrp</td>
</tr>
<tr>
<td>number protocol</td>
</tr>
</tbody>
</table>

The any option must be used to apply the policy to all protocol traffic. Otherwise, an upper-layer protocol (or protocol number) may be specified to restrict the policy to the specified protocol traffic. The optional type parameter of icmp6 can also be specified to restrict the policy for certain type of ICMPv6 packets.

- If the ipsec option is specified this policy cannot be enabled until at least one rule has been defined. The policy rules specify that IPsec algorithms be applied to the traffic that matches the policy.
**Examples**

-> ipsec policy tcp_out source 2001:db8:3::12 destination 201:db8:4::a3e protocol tcp out ipsec description "Outbound TCP traffic" admin-state disable

-> ipsec policy tcp_out source 10.20.1.2 destination 10.20.10.1 protocol tcp out ipsec description "Outbound TCP traffic" admin-state disable

-> no ipsec policy tcp_out

**Release History**

Release 7.1.1; command introduced.
Release 8.7 R1; IPv4 support added.

**Related Commands**

- **ipsec policy rule**  
  Adds, modifies, or removes an IPsec rule for a security policy.

- **show ipsec policy**  
  Displays information about the security policies.

**MIB Objects**

AlaIPsecSecurityPolicyTable
  alaIPsecSecurityPolicyName  
  alaIPsecSecurityPolicyPriority  
  alaIPsecSecurityPolicySource  
  alaIPsecSecurityPolicySourceType  
  alaIPsecSecurityPolicySourcePrefixLength  
  alaIPsecSecurityPolicySourcePort  
  alaIPsecSecurityPolicyDestination  
  alaIPsecSecurityPolicyDestinationType  
  alaIPsecSecurityPolicyDestinationPrefixLength  
  alaIPsecSecurityPolicyDestinationPort  
  alaIPsecSecurityPolicyULProtocol  
  alaIPsecSecurityPolicyICMPv6Type  
  alaIPsecSecurityPolicyDirection

  alaIPsecSecurityPolicyDescription  
  alaIPsecSecurityPolicyAdminState
ipsec policy rule

Adds, modifies, or removes an IPsec rule for a security policy.

```
ipsec policy name rule index [ah | esp]
no ipsec policy name
```

Syntax Definitions

- **name**: The name of the security policy created by using the `ipsec policy` command.
- **index**: The index of this rule. Values may range from 1 to 10.
- **ah**: Specifies that the rule requires the presence of an Authentication Header (AH).
- **esp**: Specifies that the rule requires the presence of an Encrypted Security Payload header (ESP).

Defaults

N/A.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the `index` parameter to specify the order in which the multiple rules for the same security policy are applied to the original payload.

Examples

```
-> ipsec policy alucent rule 1 ah
-> no ipsec policy alucent
```

Release History

Release 7.1.1; command introduced.
**Related Commands**

**ipsec policy**

Adds, modifies, or removes a security policy.

**MIB Objects**

`AlaIPsecSecurityPolicyRuleTable`

- `alaIPsecSecurityPolicyName`
- `alaIPsecSecurityPolicyRuleIndex`
- `alaIPsecSecurityPolicyRuleProtocol`
**ipsec sa**

Adds, modifies, or deletes a manually configured IPsec Security Association (SA).

```
ipsec sa name {esp | ah} [source {ipv6_address | ipv4_address}] [destination {ipv6_address | ipv4_address}] [spi spi] [encryption {null | 3des-cbc | aes-cbc [key-size key_length]}] [authentication {none | hmac-md5 | hmac-sha1 | hmac-sha256 | hmac-sha384 | hmac-sha512 | aes-xcbc-mac}] [description description] [admin-state {enable | disable}]
```

**no ipsec sa name**

---

**Syntax Definitions**

- **name**
  - The name assigned to this IPsec SA.

- **esp**
  - Specifies the type of security association as ESP.

- **ah**
  - Specifies the type of security association as AH.

- **source**
  - Specifies the source address of the IPv6 or IPv4 traffic that is covered by the SA.

- **destination**
  - Specifies the destination address of the IPv6 or IPv4 traffic that is covered by the SA.

- **spi**
  - The Security Parameters Index (SPI) for the SA.

- **encryption**
  - Specifies the encryption algorithm to be used for traffic covered by the SA. This parameter must be used only when the SA type is ESP.

- **key_length**
  - Key length for the specified encryption algorithm.

- **authentication**
  - Specifies the authentication algorithm to be used for traffic covered by the SA.

- **description**
  - The detailed description of the SA.

- **enable**
  - Administratively enables the SA.

- **disable**
  - Administratively disables the SA.
### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>Defaults</th>
</tr>
</thead>
<tbody>
<tr>
<td>encryption</td>
<td>none</td>
</tr>
<tr>
<td>authentication</td>
<td>none</td>
</tr>
<tr>
<td>admin-state</td>
<td>enable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The `encryption` parameter must be specified with the `none` option, if ESP is being used to verify integrity only.

- If `null` is specified as the option for `encryption`, an integrity algorithm must be specified using the `authentication` parameter.

- To override a default key length in an `encryption` algorithm, the key length must be specified after the protocol name. The key length supported for various algorithm are as follows:

<table>
<thead>
<tr>
<th>encryption algorithm</th>
<th>key length (in bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>aes-cbc</td>
<td>128 (default), 192, and 256</td>
</tr>
</tbody>
</table>

- For AH SAs, one of the authentication algorithms such as aes-xcbc-mac, hmac-md5 or hmac-sha1 must be specified.

### Examples

```bash
-> ipsec sa esp_in_1 esp source 2001:db8:3::13d destination 2001:db8:1::24 spi 10392 encryption aes-cbc authentication hmac-sha1
-> no ipsec sa esp_in_1
```

### Release History

Release 7.1.1; command introduced.
Release 8.7 R1; support for IPV4 added. hmac-sha256, hmac-sha384 and hmac-sha512 algorithm added.
**Related Commands**

**show ipsec sa** Displays information about manually configured IPsec Security Associations.

**MIB Objects**

  - AlaIPsecSAConfigAdminState
ipsec default-discard

Enable or disable the default discard policy.

```
ipsec default-discard {ipv4 | ipv6} admin-state {enable | disable}
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the default discard policy.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the default discard policy.</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The default discard policy drops all the inbound traffic that does not match an IPsec policy.
- When incoming traffic is dropped due to the default discard policy, an SWLog informational message is logged.
- The default discard policy on its own drops all the incoming traffic destined for the switch. It is required to add appropriate higher priority policies to allow the desired traffic to be accepted. At a minimum, policies must be added to allow neighbor discovery traffic to be accepted. For example:

  ```
  -> ipsec policy ns-in priority 100 source ::/0 destination ::/0 protocol ICMP6 type 135 in none
  -> ipsec policy na-in priority 100 source ::/0 destination ::/0 protocol ICMP6 type 136 in none
  ```
- The default discard policy will be given the name `default-discard-v6` for IPv6 traffic and `default-discard-v4` for IPv4 traffic when it is enabled. If the name conflicts with an existing user-defined policy, a numeric value will be appended to make the policy name unique (`default-discard-v61` for IPv6 and `default-discard-v41` for IPv4).
- If there is an existing user-defined policy that matches the default discard policy selectors (like source, destination, protocol, direction), then the default-discard policy cannot be enabled.
- The default discard policy is not applied to the forwarded traffic.
**Examples**

-> ipsec default-discard ipv6 admin-state enable
-> ipsec default-discard ipv4 admin-state disable

**Release History**

Release 8.4.1; command introduced.
Release 8.7 R1; IPv4 support added.

**Related Commands**

- **show ipsec policy**
  Displays information about the security policies.

**MIB Objects**

- a1aIPsecConfig
**show ipsec policy**

Displays information about the security policies.

```
show ipsec policy [name | ipv4 | ipv6]
```

**Syntax Definitions**

- **name**
  - The policy name to be specified to request detailed information about an individual policy.

- **ipv4 | ipv6**
  - Displays policy information based on the address type.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the *name* parameter to display information about a specific security policy.
- The policy information can also be viewed based on the address type.

**Examples**

```
-> show ipsec policy
IPV4 Default discard policy = Disabled

IPV6 Default discard policy = Enabled
```

```
Name Priority Source->Destination Protocol Direction Action State
-----------------------------------------------+----------+---------+-------------+------
default-discard 1000 ::/0 -> ::/0 any in discard active
ftp-in-drop 100 ::/0->2001:db8:3:13d TCP in discard active

**output definitions**

**Default discard policy**
Indicates whether the default discard policy is enabled or disabled.

**Name**
The name of the security policy.

**Priority**
The priority set for the policy.

**Source -> Destination**
Indicates the source and destination of traffic covered by this policy.

**Protocol**
Indicates the protocol traffic covered by this policy. The protocol name (TCP) or protocol number (80) is displayed in this field.

**Direction**
Indicates whether the policy has been applied to the incoming or outgoing traffic.

**Action**
Indicates the action to be taken on the traffic covered by this policy.

**State**
Indicates the operational state of this policy.

-> show ipsec policy telnet-out-1
Policy
Name      = telnet-out-1,
Priority  = 100,
Source    = 3ffe:49:49::/48(23),
Destination = 3ffe:123:983::/48,
Protocol  = TCP,
Direction = out,
Action    = ipsec,
State     = active

Rules
1 : esp,
2 : ah

Description
Require AH and ESP headers on outgoing telnet traffic.

**output definitions**

**Name**
The name of the security policy.

**Priority**
The priority set for the policy.

**Source**
Indicates the source of the traffic covered by this policy.

**Destination**
Indicates the destination of the traffic covered by this policy.

**Protocol**
Indicates the protocol traffic covered by this policy. The protocol name (TCP) or protocol number (80) is displayed in this field.

**Direction**
Indicates whether the policy has been applied to the incoming or outgoing traffic.

**Action**
Indicates the action to be taken on the traffic covered by this policy.

**State**
Indicates the operational state of this policy.

**Rules**
The rules specified for the policy.

**Description**
The description of the policy.
**Release History**

Release 7.1.1; command introduced.
Release 8.4.1; **default discard policy** field added.
Release 8.7 R1; **ipv4** and **ipv6** options added.

**Related Commands**

- `ipsec policy` Adds, modifies, or removes a security policy.
- `ipsec default-discard` Enable or disable the default discard policy.

**MIB Objects**

```

```
**show ipsec sa**

Displays information about manually configured IPsec Security Associations.

```
show ipsec sa [name | esp | ah | ipv4 | ipv6]
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the Security Association.</td>
</tr>
<tr>
<td>esp</td>
<td>Restricts the display to ESP type SAs.</td>
</tr>
<tr>
<td>ah</td>
<td>Restricts the display to AH type SAs.</td>
</tr>
<tr>
<td>ipv4</td>
<td>ipv6</td>
</tr>
</tbody>
</table>

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `name` parameter to display the information about a specific SA.
- Use `esp` or `ah` option to display the information about their respective type SAs.

### Examples

```
-> show ipsec sa
Name            Type  Source-> Destination [SPI]           State   Encryption      Authentication
-----------------------------------------------------------------------------------------------
telnet-in-esp   ESP  2001:db8::/49->2001:db8:1::24   active   aes-cbc(128)  hmac-sha1
        hmac-shal
        telnet-out-esp ESP 2001:db8:1::24->2001:db8::/48 active   aes-cbc(128)  hmac-sha1
        hmac-shal

-> show ipsec sa ipv6
Name            Type  Source -> Destination [SPI]           Encryption Authentication State
-----------------------------------------------------------------------------------------------
tcp_in_esp1     esp    3ffe::200 -> 3ffe::100 [1000]  null   hmac-shal     active
        tcp_out_esp1 esp    3ffe::100 -> 3ffe::200 [1001]  null   hmac-shal     active
```
-> show ipsec sa ipv4
Name | Type | Source -> Destination [SPI] | Encryption | Authentication | State
-----+------+-----------------------------+------------+---------------+------
udp_in_ah | ah | 10.1.1.2 -> 10.1.1.1 [1002] | null | hmac-sha1 | active
udp_out_ah | ah | 10.1.1.1 -> 10.1.1.2 [1003] | null | hmac-sha1 | active

output definitions

Name | The SA name.
Type | The SA type: AH or ESP.
Source -> Destination [SPI] | The traffic source, traffic destination, and SPI for this SA.
State | The operational state of this SA.
Encryption | The encryption algorithm used for this SA.
Authentication | The authentication algorithm in use for this SA.

-> show ipsec sa telnet-in-esp
Name = telnet-in-esp
Type = ESP
Source = 2001:db8::/48
Destination = 2001:db8:1::24
SPI = 8920
Encryption = aes-cbc(128)
Authentication = hmac-shal
State = active
Description:

output definitions

Name | The SA name.
Type | The SA type: AH or ESP.
Source | The traffic source for this SA.
Destination | The traffic destination for this SA.
SPI | The SA's SPI.
Encryption | The encryption algorithm used for this SA.
Authentication | The authentication algorithm used for this SA.
State | The operational state of this SA.
Description | The SA's description.

Release History
Release 7.1.1; command introduced.
Release 8.7 R1: ipv4 and ipv6 options added.
**Related Commands**

**ipsec sa**

Adds, modifies, or deletes a manually configured IPsec Security Association (SA).

<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

N/A

**Examples**

`-> show ipsec statistics`

Inbound:
- Discarded = 0,
- No SA found = 0,
- Policy violation = 0,
- Authentication failure = 0,
- Replay check failed = 0,
- Other error = 0

Outbound:
- Discarded = 0,
- No SA found = 0,
- Other error = 0

**output definitions**

- **Discarded (Inbound)**: The number of incoming packets discarded because they matched a discard policy.
- **No SA found (Inbound)**: The number of incoming packets dropped because of no matching SA found.
### output definitions

<table>
<thead>
<tr>
<th>Policy violation (Inbound)</th>
<th>The number of incoming packets that don’t have the IPsec protection required by a security policy.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication Failure (Inbound)</td>
<td>The number of incoming packets that failed authentication.</td>
</tr>
<tr>
<td>Replay check failed (Inbound)</td>
<td>The number of incoming packets that failed a replay check.</td>
</tr>
<tr>
<td>Other error (Inbound)</td>
<td>The number of incoming packets dropped for a reason not otherwise counted.</td>
</tr>
<tr>
<td>Discarded (Outbound)</td>
<td>The number of outgoing packets discarded because they matched a discard policy.</td>
</tr>
<tr>
<td>No SA found (Outbound)</td>
<td>The number of outgoing packets dropped because of no matching SA found.</td>
</tr>
<tr>
<td>Other error (Outbound)</td>
<td>The number of outgoing packets dropped for a reason not otherwise counted.</td>
</tr>
</tbody>
</table>

### Release History

Release 7.1.1; command introduced.
Release 8.7 R1; Support for IPV4 added.

  - `alaIPsecErrorsOutOther`
  - `alaIPsecStatisticsOutNoSA`
Routing Information Protocol (RIP) is an Interior Gateway Protocol (IGP) that uses hop count as its routing metric. RIP-enabled switches update neighboring switches by transmitting a copy of their own routing table. The RIP routing table always uses the most efficient route to a destination, that is, the route with the fewest hops and longest matching prefix.

The switch supports RIP version 1 (RIPv1), RIP version 2 (RIPv2), and RIP next generation (RIPng). It also supports simple and MD5 authentication, on an interface basis, for RIPv2.

The RIP commands comply with the following RFCs: RFC1058, RFC2453, RFC1722, RFC1723, RFC1724, and RFC2080.

MIB information for the RIP commands is as follows:

<table>
<thead>
<tr>
<th>Filename</th>
<th>Module</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALCATEL-IND1-VIRTUALROUTER-MIB.mib</td>
<td>alcatelIND1VirtualRouterMIB</td>
</tr>
<tr>
<td>RIPv2-MIB.mib</td>
<td>rip2</td>
</tr>
<tr>
<td>ALCATEL-IND1-ripng-MIB.mib</td>
<td>alcatelIND1RipngMIB</td>
</tr>
</tbody>
</table>

A summary of the available commands is listed here:

<table>
<thead>
<tr>

<tr>
<td>show ip rip interface</td>
<td></td>
</tr>
<tr>
<td>show ip rip peer</td>
<td></td>
</tr>
</tbody>
</table>
**ip load rip**

Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.

`ip load rip`

---

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- In simple networks where only IP forwarding is required, you may not want to use RIP. If you are not using RIP, it is best not to load it to save switch resources.

- To remove RIP from switch memory, you must manually edit the `boot.cfg` file. The `boot.cfg` file is an ASCII text-based file that controls many of the switch parameters. Open the file and delete all references to RIP. You must reboot the switch when this is complete.

- Use the `ip rip admin-state` command to enable RIP on the switch.

**Examples**

`-> ip load rip`

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- **ip rip admin-state**: Enables/disables RIP routing on the switch.
- **show ip rip**: Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

- **alaVrConfigTable**
  - **alaVrConfigRipStatus**
ip rip admin-state

Enables/disables RIP on the switch. RIP performs well in small networks. By default, RIP packets are broadcast every 30 seconds, even if no change has occurred anywhere in a route or service. Depending on the size and speed of the network, these periodic broadcasts can consume a significant amount of bandwidth.

ip rip admin-state {enable | disable}

Syntax Definitions

<table>
<thead>
<tr>
<th>enable</th>
<th>Enables RIP routing on the switch.</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables RIP routing on the switch.</td>
</tr>
</tbody>
</table>

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- RIP must be loaded on the switch (ip load rip) to enable RIP on the switch.
- A RIP network can be no more than 15 hops (end-to-end). If there is a 16th hop, that network is identified as infinity and the packet is discarded.

Examples

- ip rip admin-state enable

Release History

Release 7.1.1; command was introduced.
**Related Commands**

- **ip load rip**
  Loads RIP into the switch memory.

- **show ip rip**
  Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

**MIB Objects**

- **alaProtocolRip**
- **alaRipProtoStatus**
**ip rip interface**

Creates/deletes a RIP interface. Routing is enabled on a VLAN when you create a router interface. However, to enable RIP routing, you must also configure and enable a RIP routing interface on the VLAN’s IP router interface.

**ip rip interface**  
```
{interface_name}
```

**no ip rip interface**  
```
{interface_name}
```

### Syntax Definitions

**interface_name**  
The name of the interface.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- By default, a RIP interface is created in the disabled state. To enable RIP routing on the interface, you must enable the interface by using the **ip rip interface admin-state** command.

- You can create a RIP interface even if an IP router interface has not been configured. However, RIP will not function unless an IP router interface is configured with the RIP interface.

- For more information on VLANs and router ports, see Chapter 5, “VLAN Management Commands”.

### Examples

```
-> ip rip interface rip-1
```

### Release History

Release 7.1.1; command was introduced.
**Related Commands**

**ip interface**
Creates a VLAN router interface.

**ip load rip**
Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.

**ip rip admin-state**
Enables/disables RIP routing on the switch.

**ip rip interface admin-state**
Enables/disables a RIP interface.

**MIB Objects**

rip2IfConfTable
  rip2IfConfAddress
  rip2IfConfStatus
ip rip interface admin-state

Enables and disables a RIP interface. By default, a RIP interface is created in the disabled state. After creating a RIP interface, you must use this command to enable the interface.

`ip rip interface {interface_name} admin-state {enable | disable}`

**Syntax Definitions**

- `interface_name`: The name of the interface.
- `enable`: Administratively enables RIP on the interface.
- `disable`: Administratively disables RIP on the interface.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- You must first create a RIP interface by using the `ip rip interface` command before enabling the interface.
- You can create a RIP interface even if an IP router interface has not been configured. However, RIP will not function unless an IP router interface is configured with the RIP interface.
- For more information on VLANs and router ports, see Chapter 5, “VLAN Management Commands”.

**Examples**

`-> ip rip interface rip-1 admin-state enable`

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- `ip interface` Creates a VLAN router interface.
- `ip load rip` Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.
- `ip rip admin-state` Enables/disables RIP routing on the switch.
- `ip rip interface` Creates/deletes a RIP interface.

**MIB Objects**

- `rip2IfConfTable`
- `rip2IfConfAddress`
- `rip2IfConfStatus`
**ip rip interface metric**

Configures the RIP metric or cost for a specified interface. You can set priorities for routes generated by a switch by assigning a metric value to routes generated by that switch’s RIP interface. For example, routes generated by a neighboring switch may have a hop count of 1. However, you can lower the priority of routes generated by that switch by increasing the metric value for routes generated by the RIP interface.

```
ip rip interface {interface_name} metric value
```

### Syntax Definitions

- **interface_name**
  - The name of the interface.

- **value**
  - Metric value. Valid range is 1–15.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>1</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>No</td>
</tr>
<tr>
<td>6465</td>
<td>Yes</td>
</tr>
<tr>
<td>6560</td>
<td>Yes</td>
</tr>
<tr>
<td>6570N</td>
<td>Yes</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
</tr>
<tr>
<td>6860N</td>
<td>Yes</td>
</tr>
<tr>
<td>6865</td>
<td>Yes</td>
</tr>
<tr>
<td>6900V72/C32</td>
<td>Yes</td>
</tr>
<tr>
<td>6900X48C4E/V48C8/C32E/T24C2/X24C2</td>
<td>Yes</td>
</tr>
<tr>
<td>6900</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When you configure a metric for a RIP interface, this metric cost is added to the metric of the incoming route.

### Examples

```
-> ip rip interface rip-1 metric 2
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

- **ip rip interface**  
  Enables/disables RIP on a specific interface.

- **show ip rip peer**  
  Displays active RIP neighbors (peers). An active peer is a switch that has sent a RIP packet within the last 180 seconds.

**MIB Objects**

- **rip2IfConfTable**
  - **rip2IfConfAddress**
  - **rip2IfConfDefaultMetric**
ip rip interface send-version

Configures the send option for a RIP interface. This defines the type(s) of RIP packets that the interface will send.

ipa rip interface \{interface_name\} send-version \{none | v1 | v1compatible | v2\}

**Syntax Definitions**

<table>
<thead>
<tr>
<th>interface_name</th>
<th>The name of the interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>RIP packets will not be sent by the interface.</td>
</tr>
<tr>
<td>v1</td>
<td>Only RIPv1 packets will be sent by the interface.</td>
</tr>
<tr>
<td>v1compatible</td>
<td>Only RIPv2 broadcast packets (not multicast) will be sent by the interface.</td>
</tr>
<tr>
<td>v2</td>
<td>Only RIPv2 packets will be sent by the interface.</td>
</tr>
</tbody>
</table>

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>v1</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Using this command will override RIP default behavior.
- Other devices must be able to interpret the information provided by this command or there will not be proper routing information exchanged between the switch and other devices on the network.

**Examples**

```bash
-> ip rip interface rip-1 send-version v1
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

`ip rip interface recv-version` Configures the receive option for a RIP interface.

MIB Objects

`rip2IfConfTable`
  `rip2IfConfAddress`
  `rip2IfConfSend`
ip rip interface recv-version

Configures the receive option for a RIP interface. This defines the type(s) of RIP packets that the interface will accept.

```
ip rip interface {interface_name} recv-version {v1 | v2 | both | none}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>interface_name</th>
<th>The name of the interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>v1</td>
<td>Only RIPv1 packets will be received by the interface.</td>
</tr>
<tr>
<td>v2</td>
<td>Only RIPv2 packets will be received by the interface.</td>
</tr>
<tr>
<td>both</td>
<td>Both RIPv1 and RIPv2 packets will be received by the interface.</td>
</tr>
<tr>
<td>none</td>
<td>Interface ignores any RIP packets received.</td>
</tr>
</tbody>
</table>

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>v1</td>
<td>v2</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Using this command will override RIP default behavior.
- Other devices must be able to interpret the information provided by this command or there will not be proper routing information exchanged between the switch and other devices on the network.

### Examples

```
-> ip rip interface rip-1 recv-version both
```

### Release History

Release 7.1.1; command was introduced.
**Related Commands**

- `ip rip interface send-version` Configures the send option for a RIP interface.

**MIB Objects**

- `rip2IfConfTable`
  - `rip2IfConfAddress`
  - `rip2IfConfReceive`
ip rip interface ingress-filter

Assigns an ingress route map filter to the specified RIP interface. Received route advertisements are compared against ingress filters. When a prefix matches the corresponding filter, that prefix is accepted on the interface. When a prefix does not match the filter, the prefix is dropped as if it was never received.

**Syntax Definitions**

interface_name
The name of an existing RIP interface.

filter_name
The name of an existing route-map filter.

**Defaults**

By default, no such filter is associated with the RIP interface.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/V48C8/C32E/T24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- One route-map filter is configurable in each direction (ingress/egress) for each RIP interface.
- Configuring multiple filters in the same direction for a single RIP interface is not supported.

**Examples**

```
-> ip route-map ripfilter1 action permit
-> ip route-map ripfilter1 match ip-address 202.5.0.0/16 deny
-> ip rip interface vlan-100 Ingress-filter RipFilter1
```

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- **ip rip interface egress-filter** Assigns an egress route map filter to a RIP interface.
- **show ip rip interface** Displays RIP interface status and configuration.

**MIB Objects**

- N/A
ip rip interface egress-filter

Assigns an egress route map filter to the specified RIP interface. Outbound route advertisements are compared against egress filters. When a prefix matches the corresponding filter, that prefix is sent on the interface. When a prefix does not match the filter, the prefix is dropped as if it did not exist in the RIP RIB.

**ip rip interface {interface_name} egress-filter {filter_name}**

### Syntax Definitions

- **interface_name**: The name of an existing RIP interface.
- **filter_name**: The name of an existing route-map filter.

### Defaults

By default, no such filter is associated with the RIP interface.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</thead>
<tbody>
<tr>
<td>Release</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- One route-map filter is configurable in each direction (ingress/egress) for each RIP interface.
- Configuring multiple filters in the same direction for a single RIP interface is not supported.

### Examples

- ip route-map ripfilter1 action permit
- ip route-map ripfilter1 match ip-address 202.5.0.0/16 deny
- ip rip interface vlan-100 egress-filter RipFilter1

### Release History

Release 7.1.1; command was introduced.
Related Commands

- **ip rip interface egress-filter**: Assigns an ingress route map filter to a RIP interface.
- **show ip rip interface**: Displays RIP interface status and configuration.

MIB Objects

- **N/A**
ip rip force-holddowntimer

Configures the forced hold-down timer value, in seconds, that defines an amount of time during which routing information regarding better paths is suppressed. A route enters into a forced hold-down state when an update packet is received that indicates the route is unreachable and when this timer is set to a non-zero value. After this timer has expired and if the value is less than 120 seconds, the route enters a hold-down state for the rest of the period until the remainder of the 120 seconds has also expired. During this time the switch will accept any advertisements for better paths that are received.

**ip rip force-holddowntimer seconds**

### Syntax Definitions

- **seconds**: The forced hold-down time interval. The valid range is 0–120 seconds.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>0</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The forced hold-down timer is not the same as the RIP hold-down timer. The forced hold-down timer defines a separate interval that overlaps the hold-down state. During the forced hold-down timer interval, the switch will not accept better routes from other gateways.

- The forced hold-down time interval can become a subset of the hold-down timer (120 seconds) by using this command to set a value less than 120.

- To allow the routing switch to use better routes advertised during the entire hold-down time period, leave the forced hold-down timer set to the default value.

### Examples

```
-> ip rip force-holddowntimer 10
```

### Release History

Release 7.1.1; command was introduced.
RIP Commands

ip rip force-holddowntimer

Related Commands

show ip rip
Displays the RIP status and general configuration parameters (for example, forced hold-down timer).

MIB Objects

alaProtocolRip
alaRipForceHolddownTimer
**ip rip host-route**

Specifies whether or not RIP can add host routes (routes with a 32-bit mask) to the RIP table.

**ip rip host-route**

**no ip rip host-route**

---

**Syntax Definitions**

N/A

**Defaults**

The default is to enable a default host route.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to prevent RIP from adding host routes to the RIP table.
- When enabled, RIPv1 will interpret an incoming route announcement that contains any 1 bit in the host portion of the IP address as a host route, implying a mask of 255.255.255.255.

**Examples**

-> ip rip host-route

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `show ip rip routes` Displays the RIP Routing Database.

**MIB Objects**

alaProtocolRip
alaRipHostRouteSupport
**ip rip route-tag**

Configures the route tag value for RIP routes generated by the switch.

`ip rip route-tag value`

---

**Syntax Definitions**

`value`  
Route tag value. Valid range is 0–2147483647.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>0</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Only RIPv2 supports route tags.

**Examples**

`-> ip rip route-tag 0`

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `show ip rip`  
  Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

**MIB Objects**

- `alaRipRedistRouteTag`
ip rip interface auth-type

Configures the type of authentication that will be used for the RIP interface. By default, there is no authentication used for RIP. However, you can configure a password for a RIP interface. To configure a password, you must first select the authentication type (simple or MD5), then configure a password.

ip rip interface {interface_name} auth-type {none | simple | md5}

Syntax Definitions

- **interface_name**: The name of the interface.
- **none**: No authentication will be used.
- **simple**: Simple authentication will be used.
- **md5**: MD5 authentication will be used.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>simple</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Platforms Supported</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

Usage Guidelines

Regardless of which authentication type is used (simple or MD5), both switches on either end of a link must share the same password.

Examples

- `-> ip rip interface rip-1 auth-type none`

Release History

Release 7.1.1; command was introduced.
Related Commands

ip rip interface auth-key  Configures the text string that will be used as the password for the RIP interface.

MIB Objects

rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfAuthType
ip rip interface auth-key

Configures the text string that will be used as the password for the RIP interface. If you configure simple or MD5 authentication, you must configure a text string that will be used as the password for the RIP interface.

ip rip interface {interface_name} auth-key string

Syntax Definitions

interface_name
The name of the interface.

string
16-byte text string.

Defaults

The default authentication string is a null string.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Supported</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

Regardless of which authentication type is used (simple or MD5), both switches on either end of a link must share the same password.

Examples

-> ip rip interface rip-1 auth-key nms

Release History

Release 7.1.1; command was introduced.
Related Commands

`ip rip interface auth-type`  
Configures the type of authentication that will be used for the RIP interface.

**MIB Objects**

- `rip2IfConfTable`
- `rip2IfConfAddress`
- `rip2IfConfAuthKey`
ip rip update-interval

Configures the time interval during which RIP routing updates are sent out.

`ip rip update-interval seconds`

**Syntax Definitions**

`seconds` The RIP routing update interval, in seconds. The valid range is 1–120.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>30</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The update interval value must be less than or equal to one-third the invalid interval value.

**Examples**

```
-> ip rip update-interval 45
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `show ip rip` Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

**MIB Objects**

- `alaProtocolRip`  
  - `alaRipUpdateInterval`
**ip rip invalid-timer**

Configures the RIP invalid timer value that defines the time interval during which a route will remain active in Routing Information Base (RIB) before moving to the invalid state.

**ip rip invalid-timer seconds**

---

**Syntax Definition**

*seconds*  
The RIP invalid timer value, in seconds. The valid range is 3–360.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>180</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The invalid time interval value must be three times the update interval value.

**Examples**

-> ip rip invalid-timer 270

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**show ip rip**  
Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

**MIB Objects**

alaProtocolRip  
alaRipInvalidTimer
**ip rip garbage-timer**

Configures the RIP garbage timer value that defines the time interval, which must elapse before an expired route is removed from the RIB.

**ip rip garbage-timer seconds**

---

**Syntax Definition**

*seconds*  
The RIP garbage timer value, in seconds. The valid range is 0–180.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>seconds</em></td>
<td>120</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

|        | 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900 V72/C32 | 6900 X48C6/T48C6/  
|--------|------|------|------|-------|------|-------|------|------|------------ | X48C4E/V48C8/  
| No     | Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes          | C32E/T24C2/   
|        |      |      |      |       |      |       |      |      | X24C2       |        |

**Usage Guidelines**

During the RIP garbage interval, the router advertises the route with a metric of INFINITY (i.e., 16 hops).

**Examples**

`-> ip rip garbage-timer 180`

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

*show ip rip*  
Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

**MIB Objects**

*alaProtocolRip*  
*alaRipGarbageTimer*
**ip rip holddown-timer**

Configures the RIP hold-down timer value that defines the time interval during which a route remains in the hold-down state.

`ip rip holddown-timer seconds`

### Syntax Definition

`seconds` The hold-down time interval, in seconds. The valid range is 0–120.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>0</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When RIP detects a route with higher metric than the route in the RIB, the route with the higher metric goes into the hold-down state. The route updates with a metric of INFINITY are rejected.

### Examples

-> ip rip holddown-timer 10

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ip rip** Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

### MIB Objects

alaProtocolRip
alaRipHolddownTimer
**show ip rip**

Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

show ip rip interface

Displays RIP interface status and configuration.

**show ip rip interface [interface_name]**

### Syntax Definitions

*interface_name*  
The interface name.

### Defaults

By default, the status and configuration for all RIP interfaces is displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Enter an interface name to view detailed information for a specific interface.

### Examples

```bash
-> show ip rip interface
Interface Name Domain Name Domain ID Intf Admin Status IP Intf Status Updates
v12          Vlan    12    disabled    enabled     0/0(0)
s101         Service 101 enabled    enabled     0/0(0)
t1           Tunnel  NA    disabled    disabled    0/0(0)
```

```bash
-> show ip rip interface v12
Interface IP Name = v12,
Interface IP Address = 12.1.1.1,
Domain Name = Vlan,
Domain ID = 12,
Interface Admin status = disabled,
IP Interface Status = enabled,
Interface Config Ingress Route Map Name = ,
Interface Config Egress Route Map Name = ,
Interface Config AuthType = None,
Interface Config AuthKey Length = 0,
Interface Config Send-Version = v2,
Interface Config Receive-Version = both,
Interface Config Default Metric = 1,
Received Packets = 0,
```
show ip rip interface

- Received Bad Packets = 0,

**show ip rip peer**

Displays active RIP neighbors (peers). An active peer is a switch that has sent a RIP packet within the last 180 seconds. If a peer does not send a RIP packet (request or response) within 180 seconds, it is aged out and will not be displayed.

**show ip rip peer [ip_address]**

---

**Syntax Definitions**

*ip_address* 
32-bit IP address.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</thead>
<tbody>
<tr>
<td>100.10.10.1</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>2</td>
<td>3</td>
</tr>
</tbody>
</table>
```

---

**output definitions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>Peer IP address.</td>
</tr>
<tr>
<td>Total recvd</td>
<td>Total number of RIP packets received from the peer.</td>
</tr>
<tr>
<td>Bad Packets</td>
<td>Number of bad packets received from peer.</td>
</tr>
<tr>
<td>Bad Routes</td>
<td>Number of bad routes received from peer.</td>
</tr>
<tr>
<td>Version</td>
<td>Peer's RIP version as seen on the last packet received.</td>
</tr>
<tr>
<td>Secs since last update</td>
<td>Number of seconds since the last packet was received from the peer.</td>
</tr>
</tbody>
</table>
**Release History**
Release 7.1.1; command was introduced.

**Related Commands**

- `show ip rip interface` Displays the RIP interface status and configuration.

**MIB Objects**

- `rip2PeerTable`
  - `rip2PeerAddress`
  - `rip2PeerDomain`
  - `rip2PeerLastUpdate`
  - `rip2PeerVersion`
  - `rip2PeerRcvBadPackets`
  - `rip2PeerRcvBadRoutes`
ipv6 load rip

Loads RIPng into memory. When the switch is initially configured, you must load RIPng into memory to enable RIPng routing.

ipv6 load rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- RIPng will support a maximum of 1,000 routes.
- RIPng will support a maximum of 20 interfaces.
- Use the `ipv6 rip admin-state` command to enable RIPng on the switch.

Examples

-> ipv6 load rip

Release History

Release 7.1.1; command was introduced.

Related Commands

- `ipv6 rip admin-state` Enables/disables RIPng routing on the switch.
- `show ipv6 rip` Displays RIPng status and general configuration parameters.

MIB Objects

- `alaDrcTmConfig` `alaDrcTmTIPRipngStatus`
**ipv6 rip admin-state**

Enables or disables RIPng on the switch.

`ipv6 rip admin-state {enable | disable}`

---

**Syntax Definitions**

<table>
<thead>
<tr>
<th>enable</th>
<th>Enables RIPng.</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables RIPng.</td>
</tr>
</tbody>
</table>

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

RIPng must be loaded on the switch (**ip load rip**) to enable RIP on the switch.

**Examples**

```
-> ipv6 rip admin-state enable
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **ip load rip** Loads RIPng into memory.
- **show ipv6 rip** Displays RIPng status and general configuration parameters.

**MIB Objects**

- `alaProtocolripng`
- `alaRipngProtoStatus`
**ipv6 rip invalid-timer**

Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.

**ipv6 rip invalid-timer seconds**

---

**Syntax Definitions**

```
seconds: Time, in seconds, that a route will remain in an “Active” state. Valid range is 1 - 300.
```

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>180</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This timer is reset each time a routing update is received.

**Examples**

```
-> ipv6 rip invalid-timer 300
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **ipv6 rip garbage-timer**: Configures the RIPng garbage timer value.
- **ipv6 rip holddown-timer**: Configures the amount of time a route is placed in a holddown state.

**MIB Objects**

```
alaProtocolripng
   alaRipngInvalidTimer
```
ipv6 rip garbage-timer

Configures the RIPng garbage timer value. When a route in the RIB exceeds the configured Invalid Timer Value, the route is moved to a “Garbage” state in the RIB. The garbage timer is the length of time a route will stay in this state before it is flushed from the RIB.

ipv6 rip garbage-timer seconds

Syntax Definitions

seconds Time, in seconds, that a route will remain in the RIPng Routing Table before it is flushed from the RIB. Valid range is 0 - 180.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>120</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the ipv6 rip invalid-timer command to set the Invalid Timer Value.

Examples

-> ipv6 rip garbage-timer 180

Release History

Release 7.1.1; command was introduced.
**Related Commands**

- `ipv6 rip invalid-timer`  
  Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.

- `ipv6 rip holddown-timer`  
  Configures the amount of time a route is placed in a holddown state.

**MIB Objects**

```
alaProtocolripng
  alaRipngGarbageTimer
```
ipv6 rip holddown-timer

Configures the amount of time a route is placed in a holddown state. Whenever a route is seen from the same gateway with a higher metric than the route in RIB, the route goes into holddown. This excludes route updates with an INFINITY metric.

**ipv6 rip holddown-timer seconds**

---

**Syntax Definitions**

`seconds` Time, in seconds, that a route will remain in a holddown state. Valid range is 0–120.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>0</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

While in holddown, the route continues being announced as usual and used in RIB. This interval is used to control route flap dampening.

---

**Examples**

```
-> ipv6 rip holddown-timer 60
```

---

**Release History**

Release 7.1.1; command was introduced.

---

**Related Commands**

- **ipv6 rip invalid-timer** Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.
- **ipv6 rip garbage-timer** Configures the RIPng garbage timer value.

---

**MIB Objects**

alaProtocolripng
ipv6 rip holddown-timer

alaRipngHolddownTimer
ipv6 rip jitter

Configures an offset value for RIPng updates. This is the maximum (positive or negative) value that can be used to offset the update interval. For example, with an update interval of 30 seconds, and a jitter value of 5 seconds, the RIPng update packet would be sent somewhere (random) between 25 and 35 seconds from the previous update.

Syntax:

```
ipv6 rip jitter value
```

**Syntax Definitions**

- **value**: Time, in seconds, that a routing update is offset. Valid range is 0 to one-half the updated interval value (e.g., if the updated interval is 30, the range would be 0–300).

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>5</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>upported</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

As you increase the number of RIPng interfaces/peers, it is recommended that you increase the Jitter value to reduce the number of RIPng updates being sent over the network.

**Examples**

```
-> ipv6 rip jitter 10
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **ipv6 rip update-interval**: Configures the RIPng update interval.
- **show ipv6 rip**: Displays RIPng status and general configuration information.

**MIB Objects**

- `alaProtocolripng`
alaRipngJitter
**ipv6 rip route-tag**

Configures the route tag value for RIP routes generated by the switch.

**ipv6 rip route-tag value**

---

### Syntax Definitions

**value**

Route tag value. Valid range is 0 – 65535.

---

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>0</td>
</tr>
</tbody>
</table>

---

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

---

### Usage Guidelines

This value does not apply to routes learned from other routers. For these routes, the route tag propagates with the route.

---

### Examples

```
-> ipv6 rip route-tag 30
```

---

### Release History

Release 7.1.1; command was introduced.

---

### Related Commands

**show ipv6 rip**

Displays RIPng status and general configuration information.

---

### MIB Objects

**alaProtocolripng**

alaRipngRouteTag
**ipv6 rip update-interval**

Configures the RIPng update interval. This is the interval, in seconds, that RIPng routing updates will be sent out.

**ipv6 rip update-interval seconds**

---

**Syntax Definitions**

- **seconds** Interval, in seconds, that RIPng routing updates are sent out. Valid range is 0–120.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>30</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>OS Support</th>
<th>Command Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>6465</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>6560</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>6570M</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>6860N</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>6865</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>6900</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>6900 V72/C32</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>6900 X48C6/T48C6/X48C4E/V48C8/C32E/T24C2/X24C2</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

Use this command, along with the **ipv6 rip jitter** command to configure RIPng updates.

---

**Examples**

```
-> ipv6 rip update-interval 30
```

---

**Release History**

Release 7.1.1; command was introduced.

---

**Related Commands**

- **ipv6 rip jitter** Configures an offset value for RIPng updates.
- **show ipv6 rip** Displays RIPng status and general configuration information.

---

**MIB Objects**

- **alaRipng**
  - **alaRipngUpdateInterval**
ipv6 rip triggered-sends

Configures the behavior of triggered updates.

ipv6 rip triggered-sends {all | updated-only | none}

**Syntax Definitions**

- **all**: All RIPng routes are added to any triggered updates.
- **updated-only**: Only route changes that are causing the triggered update are included in the update packets.
- **none**: RIPng routes are not added to triggered updates.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>updated-only</td>
</tr>
<tr>
<td>updated-only</td>
<td>updated-only</td>
</tr>
<tr>
<td>none</td>
<td>updated-only</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If set to **all**, all routes are sent in the update, not just route changes, which increases RIPng traffic on the network.
- If set to **none**, no triggered updates are sent, which can cause delays in network convergence.

**Examples**

```
-> ipv6 rip triggered-sends none
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **show ipv6 rip**: Displays RIPng status and general configuration information.

**MIB Objects**

- `alaProtocolripng`
ipv6 rip interface

Creates or deletes a RIPng interface.

ipv6 rip interface if_name

no ipv6 rip interface if_name

Syntax Definitions

if_name IPv6 interface name.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- By default, a RIPng interface is created in the enabled state.
- Routing is enabled on a VLAN when you create a router port. However, to enable RIPng routing, you must also configure and enable a RIPng routing interface on the VLAN’s IP router port. For more information on VLANs and router ports, see Chapter 5, “VLAN Management Commands”.
- RIPng will support a maximum of 20 interfaces.

Examples

-> ipv6 rip interface Test_Lab

Release History

Release 7.1.1; command was introduced.
Related Commands

- **ipv6 load rip**: Loads RIPng into memory.
- **ipv6 rip admin-state**: Enables or disables RIPng on the switch.
- **ipv6 rip interface recv-status**: Configures IPv6 RIPng interface “Receive” status. When this status is set to "enable", packets can be received on this interface.
- **ipv6 rip interface send-status**: Configures IPv6 RIPng interface “Send” status. When this status is set to "enable", packets can be sent on this interface.
- **show ipv6 rip interface**: Displays information for all or specified RIPng interfaces.

MIB Objects

- **alaRipngInterfaceTable**
  - **alaRipngInterfaceStatus**
ipv6 rip interface metric

Configures the RIPng metric or cost for a specified interface. Priorities for routes generated by a switch can be set by assigning a metric value to routes generated by that switch’s RIPng interface. For example, routes generated by a neighboring switch may have a hop count of 1. However, the priority of routes generated by that switch can be lowered by increasing the metric value for routes generated by the RIPng interface.

ipv6 rip interface if_name metric value

Syntax Definitions

if_name IPv6 interface name.
value Metric value. Valid range is 1 - 15.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>1</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

When a metric for a RIPng interface is configured, this metric cost is added to the metric of the incoming route.

Examples

-> ipv6 rip Test_lab metric 1

Release History

Release 7.1.1; command was introduced.
Related Commands

- `ipv6 rip interface` Creates or deletes a RIPng interface.
- `show ipv6 rip interface` Displays information for all or specified RIPng interfaces.

MIB Objects

- `alaRipngInterfaceTable`  
  - `alaRipngInterfaceMetric`
ipv6 rip interface recv-status

Configures IPv6 RIPng interface “Receive” status. When this status is set to “enable”, packets can be received on this interface. When it is set to “disable”, packets will not be received on this interface.

ipv6 rip interface if_name recv-status {enable | disable}

Syntax Definitions

<table>
<thead>
<tr>
<th>if_name</th>
<th>IPv6 interface name.</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the “Receive” status for the specified interface.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the “Receive” status for the specified interface.</td>
</tr>
</tbody>
</table>

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

RIPng must be loaded (ip load rip) and enabled (ipv6 rip admin-state) on the switch to send or receive packets on the interface.

Examples

-> ipv6 rip interface Test_Lab recv-status disable

Release History

Release 7.1.1; command was introduced.
**Related Commands**

- `ipv6 load rip` Loads RIPng into memory.
- `ipv6 rip admin-state` Enables/disables RIPng on the switch.
- `ipv6 rip interface send-status` Configures IPv6 RIPng interface “Send” status.

**MIB Objects**

- `alaRipngInterfaceTable`  
  - `alaRipngInterfaceRecvStatus`
ipv6 rip interface send-status

Configures IPv6 RIPng interface “Send” status. When this status is enabled, packets can be sent from this interface. When it is disabled, packets will not be sent from this interface.

ipv6 rip interface if_name send-status {enable | disable}

Syntax Definitions

<table>
<thead>
<tr>
<th>if_name</th>
<th>IPv6 interface name.</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the “Send” status for the specified interface.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the “Send” status for the specified interface.</td>
</tr>
</tbody>
</table>

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>enable</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

RIPng must be loaded (ip load rip) and enabled (ipv6 rip admin-state) on the switch to send or receive packets on the interface.

Examples

-> ipv6 rip interface Test_Lab send-status enable

Release History

Release 7.1.1; command was introduced.
**Related Commands**

- **ipv6 load rip**  Loads RIPng into memory.
- **ipv6 rip admin-state**  Enables/disables RIPng on the switch.
- **ipv6 rip interface recv-status**  Configures IPv6 RIPng interface “Receive” status.

**MIB Objects**

alaRipngInterfaceTable
  alaRipngInterfaceSendStatus
**ipv6 rip interface horizon**

Configures the routing loop prevention mechanisms.

`ipv6 rip interface if_name horizon {none | split-only | poison}`

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>if_name</code></td>
<td>IPv6 interface name.</td>
</tr>
<tr>
<td><code>none</code></td>
<td>Disables loop prevention mechanisms.</td>
</tr>
<tr>
<td><code>split-only</code></td>
<td>Enables split-horizon, without poison-reverse.</td>
</tr>
<tr>
<td><code>poison</code></td>
<td>Enables split-horizon with poison-reverse.</td>
</tr>
</tbody>
</table>

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>split-only</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

- If set to `none` the route is not sent back to the peer.
- If set to `split-only`, the route received from the peer is sent back with an increased metric.
- If set to `poison` the route received from the peer is sent back with an “infinity” metric.

### Examples

`-> ipv6 rip interface Test_Lab none`

### Release History

Release 7.1.1; command was introduced.
Related Commands

- **show ipv6 rip interface**  Displays information for all or specified RIPng interfaces.
- **show ipv6 rip routes**     Displays all or a specific set of routes in the RIPng Routing Table.

MIB Objects

Bidirectional Forwarding Detection (BFD) is a hello protocol, which can be configured to interact with routing protocols for the detection of path failures and can reduce the convergence time in a network. BFD is supported with the BGP, IS-IS, OSPF, PIM, VRRP, and Static Routes.

When BFD is configured and enabled, BFD sessions are created and timers are negotiated between BFD neighbors. If a system does not receive a BFD control packet within the negotiated time interval, the neighbor system is considered down. Rapid failure detection notices are then sent to the routing protocol, which initiates a routing protocol recalculation. This process can reduce the time of convergence in a network.

This implementation of BFD supports an Asynchronous control packet mode or an Asynchronous Echo function. Demand mode is not supported.

- When the Asynchronous control packet mode is activated, BFD neighbors periodically send BFD control packets to each other. A time interval for transmitting and receiving such packets is negotiated between the two BFD systems. If a neighboring system fails to receive a number of control packets continuously over a specific period of time, the session is considered down and BFD informs the appropriate routing protocol.

- The Asynchronous Echo function is used to verify the forwarding path between neighboring BFD systems. When active, a BFD system transmits Echo packets only (no control packets are sent) to a BFD neighbor, which then sends the packets back to the originating system along the forwarding path. If no Echo packets are received back from the BFD neighbor within a configured Echo time interval, the session is considered down.

MIB information for the BFD commands is as follows:

```
Filename:   ALCATEL-IND1-BFD-MIB.mib
Module:     alcatelIND1BfdMIB
```

OmniSwitch AOS Release 8 CLI Reference Guide   April 2023   page 24-1
ip bfd admin-state

Enables or disables the global BFD protocol status for the switch.

ip bfd admin-state {enable | disable}

Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables BFD.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables BFD.</td>
</tr>
</tbody>
</table>

Defaults

By default, BFD is disabled for the switch.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Disabling BFD does not remove the existing BFD configuration from the switch.
- When BFD is disabled, all BFD functionality is disabled for the switch, but configuring BFD is still allowed.
- Configuring BFD global parameters is not allowed when BFD is enabled for the switch.

Examples

-> ip bfd admin-state enable
-> ip bfd admin-state disable

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bfd

Displays the BFD global status and general configuration parameters.

MIB Objects

alaBfdGlobalAdminStatus
**ip bfd transmit**

Configures the global transmit time interval for BFD control packets. This command specifies the minimum amount of time BFD waits between each transmission of control packets.

```
ip bfd transmit transmit_interval
```

**Syntax Definitions**

`transmit_interval` The transmit time interval, in milliseconds. The valid range is 100–999.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>transmit_interval</code></td>
<td>300 milliseconds</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/V48C8/C32E/T24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The transmit time interval is also configurable at the BFD interface level. Note that configuring the global value with the `ip bfd transmit` command does not override the value set for the interface using the `ip bfd interface transmit` command.

- The global transmit time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

**Examples**

```
-> ip bfd transmit 500
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- `ip|ipv6 bfd interface transmit`  Configures the transmit time interval for a specific BFD interface.
- `show ip bfd`  Displays the BFD global status and general configuration parameters.

MIB Objects

- `alaBfdGlobalTxInterval`
ip bfd receive

Configures the global receive time interval for BFD control packets. This command specifies the minimum amount of time BFD waits to receive control packets before determining there is a problem.

```
ip bfd receive receive_interval
```

**Syntax Definitions**

```
receive_interval
```

The receive time interval, in milliseconds. The valid range is 100–999.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>receive_interval</td>
<td>300 milliseconds</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The minimum receive time interval is also configurable at the BFD interface level. Note that configuring the global value with the `ip bfd receive` command does not override the value set for the interface using the `ip bfd interface receive` command.

- The global receive time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

**Examples**

```
-> ip bfd receive 500
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- **ip|ipv6 bfd interface receive**  Configures the receive time interval for a specific BFD interface.
- **show ip bfd**  Displays the BFD global status and general configuration parameters.

MIB Objects

- **alaBfdGlobalRxInterval**
**ip bfd multiplier**

Configures the global BFD detection time multiplier. This command specifies a number that is used to calculate the BFD detection time used in the asynchronous mode. The detection time value that is specified determines how long to wait before declaring that the BFD session is down.

```plaintext
ip bfd multiplier num
```

**Syntax Definitions**

`num` The detection time multiplier number. The valid range is 3–255.

**Defaults**

By default, the multiplier value is set to 3.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

- The global detection time multiplier is also configurable at the BFD interface level. Note that configuring the global value with the `ip bfd multiplier` command does not override the value set for the interface using the `ip bfd interface multiplier` command.

- The global detection time multiplier serves as the default multiplier value for a BFD interface. The default multiplier value is overridden when a specific value is configured for the interface.

**Examples**

`-> ip bfd multiplier 5`

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- `ip|ipv6 bfd interface multiplier`  Configures the detection time multiplier for a BFD interface.
- `show ip bfd`  Displays the BFD global status and general configuration parameters.

**MIB Objects**

- `alaBfdGlobalDetectMult`
**ip bfd echo-interval**

Configures the global BFD echo packet time interval. The echo function is available with the asynchronous mode. Echo packets are transmitted to BFD peers to see if they loop back to the peer from which they originated.

**ip bfd echo-interval** *echo_interval*

---

**Syntax Definitions**

*echo_interval*  
The echo time interval, in milliseconds. The valid range is 100–999.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>echo_interval</em></td>
<td>300 milliseconds</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- The echo packet time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd echo-interval** command does not override the value set for the interface using the **ip bfd interface echo-interval** command.

- The global echo packet time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

---

**Examples**

```
-> ip bfd echo-interval 500
```

---

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- `ip|ipv6 bfd interface echo-interval`  
  Configures the echo packet time interval for a BFD interface.

- `show ip bfd`  
  Displays the BFD global status and general configuration parameters.

**MIB Objects**

- `alaBfdGlobalEchoRxInterval`
**ip|ipv6 bfd interface**

Configures an IPv4 or IPv6 BFD interface.

```
{ip | ipv6} bfd interface if_name
no {ip | ipv6} bfd interface if_name
```

**Syntax Definitions**

`if_name`  
The name of an existing IPv4 or IPv6 interface.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to delete a BFD interface.
- The interface name must be an existing IPv4 or IPv6 interface name that is configured with an IPv4 or IPv6 address.

**Examples**

```
-> ip bfd interface bfd-vlan-101
-> no ip bfd interface bfd-vlan-101

-> ipv6 bfd interface bfd-vlan-201
-> no ipv6 bfd interface bfd-vlan-201
```

**Release History**

Release 7.1.1; command was introduced.
Release 8.4.1.R03; IPv6 BFD support added.
**Related Commands**

- `ip|ipv6 bfd interface admin-state`
  - Configures the administrative status of an IPv4 or IPv6 BFD interface.
- `show ip|ipv6 bfd interfaces`
  - Displays the status and statistics of a BFD interface.
- `show ip|ipv6 bfd sessions`
  - Displays the status and statistics of the BFD sessions.

**MIB Objects**

- `alaBfdIntfTable`
  - `alaBfdIntfIndex`
  - `alaBfdIntfRowStatus`
**ip|ipv6 bfd interface admin-state**

Enables or disables the administrative status of an IPv4 or IPv6 BFD interface.

```
{ip | ipv6} bfd interface if_name admin-state {enable | disable}
```

**Syntax Definitions**

- `if_name` The name of an existing IPv4 or IPv6 BFD interface.
- `enable` Enables the BFD interface.
- `disable` Disables the BFD interface.

**Defaults**

By default, a BFD interface is disabled when it is created.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The BFD interface must be enabled to participate in the BFD protocol.

**Examples**

- `-> ip bfd interface bfd-vlan-101 admin-state enable`
- `-> ip bfd interface bfd-vlan-101 admin-state disable`
- `-> ipv6 bfd interface bfd-vlan-201 admin-state enable`
- `-> ipv6 bfd interface bfd-vlan-201 admin-state disable`

**Release History**

Release 7.1.1; command was introduced.
Release 8.4.1.R03; IPv6 BFD support added.
**Related Commands**

- `ip|ipv6 bfd interface`  
  Creates an IPv4 or IPv6 BFD interface.

- `show ip|ipv6 bfd interfaces`  
  Displays the status and statistics of a BFD interface.

- `show ip|ipv6 bfd sessions`  
  Displays the status and statistics of BFD sessions.

**MIB Objects**

- `alaBfdIntfTable`  
  
  - `alaBfdIntfAdminStatus`
**ip|ipv6 bfd interface transmit**

Configures the transmit time interval for an IPv4 or IPv6 BFD interface. This command specifies the minimum amount of time BFD waits between each transmission of control packets from the interface.

```
{ip | ipv6} bfd interface if_name transmit transmit_interval
```

### Syntax Definitions

- `if_name` The name of an existing IPv4 or IPv6 BFD interface.
- `transmit_interval` The transmit time interval, in milliseconds. The valid range is 100–999.

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>transmit_interval</td>
<td>300 milliseconds</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The global transmit time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface transmit time interval using the `ip bfd interface transmit` or `ipv6 bfd interface transmit` command does not change the global value configured with the `ip bfd transmit` command.

### Examples

```
-> ip bfd interface bfd-vlan-101 transmit 500
```

```
-> ipv6 bfd interface bfd-vlan-201 transmit 500
```

### Release History

- Release 7.1.1; command was introduced.
- Release 8.4.1.R03; IPv6 BFD support added.
**Related Commands**

- `ip|ipv6 bfd interface`  Creates an IPv4 or IPv6 BFD interface.
- `ip bfd transmit`        Configures a global BFD transmit time interval.
- `show ip|ipv6 bfd interfaces`  Displays the status and statistics of a BFD interface.
- `show ip|ipv6 bfd sessions` Displays the status and statistics of the BFD sessions.

**MIB Objects**

- `alaBfdIntfTable`
  - `alaBfdIntfDesiredMinTxInterval`
ip|ipv6 bfd interface receive

Configures the receive time interval for an IPv4 or IPv6 BFD interface. This command specifies the minimum amount of time BFD waits to receive control packets on the interface before determining there is a problem.

{ip | ipv6} bfd interface if_name receive receive_interval

Syntax Definitions

if_name
   The name of an existing IPv4 or IPv6 BFD interface.

receive_interval
   The receive time interval, in milliseconds. The valid range is 100–999.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The global receive time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

- Note that configuring the interface transmit time interval using the ip bfd interface receive or ipv6 bfd interface receive command does not change the global value configured with the ip bfd receive command.

Examples

- ip bfd interface bfd-vlan-101 receive 500
- ipv6 bfd interface bfd-vlan-201 receive 500

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R03; IPv6 BFD support added.
**Related Commands**

- **ip|ipv6 bfd interface**
  Creates an IPv4 or IPv6 BFD interface.
- **ip bfd receive**
  Configures a global BFD receive time interval.
- **show ip|ipv6 bfd interfaces**
  Displays the BFD interface configuration table.
- **show ip|ipv6 bfd sessions**
  Displays the BFD interface configuration table.

**MIB Objects**

- **alaBfdIntfTable**
  - **alaBfdReqMinRxInterval**
ip|ipv6 bfd interface multiplier

Configures the detection time multiplier for an IPv4 or IPv6 BFD interface. This command specifies a number that is used to calculate the BFD detection time used in the asynchronous mode. When an interface stops receiving packets from a neighbor, the interface uses the detection time value to determine how long to wait before declaring that the BFD session is down.

```
{ip | ipv6} bfd interface if_name multiplier num
```

**Syntax Definitions**

- `if_name` - The name of an existing IPv4 or IPv6 BFD interface.
- `num` - The detection time multiplier number. The valid range is 3–255.

**Defaults**

By default, the multiplier value is set to 3.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The detection time between neighbors is calculated by multiplying the negotiated transmit time interval by the detection time multiplier.

**Examples**

```
-> ip bfd interface bfd-vlan-101 multiplier 5
-> ipv6 bfd interface bfd-vlan-201 multiplier 5
```

**Release History**

Release 7.1.1; command was introduced.
Release 8.4.1.R03; IPv6 BFD support added.
Related Commands

- **show ip|ipv6 bfd sessions**: Displays the BFD interface configuration table.

MIB Objects

- **alaBfdIntfTable**
  - **alaBfdIntfDetectMult**
ip|ipv6 bfd interface echo-interval

Configures the echo time interval for an IPv4 or IPv6 BFD interface. The echo function is available with the asynchronous mode. Echo packets are transmitted to BFD peers to see if they loop back to the peer from which they originated.

{ip | ipv6} bfd interface if_name echo-interval echo_interval

Syntax Definitions

if_name
The name of an existing IPv4 or IPv6 BFD interface.

echo_interval
The echo time interval, in milliseconds. The valid range is 100–999.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>echo_interval</td>
<td>300 milliseconds</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</table>

**Usage Guidelines**

Enter an interface name to display information for a specific BFD interface.

**Examples**

-> show ip bfd interfaces
  Interface     Admin     Tx  Min Rx  Min EchoRx Detect  OperStatus
  Name          Status     Interval Interval Interval   Multiplier
  -----------------+----------+----------+----------+----------+----------+----------
  bfd-intf1       enabled   300     300       300         3         UP
  bfd-intf2       enabled   300     300       300         3         UP

-> show ip bfd interfaces bfd-intf1
  Interface Name       = bfd-intf1,
  Interface IP Address = 100.1.1.1,
  Admin Status         = Enabled,
  Desired Transmit Interval = 300,
  Minimum Receive Interval = 300,
  Detection Time Multiplier = 3,
  Minimum Echo Receive Interval = 300,
  Authentication Present = No,
  Oper Status = UP

-> show ipv6 bfd interfaces
  Interface     Admin     Tx  Min Rx  Min EchoRx Detect  OperStatus
  Name          Status     Interval Interval Interval   Multiplier
  -----------------+----------+----------+----------+----------+----------+----------
  bfd-intf3       disabled    300     300       300         3         DOWN
show ipv6 bfd interfaces bfd-intf3

Interface Name                   = bfd-intf3
Interface IP Address             = fe80::2efa:a2ff:fe13:e402,
Admin Status                     = Disabled,
Desired Transmit Interval        = 300,
Minimum Receive Interval         = 300,
Detection Time Multiplier        = 3,
Minimum Echo Receive Interval    = 300,
Authentication Present           = No,
Oper Status                      = DOWN

**output definitions**

show ip|ipv6 bfd sessions

Displays the IPv4 or IPv6 BFD sessions for the switch.

**show {ip | ipv6} bfd sessions [session_num] [slot chassis/slot]**

### Syntax Definitions

- **session_num**: The BFD session number. Valid range is 1–1024.
- **chassis**: The chassis identifier.
- **slot**: The current slot position used by the switch.

### Defaults

By default, all IPv4 or IPv6 BFD sessions are displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Specify a session number to display information for an individual BFD session.

### Examples

```
-> show ip bfd sessions
Legends: Neg. = Negotiated
         Discr = Discriminator
         Intvl = Interval (in milliseconds)

Local Interface Discr Name      Neighbor State Discr Intvl Intvl Intvl Intvl
              Name      Address            Discr   Intvl   Intvl   Intvl   Intvl
-----------+------------+------------------------+-------+-------+-------+-------+--------
1          one        100.1.1.10    UP     0    0    0   ECHO
2          one        101.1.1.11    UP   10   300   300  ASYNC
```

```
-> show ip bfd sessions slot 1
Legends: Neg. = Negotiated
         Discr = Discriminator
         Intvl = Interval (in milliseconds)

Local Interface Discr Name      Neighbor State Discr Intvl Intvl Intvl Intvl
              Name      Address            Discr   Intvl   Intvl   Intvl   Intvl
-----------+------------+------------------------+-------+-------+-------+-------+--------
1          one        100.1.1.10    UP     0    0    0    300
```

-> show ip bfd sessions 1

show ip|ipv6 bfd sessions statistics

Displays the statistics for IPv4 or IPv6 BFD sessions.

show {ip | ipv6} bfd sessions statistics [session_num]

Syntax Definitions

session_num The BFD session number. Valid range is 1–1024.

Defaults

By default, statistics for all IPv4 or IPv6 sessions are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

Bootstrap Protocol (BOOTP) and Dynamic Host Configuration Protocol (DHCP) packets contain configuration information for network hosts. DHCP Relay enables forwarding of BOOTP/DHCP packets between networks. This allows routing of DHCP traffic between clients and servers. It is not necessary to enable DHCP Relay if DHCP traffic is bridged through one network (the clients and servers are on the same physical network).

This chapter includes a description of DHCP Relay commands that are used to define the IP address of DHCP servers, maximum number of hops, and forward delay time. Configure DHCP Relay on the switch where routing of BOOTP/DHCP packets occur. These CLI commands are applicable for all VRF instances.

MIB information for DHCP Relay commands is as follows:

**Filename:** ALCATEL-IND1-UDP-RELAY-MIB.mib

**Module:** alcatelIND1UDPRelayMIB

A summary of the available commands is listed here.

- `dhcpv6-snooping binding action`
- `dhcpv6-snooping binding persistency`
- `dhcpv6-snooping ipv6-source-filter`
- `ipv6 dhcp guard`
- `ipv6 dhcp guard trusted`
- `show dhcpv6-snooping`
- `show dhcpv6-snooping interfaces`
- `show dhcpv6-snooping binding`
- `show dhcpv6-snooping ipv6-source-filter`
- `show ipv6 dhcp guard`
ip dhcp relay admin-state

Enables or disables DHCP Relay for the switch for both the VLAN and Shortest Path Bridging (SPB) service domains. When enabled, DHCP packets can be relayed between a client and a server across VLANs or an SPB service domain.

**ip dhcp relay admin-state {enable | disable}**

<table>
<thead>
<tr>
<th>Syntax Definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
</tr>
<tr>
<td>disable</td>
</tr>
</tbody>
</table>

**Defaults**

By default, DHCP Relay is disabled for the switch.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
</tr>
<tr>
<td>6465</td>
</tr>
<tr>
<td>6560</td>
</tr>
<tr>
<td>6570M</td>
</tr>
<tr>
<td>6860</td>
</tr>
<tr>
<td>6860N</td>
</tr>
<tr>
<td>6865</td>
</tr>
<tr>
<td>6900</td>
</tr>
<tr>
<td>9900</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>6900 V72/C32</th>
</tr>
</thead>
</table>

| Supported | Yes | Yes | Yes | Yes | Yes | Yes | Yes | Yes | Yes | Yes |

**Usage Guidelines**

- Disabling this feature does not remove the DHCP relay agent configuration from the switch. However, the configuration is not active unless the feature is enabled using this command.

- When this feature is enabled, DHCP packets are relayed on a global basis or on a per-interface basis.
  - Global DHCP Relay requires a global destination IP address (configured through the `ip dhcp relay destination` command). All DHCP packets are forwarded by a global relay agent.
  - Per-interface DHCP Relay is disabled by default. To enable this mode and define a per-interface relay agent, use the `ip dhcp relay per-interface-mode` and `ip dhcp relay interface destination` commands. Only DHCP packets originating from the VLAN or SPB service that is associated with the specified IP interface are forwarded by the interface relay agent.
  - The global and per-interface modes are mutually exclusive.
  - The global or per-interface mode configuration is not active unless the DHCP Relay feature is enabled for the switch.

- Configure DHCP Relay on switches where packets are routed between IP networks.

- Configuring a DHCP relay agent for an IP interface that is bound to an SPB service (a service-based IP interface) is supported only on the OmniSwitch 9900.

**Examples**

- `-> ip dhcp relay admin-state enable`
-> ip dhcp relay admin-state disable

**Release History**

Release 8.5R3; command introduced.

**Related Commands**

- `ip dhcp relay destination`  
  Configures a global destination IP address.
- `ip dhcp relay per-interface-mode`  
  Enables or disables the per-interface DHCP relay mode, which is used to process DHCP packets on a per-interface basis.
- `show ip dhcp relay interface`  
  Displays the DHCP Relay configuration.

**MIB Objects**

- `alaDhcpRelayGlobalConfig`
- `alaDhcpRelayAdminStatus`
**ip dhcp relay destination**

Configures a global destination IP address. When the global DHCP Relay mode is active, all DHCP client requests are forwarded to the specified destination IP address.

`ip dhcp relay destination ip_address`

`no ip dhcp relay destination ip_address`

**Syntax Definitions**

`ip_address` The IPv4 address (for example 21.0.0.10) of the DHCP server to which packets are relayed.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of the command to remove the configured DHCP relay destination.
- Configuring a global destination IP address is required when the global DHCP Relay mode is enabled for the switch.

**Examples**

- `ip dhcp relay destination 3.3.0.2`
- `ip dhcp relay destination 4.4.0.2`
- `no ip dhcp relay destination 3.3.0.2`

**Release History**

Release 8.5R3; command introduced.
Related Commands

- `ip dhcp relay admin-state`  Configures the status of the DHCP Relay feature.
- `show ip dhcp relay interface`  Displays the DHCP Relay configuration.

  - alaDhcpRelayServerDestinationAddress
  - alaDhcpRelayServerDestinationRowStatus
ip dhcp relay per-interface-mode

Enables or disables the DHCP Relay per-interface mode. When this mode is enabled, a relay agent can be configured for a specific IP interface.

ip dhcp relay per-interface-mode
no ip dhcp relay per-interface-mode

Syntax Definitions
N/A

Defaults
By default, the global DHCP Relay mode is active when the DHCP Relay feature is enabled.

Platforms Supported
This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines
- When the per-interface DHCP relay mode is enabled with this command, the global DHCP relay mode is not available. These two types of relay agents are mutually exclusive.
- Use the no form of this command to change the DHCP Relay mode back to global (the default).
- When the per-interface mode is active, use the ip dhcp relay interface destination command to configure a destination IP address for each IP interface that will serve as a DHCP relay agent.
- The global or per-interface mode configuration is not active unless the DHCP Relay feature is enabled for the switch.

Examples
- -> ip dhcp relay per-interface-mode
- -> no ip dhcp relay per-interface-mode

Release History
Release 8.5R3; command introduced.
**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<tr>
<td><code>show ip dhcp relay interface</code></td>
<td>Displays the DHCP Relay configuration.</td>
</tr>
</tbody>
</table>

**MIB Objects**

- `alaDhcpRelayGlobalConfig`
- `alaDhcpRelayPerInterfaceMode`
ip dhcp relay interface destination

Configures a DHCP relay destination IP address for the specified interface. The specified IP interface is bound to a VLAN or an SPB service; packets destined for the specified IP address are relayed over the VLAN or SPB service domain.

```
ip dhcp relay interface if_name destination ip_address
no ip dhcp relay interface if_name destination ip_address
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>if_name</td>
<td>The name of an IPv4 interface on which a destination IP address is configured. Specify the primary IP interface for the VLAN or service.</td>
</tr>
<tr>
<td>ip_address</td>
<td>The Pv4 address (for example 21.0.0.10) of the DHCP server to which packets are relayed.</td>
</tr>
</tbody>
</table>

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>---------------------------------------------</td>
<td></td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

- Use the no form of this command to remove the configured DHCP relay destination for the specified interface.
- This command works only if the per-interface DHCP mode is active. Use the ip dhcp relay per-interface-mode command to enable this option.
- Configure DHCP Relay on switches where packets are routed between IP networks.
- The IP interface must be defined for a VLAN or an SPB service before using this command. Packets destined for the specified IP address are relayed over the VLAN or SPB service domain.
- Configuring a DHCP relay agent for an IP interface that is bound to an SPB service (a service-based IP interface) is supported only on the OmniSwitch 9900.

**Examples**

```
-> ip dhcp relay interface client_traffic destination 75.0.0.10
-> ip dhcp relay interface client_traffic destination 31.0.0.20
-> no ip dhcp relay interface client_traffic destination 31.0.0.20
```
**Release History**

Release 8.5R3; command introduced.

**Related Commands**

- `ip dhcp relay per-interface-mode` Enables or disables the DHCP Relay per-interface mode.
- `ip dhcp relay interface admin-state` Enables or disables DHCP relay on an IP interface.
- `show ip dhcp relay interface` Displays the DHCP Relay configuration.

**MIB Objects**

```
dhcpRelayInterfaceTable
  dhcpRelayInterfaceName
  dhcpRelayInterfaceIpAddressType
  dhcpRelayInterfaceIpAddress
  dhcpRelayInterfaceStatus
```
ip dhcp relay interface admin-state

Enables or disables the relay of DHCP packets received on the specified interface.

```
ip dhcp relay interface if_name admin-state {enable | disable}
```

**Syntax Definitions**

- **if_name**: The name of an IPv4 interface.
- **enable**: Enables the relay of DHCP packets on the interface.
- **disable**: Disables the relay of DHCP packets on the interface.

**Defaults**

By default, DHCP relay is enabled for the interface when a relay destination IP address is configured for the interface.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

At least one relay destination must be configured before the DHCP relay is enabled for an interface.

**Examples**

```
-> ip dhcp relay interface client_traffic admin-state enable
-> ip dhcp relay interface client-traffic admin-state disable
```

**Release History**

Release 8.5R3; command introduced.
**Related Commands**

- `ip dhcp relay per-interface-mode` Enables or disables the DHCP Relay per-interface mode.
- `ip dhcp relay interface destination` Configures the DHCP relay destination address for the specified IP interface.
- `show ip dhcp relay interface` Displays the DHCP Relay configuration.

**MIB Objects**

- `alaDhcpRelayInterfaceAdminStateTable`  
- `alaDhcpRelayInterfaceAdminStatus`
ip dhcp relay forward-delay

Sets the forward delay time value for the DHCP Relay configuration. The BOOTP/DHCP packet sent from the client contains the elapsed boot time. This is the amount of time, in seconds, since the client last booted. DHCP Relay does not process the packet unless the elapsed boot time value of the client is equal to or greater than the configured value of the forward delay time.

`ip dhcp relay forward-delay seconds`

**Syntax Definitions**

*seconds*  
Forward delay time value in seconds.

**Defaults**

By default, the forward delay time is set to 0 seconds.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The time specified applies to all defined DHCP Relay agent IP addresses.
- If a packet contains an elapsed boot time value that is less than the specified forward delay time value, DHCP Relay discards the packet.

**Examples**

```bash
-> ip dhcp relay forward-delay 300
-> ip dhcp relay forward-delay 120
```

**Release History**

Release 7.1.1; command introduced.
Release 8.6R1; `ip helper forward-delay` changed to `ip dhcp relay forward-delay`. 
Related Commands

- `ip dhcp relay admin-state` Enables or disables the DHCP Relay feature for the switch.
- `ip dhcp relay maximum-hops` Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse.
- `show ip dhcp relay interface` Displays current DHCP Relay configuration information.
- `show ip dhcp relay statistics` Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

- `alaDhcpRelayGlobalConfig`
  - `alaDhcpRelayForwardDelay`
ip dhcp relay maximum-hops

Sets the maximum number of hops value for the DHCP Relay configuration. This value specifies the maximum number of relays a BOOTP/DHCP packet is allowed to traverse until it reaches its server destination. Limiting the number of hops that can forward a packet prevents packets from looping through the network.

```
ip dhcp relay maximum-hops hops
```

**Syntax Definitions**

- **hops**: The maximum number of relays.

**Defaults**

By default, the maximum hops value is set to 16 hops.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If a packet contains a hop count equal to or greater than the `hops` value, DHCP Relay discards the packet.
- The maximum hops value only applies to DHCP Relay and is ignored by other services.

**Examples**

```
-> ip dhcp relay maximum-hops 1
-> ip dhcp relay maximum-hops 10
```

**Release History**

Release 7.1.1; command introduced.
Release 8.6R1; *ip helper maximum-hops* changed to *ip dhcp relay maximum-hops*
Related Commands

- **ip dhcp relay admin-state**: Enables or disables the DHCP Relay feature for the switch.
- **ip dhcp relay forward-delay**: Sets the forward delay time value. DHCP Relay does not process a client packet unless the packet contains an elapsed boot time value that is equal to or greater than the configured value of the forward delay time.
- **show ip dhcp relay interface**: Displays current DHCP Relay configuration information.
- **show ip dhcp relay statistics**: Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

- `alaDhcpRelayGlobalConfig`
- `alaDhcpRelayMaximumHops`
**ip dhcp relay insert-agent-information**

Enables or disables the DHCP relay agent information option (Option-82) feature. When this feature is enabled, local relay agent information is inserted into client DHCP packets when the agent forwards these packets to a DHCP server.

```
ip dhcp relay insert-agent-information
no ip dhcp relay insert-agent-information
```

### Syntax Definitions

N/A

### Defaults

By default, this feature is disabled on the switch.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to disable the DHCP Option-82 feature.
- This command enables the DHCP Option-82 feature for the entire switch; it is not configurable on a per-interface basis.
- When the relay agent receives a DHCP packet that already contains the Option-82 field, the packet is processed based on the agent information policy configured for the switch. This policy is configured using the `ip dhcp relay insert-agent-information policy` command.
- The DHCP Relay agent information option and DHCP Snooping are mutually exclusive. If the DHCP Relay Option-82 feature is enabled for the switch, then DHCP Snooping is not available. The reverse is also true; if DHCP Snooping is enabled, then DHCP Relay Option-82 is not available.

### Examples

```
-> ip dhcp relay insert-agent-information
-> no ip dhcp relay insert-agent-information
```

### Release History

Release 7.1.1; command introduced.
Release 8.6R1; `ip helper agent-information` changed to `ip dhcp relay insert-agent-information`. 
DHCP Relay Commands

**Related Commands**

- `ip dhcp relay insert-agent-information policy`: Configures a policy to determine how the relay agent handles DHCP packets that already contain the Option-82 field.
- `ip dhcp relay insert-agent-information format`: Configures the type of information that is inserted into both the Circuit ID and Remote ID suboption fields of the Option-82 field.
- `show ip dhcp relay interface`: Displays current DHCP Relay configuration information.
- `show ip dhcp relay statistics`: Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

**MIB Objects**

- `alaDhcpRelayGlobalConfig`
  
- `alaDhcpRelayInsertAgentInformation`
ip dhcp relay insert-agent-information policy

Configures a policy that determines how the DHCP relay agent handles the DHCP packets that already contain an Option-82 field.

ip dhcp relay insert-agent-information policy {drop | keep | replace}

Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>drop</td>
<td>Drop DHCP packets that already contain an Option-82 field.</td>
</tr>
<tr>
<td>keep</td>
<td>Keep the existing Option-82 field information and continue to relay the DHCP packet.</td>
</tr>
<tr>
<td>replace</td>
<td>Replace the existing Option-82 field information with local relay agent information and continue to relay the DHCP packet.</td>
</tr>
</tbody>
</table>

Defaults

By default, DHCP packets that already contain an Option-82 field are dropped.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6/V48C8/C32E/T24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The agent information policy is not applied if the DHCP relay agent receives a DHCP packet from a client that contains a non-zero value for the gateway IP address (giaddr). In this case, the agent does not insert the relay agent information option into the DHCP packet and forwards the packet to the DHCP server.
- Note that if a DHCP packet contains a gateway IP address (giaddr) value that matches a local subnet and also contains the Option-82 field, the packet is dropped by the relay agent.

Examples

- ip dhcp relay insert-agent-information policy drop
- ip dhcp relay insert-agent-information policy keep
- ip dhcp relay insert-agent-information policy replace

Release History

Release 7.1.1; command introduced.
Release 8.6R1; ip helper agent-information policy changed to ip dhcp relay insert-agent-information policy.
**Related Commands**

- **ip dhcp relay insert-agent-information**
  Enables the insertion of relay agent information Option-82 into DHCP packets.

- **show ip dhcp relay interface**
  Displays current DHCP Relay configuration information.

- **show ip dhcp relay statistics**
  Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

**MIB Objects**

- alaDhcpRelayGlobalConfig
- alaDhcpRelayInsertAgentInformationPolicy
ip dhcp relay insert-agent-information format

Configures the type of information that is inserted into both the Circuit ID and Remote ID suboption fields of the Option-82 field.

```
ip dhcp relay insert-agent-information format {base-mac | system-name | user-string string | interface-alias | auto-interface-alias | ascii {{circuit-id | remoted-id} {base-mac | cvlan | interface | interface-alias | system-name | user-string string | vlan}} {delimiter string}}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>base-mac</td>
<td>The base MAC address of the switch.</td>
</tr>
<tr>
<td>system-name</td>
<td>The system name of the switch.</td>
</tr>
<tr>
<td>string</td>
<td>A user defined text string. Supports up to 64 characters.</td>
</tr>
<tr>
<td>interface-alias</td>
<td>The alias configured for the interface.</td>
</tr>
<tr>
<td>auto-interface-alias</td>
<td>The switch automatically generates the interface-alias in the following format: SystemName_slot_port.</td>
</tr>
<tr>
<td>ascii</td>
<td>ASCII format. base-mac: The base MAC address of the switch. cvlan: The Customer VLAN ID. interface: The interface name. interface-alias: The alias configured for the interface. system-name: The system name of the switch. user-string: A user defined text string. vlan: The VLAN ID of which the client is a member. string: A user-defined text string. delimiter: The delimiter character that separates fields within the Circuit ID and Remote ID ASCII string value. Valid characters are</td>
</tr>
</tbody>
</table>

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>base-mac</td>
<td>base-mac</td>
</tr>
<tr>
<td>system-name</td>
<td></td>
</tr>
<tr>
<td>user-string</td>
<td></td>
</tr>
<tr>
<td>interface-alias</td>
<td></td>
</tr>
<tr>
<td>auto-interface-alias</td>
<td></td>
</tr>
<tr>
<td>ascii</td>
<td>base-mac</td>
</tr>
</tbody>
</table>
### Platforms Supported
This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines
- The string parameter specifies user-defined information to insert into the Circuit ID and Remote ID fields.
- When entering a *string* for user-defined Option-82 information, quotes are required around ambiguous characters, such as hex characters, spaces, etc, so they are interpreted as text. For example, the *string* “Building B Server” requires quotes because of the spaces between the words.
- The *interface-alias* parameter will use the alias configured with the *interfaces alias* command. If no alias is configured a NULL string will be inserted.
- A maximum of 63 characters can be inserted when using the *interface-alias* and *auto-interface-alias* parameters, remaining characters will be truncated.
- The Option-82 format option is a global setting, the format specified is applied to all ports on the switch.
- The data specified with this command is added to the Circuit ID and Remote ID fields only when DHCP Option-82 data insertion is enabled for the switch.
- The ASCII option is used to specify the type of information that is configured in ASCII text string format and then inserted into the Option-82 Circuit ID suboption. Each parameter provided with this command represents a different type of information.
  - Configuring the Circuit ID or Remote ID suboption in ASCII format allows up to five fields (types) of information within the ASCII string. However, if the contents of all the fields combined exceeds 127 characters, then the ASCII string is truncated.
  - Specifying at least one parameter with ASCII option is required. If multiple parameters are selected, then specifying one of the valid delimiter characters is also required.
  - To ensure that the “\” (backward slash) delimiter is parsed correctly, enter two backward slashes in quotes (for example, “\\”).

### Examples
- `ip dhcp relay insert-agent-information format user-string “Building B Server”`
- `ip dhcp relay insert-agent-information format system-name`
- `ip dhcp relay insert-agent-information format base-mac`
- `ip dhcp relay insert-agent-information format interface-alias`
- `ip dhcp relay insert-agent-information format auto-interface-alias`
- `ip dhcp relay insert-agent-information format ascii circuit-id user-string “Bldg A Server”`
- `ip dhcp relay insert-agent-information format ascii remote-id vlan system-name delimiter |`
- `ip dhcp relay insert-agent-information ascii interface system-name delimiter “\\”`
**Release History**

Release 8.1.1; command introduced.
Release 8.6R1; **ip helper option-82 format** changed to **ip dhcp relay insert-agent-information format**, **circuit-id** and **remote-id** parameter options added.

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- DHCP packets are relayed on a global basis or on a per-interface basis.

- When the global DHCP Relay mode is active (the default), a global destination IP address is required. Global destination IP addresses are displayed in the **Relay Destination list** field.

- When the per-interface DHCP Relay mode is enabled, destination IP addresses are configured for specific interfaces. The **Relay Destination list** displays these IP addresses along with the name of the IP interface associated with each address.

**Examples**

```
-> show ip dhcp relay interface
IP DHCP Relay:
  DHCP Relay Admin Status = Disable,
  Forward Delay(seconds)  = 0,
  Max number of hops      = 16,
  Relay Agent Information = Disabled,
  Relay Agent Information Policy = Drop,
  DHCP Relay Opt82 Format = Base MAC,
  DHCP Relay Opt82 String = 00:e0:b1:e7:09:a3,
  PXE support             = Disabled,
  Relay Mode              = Global,
  Bootup Option           = Disable,
  Relay Destination list (Global Mode):
    From Interface Any to Server 128.100.16.1

-> show ip dhcp relay interface
```
IP DHCP Relay:
- DHCP Relay Admin Status = Enable,
- Forward Delay (seconds) = 0,
- Max number of hops = 16,
- Relay Agent Information = Disabled,
- Relay Agent Information Policy = Drop,
- DHCP Relay Opt82 Format = Base MAC,
- DHCP Relay Opt82 String = 2c:fa:a2:13:e4:02,
- PXE support = Disabled,
- Relay Mode = Per Interface,
- Bootup Option = Disable,
- Relay Destination list (Per Interface Mode):
  - From Interface ipvpl to Server 50.3.3.1

Output definitions

**DHCP Relay Admin Status**
The status (Enable or Disable) of DHCP Relay. Configured through the `ip dhcp relay admin-state` command.

**Forward Delay (seconds)**
The current forward delay time. Use the `ip dhcp relay forward-delay` command to change this value.

**Max number of hops**
The current maximum number of hops allowed. Use the `ip dhcp relay maximum-hops` command to change this value.

**Relay Agent Information**
Indicates whether the DHCP relay agent information option (Option-82) is Enabled or Disabled. Configured through the `ip dhcp relay insert-agent-information` command.

**Relay Agent Information Policy**
The policy configured to determine how the DHCP relay agent handles the DHCP packets that already contain an Option-82 field. Configured through the `ip dhcp relay insert-agent-information policy` command.

**DHCP Relay Opt82 Format**
The type of Option-82 information inserted. Configured through the `ip dhcp relay insert-agent-information format` command.

**DHCP Relay Opt82 String**
The Option-82 string based on the specified Option-82 format.

**PXE support**
Specifies the status (Enabled or Disabled) of the relay agent support for PXE devices. By default the PXE support is disabled. Configured through the `ip dhcp relay pxe-support` command.

**Relay Mode**
Whether DHCP Relay is set to operate in the global mode or the per-interface mode. Configured through the `ip dhcp relay per-interface-mode` command.

**Bootup Option**
Indicates whether or not automatic IP address configuration for a specific VLAN is done when the switch boots up (Enabled or Disabled). Configured through the `ip interface dhcp-client` command.

**Relay Destination list**
IP addresses for DHCP servers that receive BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the `ip dhcp relay destination` command (global mode) or `ip dhcp relay interface destination` (per-interface mode) to add or remove DHCP server IP addresses from the DHCP Relay configuration.

**Release History**
- Release 8.5R3; command introduced.
- Release 8.6R1; “Relay Agent Information” field added.
Related Commands

show ip dhcp relay statistics  Displays the collected DHCP Relay statistics.

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The following DHCP Relay statistics are collected:
  - The number of packets DHCP Relay has received.
  - The number of packets dropped due to forward delay, maximum hops, relay agent, and gateway IP violations.
  - Statistics that apply to a specific DHCP server (such as the number of packets transmitted to the server and the number of invalid Option-82 DHCP server packets dropped by the relay agent).
  - The number of packets processed since the last time these statistics were displayed.

- Use the `ip dhcp relay clear statistics` command to clear all DHCP Relay statistics.

**Examples**

```
-> show ip dhcp relay statistics
Global Statistics :
    Reception From Client :
        Total Count = 12, Delta = 12
    Forw Delay Violation :
        Total Count = 3, Delta = 3
    Max Hops Violation :
        Total Count = 0, Delta = 0
    Agent Info Violation :
        Total Count = 0, Delta = 0
    Invalid Gateway IP :
        Total Count = 0, Delta = 0
Server Specific Statistics :
    From Interface ipv4-v200 to Server 75.0.0.1
```
DHCP Relay Commands

show ip dhcp relay statistics

Tx Server:
  Total Count = 9, Delta = 9
InvAgentInfoFromServer:
  Total Count = 0, Delta = 0

Output definitions

<table>
<thead>
<tr>
<th>Reception From Client</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forw Delay Violation</td>
<td>Number of packets dropped as a result of forward delay violations. A violation occurs if a client packet contains an elapsed boot time value that is less than the configured DHCP Relay forward delay time value.</td>
</tr>
<tr>
<td>Max Hops Violation</td>
<td>Number of packets dropped as a result of maximum hop violations. A violation occurs if a packet contains a hop count equal to or greater than the configured DHCP Relay maximum hops value.</td>
</tr>
<tr>
<td>Agent Info Violation</td>
<td>Number of packets dropped as a result of a relay agent information (Option-82) violation. A violation occurs if an Option-82 DHCP packet contains a zero gateway IP address (giaddr) and the relay agent information policy is set to <strong>Drop</strong> or a DHCP packet has no Option-82 field and contains a non-zero giaddr.</td>
</tr>
<tr>
<td>Invalid Gateway IP</td>
<td>Number of packets dropped as a result of a gateway IP violation. A violation occurs if an Option-82 DHCP packet contains a gateway IP address (giaddr) that matches a local subnet address.</td>
</tr>
</tbody>
</table>

**Delta**

Total number of packets processed since the last time the DHCP Relay statistics were checked during any user session.

**Server**

DHCP server IP address that receives BOOTP/DHCP packets forwarded by this DHCP Relay service.

**Tx Server**

Number of packets DHCP Relay has transmitted to the DHCP server.

**InvAgentInfoFromServer**

Number of invalid Option-82 DHCP server packets dropped by the relay agent.

**Delta**

The difference between the number of packets received from the client and the number of packets transmitted to the DHCP server since the last time DHCP Relay statistics were checked during any user session.

Release History

Release 8.5R3; command introduced.

Related Commands

- **ip dhcp relay admin-state**
  Enables or disables the DHCP relay feature.
- **ip dhcp relay clear statistics**
  Resets the DHCP Relay statistic counters to zero.
- **show ip dhcp relay insert-agent-information error-count**
  Displays the Option-82 related error statistics.

MIB Objects

N/A
**ip dhcp relay clear statistics**

Clears DHCP relay statistics collected.

```
ip dhcp relay clear statistics [global-only | destination ip_address | interface if_name destination ip_address]
```

### Syntax Definitions

- **global-only**
  - Clears statistics collected for global DHCP Relay.
- **ip_address**
  - The IPv4 destination address for which statistics are cleared.
- **if_name**
  - The IPv4 interface name for which statistics are cleared.

### Defaults

By default, all DHCP Relay statistics are cleared.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When this command is used, all DHCP Relay statistics are reset to zero.
- Use the `show ip dhcp relay statistics` command to display DHCP Relay statistics.

### Examples

- `-> ip dhcp relay clear statistics`
- `-> ip dhcp relay clear statistics global-only`
- `-> ip dhcp relay clear statistics destination 75.0.0.2`
- `-> ip dhcp relay clear statistics interface ipv4-200 destination 75.0.0.2`

### Release History

Release 8.5R3; command introduced.
Release 8.6R1; `clear ip dhcp relay statistics` changed to `ip dhcp relay clear statistics` and `global-only`, `destination`, `interface` parameters added.
**Related Commands**

- `ip dhcp relay admin-state` Enables or disables the DHCP Relay feature.
- `show ip dhcp relay statistics` Displays DHCP Relay statistics.

**MIB Objects**

- `alaDhcpRelayGlobalConfig`
  - `alaDhcpRelayStatisticsClear`
- `alaDhcpRelayClearStatisticsTable`
  - `alaDhcpRelayClearStatisticsAction`
**show ip dhcp relay insert-agent-information error-count**

Displays the Option-82 related error statistics on a per-port and per-interface basis.

```
show ip dhcp relay insert-agent-information error-count [interface if_name | port chassis/slot/port [interface if_name]]
```

**Syntax Definitions**

- **if_name**
  The name of the IPv4 interface for which the Option-82 error count statistics are displayed.

- **chassis/slot/port**
  The chassis, slot, and port number of the port for which the Option-82 error count statistics are displayed.

**Defaults**

By default, all Option-82 error count statistics are displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- To display the statistics for a specific port, use the **port chassis/slot/port** parameter option.
- To display the statistics for a specific IPv4 interface, use the **interface if_name** parameter option.
- Use the **ip dhcp relay clear insert-agent-information error-count** command to clear Option-82 error statistics.

**Examples**

```
-> show ip dhcp relay insert-agent-information error-count port 1/1/3
Slot/Port | Interface | Agent Info Violation | Invalid Gateway IP
-------------------------------+---------------------+---------------------
      1/1/3   ipv4-v100          500                      0
      1/1/3   ipv4-v200          0                       10
      1/1/3   ipv4-v1100         500                      0
      1/1/3   ipv4-v3100         500                      0

-> show ip dhcp relay insert-agent-information error-count interface ipv4-v100
Slot/Port | Interface | Agent Info Violation | Invalid Gateway IP
-------------------------------+---------------------+---------------------
      1/1/3   ipv4-v100         400                      0
      2/1/3   ipv4-v100         500                      0
```
-> show ip dhcp relay insert-agent-information error-count port 1/1/3 interface ipv4-v100

<table>
<thead>
<tr>
<th>Slot/Port</th>
<th>Interface</th>
<th>Agent Info Violation</th>
<th>Invalid Gateway IP</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/1/3</td>
<td>ipv4-v100</td>
<td>500</td>
<td>0</td>
</tr>
</tbody>
</table>

Output definitions

<table>
<thead>
<tr>
<th>Slot/port</th>
<th>The chassis, slot, and port number for which the error count statistics is displayed.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The name of the IPv4 interface associated with the port.</td>
</tr>
<tr>
<td>Agent Info Violation</td>
<td>Number of packets dropped as a result of a relay agent information (Option-82) violation. A violation occurs if an Option-82 DHCP packet contains a zero gateway IP address (giaddr) and the relay agent information policy is set to <strong>Drop</strong> or a DHCP packet has no Option-82 field and contains a non-zero giaddr.</td>
</tr>
<tr>
<td>Invalid Gateway IP</td>
<td>Number of packets dropped as a result of a gateway IP violation. A violation occurs if an Option-82 DHCP packet contains a gateway IP address (giaddr) that matches a local subnet address.</td>
</tr>
</tbody>
</table>

Release History

Release 8.1.1; command introduced.
Release 8.6.R1; **show ip helper option-82 error-count** changed to **show ip dhcp relay insert-agent-information error-count** and **vlan** changed to **interface**.

Related Commands

**ip dhcp relay insert-agent-information format** Configures the type of information that is inserted into both the Circuit ID and Remote ID suboption fields of the Option-82 field.

**show ip dhcp relay interface** Displays current DHCP Relay configuration information.

MIB Objects

alaDhcpRelayOpt82ErrStatsTable
  - alaDhcpRelayOpt82ErrStatsIfIndex
  - alaDhcpRelayOpt82ErrStatsIfName

  - alaDhcpRelayOpt82ErrStatsInvalidGatewayIPAddr
ip dhcp relay clear insert-agent-information error-count

Clears the Option-82 related error statistics on a per-port and per-interface basis.

**ip dhcp relay clear insert-agent-informaton error-count [interface if_name | port chassis/slot/port]**

### Syntax Definitions

- **if_name**: The name of the IPv4 interface for which the Option-82 error count statistics are cleared.
- **chassis/slot/port**: The chassis, slot, and port number of the port for which the Option-82 error count statistics are cleared.

### Defaults

By default, all Option-82 error count statistics are cleared.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- To clear the statistics for a specific IPv4 interface, use the **interface if_name** parameter option.
- To clear the statistics for a specific port, use the **port chassis/slot/port** parameter option.
- When this command is used, all Option-82 error statistics are reset to zero.
- Use the **show ip dhcp relay insert-agent-information error-count** command to display Option-82 statistics collected.

### Examples

- `-> ip dhcp relay clear insert-agent-information error-count`
- `-> ip dhcp relay clear insert-agent-information error-count interface ipv4-v100`
- `-> ip dhcp relay clear insert-agent-information error-count port 1/1/3`

### Release History

Release 8.6R1; command introduced.
Related Commands

- **ip dhcp relay insert-agent-information format**  
  Configures the type of information that is inserted into both the Circuit ID and Remote ID suboption fields of the Option-82 field.

- **show ip helper**  
  Displays current DHCP Relay configuration information.

MIB Objects

- `alaDhcpRelayOpt82ErrStatsTable`
- `alaDhcpRelayOpt82ErrStatsReset`
show ip dhcp relay counters

Displays DHCP Relay packet statistics.

show ip dhcp relay counters

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use this command to display statistics for the various types of DHCP packets that were relayed or passed through by the switch.

Examples

-> show ip dhcp relay counters
DHCP Packets:
DHCP Discover Packets : 0,
DHCP Offer Packets    : 0,
DHCP Request Packets  : 0,
DHCP ACK Packets      : 0,
DHCP NACK Packets     : 0,
DHCP Release Packets  : 0,
DHCP Decline Packets  : 0,
DHCP Inform Packets   : 0,
DHCP Renew Packets    : 0,

Release History

Release 8.6R1; command introduced.
Related Commands

- `ip dhcp relay admin-state`  Enables or disables the DHCP relay feature.
- `show ip dhcp relay statistics`  Displays DHCP Relay error statistics.
- `show ip dhcp relay insert-agent-information error-count`  Displays the Option-82 related error statistics.

MIB Objects

N/A
ip helper address

Adds or deletes a DHCP server IP address. DHCP Relay forwards BOOTP/DHCP broadcasts to and from the specified address. If multiple DHCP servers are used, configure one IP address for each server.

```
ip helper address ip_address
no ip helper address [ip_address]
```

**Syntax Definitions**

- `ip_address` DHCP server IP address (for example 21.0.0.10).

**Defaults**

N/A

**Platforms Supported**

Not supported in this release.

**Usage Guidelines**

- Use the `no` form of this command to delete an IP address from the DHCP Relay service. If an address is not specified, then all addresses are deleted.

- Using this command enables a Global DHCP Relay service on the switch. When the DHCP Relay is specified by the DHCP server IP address, the service is called Global DHCP.

- When the DHCP Relay is specified by the VLAN number of the DHCP request, the service is referred to as Per-VLAN DHCP.

- Global DHCP and Per-VLAN DHCP are mutually exclusive. You can only configure one or the other.

- Use this command to configure DHCP Relay on switches where packets are routed between IP networks.

**Examples**

```
-> ip helper address 75.0.0.10
-> no ip helper address 31.0.0.20
```

**Release History**

- Release 7.1.1; command introduced.
- Release 8.6R1; command deprecated (use `ip dhcp relay destination`).
Related Commands

**ip helper vlan address**
Specifies or deletes DHCP Relay based on the VLAN of the DHCP request.

**ip dhcp relay forward-delay**
Sets the forward delay time value. DHCP Relay does not process a client packet unless the packet contains an elapsed boot time value that is equal to or greater than the configured value of the forward delay time.

**ip dhcp relay maximum-hops**
Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse.

**show ip helper**
Displays current DHCP Relay configuration information.

**show ip helper statistics**
Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

- **iphelperTable**
- **iphelperService**
- **iphelperForwAddr**
**ip helper vlan address**

Configures a DHCP Relay service for the specified VLAN. This command is used when a per-VLAN only relay service is active on the switch. It does not apply when a standard relay service is used.

```
ip helper vlan vlan_id[-vlan_id2] address ip_address
no ip helper vlan vlan_id[-vlan_id2] address ip_address
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan_id[-vlan_id2]</td>
<td>VLAN ID number of the DHCP server VLAN. Use a hyphen to specify a range of VLAN IDs (3-5).</td>
</tr>
<tr>
<td>ip_address</td>
<td>IP address (for example 21.0.0.10) of the DHCP server VLAN.</td>
</tr>
</tbody>
</table>

**Defaults**

If no VLAN identification number is entered, VLAN ID 0 is used by default.

**Platforms Supported**

Not supported in this release.

**Usage Guidelines**

- Specifying multiple VLAN IDs and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range of VLAN ID entries. (for example, 10-15).
- The `ip helper vlan address` command works only if the `per-vlan-only` forwarding option is active. Use the `ip helper per-vlan-only` command to enable this option.
- Configure DHCP Relay on switches where packets are routed between IP networks.
- The IP interface must be defined for the VLANs before using this command.
- Use the `no` form of this command to delete the DHCP server VLAN from the DHCP Relay.

**Examples**

```
-> ip helper vlan 3 address 75.0.0.10
-> ip helper vlan 250-255 address 198.206.15.2
-> no ip helper vlan 3 address 75.0.0.1
-> no ip helper vlan 1601 address 198.206.15.20
```

**Release History**

Release 7.1.1; command introduced.
Release 8.6R1; command deprecated (use `ip dhcp relay interface destination`).
### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip helper per-vlan-only</td>
<td>Sets the DHCP Relay forwarding option to process only DHCP packets received from a specific, identified VLAN.</td>
</tr>
<tr>
<td>show ip helper</td>
<td>Displays current DHCP Relay configuration information.</td>
</tr>
<tr>
<td>show ip helper statistics</td>
<td>Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.</td>
</tr>
</tbody>
</table>

### MIB Objects

```
iphelperTable
    iphelperService
    iphelperVlan
```
**ip helper standard**

Sets the DHCP Relay forwarding option to standard. All DHCP packets are processed by a global relay service.

```
ip helper standard
```

### Syntax Definitions

N/A

### Defaults

By default, the DHCP Relay forwarding option is set to **standard**.

### Platforms Supported

Not supported in this release.

### Usage Guidelines

To process DHCP packets on a per VLAN basis or to change the DHCP Relay forwarding option from standard to per VLAN, use the `ip helper per-vlan-only` command.

### Examples

```
-> ip helper standard
```

### Release History

Release 7.1.1; command introduced.
Release 8.6R1; command deprecated (use the no form of the `ip dhcp relay per-interface-mode`).

### Related Commands

- `show ip helper` Displays current DHCP Relay configuration information.
- `show ip helper statistics` Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

### MIB Objects

- `iphelperStatTable`
- `iphelperForwOption`
ip helper per-vlan-only

Sets the DHCP Relay forwarding option to process only DHCP packets received from a specific, identified VLAN. This option allows each VLAN to have its own relay.

Syntax Definitions
N/A

Defaults
By default, the UDP forwarding option is set to standard.

Platforms Supported
Not supported in this release.

Usage Guidelines

- When the forwarding option is set to per-vlan-only, the standard (global) DHCP relay service is not available. These two types of services are mutually exclusive.

- To process DHCP packets on a per VLAN basis, or to change the DHCP Relay forwarding option from standard to per VLAN, use the ip helper per-vlan-only command.

- Using the per-vlan-only forwarding option requires you to specify a DHCP server IP address for each VLAN that provides a relay service. The ip helper vlan address command performs this function and at the same time enables relay for the specified VLAN.

Examples
-> ip helper per-vlan-only

Release History
Release 7.1.1; command introduced.
Release 8.6R1; command deprecated (use ip dhcp relay per-interface-mode).
**Related Commands**

- **ip helper vlan address**
  Configures a DHCP Relay service for the specified VLAN.

- **ip helper standard**
  Sets DHCP Relay forwarding option to standard. All DHCP packets are processed.

- **show ip helper**
  Displays current DHCP Relay configuration information.

- **show ip helper statistics**
  Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

**MIB Objects**

- **iphelperStatTable**
  - **iphelperForwOption**
show ip helper

Displays the current DHCP Relay and Relay Agent Information.

show ip helper

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

Not supported in this release.

**Usage Guidelines**

Displays information for all IP addresses configured.

**Examples**

```bash
-> show ip helper
Ip helper :
     Forward Delay(seconds) = 300,
     Max number of hops = 5,
     Relay Agent Information = Enabled,
     Relay Agent Information Policy = Keep,
     DHCP Opt82 Format = Base MAC,
     DHCP Opt82 String = 2c:fa:a2:13:e4:02,
     PXE support = Enabled,
     Forward option = standard mode,
     Bootup Option = Disable,
     Bootup Packet Option = DHCP
     Forwarding address list (Standard mode):
     128.100.16.1
```

**output definitions**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forward Delay</td>
<td>The current forward delay time (default is three seconds). Use the <code>ip dhcp relay forward-delay</code> command to change this value.</td>
</tr>
<tr>
<td>Max number of hops</td>
<td>The current maximum number of hops allowed (default is four hops). Use the <code>ip dhcp relay maximum-hops</code> command to change this value.</td>
</tr>
<tr>
<td>Relay Agent Information</td>
<td>Indicates the status (Enabled or Disabled) of the DHCP relay agent information option feature. Configured through the <code>ip dhcp relay insert-agent-information</code> command.</td>
</tr>
<tr>
<td>Relay Agent Information Policy</td>
<td>The policy configured to determine how the DHCP relay agent handles the DHCP packets that already contain an Option-82 field. Configured through the <code>ip dhcp relay insert-agent-information policy</code> command.</td>
</tr>
</tbody>
</table>
**DHCP Relay Commands**

### Output Definitions

- **DHCP Opt82 Format**
  The type of option-82 information inserted. Configured through the `show ip dhcp relay insert-agent-information format` command.

- **DHCP Opt82 String**
  The option-82 string based on the specified Option-82 format.

- **PXE support**
  Specifies the status (Enabled or Disabled) of the relay agent support for PXE devices. By default the PXE support is disabled. Configured through the `ip dhcp relay pxe-support` command.

- **Forward option**
  The current forwarding option setting: standard mode.

- **Bootup Option**
  Indicates whether or not automatic IP address configuration for default VLAN 1 is done when the switch boots up (Enabled or Disabled). Configured through the `ip interface dhcp-client` command.

- **Bootup Packet Option**
  Indicates if the Bootup Option broadcasts a DHCP or BOOTP packet to obtain an IP address for default VLAN 1.

- **Forwarding Addresses**
  IP addresses for DHCP servers that receive BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the `ip helper address` command to add or remove DHCP server IP addresses from the DHCP Relay configuration.

### Release History

- Release 7.1.1; command introduced.
- Release 8.6R1; command deprecated (use `show ip dhcp relay interface`)

### Related Commands

- **show ip dhcp relay statistics**
  Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

### MIB Objects

  - iphelperService
  - iphelperForwAddr
  - iphelperForwDelay
  - iphelperMaxHops
  - iphelperAgentInformation
  - iphelperAgentInformationPolicy
  - iphelperStatTable
    - iphelperBootupOption
    - iphelperBootupPacketOption
**show ip helper statistics**

Displays the number of packets DHCP Relay has received, the number of packets dropped due to forward delay and maximum hops violations. It also displays the number of packets processed since the last time these statistics were displayed. It includes statistics that apply to a specific DHCP server, such as the number of packets transmitted to the server and the difference between the number of packets received from a client and the number transmitted to the server.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

Not supported in this release.

**Usage Guidelines**

Use the `no ip helper statistics` command to clear DHCP Relay statistics.

**Examples**

```plaintext
-> show ip helper statistics

Global Statistics :
   Reception From Client :
       Total Count = 12, Delta = 12,
   Forw Delay Violation :
       Total Count = 3, Delta = 3,
   Max Hops Violation :
       Total Count = 0, Delta = 0,
   Agent Info Violation :
       Total Count = 0, Delta = 0,
   Invalid Gateway IP :
       Total Count = 0, Delta = 0,
Server Specific Statistics :
   From any Vlan to Server 5.5.5.5
   Tx Server :
       Total Count = 9, Delta = 9
   InvAgentInfoFromServer :
       Total Count = 0, Delta = 0
```

**output definitions**

</table>
no ip helper statistics

Resets the IP helper statistics for the specified VRF instances.

**no ip helper statistics [global-only | server-only | address ip_address | vlan vlan_id {address ip_address}]**

### Syntax Definitions

- **global-only**: Specifies that only the global IP helper statistics must be reset.
- **server-only**: Specifies that only the IP helper statistics related to the server must be reset.
- **vlan_id**: Specifies the VLAN ID for the per-VLAN mode instance.
- **ip_address**: Specifies the IP address for the flat mode instance.

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- This command works only for VRF instances.
- To reset all the IP helper related statistics, use this command without the additional keywords.
- To reset the IP helper statistics for the flat mode instance, provide the related IP address with the `address` keyword.
- To reset the IP helper statistics for the per-vlan mode instance, provide the VLAN ID with the `vlan` keyword and the related IP address with the `address` keyword.

### Examples

- `-> no ip helper statistics`
- `-> no ip helper statistics global-only`
- `-> no ip helper statistics server-only`
- `-> no ip helper statistics address 172.6.5.1`
- `-> no ip helper statistics vlan 20 address 172.6.5.1`

### Release History

Release 7.1.1; command introduced.
Release 8.6R1; command deprecated (use `ip dhcp relay clear statistics`)
Related Commands

show ip helper statistics  Displays the current statistics for each UDP port relay service.

MIB Objects

iphelperStatsTable
  iphelperResetAllStats
  iphelperResetSrvStats
ip udp relay port

Enables or disables generic UDP relay for the specified UDP service port. A user-defined or well-known UDP port number is specified with this command.

**ip udp relay port** *port_num* [description *description*]  
ip udp relay no port *port_num*

---

**Syntax Definitions**

*port_num*  
A UDP service port number (for example, 53, 69, 301).

*description*  
An optional description for the specified UDP service port.

---

**Defaults**

By default, relay is enabled on the BOOTP/DHCP well-known ports.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Use the **no** form of this command to disable generic UDP relay for the specified port.
- Use the **ip dhcp relay** commands to configure functionality for BOOTP/DHCP well-known ports (67/68).

**Examples**

- `-> ip udp relay port 54`
- `-> ip udp relay port 54 description “Generic UDP Service”`
- `-> ip udp relay no port 54`
- `-> ip udp relay port 69 description “TFTP relay”`
- `-> ip udp relay no port 69`

---

**Release History**

Release 7.1.1; command introduced.
Related Commands

**ip udp relay vlan**
Specifies a VLAN on which traffic destined for the specified UDP service port is forwarded.

**ip udp relay svc**
Specifies a Shortest Path Bridging (SPB) service on which traffic destined for the specified UDP service port is forwarded.

**ip udp relay address**
Specifies the UDP server IP address to which traffic destined for the specified UDP port is forwarded as unicast packets.

**show ip udp relay**
Displays the current configuration for UDP services by service name or by service port number.

MIB Objects

genericUdpServiceTable
- genericUdpServiceUdpPort
- genericUdpServiceDescription
- genericUdpServiceRowStatus
**ip udp relay service**

Enables or disables generic UDP relay for the specified UDP service name (NBNS, NBDD, or other well-known UDP ports).

```
ip udp relay service {tftp | tacacs | ntp | nbns | nbdd | dns} [description description]
ip udp relay no service {tftp | tacacs | ntp | nbns | nbdd | dns}
```

**Syntax Definitions**

- **tftp**: TFTP well-known port 69.
- **tacacs**: TACACS well-known port 65.
- **ntp**: NTP well-known port 123.
- **nbns**: NBNS well-known ports 137.
- **nbdd**: NBDD well-known port 138.
- **dns**: DNS well-known port 53.
- **description**: An optional description for the specified UDP well-known service port.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>service name and port #</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to disable UDP Relay for the specified service port.
- The **description** parameter is used with any of the **service** keywords and provides a user-defined description to identify the port service.
- If port relay is enabled for the NBDD well-known port, NBNS is not automatically enabled by default.
- Note that when UDP port relay is enabled for NTP, relay cannot forward NTP packets that contain a destination IP address that matches a VLAN router IP address on the switch.

**Examples**

```
-> ip udp relay service dns
```
-> ip udp relay service dns description dns_1
-> ip udp relay no service dns

**Release History**

Release 7.1.1; command introduced.

  - genericUdpServiceRowStatus
**ip udp relay vlan**

Specifies a VLAN on which traffic destined for the specified UDP service port is forwarded.

```
ip udp relay {service {tftp | tacacs | ntp | nbns | nbdd | dns} | port port_num [description description]} vlan vlan_id[-vlan_id2]
```

```
ip udp relay {service {tftp | tacacs | ntp | nbns | nbdd | dns} | port port_num} no vlan vlan_id[-vlan_id2]
```

**Syntax Definitions**

- **tftp**: TFTP well-known port 69.
- **tacacs**: TACACS well-known port 65.
- **ntp**: NTP well-known port 123.
- **nbns**: NBNS well-known ports 137.
- **nbdd**: NBDD well-known port 138.
- **dns**: DNS well-known port 53.
- **port_num**: A user-defined port number.
- **description**: A description of the UDP service.
- **vlan_id[-vlan_id2]**: VLAN ID number. Use a hyphen to specify a range of VLAN IDs (3-5).

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to remove the VLAN association with the UDP service port.
- The UDP port must be created before using this command.
- Use the **service** keyword to specify a well-known UDP service name. Use the **port** keyword to specify a user-defined or well-known UDP service port number.

**Examples**

- `-> ip udp relay service DNS vlan 10`
- `-> ip udp relay service DNS vlan 500-550`
- `-> ip udp relay service DNS no vlan 10`
-> ip udp relay port 3047 vlan 20
-> ip udp relay port 3047 no vlan 20

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- **ip udp relay port** Enables or disables generic UDP relay for user-defined or well-known UDP service port numbers.
- **ip udp relay service** Enables or disables generic UDP relay for well-known UDP service names.
- **ip udp relay svc** Specifies a Shortest Path Bridging (SPB) service on which traffic destined for the specified UDP port is forwarded.
- **ip udp relay address** Specifies the UDP server IP address to which traffic destined for the specified UDP port is forwarded as unicast packets.
- **show ip udp relay** Displays the current configuration for UDP services by service name or by service port number.

**MIB Objects**

- **genericUdpServiceDstTable**
  - **genericUdpServicePort**
  - **genericUdpServiceDstVlan**
  - **genericUdpServiceDstTblRowStatus**
**ip udp relay svc**

Specifies a Shortest Path Bridging (SPB) service on which traffic destined for a UDP port is forwarded.

```
ip udp relay {service {tftp | tacacs | ntp | nbns | nbdd | dns} | port port_num [description description]} svc service_id[-service_id2]
```

```
ip udp relay service {tftp | tacacs | ntp | nbns | nbdd | dns} | port port_num} no svc service_id[-service_id2]
```

---

**Syntax Definitions**

- **tftp**: TFTP well-known port 69.
- **tacacs**: TACACS well-known port 65.
- **ntp**: NTP well-known port 123.
- **nbns**: NBNS well-known ports 137.
- **nbdd**: NBDD well-known port 138.
- **dns**: DNS well-known port 53.
- **port_num**: A user-defined port number.
- **description**: A description of the UDP service.
- **service_id[-service_id2]**: SPB service ID number. Use a hyphen to specify a range of service IDs (3-5).

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to remove the SPB service association with the UDP service port.
- The UDP port must be created before using this command.
- Use the **service** keyword to specify a well-known UDP service name. Use the **port** keyword to specify a user-defined or well-known UDP service port number.

**Examples**

- `-> ip udp relay service dns svc 10`
- `-> ip udp relay service dns svc 50-55`
- `-> ip udp relay service dns no svc 10`
DHCP Relay Commands

-> ip udp relay port 3047 svc 20
-> ip udp relay port 3047 no svc 20

**Release History**

Release 8.5R4; command introduced.

**Related Commands**

- **ip udp relay port**  
  Enables or disables generic UDP relay for user-defined or well-known UDP service port numbers.

- **ip udp relay service**  
  Enables or disables generic UDP relay for well-known UDP service names.

- **ip udp relay vlan**  
  Specifies the VLAN on which traffic destined for the specified UDP port is forwarded.

- **ip udp relay address**  
  Specifies the UDP server IP address to which traffic destined for the specified UDP port is forwarded as unicast packets.

- **show ip udp relay**  
  Displays the current configuration for UDP services by service name or by service port number.

**MIB Objects**

- **alaGenericUdpServiceSvcTable**
  - **alaGenericUdpServiceSvcPort**
  - **alaGenericUdpServiceDstSvc**
  - **alaGenericUdpServiceSvcRowStatus**
**ip udp relay address**

Specifies the UDP server IP address to which traffic destined for a UDP port is forwarded as unicast packets.

```
ip udp relay {service {tftp | tacacs | ntp | nbns | nbdd | dns} | port port_num [description description]} address ip_address
```

```
ip udp relay service {tftp | tacacs | ntp | nbns | nbdd | dns} | port port_num} no address ip_address
```

**Syntax Definitions**

- **tftp**: TFTP well-known port 69.
- **tacacs**: TACACS well-known port 65.
- **ntp**: NTP well-known port 123.
- **nbns**: NBNS well-known ports 137.
- **nbdd**: NBDD well-known port 138.
- **dns**: DNS well-known port 53.
- **port_num**: A user-defined port number.
- **description**: A description of the UDP service.
- **ip_address**: The IPv4 address of a UDP server.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Yes</strong></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to remove the IP address association with the UDP service port.
- The UDP port must be created before using this command.
- Only one IP address can be configured for a UDP port (multiple IP addresses for the same UDP port is not supported).
- Use the **service** keyword to specify a well-known UDP service name. Use the **port** keyword to specify a user-defined or well-known UDP service port number.
• When the specified UDP port is associated with an IP address, the relay is operating at the Layer 3 level; any attempt to then assign a VLAN or SPB service to that UDP port is blocked. UDP ports associated with a VLAN or SPB service are operating at the Layer 2 level.

**Examples**

- `ip udp relay service dns address 10.2.2.1`
- `ip udp relay service tftp address 20.2.2.1`
- `ip udp relay service dns no address 10.2.2.1`
- `ip udp relay port 3047 address 10.2.2.1`
- `ip udp relay port 3047 address 10.2.2.1`

- `ip udp relay port 54 address 30.2.2.1`
- `ip udp relay port 54 vlan 200`
ERROR: UDP port configured in L3 mode

- `ip udp relay port 64 vlan 200`
- `ip udp relay port 64 address 40.2.2.1`
ERROR: UDP port configured in L2 mode

**Release History**

Release 8.3.1; command introduced.

**Related Commands**

- `ip udp relay port` Enables or disables generic UDP relay for user-defined or well-known UDP service port numbers.
- `ip udp relay service` Enables or disables generic UDP relay for well-known UDP service names.
- `ip udp relay vlan` Specifies the VLAN on which traffic destined for the specified UDP port is forwarded.
- `ip udp relay svc` Specifies the Shortest Path Bridging (SPB) service on which traffic destined for the specified UDP port is forwarded.
- `show ip udp relay` Displays the current configuration for UDP services by service name or by service port number.

**MIB Objects**

- `alaGenericUdpServiceDstIpTable`
  - `alaGenericUdpServiceDstUdpPort`
  - `alaGenericUdpServiceDstIpType`
  - `alaGenericUdpServiceDstIpAddress`
  - `alaGenericUdpServiceDstIpRowStatus`
**show ip udp relay**

Displays the generic UDP relay service configuration.

```
show ip udp relay [service {tftp | tacacs | ntp | nbns | nbdd | dns} | port port_num]
```

### Syntax Definitions

- **tftp**: TFTP well-known port 69.
- **tacacs**: TACACS well-known port 65.
- **ntp**: NTP well-known port 123.
- **nbns**: NBNS well-known ports 137.
- **nbdd**: NBDD well-known port 138.
- **dns**: DNS well-known port 53.
- **port_num**: A user-defined or well-known port number.

### Defaults

By default, the configuration for all UDP services is shown.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td></td>
</tr>
<tr>
<td>UDP port 54</td>
<td>54</td>
<td>20.2.2.1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>UDP port 56</td>
<td>56</td>
<td></td>
<td>10</td>
<td></td>
</tr>
<tr>
<td>TFTP port</td>
<td>69</td>
<td>200</td>
<td></td>
<td>20</td>
</tr>
</tbody>
</table>
```

```
-> show ip udp relay port 54
<table>
<thead>
<tr>
<th>Service Name</th>
<th>Port</th>
<th>IP Address</th>
<th>Vlans</th>
<th>Services</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```
UDP port 54      54      20.2.2.1

-> show ip udp relay service tftp
      Service Name         Port   IP Address       Vlans   Services
      ---------------------+------+----------------+---------+---------------------
      TFTP port            69                      200           20

**Output Definitions**

<td>Port</td>
<td>The UDP service port number.</td>
</tr>
<tr>
<td>IP Address</td>
<td>The destination IP address assigned to the UDP service port. Configured through the <code>ip udp relay address</code> command.</td>
</tr>
<tr>
<td>Vlans</td>
<td>The destination VLANs assigned to the UDP service port. Configured through the <code>ip udp relay vlan</code> command.</td>
</tr>
<tr>
<td>Services</td>
<td>The destination Shortest Path Bridging (SPB) service assigned to the UDP service port. Configured through the <code>ip udp relay svc</code> command.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command introduced.
Release 8.5R4; IP Address and Services field added.

**Related Commands**

`show ip udp relay statistics` Displays the current statistics for each UDP port relay service.

**MIB Objects**

N/A
show ip udp relay statistics

Displays the current statistics for each UDP port relay service. These statistics include the name of the service, the forwarding VLANs, Shortest Path Bridging (SPB) services, or an IP address configured for that service, and the number of packets the service has sent and received.

```
show ip udp relay statistics [service {tftp | tacacs | ntp | nbns | nbdd | dns}] [port [port_num]]
```

### Syntax Definitions

- **tftp**: TFTP well-known port 69.
- **tacacs**: TACACS well-known port 65.
- **ntp**: NTP well-known port 123.
- **nbns**: NBNS well-known ports 137.
- **nbdd**: NBDD well-known port 138.
- **dns**: DNS well-known port 53.
- **port_num**: A user-defined or well-known UDP service port number.

### Defaults

By default, the statistics for all UDP services is shown.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|-------|------|------|------|-------|------|-------|------|------|----------------+-----------------------------------------------|------|
|       | Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes            | Yes                                          | Yes  |

### Usage Guidelines

- Enter a UDP service name with the **service** parameter to display information about a specific service.
- Enter a UDP service port number with the **port** parameter to display information about a specific user-defined or well-known port.
- Use the **ip udp relay no statistics** command to reset statistics counters.

### Examples

```
-> show ip udp relay statistics
Port   Service        Pkts Recvd      Pkts Sent   Dst Vlan/IP Address    Svc
------+--------------+---------------+-----------+----------------------+-----------

<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

When this command is applied, the UDP relay statistics are cleared and the show ip udp relay statistics command displays no information.

Examples

-> ip udp relay no statistics

Release History

Release 7.1.1; command introduced.

Related Commands

show ip udp relay statistics Displays the current statistics for each UDP port relay service.

MIB Objects

genericUdpServiceTable
genericUdpServiceStatReset
**ipv6 udp relay port**

Enables or disables generic IPv6 UDP relay for the specified UDP service port. A user-defined or well-known UDP port number is specified with this command.

```
ipv6 udp relay port port_num [description description]
ipv6 udp relay no port port_num
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port_num</td>
<td>A UDP service port number (for example, 53, 69, 301).</td>
</tr>
<tr>
<td>description</td>
<td>An optional description for the specified UDP service port.</td>
</tr>
</tbody>
</table>

### Defaults

By default, relay is enabled on the BOOTP/DHCP well-known ports.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to disable generic UDP relay for the specified port.
- Use the `ipv6 dhcp relay` commands to configure functionality for BOOTP/DHCP well-known ports (67/68).

### Examples

- `ipv6 udp relay port 54`
- `ipv6 udp relay port 54 description “Generic UDP Service”`
- `ipv6 udp relay no port 54`
- `ipv6 udp relay port 69 description “TFTP relay”`
- `ipv6 udp relay no port 69`

### Release History

Release 8.6R1; command introduced.
**Related Commands**

- **ipv6 udp relay vlan** Specifies a VLAN on which traffic destined for the specified UDP service port is forwarded.
- **ipv6 udp relay svc** Specifies a Shortest Path Bridging (SPB) service on which traffic destined for the specified UDP service port is forwarded.
- **ipv6 udp relay address** Specifies the UDP server IPv6 address to which traffic destined for the specified UDP port is forwarded as unicast packets.
- **show ipv6 udp relay** Displays the current configuration for UDP services by service name or by service port number.

**MIB Objects**

alaGenericUdpv6ServiceTable
  alaGenericUdpv6ServiceUdpPort
  alaGenericUdpv6ServiceDescription
  alaGenericUdpv6ServiceRowStatus
**ipv6 udp relay service**

Enables or disables generic IPv6 UDP relay for the specified UDP service name (DNS, NTP, or other well-known UDP ports).

```
ipv6 udp relay service {tftp | tacacs | ntp | dns} [description description]
ipv6 udp relay no service {tftp | tacacs | ntp | dns}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>tftp</td>
<td>TFTP well-known port 69.</td>
</tr>
<tr>
<td>tacacs</td>
<td>TACACS well-known port 65.</td>
</tr>
<tr>
<td>ntp</td>
<td>NTP well-known port 123.</td>
</tr>
<tr>
<td>dns</td>
<td>DNS well-known port 53.</td>
</tr>
<tr>
<td>description</td>
<td>An optional description for the specified UDP well-known service port.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to disable UDP Relay for the specified service port.
- The `description` parameter is used with any of the `service` keywords and provides a user-defined description to identify the port service.
- Note that when UDP port relay is enabled for NTP, relay cannot forward NTP packets that contain a destination IP address that matches a VLAN router IP address on the switch.

### Examples

- `-> ipv6 udp relay service dns`
- `-> ipv6 udp relay service dns description dns_1`
- `-> ipv6 udp relay no service dns`
Release History
Release 8.6R1; command introduced.

Related Commands

ipv6 udp relay vlan  Specifies a VLAN on which traffic destined for the specified UDP service port is forwarded.
ipv6 udp relay svc  Specifies a Shortest Path Bridging (SPB) service on which traffic destined for the specified UDP service port is forwarded.
ipv6 udp relay address  Specifies the UDP server IPv6 address to which traffic destined for the specified UDP port is forwarded as unicast packets.
show ipv6 udp relay  Displays the current configuration for UDP services by service name or by service port number.

MIB Objects
alaGenericUdpv6ServiceTable
  alaGenericUdpv6ServiceUdpPort
  alaGenericUdpv6ServiceDescription
  alaGenericUdpv6ServiceRowStatus
**ipv6 udp relay vlan**

Specifies a VLAN on which traffic destined for the specified UDP service port is forwarded.

```
ipv6 udp relay {service {tftp | tacacs | ntp | dns} | port port_num [description description]} vlan vlan_id[-vlan_id2]
```

```
ipv6 udp relay {service {tftp | tacacs | ntp | dns} | port port_num} no vlan vlan_id[-vlan_id2]
```

### Syntax Definitions

- **tftp**: TFTP well-known port 69.
- **tacacs**: TACACS well-known port 65.
- **ntp**: NTP well-known port 123.
- **dns**: DNS well-known port 53.
- **port_num**: A user-defined port number.
- **description**: A description of the UDP service.
- **vlan_id[-vlan_id2]**: VLAN ID number. Use a hyphen to specify a range of VLAN IDs (for example, 3-5).

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **no** form of this command to remove the VLAN association with the UDP service port.
- The UDP port must be created before using this command.
- Use the **service** keyword to specify a well-known UDP service name. Use the **port** keyword to specify a user-defined or well-known UDP service port number.

### Examples

- `-> ipv6 udp relay service dns vlan 10`
- `-> ipv6 udp relay service dns vlan 500-550`
- `-> ipv6 udp relay service dns no vlan 10`
- `-> ipv6 udp relay port 3047 vlan 20`
- `-> ipv6 udp relay port 3047 no vlan 20`
**Release History**

Release 8.6R1; command introduced.

**Related Commands**

- **ipv6 udp relay port**
  Enables or disables generic UDP relay for user-defined or well-known UDP service port numbers.

- **ipv6 udp relay service**
  Enables or disables generic UDP relay for well-known UDP service names.

- **ipv6 udp relay svc**
  Specifies a Shortest Path Bridging (SPB) service on which traffic destined for the specified UDP port is forwarded.

- **ipv6 udp relay address**
  Specifies the UDP server IPv6 address to which traffic destined for the specified UDP port is forwarded as unicast packets.

- **show ipv6 udp relay**
  Displays the current configuration for UDP services by service name or by service port number.

**MIB Objects**

- `alaGenericUdpv6ServiceDstTable`
  - `alaGenericUdpv6ServiceDstType`
  - `alaGenericUdpv6ServiceDstPort`
  - `alaGenericUdpv6ServiceDstId`
  - `alaGenericUdpv6ServiceDstDescription`
  - `alaGenericUdpv6ServiceDstRowStatus`
**ipv6 udp relay svc**

Specifies a Shortest Path Bridging (SPB) service on which traffic destined for a UDP port is forwarded.

```plaintext
ipv6 udp relay {service {tftp | tacacs | ntp | dns} | port port_num [description description]} svc service_id[-service_id2]
```

```plaintext
ipv6 udp relay service {tftp | tacacs | ntp | dns} | port port_num no svc service_id[-service_id2]
```

### Syntax Definitions

- **tftp**
  - TFTP well-known port 69.
- **tacacs**
  - TACACS well-known port 65.
- **ntp**
  - NTP well-known port 123.
- **dns**
  - DNS well-known port 53.
- **port_num**
  - A user-defined port number.
- **description**
  - A description of the UDP service.
- **service_id[-service_id2]**
  - SPB service ID number. Use a hyphen to specify a range of service IDs (3-5).

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to remove the SPB service association with the UDP service port.
- The UDP port must be created before using this command.
- Use the `service` keyword to specify a well-known UDP service name. Use the `port` keyword to specify a user-defined or well-known UDP service port number.

### Examples

- `ipv6 udp relay service dns svc 10`
- `ipv6 udp relay service dns svc 50-55`
- `ipv6 udp relay service dns no svc 10`
- `ipv6 udp relay port 3047 svc 20`
- `ipv6 udp relay port 3047 no svc 20`
**Release History**

Release 8.6R1; command introduced.

**Related Commands**

- `ipv6 udp relay port` Enables or disables generic UDP relay for user-defined or well-known UDP service port numbers.
- `ipv6 udp relay service` Enables or disables generic UDP relay for well-known UDP service names.
- `ipv6 udp relay vlan` Specifies the VLAN on which traffic destined for the specified UDP port is forwarded.
- `ipv6 udp relay address` Specifies the UDP server IPv6 address to which traffic destined for the specified UDP port is forwarded as unicast packets.
- `show ipv6 udp relay` Displays the current configuration for UDP services by service name or by service port number.

**MIB Objects**

- `alaGenericUdpv6ServiceDstTable`
  - `alaGenericUdpv6ServiceDstType`
  - `alaGenericUdpv6ServiceDstPort`
  - `alaGenericUdpv6ServiceDstId`
  - `alaGenericUdpv6ServiceDstDescription`
  - `alaGenericUdpv6ServiceDstRowStatus`
**ipv6 udp relay address**

Specifies the UDP server IPv6 address to which traffic destined for a UDP port is forwarded as unicast packets.

```plaintext
ipv6 udp relay {service {tftp | tacacs | ntp | dns} | port port_num [description description]} address ipv6_address
```

```plaintext
ipv6 udp relay service {tftp | tacacs | ntp | dns} | port port_num no address ip6_address
```

### Syntax Definitions

- **tftp**: TFTP well-known port 69.
- **tacacs**: TACACS well-known port 65.
- **ntp**: NTP well-known port 123.
- **dns**: DNS well-known port 53.
- **port_num**: A user-defined port number.
- **description**: A description of the UDP service.
- **ipv6_address**: The IPv6 address of a UDP server.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to remove the IPv6 address association with the UDP service port.
- The UDP port must be created before using this command.
- Only one IPv6 address can be configured for a UDP port (multiple IPv6 addresses for the same UDP port is not supported).
- Use the `service` keyword to specify a well-known UDP service name. Use the `port` keyword to specify a user-defined or well-known UDP service port number.
- When the specified UDP port is associated with an IPv6 address, the relay is operating at the Layer 3 level; any attempt to then assign a VLAN or SPB service to that UDP port is blocked. UDP ports associated with a VLAN or SPB service are operating at the Layer 2 level.
**Examples**

-> ipv6 udp relay service dns address 2001:DB8:3001::3
-> ipv6 udp relay service tftp address 2001:DB8:3001::3
-> ipv6 udp relay service dns no address 2001:DB8:3001::3
-> ipv6 udp relay port 3047 address 2001:DB8:3001::3
-> ipv6 udp relay port 3047 no address 2001:DB8:3001::3

-> ipv6 udp relay port 54 address 30.2.2.1
-> ipv6 udp relay port 54 vlan 200
ERROR: UDP port configured in L3 mode

-> ipv6 udp relay port 64 vlan 200
-> ipv6 udp relay port 64 address 40.2.2.1
ERROR: UDP port configured in L2 mode

**Release History**

Release 8.6R1; command introduced.

**Related Commands**

- **ipv6 udp relay port** Enables or disables generic UDP relay for user-defined or well-known UDP service port numbers.

- **ipv6 udp relay svc** Specifies the Shortest Path Bridging (SPB) service on which traffic destined for the specified UDP port is forwarded.
- **show ipv6 udp relay** Displays the current configuration for UDP services by service name or by service port number.

**MIB Objects**

alaGenericUdpv6ServiceDstIpTable
- alaGenericUdpv6ServiceDstUdpPort
- alaGenericUdpv6ServiceDstIpType
- alaGenericUdpv6ServiceDstIpAddress
- alaGenericUdpv6ServiceDstIpRowStatus
show ipv6 udp relay

Displays the generic UDP relay service configuration.

show ipv6 udp relay [service {tftp | tacacs | ntp | dns} | port port_num]

Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tftp</td>
<td>TFTP well-known port 69.</td>
</tr>
<tr>
<td>tacacs</td>
<td>TACACS well-known port 65.</td>
</tr>
<tr>
<td>ntp</td>
<td>NTP well-known port 123.</td>
</tr>
<tr>
<td>dns</td>
<td>DNS well-known port 53.</td>
</tr>
<tr>
<td>port_num</td>
<td>A user-defined or well-known port number.</td>
</tr>
</tbody>
</table>

Defaults

By default, the configuration for all UDP services is shown.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Enter a UDP service name with the service parameter to display information about a specific service.
- Enter a UDP service port number with the port parameter to display information about a specific user-defined or well-known port.

Examples

- show ipv6 udp relay
  Service Name     Port  IPv6 Address    Vlans/Services
  ----------------+-------+------------------+---------------
  DNS port        53     3001::3          
  UDP port 137    137    123             200

- show ipv6 udp relay port 69
  Service Name     Port  IPv6 Address    Vlans/Services
  ----------------+-------+------------------+---------------
  TFTP port       69     110             
  TFTP port       69     120             
  TFTP port       69     200             
  TFTP port       69     200             
-> show ipv6 udp relay service dns

<table>
<thead>
<tr>
<th>Service Name</th>
<th>Port</th>
<th>IPv6 Address</th>
<th>Vlans/Services</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS port</td>
<td>53</td>
<td>3001::3</td>
<td></td>
</tr>
</tbody>
</table>

**Release History**
Release 8.6R1; command introduced.

**Related Commands**
- **show ipv6 udp relay statistics** Displays the current statistics for each UDP port relay service.

**MIB Objects**
- **N/A**
**show ipv6 udp relay statistics**

Displays the current statistics for each UDP port relay service. These statistics include the name of the service, the forwarding VLANs, Shortest Path Bridging (SPB) services, or an IPv6 address configured for that service, and the number of packets the service has sent and received.

```
show ipv6 udp relay statistics [service {tftp | tacacs | ntp | dns}] [port [port_num]]
```

### Syntax Definitions

- **tftp**  
  TFTP well-known port 69.
- **tacacs**  
  TACACS well-known port 65.
- **ntp**  
  NTP well-known port 123.
- **dns**  
  DNS well-known port 53.
- **port_num**  
  A user-defined or well-known UDP service port number.

### Defaults

By default, the statistics for all UDP services is shown.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

ipv6 dhcp relay admin-state

Enables or disables the DHCPv6 Relay feature on a per-VRF basis.

ipv6 dhcp relay admin-state {enable | disable}

---

**Syntax Definitions**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the DHCPv6 Relay feature.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the DHCPv6 Relay feature.</td>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

DHCPv6 Relay must be explicitly enabled on the interfaces from which received DHCP client messages are to be relayed.

**Examples**

- `-> ipv6 dhcp relay admin-state enable`
- `-> ipv6 dhcp relay admin-state disable`

**Release History**

Release 7.3.4; command introduced.
**Related Commands**

- `ipv6 dhcp relay interface admin-state`
  Enables or disables the relay of DHCPv6 client messages received on an interface.

- `show ipv6 dhcp relay`
  Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

**MIB Objects**

- `alaDHCPv6Config`
  - `alaDHCPv6RelayAdminStatus`
ipv6 dhcp relay interface admin-state

Enables or disables the relay of DHCPv6 client messages received on an interface.

`ipv6 dhcp relay if_name admin-state {enable | disable}

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>if_name</td>
<td>IPv6 interface name.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables the relay of DHCPv6 client messages on an interface.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the relay of DHCPv6 client messages on an interface.</td>
</tr>
</tbody>
</table>

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

At least one relay destination must be configured before enabling the DHCPv6 relay on an interface.

### Examples

`-> ipv6 dhcp relay int1 admin-state enable`

`-> ipv6 dhcp relay int1 admin-state disable`

### Release History

Release 7.3.4; command introduced.
**Related Commands**

- **ipv6 dhcp relay destination**  
  Configures the DHCPv6 relay destination.

- **show ipv6 dhcp relay**  
  Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

**MIB Objects**

- alaDHCPv6RelayInterfaceTable
- alaDHCPv6RelayInterfaceAdminStatus
**ipv6 dhcp relay destination**

Configures the DHCPv6 Relay destination.

```
ipv6 dhcp relay if_name destination ip6_address scope_if_name
no ipv6 dhcp relay if_name destination ip6_address scope_if_name
```

### Syntax Definitions

- **if_name**: IPv6 interface name.
- **ip6_address**: The IPv6 address of the relay destination.
- **scope_if_name**: Name of the interface for the local-link. This must be specified if the relay destination is a link-local. Not required if the destination address is not a link-local address.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Maximum of five relay destinations can be configured for an interface.
- If the relay destination is a link-local address, the name of the interface used to reach the destination must be specified.
- Use the `no` form of the command to remove the configured DHCPv6 Relay destination for an interface.
- The IPv6 interface must be defined for a VLAN or a Shortest Path Bridging (SPB) service before using this command. Packets destined for the specified IPv6 address are relayed over the VLAN or SPB service domain.
- Configuring a DHCPv6 Relay agent for an IPv6 interface that is bound to an SPB service (a service-based IPv6 interface) is supported only on the OmniSwitch 9900.

### Examples

```
-> ipv6 dhcp relay int1 destination 2001:DB8:3001::3
-> ipv6 dhcp relay int1 destination fe80::64 int1
-> no ipv6 dhcp relay int1 destination 2001:DB8:3001::3
```
**Release History**

Release 7.3.4; command introduced.

**Related Commands**

`show ipv6 dhcp relay`  Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

**MIB Objects**

`alaDHCPv6RelayDestinationTable`  
`alaDHCPv6RelayDestinationAddressType`  
`alaDHCPv6RelayDestinationAddress`  
`alaDHCPv6RelayDestinationRowStatus`
**ipv6 dhcp relay maximum-hops**

Sets the maximum number of hops value for the DHCPv6 Relay configuration. This value specifies the maximum number of relays a DHCPv6 packet is allowed to traverse until it reaches its server destination. Limiting the number of hops that can forward a packet prevents packets from looping through the network.

`ipv6 dhcp relay maximum-hops hops`

**Syntax Definitions**

`hops` The maximum number of relays. The valid range is 1–32.

**Defaults**

By default, the maximum hops value is set to 32 hops.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

**Usage Guidelines**

- If a packet contains a hop count equal to or greater than the `hops` value, DHCPv6 Relay discards the packet.
- The maximum hops value only applies to DHCPv6 Relay and is ignored by other services.

**Examples**

`-> ipv6 dhcp relay maximum-hops 1`

`-> ipv6 dhcp relay maximum-hops 10`

**Release History**

Release 8.6R1; command introduced.
Related Commands

- `ipv6 dhcp relay admin-state`  Enables or disables the DHCP Relay feature for the switch.
- `show ipv6 dhcp relay`  Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

MIB Objects

- `alaDHCPv6RelayConfig`
- `alaDHCPv6RelayMaximumHops`
**show ipv6 dhcp relay**

Displays all the interfaces on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>6900 X48C4E/V48C8/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Enabled</td>
<td>Enabled</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Interfaces on which DHCPv6 relay is disabled and which have no relay destinations configured will not be shown in the output.

**Examples**

```
-> show ipv6 dhcp relay
DHCPv6 Relay: Enabled
Maximum Hops: 32

Interface                   Relay Destination(s)                      Status
---------------------------+-----------------------------------------+--------
vlan-41                     ff02::1:2                                 Enabled
vlan-103                    2001:dbc8:8003::17                        Disabled
                              2001:dbc8:8004::99
vlan-200                    fe80::cd0:deff:fe28:1ca5 vlan-201         Enabled
                              tunnel-2 2001:dbc8:a23::ea77
```

**output definitions**

- **DHCPv6 Relay**: Specifies if the DHCPv6 Relay feature is enabled in the current VRF.
- **Maximum Hops**: The maximum number of relays the BOOTP/DHCP packet can go through until it reaches its server destination.
- **Interface**: Displays the interface on which DHCPv6 Relay is enabled.
output definitions

<table>
<thead>
<tr>
<th>Relay Destination(s)</th>
<th>Displays the configured DHCPv6 Relay destination(s) for the interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Displays the status of DHCPv6 Relay on the interface.</td>
</tr>
</tbody>
</table>

Release History

Release 7.3.4; command introduced.
Release 8.6R1; “Maximum Hops” field added.

Related Commands

ipv6 dhcp relay admin-state
ipv6 dhcp relay interface admin-state
ipv6 dhcp relay destination
ipv6 dhcp relay maximum-hops

Enables or disables the DHCPv6 Relay feature on a per-VRF basis.
Enables or disables the relay of DHCPv6 client messages received on an interface.
Configures the DHCPv6 relay destination address.
Configures the maximum number of hops value.

MIB Objects

alaDHCPv6RelayConfig
alaDHCPv6RelayMaximumHops
alaDHCPv6RelayAdminStatus
alaDHCPv6RelayInterfaceTable
alaDHCPv6RelayInterfaceEntry
alaDHCPv6RelayInterfaceAdminStatus
alaDHCPv6RelayDestinationTable
alaDHCPv6RelayDestinationAddress
**dhcp-server**

Enables or disables the DHCP server operation.

`dhcp-server {enable | disable}`

---

### Syntax Definitions

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the DHCP server.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the DHCP server.</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When DHCP server is enabled on the switch, DHCP relay and DHCP snooping will not be supported on the default VRF of the switch.

- DHCP server must be restarted when changes are made to the dhcpd.conf or dhcpd.pcy file. Use the `dhcp-server restart` command to restart the DHCP server.

### Examples

```
-> dhcp-server enable
-> dhcp-server disable
```

### Release History

Release 7.3.4; command was introduced.
Related Commands

- **show dhcp-server leases** Displays the leases offered by the DHCP server.
- **dhcpp-server restart** Allows to restart the DHCP server when the `dhcpp.conf` or `dhcpp.pcy` file is modified.
- **clear dhcp-server statistics** Clears the statistics of the DHCP server.

MIB Objects

- `alaDhcpSrvGlobalConfigStatus`
**dhcp-server restart**

Allows to restart the DHCP server when the dhcpd.conf or dhcpd.pcy file is modified.

```
dhcp-server restart
```

---

**Syntax Definitions**

<table>
<thead>
<tr>
<th>restart</th>
<th>Reverts the DHCP server.</th>
</tr>
</thead>
</table>

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>Yes</td>
</tr>
<tr>
<td>6465</td>

<td>Yes</td>
</tr>
<tr>
<td>6900 V72/C32</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The command can be used to restart the DHCP server when the dhcpd.conf or dhcpd.pcy file is modified.

**Examples**

```
-> dhcp-server restart
```

**Release History**

Release 7.3.4; command was introduced.

**Related Commands**

- **dhcp-server**  
  Enables or disables the DHCP server operation

**MIB Objects**

alaDhcpSrvGlobalRestart
show dhcp-server leases

Displays the leases offered by the DHCP server.

```
show dhcp-server leases [ip- address ip_address | mac-address mac_address] [type {static | dynamic}] [count]
```

### Syntax Definitions

- **ip_address**: Specifies IP address of the interface configured with DHCP server.
- **mac_address**: Specifies MAC address of the interface configured with DHCP server.
- **static**: Displays only static leases.
- **dynamic**: Displays only dynamic leases.
- **count**: Count of DHCP messages recorded.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>

output definitions

General stats Denotes general DHCP Server statistics.
Name Specifies the name assigned to the DHCP server.
Status Specifies up or down status of the DHCP server.
Total subnets used Specifies the total number of subnets being used.
Total subnets managed Specifies the total number of subnets being managed by the DHCP server.
Total subnets unused Specifies the total number of subnets being unused.
Total subnets full Specifies the total number of subnets where all the IP addresses are used.
DHCP Server System Up Time Shows the DHCP Server System Up Time Performance Monitor counter.
### Output Definitions (Continued)

<table>
<thead>
<tr>
<th>Output Definition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sync time</td>
<td>Specifies the time for DHCP server to contact and synchronize with the designated time server.</td>
</tr>
<tr>
<td>Last sync time</td>
<td>Specifies the last time the synchronization occurred.</td>
</tr>
<tr>
<td>Next sync time</td>
<td>Specifies the next time the synchronization should be scheduled.</td>
</tr>
<tr>
<td>Packet stats</td>
<td>Denotes statistical information about the data packet transmission.</td>
</tr>
<tr>
<td>Total DHCP Discovers</td>
<td>Specifies the total number of DHCPDISCOVER packets sent by the clients to the DHCP server.</td>
</tr>
<tr>
<td>Total DHCP Offers</td>
<td>Specifies the total number of DHCPOFFER packets sent by the server to the clients.</td>
</tr>
<tr>
<td>Total DHCP Requests</td>
<td>Specifies the total number of DHC普REQUEST packets sent by the clients in response to the DHCPOFFER packets.</td>
</tr>
<tr>
<td>Total DHCP Request Grants</td>
<td>Specifies the total number of DHCP request grants provided by the server to the clients.</td>
</tr>
<tr>
<td>Total DHCP Request Renews</td>
<td>Specifies the total number of DHCP lease renew requests sent by the clients to the DHCP server.</td>
</tr>
<tr>
<td>Total DHCP Declines</td>
<td>Specifies the total number of DHCP requests declined by the DHCP server.</td>
</tr>
<tr>
<td>Total DHCP Acks</td>
<td>Specifies the total number of DHCPACK acknowledgement packets sent by the DHCP server to the clients.</td>
</tr>
<tr>
<td>Total DHCP Nacks</td>
<td>Specifies the total number of DHCP Negative acknowledgements sent from the DHCP server to the clients. The DHCPNACK message is sent when all the IP addresses available to the server are exhausted and the client sends a DHCPREQUEST.</td>
</tr>
<tr>
<td>Total DHCP Releases</td>
<td>Specifies the total number of DHCPRELEASE packets sent by the DHCP server to release IP addresses from its clients.</td>
</tr>
<tr>
<td>Total DHCP Informs</td>
<td>Specifies the total number of DHCPINFORM packets sent by the clients to obtain DHCP options from the DHCP server.</td>
</tr>
<tr>
<td>Total Bootp requests</td>
<td>Specifies the total number of BOOTP requests sent by the clients to the DHCP server.</td>
</tr>
<tr>
<td>Total Bootp response</td>
<td>Specifies the total number of BOOTP response packets sent by the DHCP server to the clients.</td>
</tr>
<tr>
<td>Total Unknown packets</td>
<td>Specifies the total number of unknown or badly formatted DHCP packets received by the DHCP server.</td>
</tr>
<tr>
<td>Leases stats</td>
<td>Denotes statistical information about leases provided by the DHCP server.</td>
</tr>
<tr>
<td>Hosts Managed</td>
<td>Specifies the total number of clients managed by the DHCP server.</td>
</tr>
<tr>
<td>Hosts used</td>
<td>Specifies the total number of clients using the IP addresses provided by the DHCP server.</td>
</tr>
<tr>
<td>Hosts unused</td>
<td>Specifies the total number of clients managed by the DHCP server which are not being used.</td>
</tr>
<tr>
<td>Hosts Pending</td>
<td>Specifies the total number of DHCP IP address requests which are pending by the DHCP server.</td>
</tr>
<tr>
<td>Hosts unavailable</td>
<td>Specifies the total number of DHCP hosts which are unavailable i.e; whose lease period have expired.</td>
</tr>
</tbody>
</table>
### Static DHCP
Denotes statistical information about the hosts configured with Static DHCP.

### Automatic DHCP
Denotes statistical information about the hosts configured with Automatic DHCP.

### Static BootP
Denotes statistical information about the hosts configured under Static BootP. **Note:** BootP Relay is disabled when DHCP server is enabled on the switch.

### Automatic BootP
Denotes statistical information about the hosts configured with Automatic BootP.

### Subnet statistics
Denotes all DHCP related statistical information for individual subnets.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>Specifies the range of IP addresses in the individual subnet.</td>
</tr>
<tr>
<td>Mask</td>
<td>Specifies the subnet mask.</td>
</tr>
<tr>
<td>Type</td>
<td>Specifies whether the type of IP address allocation is dynamic or static.</td>
</tr>
</tbody>
</table>

### Release History
Release 7.3.4; command introduced.

### Related Commands
- **clear dhcp-server statistics** Clears the DHCP Server lease statistics.

### MIB Objects

<table>
<thead>
<tr>
<th>MIB Object</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td></td>
</tr>
</tbody>
</table>
clear dhcp-server statistics

Clears the packet counters of DHCP server statistics.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to clear the packet counters of DHCP server statistics.

**Examples**

-> clear dhcp-server statistics

**Release History**

Release 7.3.4; command introduced.

**Related Commands**

- `show dhcp-server statistics`  
  Displays the DHCP Server lease statistics.

**MIB Objects**

N/A
dhcpv6-server

Enables or disables the DHCPv6 server operation.

```
dhcpv6-server {enable | disable}
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the DHCPv6 server.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the DHCPv6 server.</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The dhcpdv6.conf and dhcpdv6.pcy files will be parsed when the DHCPv6 status is enabled for the first time.
- There will be one instance of DHCPv6 for the default VRF.

**Examples**

```
-> dhcpv6-server enable
-> dhcpv6-server disable
```

**Release History**

Release 7.3.4; command was introduced.
Related Commands

- **show dhcpv6-server leases**  Displays the leases offered by the DHCPv6 server.
- **dhcpv6-server restart**  Allows to restart the DHCPv6 server when the dhcpdv6.conf or dhcpdv6.pcy file is modified.
- **clear dhcpv6-server statistics**  Displays the statistics of the DHCPv6 server.

MIB Objects

- **alaDhcpv6SrvGlobalConfigStatus**
**dhcpv6-server restart**

Allows to restart the DHCPv6 server when the dhcpdv6.conf or dhcpdv6.pcy file is modified.

Release 7.3.4; command was introduced.

**Related Commands**

`dhcpv6-server` Enables or disables the DHCPv6 server operation.

**MIB Objects**

alaDhcpv6SrvGlobalRestart
show dhcpv6-server leases

Displays the leases offered by the DHCPv6 server.

show dhcpv6-server leases [ip-address ipv6_address | type {static | dynamic}] [count]

**Syntax Definitions**

- `ipv6_address`: Specifies IPv6 address of the interface configured with DHCPv6 server.
- `static`: Displays only static leases.
- `dynamic`: Displays only dynamic leases.
- `count`: Count of DHCPv6 messages recorded.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

output definitions

General
Denotes general DHCPv6 Server statistics.

DHCPv6 Server Name
Specifies the name assigned to the DHCPv6 server.

DHCPv6 Server Status
Specifies up or down status of the DHCPv6 server.

Total subnets used
Specifies the total number of subnets being used.

Total subnets managed
Specifies the total number of subnets being managed by the DHCPv6 server.

Total subnets unused
Specifies the total number of subnets being unused.

Total subnets full
Specifies the total number of subnets where all the IP addresses are used.

DHCP Server System Up Time
Shows the DHCPv6 Server System Up Time Performance Monitor counter.

Sync time
Specifies the time for DHCPv6 server to contact and synchronize with the designated time server.

Last sync time
Specifies the last time the synchronization occurred.

Next sync time
Specifies the next time the synchronization should be scheduled.

Packet stats
Denotes statistical information about the data packet transmission.

Total DHCP Discovers
Specifies the total number of DHCPDISCOVER packets sent by the clients to the DHCPv6 server.
### Output Definitions (Continued)

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to clear the packet counters of DHCPv6 server statistics.

**Examples**

`-> clear dhcpv6-server statistics`

**Release History**

Release 7.3.4; command introduced.

**Related Commands**

- `show dhcpv6-server statistics` Displays the DHCPv6 Server lease statistics.

**MIB Objects**

N/A
**dhcp-message-service**

Enable or disable the message service operation.

```
dhcp-message-service {enable | disable}
```

### Syntax Definitions

- **enable** Enables the operational status of the message service.
- **disable** Disables the operational status of the message service.

### Defaults

By default, the operational status of the message service is disabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The **conf** and **pcy** files are parsed when message service is enabled.
- There is one instance of the message service for the default VRF in the switch that can be enabled or disabled.

### Examples

```
-> dhcp-message-service enable
-> dhcp-message-service disable
```

### Release History

Release 7.3.4; command introduced.

### Related Commands

- **dhcp-message-service restart** Restarts the message service after the msgd.conf file is modified.

### MIB Objects

- **alaMsgSrvGlobalConfigStatus**

---

OmniSwitch AOS Release 8 CLI Reference Guide   April 2023   page 25-122
**dhcp-message-service restart**

Restarts the message service after the `msgd.conf` file or `dhcpd.pcy` is modified.

`dhcp-message-service restart`

Usage Guidelines

N/A

Examples

-> show active-lease-service status
Active Lease Service is enabled

Release History

Release 7.3.4; command introduced.

Related Commands

active-lease-service    Enable or disable the Active Lease Service operation.

MIB Objects

N/A
**dhcp-snooping admin-state**

Enables or disables DHCP Snooping for the switch.

```
dhcp-snooping admin-state {enable | disable}
```

```
no dhcp-snooping
```

---

**Syntax Definitions**

- **enable**: Enables DHCP Snooping for the switch.
- **disable**: Disables DHCP Snooping for the switch.

**Defaults**

By default, this feature is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6</th>
<th>6900 X48C4E/V48C8/C32E/T24C2</th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When DHCP Snooping is administratively disabled for the switch, the DHCP Snooping configuration remains and dynamic binding table entries are cleared.
- When the `no` form of the command is used, the DHCP Snooping configuration is removed and dynamic binding table entries are cleared.

**Examples**

```
-> dhcp-snooping admin-state enable
-> dhcp-snooping admin-state disable
-> no dhcp-snooping
```

**Release History**

Release 7.3.4; command introduced.
Release 8.6R1; `no` form of the command added.
Related Commands

dhcp-snooping vlan
   Enables or disables DHCP Snooping on a per-VLAN basis.
show dhcp-snooping
   Displays the current DHCP Snooping configuration for the switch.

MIB Objects

dhcpSnoopingMode
**dhcp-snooping mac-address-verification**

Globally enables or disables MAC address verification for incoming DHCP traffic. When this feature is enabled, the source MAC address is compared to the client hardware MAC address in the DHCP packet. If these two addresses do not match, the DHCP packet is dropped.

```
dhcp-snooping mac-address-verification admin-state {enable | disable}
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables DHCP MAC address verification for the switch.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables DHCP MAC address verification for the switch.</td>
</tr>
</tbody>
</table>

**Defaults**

By default, this feature is enabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- DHCP Snooping must be enabled before using this command.

- When DHCP Snooping is enabled at the switch level, MAC address verification and Option-82 data insertion are enabled by default. In addition, the trust mode for all ports is set to the DHCP client only mode.

- Changing the enabled or disabled status for MAC address verification is only allowed when DHCP Snooping is globally enabled for the switch.

**Examples**

```
-> dhcp-snooping mac-address-verification admin-state enable
-> dhcp-snooping mac-address-verification admin-state disable
```

**Release History**

Release 7.3.4; command introduced.
Related Commands

- `dhcp-snooping admin-state` Globally enables or disables DHCP Snooping for the switch.
- `dhcp-snooping option-82-data-insertion` Globally enables or disables DHCP Option-82 data insertion for DHCP packets.
- `show dhcp-snooping` Displays the current DHCP Snooping configuration for the switch.

MIB Objects

- `dhcpSnoopingMacAddrVerificationStatus`
**dhcp-snooping option-82-data-insertion**

Globally enables or disables DHCP Option-82 data insertion for DHCP packets. When this feature is enabled, the relay agent inserts the Option-82 field into DHCP packets before forwarding them to the DHCP server.

**dhcp-snooping option-82-data-insertion admin-state {enable | disable}**

---

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables inserting the DHCP Option-82 field into DHCP packets.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables inserting the DHCP Option-82 field into DHCP packets.</td>
</tr>
</tbody>
</table>

**Defaults**

By default, this feature is enabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>

</tr>
</tbody>
</table>

**Usage Guidelines**

- DHCP Snooping must be enabled before using this command.
- When DHCP Snooping is enabled at the switch level, Option-82-data-insertion and MAC address verification are enabled by default. In addition, the trust mode for all ports is set to the DHCP client only mode.

**Examples**

- `-> dhcp-snooping option-82-data-insertion admin-state enable`
- `-> dhcp-snooping option-82-data-insertion admin-state disable`

**Release History**

Release 7.3.4; command introduced.
**Related Commands**

- **dhcp-snooping admin-state**: Globally enables or disables DHCP Snooping for the switch.
- **dhcp-snooping option-82 format**: Configures the type of information that is inserted in both the Circuit ID and Remote ID suboption of the Option-82 field.
- **show dhcp-snooping**: Displays the current DHCP Snooping configuration for the switch.

**MIB Objects**

- `dhcpSnoopingOpt82DataInsertionStatus`
**dhcp-snooping bypass option-82-check**

Enables or disables checking for an Option-82 field in DHCP packets ingressing on untrusted ports.

```
dhcp-snooping bypass option-82-check admin-state {enable | disable}
```

---

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Bypasses the Option-82 field check.</td>
</tr>
<tr>
<td>disable</td>
<td>Checks DHCP packets for the Option-82 field.</td>
</tr>
</tbody>
</table>

---

**Defaults**

By default, this feature is disabled.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Release</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- When this feature is disabled (the default), DHCP packets ingressing on untrusted ports are checked to see if they contain the Option-82 field. If this field is present, the DHCP packet is discarded.

- When this feature is enabled, DHCP packets ingressing on untrusted ports are not checked to see if they contain the Option-82 field. In this case, the Option-82 field is ignored and all DHCP packets are processed.

- Using this command is only allowed when DHCP Snooping is enabled globally for the switch or at the VLAN level.

---

**Examples**

```
-> dhcp-snooping bypass option-82-check admin-state enable
-> dhcp-snooping bypass option-82-check admin-state disable
```

---

**Release History**

Release 7.3.4; command introduced.
Related Commands

- **dhcp-snooping admin-state**: Globally enables or disables DHCP Snooping for the switch.
- **show dhcp-snooping**: Displays the current DHCP Snooping configuration for the switch.

MIB Objects

- **dhcpSnoopingBypassOpt82CheckStatus**
**dhcp-snooping option-82 format**

Configures the type of information that is inserted into both the Circuit ID and Remote ID suboption fields of the Option-82 field.

**Dhcp-snooping option-82 format [base-mac | system-name | user-string string | interface-alias | auto-interface-alias | ascii] { remote-id | circuit-id} [base-mac | cvlan | interface | interface-alias | system-name | user-string string | vlan} {delimiter string}]

**no dhcp-snooping option-82 format ascii {remote-id | circuit-id}**

---

<td>Yes</td>
</tr>
<tr>
<td>6900 V72/C32</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The string parameter specifies user-defined information to insert into the Circuit ID and Remote ID fields.

- When entering a string for user-defined Option-82 information, quotes are required around ambiguous characters, such as hex characters, spaces, etc, so they are interpreted as text. For example, the string “Building B Server” requires quotes because of the spaces between the words.

- The interface-alias parameter will use the alias configured with the interfaces alias command. If no alias is configured a NULL string will be inserted.

- A maximum of 63 characters can be inserted when using the interface-alias and auto-interface-alias commands, remaining characters will be truncated.

- The Option-82 format option is a global setting, the format specified will be applied to all ports on the switch.

- The data specified with this command is added to the Circuit ID and Remote ID fields only when DHCP Option-82 data insertion is enabled for the switch.

- When DHCP Snooping is enabled at the switch level, Option-82 data insertion is enabled by default.

- The ASCII option is used to specify the type of information that is configured in ASCII text string format and then inserted into the Option-82 Circuit ID suboption. Each parameter provided with this command represents a different type of information.

- Configuring the Circuit ID or Remote ID suboption in ASCII format allows up to five fields (types) of information within the ASCII string. However, if the contents of all the fields combined exceeds 127 characters, then the ASCII string is truncated.

- Specifying at least one parameter with ASCII option is required. If multiple parameters are selected, then specifying one of the valid delimiter characters is also required.

- In order for the backward slash “\” delimiter to be parsed correctly it must be entered as “\\”.

- Use the no form of this command to remove the type of information that is inserted into both the Circuit ID and Remote ID suboption fields of the Option-82 fields option-82-check admin-state disable.

Examples

- `-> dhcp-snooping option-82 format user-string “Building B Server”`
- `-> dhcp-snooping option-82 format system-name`
- `-> dhcp-snooping option-82 format base-mac`
- `-> dhcp-snooping option-82 format interface-alias`
- `-> dhcp-snooping option-82 format auto-interface-alias`
-> no dhcp-snooping option-82 format ascii remote-id
-> no dhcp-snooping option-82 format ascii circuit-id
-> dhcp-snooping option-82 format ascii circuit-id cvlan cvlan delimiter "\\"

**dhcp-snooping option-82 policy**

Specifies whether to keep, replace, or drop the Option-82 field from DHCP packets entering the switch.

`dhcp-snooping option-82 policy [replace | keep | drop]`

### Syntax Definitions

- **replace**: Replaces Option-82 field in the incoming DHCP packets.
- **keep**: Keeps Option-82 field in the incoming DHCP packets.
- **drop**: Drops the packet with Option-82 in the incoming DHCP packets.

### Defaults

By default, the Option-82 field is replaced in the DHCP packets.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

</tbody>
</table>

### Usage Guidelines

N/A

### Examples

-> dhcp-snooping option-82 policy replace
-> dhcp-snooping option-82 policy keep
-> dhcp-snooping option-82 policy drop

### Release History

Release 8.5R2; command introduced.

### Related Commands

- **dhcp-snooping admin-state**: Globally enables or disables DHCP Snooping for the switch.
- **show dhcp-snooping**: Displays the global DHCP Snooping configuration.

### MIB Objects

- `dhcpSnoopingOption82Policy`
dhcp-snooping vlan

Enables or disables DHCP Snooping on a per VLAN basis. When this feature is enabled, all DHCP packets received on ports associated with the DHCP Snooping VLAN are filtered.

```
dhcp-snooping vlan vlan_id[-vlan_id2] [mac-address-verification | option-82-data-insertion] admin-state {enable | disable}
```

```
no dhcp-snooping vlan vlan_id[-vlan_id2]
```

**Syntax Definitions**

- `vlan_id[-vlan_id2]`: The VLAN identification number. Valid range is 1–4094. Use a hyphen to specify a range of VLANs (10-15).
- `mac-address verification`: Enables or disables verifying the source MAC address of DHCP packets with the client MAC address contained in the same packet.
- `option-82 data-insertion`: Enables or disables inserting Option-82 information into DHCP packets.
- `admin-state`: Enables or disables DHCP snooping feature for specified VLAN.

**Defaults**

By default, DHCP Snooping is disabled. When this feature is enabled for the specified VLAN, the following default parameter values apply:

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac-address verification</td>
<td>Enabled</td>
</tr>
<tr>
<td>option-82 data-insertion</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove the DHCP Snooping configuration for the specified VLAN.
- The MAC address verification and Option-82 data insertion are applied to packets received on ports associated with the DHCP Snooping VLAN.
If the DHCP relay agent Option-82 feature is enabled, DHCP Snooping is not available. These two features are mutually exclusive.

If the DHCP Snooping feature is globally enabled for the switch, then configuring snooping on a per-VLAN basis is not allowed. The opposite is also true; invoking VLAN based snooping prevents the use of switch level snooping.

Note that disabling the DHCP Snooping Option-82 data insertion operation for a VLAN is not allowed when the binding table functionality is enabled.

Examples

- `dhcp-snooping vlan 100 admin-state enable`
- `dhcp-snooping vlan 100 admin-state disable`
- `dhcp-snooping vlan 100 mac-address-verification admin-state enable`
- `no dhcp-snooping vlan 100`
- `dhcp-snooping vlan 200-205 admin-state enable`
- `dhcp-snooping vlan 200-205 admin-state disable`
- `dhcp-snooping vlan 200-205 option-82 data-insertion admin-state enable`
- `no dhcp-snooping vlan 200-205`

Release History

Release 7.3.4; command introduced.
Release 8.6R1; no form of the command added.

Related Commands

- `dhcp-snooping admin-state` Globally enables or disables DHCP Snooping for the switch.
- `show dhcp-snooping vlan` Displays a list of DHCP Snooping VLANs.

MIB Objects

**dhcp-snooping port**

Configures the DHCP Snooping trust mode for the port. The trust mode determines if the port will accept all DHCP traffic, block all DHCP traffic, or accept only client DHCP traffic.

```
dhcp-snooping port chassis/slot1/port[-port2] {block | client-only | trust}
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot1/port[-port2]**: The slot and port number (1/1/3). Use a hyphen to specify a range of ports (1/1/3-8).
- **block**: Blocks all DHCP traffic on the port.
- **client-only**: Allows only DHCP client traffic on the port.
- **trust**: Allows all DHCP traffic on the port. The port behaves as if DHCP Snooping was not enabled.

### Defaults

By default, the trust mode for a port is set to **client-only** when the DHCP Snooping feature is enabled for the switch or for a VLAN.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The DHCP trust mode only applies when the DHCP Snooping feature is enabled for the switch or for a VLAN.
- If DHCP Snooping is enabled at the switch level, the trust mode applies to all switch ports.
- If DHCP Snooping is enabled for a specific VLAN, then the trust mode applies to only those ports that are associated with that VLAN.

### Examples

```
-> dhcp-snooping port 1/1/24 trust
-> dhcp-snooping port 1/1-10 block
-> dhcp-snooping port 1/1/8 client-only
```
**Release History**

Release 7.3.4; command introduced.

**Related Commands**

**MIB Objects**

- dhcpSnoopingPortTable
  - dhcpSnoopingPortIfIndex
  - dhcpSnoopingPortTrustMode
**dhcp-snooping linkagg**

Configures the DHCP Snooping trust mode for the link aggregate. The trust mode determines if the link aggregate will accept all DHCP traffic, block all DHCP traffic, or accept only client DHCP traffic.

```
dhcp-snooping linkagg agg_id[-agg_id2] {block | client-only | trust}
```

### Syntax Definitions

- **agg_id[-agg_id2]**: The link aggregate ID number. Use a hyphen to specify a range of IDs (1-5).
- **block**: Blocks all DHCP traffic on the link aggregate.
- **client-only**: Allows only DHCP client traffic on the link aggregate.
- **trust**: Allows all DHCP traffic on the link aggregate. The link aggregate behaves as if DHCP Snooping was not enabled.

### Defaults

By default, the trust mode for a link aggregate is set to **client-only** when the DHCP Snooping feature is enabled for the switch or for a VLAN.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The DHCP trust mode only applies when the DHCP Snooping feature is enabled for the switch or for a VLAN.
- If DHCP Snooping is enabled at the switch level, the trust mode applies to all link aggregates.
- If DHCP Snooping is enabled for a specific VLAN, then the trust mode applies to only those link aggregates that are associated with that VLAN.
- Use the `show dhcp-snooping port` command to display the current trust mode for a link aggregate and statistics regarding the number of packets dropped due to DHCP Snooping violations.

### Examples

- `-> dhcp-snooping linkagg 1 trust`
- `-> dhcp-snooping linkagg 5-8 trust`
- `-> dhcp-snooping linkagg 2 block`
- `-> dhcp-snooping linkagg 5-8 block`
- `-> dhcp-snooping linkagg 3 client-only`
-> dhcp-snooping linkagg 5-8 client-only

**Release History**

Release 7.3.4; command introduced.

**Related Commands**

- **dhcp-snooping admin-state**  Globally enables or disables DHCP Snooping for the switch.
- **dhcp-snooping vlan**  Enables or disables DHCP Snooping on a per-VLAN basis.

**MIB Objects**

dhcpSnoopingPortTable
  
  - dhcpSnoopingPortIfIndex
  - dhcpSnoopingPortTrustMode
**dhcp-snooping ip-source-filter admin-state**

Enables or disables the DHCP Snooping IP source filtering functionality for the switch.

`dhcp-snooping ip-source-filter admin-state {enable | disable}`

### Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables IP source filtering for the switch.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables IP source filtering for the switch.</td>
</tr>
</tbody>
</table>

### Defaults

By default, the DHCP Snooping IP source filtering functionality is enabled for the switch.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When IP source filtering is disabled for the switch, the user-defined IP source filtering configuration is maintained but not operationally active.
- When DHCP Snooping is disabled for the switch, the status of IP source filtering is not changed; if IP source filtering is enabled, the functionality is still applied to static binding table entries.

### Examples

- `-> dhcp-snooping ip-source-filter admin-state disable`
- `-> dhcp-snooping ip-source-filter admin-state enable`

### Release History

Release 8.6R1; command introduced.

### Related Commands

- **dhcp-snooping ip-source-filter**  Enables or disables DHCP Snooping IP source filtering for a port, link aggregate, or VLAN.
- **show dhcp-snooping ip-source-filter**  Displays the global IP source filtering status.
MIB Objects

dhcpSnoopingIpSourceFilterAdminState
**dhcp-snooping ip-source-filter**

Enables or disables the IP source filtering capability on a port, link aggregate, or VLAN. When this function is enabled, the switch allows the traffic that matches the client IP address, MAC address, port, and VLAN combination obtained from the DHCP snooping binding table entry.

```
dhcp-snooping ip-source-filter {vlan vlan_id|-vlan_id2} [port chassis/slot/port|-port] | linkagg agg_id|-agg_id2] admin-state {enable | disable}
```

**Syntax Definitions**

- `vlan vlan_id|-vlan_id2` The VLAN identification number (1–4094). Use a hyphen to specify a range of VLANs (10-15).
- `chassis` The chassis identifier.
- `slot1/port|-port2` The slot and port number (1/1/3). Use a hyphen to specify a range of ports (1/1/3-8).
- `agg_id|-agg_id2` The link aggregate ID number. Use a hyphen to specify a range of IDs (1-5).
- `enable` Enables IP source filtering for the specified port, link aggregate, or VLAN.
- `disable` Disables IP source filtering for the specified port, link aggregate, or VLAN.

**Defaults**

By default, IP source filtering is disabled for a port, link aggregate, or VLAN.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Source filtering can be enabled only on the VLANs on which the DHCP Snooping is enabled.
- Source filtering can be enabled as follows:
  - on the ports that are associated with a VLAN on which DHCP Snooping is enabled.
  - on all the ports when DHCP Snooping is globally enabled for the switch.
- The user-defined IP source filtering configuration is not operationally active unless the IP source filtering functionality is globally enabled for the switch. By default, the global functionality is enabled and is configurable through the `dhcp-snooping ip-source-filter admin-state` command.
**Examples**

-> dhcp-snooping ip-source-filter port 1/1/1 admin-state enable
-> dhcp-snooping ip-source-filter port 1/1/1-5 admin-state enable
-> dhcp-snooping ip-source-filter linkagg 2 admin-state enable
-> dhcp-snooping ip-source-filter vlan 10 admin-state enable
-> dhcp-snooping ip-source-filter vlan 20 admin-state disable

**Release History**

Release 7.3.4; command introduced.
Release 8.5R2; support for port ranges added.

**Related Commands**

- `dhcp-snooping ip-source-filter admin-state` Enables or disables DHCP Snooping IP source filtering functionality for the switch.
- `show dhcp-snooping ip-source-filter` Displays the ports or VLANs on which IP source filtering is enabled.

**MIB Objects**

  - `dhcpSnoopingSourceFilterVlanNumber`
  - `dhcpSnoopingSourceFilterVlanFilteringStatus`

- `dhcpSnoopingPortTable`
  - `dhcpSnoopingPortIpSourceFiltering`
dhcp-snooping binding admin-state

Enables or disables the DHCP Snooping binding table functionality. The binding table contains the MAC address, IP address, lease time, binding type (dynamic or static), VLAN number, and the interface information that corresponds to a local untrusted port on the switch.

**dhcp-snooping binding admin-state {enable | disable}**

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the creation of binding table entries.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the creation of binding table entries.</td>
</tr>
</tbody>
</table>

**Defaults**

By default, the binding table functionality is enabled when the DHCP Snooping feature is enabled for the switch or for a VLAN.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>Yes</td>
</tr>
<tr>
<td>6465</td>
<td>Yes</td>
</tr>
<tr>
<td>6560</td>
<td>Yes</td>
</tr>
<tr>
<td>6570M</td>
<td>Yes</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
</tr>
<tr>
<td>6860N</td>
<td>Yes</td>
</tr>
<tr>
<td>6865</td>
<td>Yes</td>
</tr>
<tr>
<td>6900</td>
<td>Yes</td>
</tr>
<tr>
<td>6900V72/C32</td>
<td>Yes</td>
</tr>
<tr>
<td>6900X48C6/T48C6/X48C8/</td>
<td>Yes</td>
</tr>
<tr>
<td>6900C32E/T24C2/X24C2</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Note that enabling the binding table functionality is not allowed if Option-82 data insertion is *not* enabled at either the switch or VLAN level.

**Examples**

- `-> dhcp-snooping binding admin-state disable`
- `-> dhcp-snooping binding admin-state enable`

**Release History**

Release 7.3.4; command introduced.

**Related Commands**

- **dhcp-snooping binding timeout** Configures the amount of time between each automatic save of the binding table contents to a file on the switch.
- **dhcp-snooping binding action** Synchronizes the contents of the DHCP Snooping binding table with the contents of the `dhcpBinding.db` file saved on the switch.

**MIB Objects**
dhcpSnoopingBindingStatus
**dhcp-snooping binding timeout**

Configures the amount of time between each automatic save of the DHCP Snooping binding table contents maintained in memory to a file on the switch. This functionality preserves binding table contents across switch reboots.

**dhcp-snooping binding timeout seconds**

---

**Syntax Definitions**

seconds The number of seconds to wait before the next save. The valid range is 1–600.

**Defaults**

By default, the timeout value is set to 1 second.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The timeout value is only valid if the DHCP Snooping binding table functionality is enabled.
- The contents of the binding table is saved to the `dhcpBinding.db` file in the `/flash/switch` directory.
- The `dhcpBinding.db` file is time stamped when a save of the binding table contents is successfully completed.

**Examples**

- `dhcp-snooping binding timeout 600`
- `dhcp-snooping binding timeout 250`

**Release History**

Release 7.3.4; command introduced.
Release 8.6R1; default timeout changed to 1 second and valid timeout range changed to 1–600 seconds.
Related Commands

- **dhcp-snooping binding admin-state**
  Enables or disables the DHCP Snooping binding table functionality.

- **dhcp-snooping binding action**
  Synchronizes the contents of the DHCP Snooping binding table with the contents of the `dhcpBinding.db` file saved on the switch.

MIB Objects

- `dhcpSnoopingBindingDatabaseSyncTimeout`
dhcp-snooping binding action

Triggers a purge, renew, or save action against the DHCP Snooping binding table. A purge action clears the contents of the table. A renew action populates the table with entries saved in the dhcpBinding.db file. A save action saves table entries in switch memory to the dhcpBinding.db file.

**Syntax Definitions**

```
dhcp-snooping binding action {purge | renew | save}
```

**purge**
Clears all binding table entries that are maintained in switch memory.

**renew**
Populates the binding table with entries saved in the dhcpBinding.db file located in the /flash/switch directory on the switch.

**save**
Saves the binding table entries in switch memory to the dhcpBinding.db file located in the /flash/switch directory on the switch.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The DHCP Snooping binding table is maintained in the switch memory. Binding table entries are saved on a periodic basis to the dhcpBinding.db file on the switch. Use the save option to invoke an explicit save of binding table entries to the dhcpBinding.db file.
- To sync the binding table contents with the contents of the dhcpBinding.db file:
  - use the purge option to clear the binding table entries, then
  - use the renew option to repopulate the binding table with entries saved in the dhcpBinding.db file.

**Examples**

- `-> dhcp-snooping binding action purge`
- `-> dhcp-snooping binding action renew`
- `-> dhcp-snooping binding action save`

**Release History**

Release 7.3.4; command introduced.
Release 8.6.R1; `save` option added.

**Related Commands**

- `dhcp-snooping binding admin-state`: Enables or disables the DHCP Snooping binding table functionality.
- `dhcp-snooping binding timeout`: Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

**MIB Objects**

- `dhcpSnoopingBindingDatabaseAction`
**dhcp-snooping binding persistency**

Retains the entries in the DHCP Snooping binding table for the duration of the lease regardless of the existence of the MAC address in the MAC address table.

```
dhcp-snooping binding persistency admin-state {enable | disable}
```

**Syntax Definitions**

- **enable**: Enables DHCP Snooping binding persistency.
- **disable**: Disables DHCP Snooping binding persistency.

**Defaults**

By default, DHCP Snooping binding persistency is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6</th>
<th>X48C4E/V48C8/C32E/T24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- With this option disabled, the entry will be removed if the MAC address is missing from the MAC address table when the database is synchronized.
- Use the `show dhcp-snooping` command to display the current status.

**Examples**

```
-> dhcp-snooping binding persistency admin-state enable
-> dhcp-snooping binding persistency admin-state disable
```

**Release History**

Release 7.3.4; command introduced.

**Related Commands**

- `dhcp-snooping binding admin-state`: Enables or disables the DHCP Snooping binding table functionality.
- `dhcp-snooping binding timeout`: Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

**MIB Objects**
dhcpSnoopingBindingPersistencyStatus
**dhcp-snooping binding**

Creates a static entry in the binding table.

```
dhcp-snooping binding mac_address port chassis/slot/port address ip_address vlan vlan_id
```

```
no dhcp-snooping binding mac_address port chassis/slot/port address ip_address vlan vlan_id
```

**Syntax Definitions**

- `mac_address` The client MAC address.
- `chassis` The chassis identifier.
- `slot1/port[1-port2]` The slot and port number (3/1).
- `ip_address` The IP address that the DHCP server offered to the client.
- `vlan_id` The VLAN identification number (1–4094).

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6900V72/C32</th>
<th>6900</th>
<th>6900X48C6/T48C6</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Static binding table entries are created using this command. If DHCP Snooping binding table functionality is not enabled, creating a static entry is not allowed.
- Dynamic binding table entries are created when the relay agent receives a DHCPACK packet.
- Use the `no` form of this command to remove a static entry from the DHCP Snooping binding table.

**Examples**

```
-> dhcp-snooping binding 00:2a:95:51:6c:10 port 1/1/15 address 17.15.3.10 vlan 200
```

```
-> no dhcp-snooping binding 00:2a:95:51:6c:10 port 1/1/15 address 17.15.3.10 vlan 200
```

**Release History**

Release 7.3.4; command introduced.
Related Commands

**dhcp-snooping binding timeout**  Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

**dhcp-snooping binding action**  Synchronizes the contents of the DHCP Snooping binding table with the contents of the `dhcpBinding.db` file saved on the switch.

Usage Guidelines

- When DHCP Snooping is enabled for the switch or for a specific VLAN, the DHCP Snooping binding database status is automatically enabled and additional fields are displayed.

- When DHCP Snooping is enabled at the switch level, the “Option 82 Data Insertion Per Switch” and “MAC Address Verification Per Switch” fields are displayed; these fields do not display when DHCP Snooping is enabled at the VLAN level.

Examples

-> show dhcp-snooping
DHCP Snooping :
  DHCP Snooping Status = Disabled
  DHCP Snooping Bypass Opt82-Check = Disabled,
  DHCP Snooping Opt82 Format = Base MAC,
  DHCP Snooping Opt82 String = 2c:fa:a2:13:e4:02,
  DHCP Snooping Binding DB Status = Disabled,
  DHCP Snooping Option-82 Policy = Replace,

-> dhcp-snooping admin-state enable
-> show dhcp-snooping
DHCP Snooping :
  DHCP Snooping Status = Switch-Level Enabled,
  Option 82 Data Insertion Per Switch = Enabled,
  MAC Address Verification Per Switch = Enabled,
  DHCP Snooping Bypass Opt82-Check = Disabled,
  DHCP Snooping Opt82 Format = Base MAC,
  DHCP Snooping Opt82 String = 2c:fa:a2:13:e4:02,
DHCP Snooping Binding DB Status = Enabled,
Database Sync Timeout = 1,
Database Last Sync Time = Oct 25 2016 14:56,
Binding Persistency Status = Disabled,
DHCP Snooping Option-82 Policy = Replace,

-> dhcp-snooping vlan 200 admin-state enable
-> show dhcp-snooping

DHCP Snooping:
DHCP Snooping Status = VLAN-Level,
DHCP Snooping Bypass Opt82-Check = Disabled,
DHCP Snooping Opt82 Format = Base MAC,
DHCP Snooping Opt82 String = 2c:fa:a2:13:e4:02,
DHCP Snooping Binding DB Status = Enabled,
Database Sync Timeout = 1,
Database Last Sync Time = Oct 28 2016 07:36,
Binding Persistency Status = Disabled,
DHCP Snooping Option-82 Policy = Replace,

output definitions

<table>
<thead>
<tr>
<th>DHCP Snooping Status</th>

show dhcp-snooping ip-source-filter

Displays the ports or VLANs on which IP source filtering is enabled.

show dhcp-snooping ip-source-filter {vlan | port}

**Syntax Definitions**

- **vlan** Displays the VLANs on which IP source filtering is enabled.
- **port** Displays the ports on which IP source filtering is enabled.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The show output displays only those ports or VLANs on which IP source filtering is enabled.
- This command also displays the status of the link aggregate ports when source filtering is enabled at VLAN or port level.

**Examples**

-> show dhcp-snooping ip-source-filter port

Global Admin Status : Enabled

<table>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- This command only applies if DHCP Snooping is enabled at the VLAN level.
- Use the show dhcp-snooping command to determine the status of DHCP Snooping at the switch level.

Examples

```bash
-> show dhcp-snooping vlan
VLAN   Admin  Opt82  MAC Addr
ID     State  Insertion Verification
-------+---------+----------+---------------------
  50    Enabled Enabled  Enabled
  60    Enabled Enabled  Enabled
 100    Enabled Disabled  Enabled
 200    Enabled Enabled  Disabled
 300    Disabled Enabled  Enabled
 1500   Disabled Disabled  Disabled
```

output definitions

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>The VLAN identification number for the DHCP Snooping VLAN.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin State</td>
<td>The administrative status of DHCP Snooping for the VLAN (Enabled or Disabled).</td>
</tr>
</tbody>
</table>
**output definitions (continued)**

<table>
<thead>
<tr>

show dhcp-snooping port

Displays the trust mode and DHCP Snooping violation statistics for all switch ports and link aggregates that are filtered by DHCP Snooping.

show dhcp-snooping port [chassis/slot/port | linkagg_id]

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- If DHCP Snooping is operating at the switch level, then information for all switch ports and link aggregates is displayed.

- If DHCP Snooping is operating at the VLAN level, then information for only those ports and link aggregates that are associated with a DHCP Snooping VLAN is displayed.

- The violation statistics displayed only apply to ports and link aggregates that are in the client only trust mode. When the trust mode for a port is changed from client-only to trusted or blocked, the violation counters are set to zero (0).

- Use specific port numbers and link aggregate ID to filter and enhance display.

Examples

-> show dhcp-snooping port

Release History

Release 8.5R2; command introduced.

Related Commands

dhcp-snooping clear counters  Clears the global counters for DHCP Snooping/Relay.

MIB Objects

N/A
### dhcp-snooping clear counters

Clears the global and per NI counters for DHCP Snooping/Relay.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When this command is used, the counter statistics displayed with the `show dhcp-snooping counters` command are reset to zero.

**Examples**

```bash
-> dhcp-snooping clear counters
```

**Release History**

Release 8.5R2; command introduced.

**Related Commands**

- `show dhcp-snooping counters` Displays the DHCP snooping/Relay global counters. NI counters display the cumulative value from requested NIs.

**MIB Objects**

N/A
**show dhcp-snooping isf-statistics**

Displays the IP source filter (ISF) drop counters.

**show dhcp-snooping isf-statistics [vlan vlan_id]**

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When this command is used, the counter statistics displayed with the `show dhcp-snooping isf-statistics` command are reset to zero.

**Examples**

```
-> dhcp-snooping clear isf-statistics
```

**Release History**

Release 8.5R2; command introduced.

**Related Commands**

- `show dhcp-snooping isf-statistics` Displays the ISF drop counters.

**MIB Objects**

N/A
show dhcp-snooping binding

Displays the contents of the DHCP Snooping binding table (database).

```
show dhcp-snooping binding [port chassis/slot/port] | linkagg agg_id | ip-address ip_address | snapshot [static | dynamic]]
```

### Syntax Definitions

- **chassis/slot/port**: The chassis, slot, and port number for which binding table entries are displayed.
- **agg_id**: The link aggregate ID for which binding table entries are displayed.
- **ip_address**: The IPv4 address for which binding table entries are displayed.
- **snapshot**: Displays binding table entries in the configuration snapshot format.
- **static**: Displays only static binding table entries.
- **dynamic**: Displays only dynamic binding table entries.

### Defaults

By default, all binding table entries are displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `dhcp-snooping binding` command to create a static entry in the binding table.
- Dynamic binding table entries are created when the relay agent receives a DHCPACK packet.

### Examples

```
-> show dhcp-snooping binding

Total Number of Binding Entries: 12

<table>
<thead>
<tr>
<th>MAC Address</th>
<th>Port</th>
<th>IP Address</th>
<th>Lease Time</th>
<th>VLAN ID</th>
<th>Binding Type</th>

OmniSwitch AOS Release 8 CLI Reference Guide  April 2023  page 25-178
**Release History**

Release 7.3.4; command introduced.
Release 8.5R2; **snapshot, static, dynamic** parameters added.
Release 8.6R1; **port, linkagg, ip-address** parameters added.

**Related Commands**

- `show dhcp-snooping` Displays the current DHCP Snooping configuration.
- `show dhcp-snooping vlan` Displays a list of DHCP Snooping VLANs.
- `show dhcp-snooping port` Displays the trust mode and DHCP violation statistics for all switch ports that are filtered by DHCP Snooping.

**MIB Objects**

- `dhcpSnoopingBindingStatus`
- `dhcpSnoopingBindingTable`
  - `dhcpSnoopingBindingMacAddress`
  - `dhcpSnoopingBindingIfIndex`
  - `dhcpSnoopingBindingIpAddress`
  - `dhcpSnoopingBindingLeaseTime`
  - `dhcpSnoopingBindingVlan`
  - `dhcpSnoopingBindingType`

---

**output definitions (continued)**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>The IP address offered by the DHCP server.</td>
</tr>
<tr>
<td>Lease Time</td>
<td>The IP address lease time assigned by the DHCP server. A value of 0 indicates a static entry.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>The VLAN ID of the VLAN to which the client belongs.</td>
</tr>
<tr>
<td>Binding Type</td>
<td>Indicates whether the binding table entry is <strong>dynamic</strong> or <strong>static</strong>. Static entries are created using the <code>dhcp-snooping binding</code> command.</td>
</tr>
</tbody>
</table>
**dhcpv6-snooping vlan admin-state**

Enables or disables DHCPv6 Snooping on a per-VLAN basis.

```
dhcpv6-snooping vlan vlan_id[-vlan_id2] admin-state {enable | disable}

no dhcpv6-snooping vlan vlan_id[-vlan_id2]
```

**Syntax Definitions**

- `vlan_id[-vlan_id2]`: The VLAN ID on which DHCPv6 Snooping must be enabled or disabled. Use a hyphen to specify a range of VLANs (10-15).
- `enable`: Enables DHCPv6 Snooping on the specified VLAN.
- `disable`: Disables DHCPv6 Snooping on the specified VLAN.

**Defaults**

By default, this feature is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- DHCPv6 Snooping can be enabled on per-VLAN basis or globally on the switch.
- The global DHCPv6 Snooping must be disabled before enabling the per-VLAN DHCPv6 Snooping.
- When DHCPv6 Snooping is configured on a per-VLAN basis, DHCPv6 snooping is limited to a maximum of 64 VLANs.
- DHCPv6 snooping must not be enabled in configurations where a DHCPv6 server assigns multiple addresses to a client. In such situations, only the first address will be stored in the binding table.
- To completely remove DHCPv6 snooping configuration from a VLAN, use the `no` form of the command.

**Examples**

```
-> dhcpv6-snooping vlan 1 admin-state enable
-> dhcpv6-snooping vlan 10-20 admin-state enable
-> dhcpv6-snooping vlan 1 admin-state disable
-> dhcpv6-snooping vlan 10-20 admin-state disable
-> no dhcpv6-snooping vlan 2
-> no dhcpv6-snooping vlan 10-20
```
**Release History**

Release 8.5R3; command introduced.
Release 8.6R2; VLAN range added.

**Related Commands**

- `dchpv6-snooping binding` Configures a static entry in the binding table.
- `dchpv6-snooping binding persistency` Configures whether to retain or not retain the entries in the DHCPv6 Snooping binding table for the duration of the lease, regardless of the existence of the MAC address in the MAC address table.
- `dchpv6-snooping ipv6-source-filter` Enables or disables the IPv6 source filtering capability at a port, link aggregation, or VLAN level using the DHCPv6 Snooping binding table.
- `show dchpv6-snooping` Displays the global DHCPv6 Snooping configuration.
- `show dchpv6-snooping interfaces` Displays the DHCPv6 Snooping configuration status on per-VLAN.

**MIB Objects**

- `alaiDHCPv6SnoopingTable`
  - `alaiDHCPv6SnoopingInterfaceIndex`
  - `alaiDHCPv6SnoopingInterfaceAdminStatus`
  - `alaiDHCPv6SnoopingInterfaceRowStatus`
**dhcpv6-snooping global admin-state**

Enables or disables DHCPv6 Snooping globally on the switch.

```
dhcpv6-snooping global admin-state {enable | disable}
```

### Syntax Definitions

- **global**
  - The DHCPv6 Snooping is enabled or disabled globally on the switch.

- **enable**
  - Enables DHCPv6 Snooping for the switch.

- **disable**
  - Disables DHCPv6 Snooping for the switch.

### Defaults

By default, this feature is disabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- DHCPv6 Snooping can be enabled on per-VLAN or globally on the switch.
- The per-VLAN DHCPv6 Snooping must be disabled before enabling global DHCPv6 Snooping.
- DHCPv6 snooping must not be enabled in configurations where a DHCPv6 server assigns multiple addresses to a client. In such situations only the first address will be stored in the binding table.

### Examples

- `-> dhcpv6-snooping global admin-state enable`
- `-> dhcpv6-snooping global admin-state disable`

### Release History

Release 8.5R3; command introduced.

```

```
no dhcpv6-snooping binding vlan vlan_id link-local ipv6_address
```

---

**Syntax Definitions**

- `vlan_id` The VLAN ID on which the DHCPv6 client is configured.
- `link-local` The clients link-local IPv6 address.
- `global-address` The IPv6 global unicast address assigned by the DHCPv6 lease server.
- `mac-address` The clients MAC address.
- `port | linkagg` The port or link aggregate used to reach the DHCPv6 client.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When a new binding entry is added or an existing entry is modified using this command, the entry's lease lifetime is changed to indefinite.
- While adding a new binding entry the values for all the parameters must be specified. Else, the binding entry will not be added.
- When a VLAN is deleted, all binding entries on the VLAN including the manually added binding entry is also removed.

**Examples**

```
-> dhcpv6-snooping binding vlan 1 link-local fe80:eaee7:32ff:fe4a:6321 global-address 2001:db8:1000::2b0:d0ff:fe86:880e mac-address 00:00:01:1d:4f:7d linkagg 1
```

```
-> no dhcpv6-snooping binding vlan 1 link-local fe80:eaee7:32ff:fe4a:6321
```

**Release History**

Release 8.5R3; command introduced.
Related Commands

**dhcpv6-snooping global admin-state**  Enables or disables DHCPv6 Snooping globally on the switch.

**dhcpv6-snooping vlan admin-state**  Enables or disables DHCPv6 Snooping on a per-VLAN basis.

**show dhcpv6-snooping binding**  Displays the DHCPv6 Snooping binding table information.

MIB Objects

<table>

</table>
**dhcpv6-snooping binding timeout**

Configures the amount of time between each automatic save of the DHCPv6 Snooping binding table contents maintained in memory to a file on the switch.

**dhcpv6-snooping binding timeout seconds**

---

**Syntax Definitions**

```
seconds
```

The time interval in seconds between automatic save of the DHCPv6 Snooping binding table to file on the switch. The time interval range is 1 to 600 seconds.

**Defaults**

The default value is 1 second.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

The timeout value is only valid if the DHCPv6 Snooping binding table functionality is enabled.

---

**Examples**

```
-> dhcpv6-snooping binding timeout 5
```

---

**Release History**

Release 8.5R3; command introduced.

---

**Related Commands**

<tr>
<td>6900X48C8/C32E/T24C2/</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The DHCPv6 Snooping binding table is maintained in the switch memory. Binding table entries are saved on a periodic basis to the file on the switch. Use the purge, renew, and save options available with this command to sync the binding table contents with the contents of the file.

- While using binding table action commands ensure the binding timeout interval is set greater than 10 seconds from the default interval 1 second to avoid quick timeout.

**Examples**

- `-> dhcpv6-snooping binding action purge`
- `-> dhcpv6-snooping binding action renew`
- `-> dhcpv6-snooping binding action save`

**Release History**

Release 8.5R3; command introduced.
Related Commands

**dhcpv6-snooping binding**  Configures a static entry in the binding table.

**show dhcpv6-snooping binding**  Displays the DHCPv6 Snooping binding table information.

MIB Objects

alaDHCPV6BindingConfig
alaDHCPv6BindingAction
**dhcpv6-snooping binding persistency**

Configures whether to retain or not retain the entries in the DHCPv6 Snooping binding table for the duration of the lease, regardless of the existence of the MAC address in the MAC address table.

**Syntax Definitions**

| enable | Enables DHCPv6 Snooping binding persistency. The DHCPv6 Snooping binding table entries will be retained even if the MAC address is deleted from the switch's MAC cache. |
| disable | Disables DHCPv6 Snooping binding persistency. The DHCPv6 Snooping binding table entries will be deleted if the MAC address is deleted from the switch's MAC cache. |

**Defaults**

By default, DHCPv6 snooping binding persistency is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If the binding table is restored from permanent storage when the DHCPv6 Snooping binding persistency is enabled, all entries will be added to the binding table, even if the MAC address is not in the switch's MAC cache.

- If the binding table is restored from permanent storage when the DHCPv6 Snooping binding persistency is disabled, only entries for which there is a corresponding entry in the switch's MAC cache will be restored.

- The binding entries will get deleted upon lease time expiry and also during link down or MAC address deletion unless persistency is enabled on the switch.

**Examples**

- `-> dhcpv6-snooping binding persistency enable`
- `-> dhcpv6-snooping binding persistency disable`

**Release History**

Release 8.5R3; command introduced.
**Related Commands**

*show dhcpv6-snooping binding*  Displays the DHCPv6 Snooping binding table information.

**MIB Objects**

alaDHCPV6BindingConfig

alaDHCPv6BindingPersistency
**dhcppv6-snooping ipv6-source-filter**

Enables or disables the IPv6 source filtering capability for a port, link aggregate, or VLAN using the DHCPv6 Snooping binding table.

```
dhcppv6-snooping ipv6-source-filter {vlan vlan_id[-vlan_id2] | port chassis/slot1/port[-port2] | linkagg agg_id[-agg_id2]} admin-state {enable | disable}
```

**Syntax Definitions**

- `vlan_id[-vlan_id2]` The VLAN ID on which the IPv6 source filtering needs to be enabled or disabled. Use a hyphen to specify a range of VLAN IDs (10-15).
- `chassis/slot1/port[-port2]` The port number on which the IPv6 source filtering needs to be enabled or disabled. Use a hyphen to specify a range of ports (1/1/3-8).
- `agg_id[-agg_id2]` The linkagg ID on which the IPv6 source filtering needs to be enabled or disabled. Use a hyphen to specify a range of IDs (1-5).
- `enable` Enables IPv6 source filtering for the specified port, link aggregation, or VLAN.
- `disable` Disables IPv6 source filtering for the specified port, link aggregation, or VLAN level.

**Defaults**

By default, IPv6 source filtering is disabled on port, link aggregation, or VLAN level.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- DHCPv6 Snooping must be enabled for IPv6 source filtering to be enabled.
- IPv6 source filtering can be enabled per-VLAN or per-port (linkagg).
- If DHCPv6 Snooping is enabled on switch level, then IPv6 source filtering can be enabled on any port, linkagg or VLAN.
- If DHCPv6 Snooping is enabled on VLAN, then IPv6 source filtering can only be enabled on ports which are part of that VLAN, or on the same VLAN.
- If a static host is connected to IPv6 source filtering enabled port or VLAN, then all the packets coming from this host are dropped. A static binding entry must be created to allow the packets coming from this host to pass.
To support IPv6 source filtering on an OmniSwitch 6560 and OmniSwitch 6570M, use the `capability profile tcam mode` command to set the TCAM mode to source IPv6 filtering. After the TCAM mode is changed, reboot the switch to activate the source IPv6 filtering mode.

**Examples**

- `-> dhcpv6-snooping ipv6-source-filter vlan 1 admin-state enable`
- `-> dhcpv6-snooping ipv6-source-filter vlan 10-15 admin-state enable`
- `-> dhcpv6-snooping ipv6-source-filter port 1/1/2 admin-state enable`
- `-> dhcpv6-snooping ipv6-source-filter port 1/1/3-8 admin-state enable`
- `-> dhcpv6-snooping ipv6-source-filter linkagg 6 admin-state enable`
- `-> dhcpv6-snooping ipv6-source-filter linkagg 1-5 admin-state enable`
- `-> dhcpv6-snooping ipv6-source-filter vlan 1 admin-state disable`
- `-> dhcpv6-snooping ipv6-source-filter vlan 10-15 admin-state disable`
- `-> dhcpv6-snooping ipv6-source-filter port 1/1/2 admin-state disable`
- `-> dhcpv6-snooping ipv6-source-filter port 1/1/3-8 admin-state disable`
- `-> dhcpv6-snooping ipv6-source-filter linkagg 6 admin-state disable`
- `-> dhcpv6-snooping ipv6-source-filter linkagg 1-5 admin-state disable`

**Release History**

Release 8.5R3; command introduced.
Release 8.6R2; VLAN, port, and link aggregate range added.

**Related Commands**

- `dhcpv6-snooping vlan admin-state` Enables or disables DHCPv6 Snooping on a per-VLAN basis.
- `dhcpv6-snooping global admin-state` Enables or disables DHCPv6 Snooping globally on the switch.
- `show dhcpv6-snooping ipv6-source-filter` Displays the port, VLAN or link aggregation on which IPv6 Source Filter (ISF) is configured.

**MIB Objects**

- `alaDHCPV6SourceFilterInterfaceTable`
  - `alaDHCPV6SourceFilterVlanId`
  - `alaDHCPV6SourceFilterInterfaceIfIndex`
  - `alaDHCPV6SourceFilterInterfaceRowStatus`
  - `alaDHCPV6SourceFilterVlanRowStatus`
**ipv6 dhcp guard**

Enables or disables DHCPv6 Guard on a VLAN or a VLAN range. If enabled (the default), DHCPv6 server messages are discarded unless the messages are received on trusted ports. This command also includes an option to enable DHCPv6 Guard for client messages.

```
ipv6 dhcp guard vlan vlan_id [-vlan_id] [client {enable | disable}] [admin-state {enable | disable}]
no ipv6 dhcp guard vlan vlan_id [-vlan_id]
```

**Syntax Definitions**

- `vlan_id[-vlan_id]` A VLAN ID number or a range of VLAN IDs on which the DHCPv6 Guard is configured. The valid range is 1–4094. Use a hyphen to specify a range of VLAN IDs (21-30).
- `client enable` Enables DHCPv6 Guard for client messages. Multicast client-originated messages are sent out only on trusted ports. If there are no configured trusted ports, the client messages are dropped.
- `client disable` Disables DHCPv6 Guard for client messages. Client-originated messages are not checked.
- `admin-state enable` Enables DHCPv6 guard for server messages. DHCPv6 server messages that are not received on configured trusted ports are dropped. Enabling DHCPv6 Guard helps to prevent access from rogue DHCPv6 servers.
- `admin-state disable` Disables DHCPv6 Guard. Server messages are not checked.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>client enable</td>
<td>disable</td>
</tr>
<tr>
<td>admin-state enable</td>
<td>enable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Trusted source ports serve as a filtering mechanism and are identified using the `ipv6 dhcp guard trusted` command.
  - Only DHCPv6 server messages received on trusted ports are allowed.
  - Client multicast messages are sent out only on trusted ports rather than flooded out on all ports in the VLAN.
- Enabling DHCPv6 Guard without configuring any trusted ports helps to prevent unwanted DHCPv6 traffic flow. For example:
  - DHCPv6 server messages are discarded, which helps to prevent messages from reaching clients on the VLAN.
  - If the client option is also enabled, then DHCPv6 multicast client messages are also discarded. This helps to prevent DHCPv6 traffic from getting past the switch. If there are no client messages sent out, then there are no responses sent from the DHCPv6 server.
- Use the `no` form of this command to remove the DHCPv6 Guard configuration, which includes removing any configured trusted ports for the VLAN.

**Examples**

```plaintext
-> ipv6 dhcp guard vlan 200 admin-state enable
-> ipv6 dhcp guard vlan 200 admin-state disable
-> ipv6 dhcp guard vlan 200 client enable
-> ipv6 dhcp guard vlan 200 client disable
-> no ipv6 dhcp guard vlan 200
```

**Release History**

Release 8.5R2; command introduced.
Release 8.6R1; `vlan` and `client` parameters added, `if_name` parameter deprecated.
Release 8.8R1; support for VLAN range added.

**Related Commands**

- `ipv6 dhcp guard trusted` Configures the DHCPv6 Guard trusted source ports.
- `show ipv6 dhcp guard` Displays the DHCPv6 Guard configuration.

**MIB Objects**

alaDHCPv6GuardInterfaceTable

```
ipv6 dhcp guard vlan vlan_id trusted [port chassis/slot/port [-port2]] | linkagg agg_id[-agg_id2]]
no ipv6 dhcp guard vlan vlan_id trusted [port chassis/slot/port [-port2]] | linkagg agg_id[-agg_id2]]
```

**Syntax Definitions**

- `vlan_id` The VLAN ID on which DHCPv6 Guard is configured.
- `chassis/slot/port [-port2]` The chassis/slot/port on which the DHCPv6 server messages must be allowed. Use a hyphen to specify a range of ports (3/1-10). Make sure the port is a member of the specified VLAN.
- `agg_id[-agg_id2]` The link aggregate ID on which the DHCPv6 server messages must be allowed. Use a hyphen to specify a range of IDs (10-15). Make sure the link aggregate ID is a member of the specified VLAN.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

DHCP Relay Commands  

**show dhcpv6-snooping ipv6-source-filter**

**output definitions**

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>Displays the VLAN on which the ISF is enabled.</th>
</tr>
</thead>
<tbody>
<tr>
<td>PORT</td>
<td>Displays the port or link aggregation on which the ISF is enabled.</td>
</tr>
</tbody>
</table>

**Release History**

Release 8.5R3; command introduced.

**Related Commands**

`dhcpv6-snooping ipv6-source-filter` Enables or disables the IPv6 source filtering capability at a port, link aggregation, or VLAN level using the DHCPv6 Snooping binding table.

**MIB Objects**

- `alaDHCPv6SourceFilterVlanId`
- `alaDHCPv6SourceFilterInterfaceIfIndex`
show ipv6 dhcp guard

Displays the DHCPv6 Guard configuration.

```
show ipv6 dhcp guard [vlan vlan_id]
```

### Syntax Definitions

- **vlan_id**
  
  Displays the DHCPv6 Guard configuration for the specified VLAN.

### Defaults

By default, a summary table of information about all VLANs on which DHCPv6 Guard is configured is displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Specify the `vlan vlan_id` option to view the DHCPv6 Guard configuration for a specific VLAN.

### Examples

```
-> show ipv6 dhcp guard
Interface                        Status   Client   Trusted Ports
--------------------------------+--------+--------+--------------------------------
VLAN 200                         Enabled  Disabled 1/1/9, 1/1/10, 1/1/11, 1/1/12+
VLAN 250                         Enabled  Disabled
VLAN 300                         Enabled  Enabled  agg 10, 1/4/20
```

#### output definitions

- **Interface**
  
  Displays the VLAN on which the DHCPv6 Guard is configured.

- **Status**
  
  Displays the status of DHCPv6 Guard (**Enabled** or **Disabled**).

- **Client**
  
  Displays the status of DHCPv6 Guard for client messages (**Enabled** or **Disabled**).

- **Trusted Ports**
  
  Displays the DHCPv6 Guard trusted sources. A '+' will appear at the end of the list to indicate that there are more trusted sources configured which cannot be displayed in a single line. To view the full list of configured trusted sources, specify the VLAN ID in the show command.
-> show ipv6 dhcp guard vlan 200
DHCPv6 Guard = Enabled
Client Guard = Disabled
Trusted ports:
   1/1/9
   1/1/10
   1/1/11
   1/1/12
   1/1/20

-> show ipv6 dhcp guard vlan 250
DHCPv6 Guard = Enabled
Client Guard = Disabled

-> show ipv6 dhcp guard vlan 300
DHCPv6 Guard = Enabled
Client Guard = Enabled
Trusted ports:
   linkagg 10
   1/4/20

The Virtual Router Redundancy Protocol (VRRP) eliminates the single point of failure in a default route environment. VRRP specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the IPv4 or IPv6 VRRP routers on the LAN. The VRRP router that controls the IPv4 or IPv6 address associated with a virtual router is called the master router and is responsible for forwarding packets to that IPv4 or IPv6 address. If the master router becomes unavailable, the highest priority backup router will transition to the master state. The OmniSwitch implementation of VRRP also supports the collective management of virtual routers on a switch.

The VRRP commands comply with RFC 3768 for VRRP version 2 (IPv4) and RFC 5798 for VRRP version 3 (IPv4 and IPv6).

MIB information is as follows:

- **Filename**: VRRP-MIB.mib
  **Module**: vrrpMIB

- **Filename**: VRRPv3-MIB.mib

---
vrrp

Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.

```
{ip | ipv6} vrrp vrid interface if_name admin-state [enable | disable] [priority priority] [preempt | no preempt] [accept | no accept] [interval centiseconds] [version {v2 | v3}]
```

```
no {ip | ipv6} vrid interface if_name
```

### Syntax Definitions

- **ip**
  - Configures an IPv4 virtual router.

- **ipv6**
  - Configures an IPv6 virtual router.

- **vrid**
  - The virtual router ID. The valid range is 1–255.

- **if_name**
  - The name of an existing IPv4 or IPv6 interface on which the virtual router is configured.

- **enable**
  - Enables the virtual router. An IPv4 virtual router may only be enabled if an IP address is configured for the virtual router (not required to enable an IPv6 virtual router).

- **disable**
  - Disables the virtual router. Cannot be combined on the same line with other parameters.

- **priority**
  - The priority for this virtual router to become the master router. The range is 1 (lowest priority) to 255 (highest priority). The priority should be set to 255 only if this router is the actual owner of the virtual router’s IP address.

- **preempt**
  - Specifies that a higher priority router may preempt a lower priority master router. However, the virtual router's actual IP address owner will always preempt another master router regardless of whether preempt is enabled.

- **no preempt**
  - Specifies that a higher priority router may not preempt a lower priority master router.

- **accept**
  - Specifies that the master router, which is not the IP address owner, will accept the packets addressed to the IP address owner as its own. *This parameter applies only to IPv4 version 3 and IPv6 virtual routers.*

- **no accept**
  - Specifies that the master router, which is not the IP address owner, will not accept the packets addressed to the IP address owner as its own. *This parameter applies only to IPv4 version 3 and IPv6 virtual routers.*

- **centiseconds**
  - The interval in centiseconds after which the master router will send VRRP advertisements. The advertising interval must be the same for all VRRP routers configured with the same VRID. The valid interval ranges are as follows:
    - 1–25500 centiseconds for VRRP version 2 router.
    - 1–4095 centiseconds for VRRP version 3 router.

- **v2**
  - Converts an IPv4 VRRP router to a version 2 virtual router. *This parameter applies only to IPv4 virtual routers; IPv6 virtual routers are always version 3.*
v3

Converts an IPv4 VRRP router to a version 3 virtual router. *This parameter applies only to IPv4 virtual routers; IPv6 virtual routers are always version 3.*

**Defaults**

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove a virtual router from the configuration.
- Use the `ip vrrp address` command to configure an IPv4 address for the virtual router. This must be done before the IPv4 virtual router can be enabled (not required to enable an IPv6 virtual router).
- To disable the virtual router, rather than remove it, use the `admin-state disable` option. Note that this option cannot be used with any other optional parameter.
- Do not disable a virtual router when it is the address owner without first disabling the IP interface. Failure to do so may result in duplicate IP address errors.
- A virtual router must be disabled before it can be modified.
- A priority value of 255 indicates that the VRRP router owns the IP address; that is, the router contains the real physical interface to which the IP address is assigned. The system automatically sets this value to 255 if it detects that this router is the IP address owner. If the priority is set to 255 and the virtual router is not the IP address owner, then the priority will be set to the default value of 100. The IP address owner will always be the master router if it is available.
- VRRP routers backing up a virtual router must use priority values from 1 to 255. The default priority value for VRRP routers backing up a virtual router is 100. If you configure more than one backup, their priority values should be different. The `preempt` or `no preempt` setting specifies whether or not a higher priority router may preempt a lower priority master router.
• The maximum number of virtual routers supported is based on the 100 centisecond advertising interval. A smaller interval will result in a relatively lesser number of virtual routers.

• The VRRP router version (v2 or v3) determines the advertising interval value range and the level of granularity that is used to specify the interval value. For example:
  – The advertising interval range for VRRP version 2 is 1–25500 and cannot be less than 100 centiseconds. The interval value should also be entered in increments of 100 (for example, 100, 200, 300) up to the maximum allowed. If the interval value is not specified in an increment of 100, then the value is rounded down to the next increment of 100. For example, if a value of 209 is specified, then that value is rounded down to 200.
  – The advertising interval range for VRRP version 3 is 1–4095 and cannot be less than 10 centiseconds. The interval value should also be entered in increments of 10 (for example, 10, 20, 30) up to the maximum allowed. If the interval value is not specified in an increment of 10, then the value is rounded down to the next increment of 10. For example, if a value of 15 is specified, then that value is rounded down to 10.

Examples

-> ip vrrp 23 interface ipv4-100 priority 75
-> ip vrrp 23 interface ipv4-100 address 192.168.173.1
-> ip vrrp 23 interface ipv4-100 admin-state enable

-> ip vrrp 23 interface ipv4-100 admin-state disable
-> ip vrrp 23 interface ipv4-100 priority 255
-> ip vrrp 23 interface ipv4-100 admin-state enable
-> no ip vrrp 23 interface ipv4-100

-> ip vrrp 28 interface v4if-v150 interval 30000
ERROR: Advertisement interval must be between 1 and 25500

-> ipv6 vrrp 33 interface ipv6-200 priority 75
-> ipv6 vrrp 33 interface ipv6-200 admin-state enable

-> ipv6 vrrp 33 interface ipv6-200 admin-state disable
-> ipv6 vrrp 33 interface ipv6-200 priority 50
-> ipv6 vrrp 33 interface ipv6-200 admin-state enable
-> no ipv6 vrrp 33 interface ipv6-200

-> ipv6 vrrp 44 interface "v6if-v200" interval 4096
ERROR: Advertisement interval must be between 1 and 4095 for version V3

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; interface and version parameter added; vlan_id parameter deprecated.
Release 8.7R2; VRRP router advertising interval range updated.
Related Commands

vrrp address

Configures an IPv4 or IPv6 address for a VRRP virtual router.

{ip | ipv6} vrrp vrid interface if_name address {ipv4_address | ipv6_address}
{ip | ipv6} vrrp vrid interface if_name no address {ipv4_address | ipv6_address}

Syntax Definitions

ip                  Configures an IPv4 address for a virtual router.
ipv6                Configures an IPv6 address for a virtual router.
vrid                The virtual router ID. The valid range is 1–255.
if_name             The name of an existing IPv4 or IPv6 interface on which the virtual
                    router is configured.
ipv4_address        The virtual IPv4 address to associate with the specified virtual router.
ipv6_address        The virtual IPv6 address to associate with the specified virtual router.

Defaults

N/A

Platforms Supported

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

An IPv4 address must be configured for an IPv4 virtual router before the virtual router can be enabled (not required to enable an IPv6 virtual router).

Examples

-> ip vrrp 23 interface ipv4-100 address 192.168.173.1
-> ip vrrp 23 interface ipv4-100 address 192.168.173.2
-> ip vrrp 23 interface ipv4-100 no address 192.168.173.1

-> ipv6 vrrp 33 interface ipv6-200 213:100:1::56
-> ipv6 vrrp 33 interface ipv6-200 213:100:1::57
-> ipv6 vrrp 33 interface ipv6-200 no address 213:100:1::56
**Release History**

Release 7.1.1; command was introduced.
Release 8.5R2; **interface** parameter added; **vlan_id** and optional **ip** parameter deprecated.

**Related Commands**

- **vrrp**
  Configures a new VRRP virtual router or modifies an existing one. Used to enable to disable a virtual router.

- **show vrrp**
  Displays the virtual router configuration for all virtual routers or for a specific virtual router.

- **show vrrp statistics**
  Displays statistics about VRRP packets for all virtual routers configured on the switch or for a specific virtual router.

**MIB Objects**

- **vrrpv3AssociatedIpAddrTable**

  **vrrpv3AssociatedIpAddrRowStatus**
vrrp track

Creates a new tracking policy or modifies an existing tracking policy.

```
ip vrrp track track_id [admin-state [enable | disable] | priority priority | ipv4-interface if_name | ipv6-interface if_name | port chassis/slot/port | address ip_address [bfd-state {enable | disable} | delay seconds]]
```

```
no ip vrrp track track_id
```

Syntax Definitions

- **track_id**: The ID of the tracking policy. The valid range is 1–255.
- **admin-state enable**: Enables the tracking policy.
- **admin-state disable**: Disables the tracking policy.
- **priority**: The decrement priority value. A virtual router monitoring this tracking policy will have its priority decremented by this value when the conditional state of the tracking policy entity is down. The valid range is 0–255.
- **if_name**: The name of the IPv4 or IPv6 interface that this policy will track.
- **chassis**: The chassis identifier.
- **slot/port**: The slot/port number that this policy will track.
- **ip_address**: The remote IPv4 or IPv6 address that this policy will track.
- **bfd-state enable**: Enables Bidirectional Forwarding Detection (BFD) for an address tracking policy. This parameter is not supported on the OmniSwitch 6560 and OmniSwitch 6570M.
- **bfd-state disable**: Disables BFD for an address tracking policy. This parameter is not supported on the OmniSwitch 6560 and OmniSwitch 6570M.
- **delay seconds**: The amount of time to wait after a VRRP address track is detected as operationally up and before the associated virtual router's priority value is incremented by the tracking policy's priority value. The valid range is 0–60 seconds.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>admin-state enable</td>
<td>disable</td>
</tr>
<tr>
<td>priority</td>
<td>25</td>
</tr>
<tr>
<td>bfd-state enable</td>
<td>disable</td>
</tr>
<tr>
<td>seconds</td>
<td>0</td>
</tr>
</tbody>
</table>
Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the **no** form of this command to remove a tracking policy.
- Use the **admin-state disable** option to disable the tracking policy, rather than removing it from the switch.
- Registering VRRP with BFD is required at the protocol level before VRRP can interact with BFD. Once VRRP is a registered protocol with BFD, then BFD can be enabled for a specific VRRP address tracking policy.
- Enabling BFD for an address tracking policy requires a Loopback0 interface on the local switch. The IP address of this interface will serve as the source IP address of BFD packets. For more information about configuring a Loopback0 interface, see the “IP Commands” or “IPv6 Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide*.
- Configuring the delay time for an IPv4 address or IPv6 address tracking policy helps to prevent the loss of device connectivity that may occur before a virtual router prematurely becomes the master. For example, configuring a delay time allows the switch routing tables to stabilize before the master router resumes the master role.

Examples

```
-> ip vrrp track 2 admin-state enable priority 50 ipv4-interface Marketing
-> ip vrrp track 3 admin-state enable priority 60 ipv6-interface Sales
-> ip vrrp track 2 address 10.1.1.1 bfd-state enable
-> ip vrrp track 3 address 10.1.1.2 delay 30
-> ip vrrp track 4 address 10.1.1.2 bfd-state enable delay 45
-> ip vrrp track 5 address 20.1.1.12 bfd-state enable delay 45
-> ip vrrp track 2 address 10.1.1.12 bfd-state enable delay 45
-> no ip vrrp track 2
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **delay** parameter added.
**Related Commands**

**vrrp track-association**
Associates a VRRP tracking policy with a virtual router.

**vrrp bfd-state**
Enables or disables the BFD protocol for VRRP.

**show vrrp track**
Displays information about tracking policies on the switch.

**MIB Objects**

vrrp bfd-state

Enables or disables the registration of VRRP with the BFD protocol.

```
ip vrrp bfd-state {enable | disable}
```

**Syntax Definitions**

- **enable**: Enables BFD for VRRP.
- **disable**: Disables BFD for VRRP.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- BFD interaction with VRRP is supported only for VRRP tracking policies that track a remote IP address.
- BFD must be globally enabled for the switch and VRRP must be registered with BFD at the protocol level before VRRP can interact with BFD.

**Examples**

```
-> ip bfd admin-state enable
-> ip vrrp bfd-state enable
-> ip vrrp bfd-state disable
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

  - Enables or disables the global BFD protocol status for the switch.

- **show vrrp**
  - Displays the virtual router configuration for all virtual routers or for a specific virtual router

MIB Objects

- **alaVrrpConfig**
  - **alaVrrpBfdStatus**
vrrp track-association

Associates an IPv4 or IPv6 VRRP tracking policy with a virtual router.

\{ip | ipv6\} vrrp vrid interface if_name track-association track_id
\{ip | ipv6\} vrrp vrid interface if_name no track-association track_id

Syntax Definitions

ip Associates a tracking policy with an IPv4 virtual router.
ipv6 Associates a tracking policy with an IPv6 virtual router.
vrid The virtual router ID. The valid range is 1–255.
if_name The name of an existing IPv4 or IPv6 interface on which the virtual router is configured.
track_id The ID of the tracking policy to associate with the virtual router. The valid range is 1–255.

Defaults

N/A

Usage Guidelines

- Use the no form of this command to remove a tracking policy from a virtual router.
- The tracking policy ID must already exist in the switch configuration. Use the vrrp track command to create a tracking policy.

Examples

- \(\rightarrow\) ip vrrp 23 interface ipv4-100 track-association 1
- \(\rightarrow\) ip vrrp 23 interface ipv4-100 no track-association 1

- \(\rightarrow\) ipv6 vrrp 33 interface ipv6-200 track-association 1
- \(\rightarrow\) ipv6 vrrp 33 interface ipv6-200 no track-association 1
**Release History**

Release 7.1.1; command was introduced.
Release 8.5R2; `interface` parameter added; `vlan_id` parameter deprecated.

**Related Commands**

- **vrrp**
  - Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.

- **vrrp track**
  - Configures a VRRP or VRRP3 tracking policy.

- **show vrrp track-association**
  - Displays the tracking policies associated with virtual routers.

**MIB Objects**

alaVrrp3AssoTrackTable
- alaVrrp3AssoTrackId
- alaVrrp3TrackRowStatus
**vrrp delay**

Configures the amount of time allowed for routing tables to stabilize before virtual routers are started.

```
   ip vrrp delay seconds
```

**Syntax Definitions**

- `seconds` The amount of time after a reboot that virtual routers will wait before they go active. The valid range is 0–180 seconds.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>45 seconds</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to prevent loss of workstation connectivity before a virtual router becomes master.

**Examples**

```
   -> ip vrrp delay 50
```

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

**vrrp**
Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.

**show vrrp**
Displays the virtual router configuration for all virtual routers or for a specific virtual router.

**MIB Objects**

`alaVRRPConfig`

`alaVRRPStartDelay`
vrrp version

Modifies the default VRRP version assigned to the IPv4 virtual routers on the switch. The VRRP version for IPv6 virtual routers is not configurable (IPv6 virtual routers support only version 3).

ip vrrp version [v2 | v3]

Syntax Definitions

| v2 | Assigns version 2 by default to IPv4 virtual routers. |
| v3 | Assigns version 3 by default to IPv4 virtual routers. |

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>v2</td>
<td>v2</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Modifying the default VRRP version will affect the version assigned by default to any new IPv4 virtual routers that are created.

- To apply the new default value to the existing IPv4 virtual routers, first disable the virtual routers, then apply the new default value using the `ip vrrp set version` command and enable the virtual routers again.

- If any of the IPv4 virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the `ip vrrp set version` command with the `override` option and enable the virtual routers again.

- There is no interoperability between VRRP version 2 and 3. A version 3 virtual router will not acknowledge version 2 advertisements.

- The VRRP router version (`v2` or `v3`) determines the advertising interval value range and the level of granularity that is used to specify the interval value. For example:
  - The advertising interval range for VRRP version 2 is 1–25500 and cannot be less than 100 centiseconds. The interval value should also be entered in increments of 100 (for example, 100, 200, 300) up to the maximum allowed.
  - The advertising interval range for VRRP version 3 is 1–4095 and cannot be less than 10
centiseconds. The interval value should also be entered in increments of 10 (for example, 10, 20, 30) up to the maximum allowed.

**Examples**

```
-> ip vrrp version v3
-> ip vrrp version v2

-> ip vrrp admin-state disable
-> ip vrrp set version
-> ip vrrp set version override
-> ip vrrp admin-state enable
```

**Release History**

Release 8.5R2; command introduced.

**Related Commands**

- **vrrp admin-state**: Changes the administrative status of all the virtual routers on the switch.
- **vrrp set**: Sets the new default parameter values to existing virtual routers on the switch.
- **show vrrp**: Displays the virtual router configuration for all virtual routers or for a specific virtual router.

**MIB Objects**

- `alaVRRPv3IPv4Config`
- `alaVRRPv3IPv4DefaultVersion`
**vrrp interval**

Modifies the default advertising interval value assigned to the IPv4 or IPv6 virtual routers on the switch.

```
{ip | ipv6} vrrp interval centiseconds
```

### Syntax Definitions

- **ip**: Modifies the default advertising interval value assigned to IPv4 virtual routers.
- **ipv6**: Modifies the default advertising interval value assigned to IPv6 virtual routers.
- **centiseconds**: The default advertising interval to assign to IPv4 (version 2 or 3) virtual routers or IPv6 (version 3) virtual routers.
  - 1–25500 centiseconds for a VRRP version 2 router.
  - 1–4095 centiseconds for a VRRP version 3 router.

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>centiseconds</td>
<td>100</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Modifying the default advertising interval value will affect the value assigned by default to any new IPv4 or IPv6 virtual routers that are created.

- To apply the new default value to existing IPv4 or IPv6 virtual routers, first disable the virtual routers, then apply the new default value using the **ip vrrp set interval** or **ipv6 vrrp set interval** command and enable the virtual routers again.

- If any of the IPv4 or IPv6 virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the **ip vrrp set interval** or **ipv6 vrrp set interval** command with the **override** option and enable the virtual routers again.
The VRRP router version (v2 or v3) determines the advertising interval value range and the level of granularity that is used to specify the interval value. For example:

- The advertising interval range for VRRP version 2 is 1–25500 and cannot be less than 100 centiseconds. The interval value should also be entered in increments of 100 (for example, 100, 200, 300) up to the maximum allowed. If an interval value is not specified in an increment of 100, then the value is rounded down to the next increment of 100. For example, if a value of 209 is specified, then that value is rounded down to 200.

- The advertising interval range for VRRP version 3 is 1–4095 and cannot be less than 10 centiseconds. The interval value should also be entered in increments of 10 (for example, 10, 20, 30) up to the maximum allowed. If the interval value is not specified in an increment of 10, then the value is rounded down to the next increment of 10. For example, if a value of 15 is specified, then that value is rounded down to 10.

Examples

```
-> ip vrrp interval 30000
ERROR: Advertisement interval must be between 1 and 25500
-> ip vrrp interval 200
-> ip vrrp admin-state disable
-> ip vrrp set interval
-> ip vrrp set interval override
-> ip vrrp admin-state enable

-> ipv6 vrrp interval 4096
ERROR: Advertisement interval must be between 1 and 4095 for version V3
-> ipv6 vrrp interval 75
-> ipv6 vrrp admin-state disable
-> ipv6 vrrp set interval
-> ipv6 vrrp set interval override
-> ipv6 vrrp admin-state enable
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added.
Release 8.7R2; VRRP router advertising interval range updated.

Related Commands

```
**vrrp admin-state**

<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Modifying the default priority value will affect the value assigned by default to any new IPv4 or IPv6 virtual routers that are created.

- To apply the new default value to the existing IPv4 or IPv6 virtual routers, first disable the virtual routers, then apply the new default value using the `ip vrrp set priority` or `ipv6 vrrp set priority` command and enable the virtual routers again.

- If any of the IPv4 or IPv6 virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the `ip vrrp set priority` or `ipv6 vrrp set priority` command with the `override` option and enable the virtual routers again.

Examples

- `-> ip vrrp priority 50`
- `-> ip vrrp admin-state disable`
- `-> ip vrrp set priority`
- `-> ip vrrp set priority override`
- `-> ip vrrp admin-state enable`
VRRP Commands

- ipv6 vrrp priority 75
- ipv6 vrrp admin-state disable
- ipv6 vrrp set priority
- ipv6 vrrp set priority override
- ipv6 vrrp admin-state enable

Release History

**vrrp preempt**

Modifies the default preempt mode assigned to the IPv4 or IPv6 virtual routers on the switch.

```
{ip | ipv6} vrrp [preempt | no preempt]
```

**Syntax Definitions**

- **ip**
  - Modifies the default preempt mode assigned to IPv4 virtual routers.
- **ipv6**
  - Modifies the default preempt mode assigned to IPv6 virtual routers.
- **preempt**
  - Specifies that a higher priority router may preempt a lower priority master router by default.
- **no preempt**
  - Specifies that a higher priority router may not preempt a lower priority master router by default.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>preempt</td>
<td>no preempt</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>

  - `alaVRRPv3IPv6DefaultPreemptMode`
vrrp accept

Modifies the default accept mode assigned to the IPv4 (version 3) or IPv6 virtual routers on the switch.

{ip | ipv6} vrrp [accept | no accept]

Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>Modifies the default accept mode assigned to IPv4 virtual routers.</td>
</tr>
<tr>
<td>ipv6</td>
<td>Modifies the default accept mode assigned to IPv6 virtual routers.</td>
</tr>
<tr>
<td>accept</td>
<td>Specifies that the master router, which is not the IP address owner, will accept the packets addressed to the IP address owner as its own.</td>
</tr>
<tr>
<td>no accept</td>
<td>Specifies that the master router, which is not the IP address owner, will not accept the packets addressed to the IP address owner as its own.</td>
</tr>
</tbody>
</table>

Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>accept</td>
<td>accept</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Modifying the default accept mode will affect the mode assigned by default to any new IPv4 or IPv6 virtual routers that are created.

- To apply the new default accept mode value to the existing IPv4 or IPv6 virtual routers, first disable the virtual routers, then apply the new default value using the ip vrrp set accept or ipv6 vrrp set accept command and enable the virtual routers again.

- If any of the IPv4 or IPv6 virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the ip vrrp set accept or ipv6 vrrp set accept command with the override option and enable the virtual routers again.

- The accept mode is not a configurable option for IPv4 virtual routers running VRRP version 2; this command only applies to IPv4 virtual routers running VRRP version 3 and IPv6 virtual routers.
Examples

- `ip vrrp accept`
- `ip vrrp no accept`
- `ip vrrp admin-state disable`
- `ip vrrp set accept`
- `ip vrrp set accept override`
- `ip vrrp admin-state enable`
- `ipv6 vrrp accept`
- `ipv6 vrrp no accept`

- `ipv6 vrrp admin-state disable`
- `ipv6 vrrp set accept`
- `ipv6 vrrp set accept override`
- `ipv6 vrrp admin-state enable`

Release History

Release 8.5R2; command was introduced.

Related Commands

vrrp admin-state
Changes the administrative status of all the virtual routers on the switch.

vrrp set
Sets the new default parameter values to existing virtual routers on the switch.

show vrrp
Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

alaVRRPv3IPv4Config
alaVRRPv3IPv4DefaultAcceptMode
alaVRRPv3IPv6Config
alaVRRPv3IPv6DefaultAcceptMode
**vrrp admin-state**

Changes the administrative status of all the IPv4 or IPv6 virtual routers on the switch.

```
{ip | ipv6} vrrp admin-state [disable | enable | enable-all]
```

**Syntax Definitions**

- **ip**: Changes the administrative status of all IPv4 virtual routers.
- **ipv6**: Changes the administrative status of all IPv6 virtual routers.
- **disable**: Disables all the IPv4 or IPv6 virtual routers on the switch.
- **enable**: Enables the IPv4 or IPv6 virtual routers that have not previously been disabled individually or collectively through the `ip vrrp group all` or `ipv6 vrrp group all` command.
- **enable-all**: Enables all the IPv4 or IPv6 virtual routers on the switch including those virtual routers that have been disabled individually or collectively through the `ip vrrp group all` or `ipv6 vrrp group all` command.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command changes the administrative status of all the IPv4 or IPv6 virtual routers on the switch by executing a single command.

- This command will not affect the ability to change the administrative status of an individual IPv4 or IPv6 virtual router.

**Examples**

```
-> ip vrrp admin-state disable
-> ip vrrp admin-state enable
-> ip vrrp admin-state enable-all

-> ipv6 vrrp admin-state disable
-> ipv6 vrrp admin-state enable
-> ipv6 vrrp admin-state enable-all
```
**Release History**

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added.

**Related Commands**

- **vrrp version**
  Modifies the default VRRP version assigned to the IPv4 virtual routers on the switch.

- **vrrp interval**
  Modifies the default advertising interval value assigned to the virtual routers on the switch.

- **vrrp priority**
  Modifies the default priority value assigned to the virtual routers on the switch.

- **vrrp preempt**
  Modifies the default preempt mode assigned to the virtual routers on the switch.

- **vrrp accept**
  Modifies the default accept mode assigned to the virtual routers on the switch.

- **vrrp set**
  Sets the new default parameter values to existing virtual routers on the switch.

- **show vrrp**
  Displays the virtual router configuration for all virtual routers or for a specific virtual router.

**MIB Objects**

- alaVRRPv3IPv4Config
- alaVRRPv3IPv4AdminState
- alaVRRPv3IPv6Config
- alaVRRPv3IPv6AdminState
**vrrp set**

Applies the global default parameter values to IPv4 or IPv6 virtual routers on the switch. When this command is used, IPv4 or IPv6 virtual routers revert to using the default parameter values.

```
{ip | ipv6} vrrp set {interval | priority | preempt | accept | version | all | none} [override]
```

### Syntax Definitions

- **ip**: Applies the default parameter values to IPv4 virtual routers.
- **ipv6**: Applies the default parameter values to IPv6 virtual routers.
- **interval**: Sets the VRRP advertisement interval value to the default value.
- **priority**: Sets the priority value to the default value.
- **preempt**: Sets the preempt mode to the default mode.
- **accept**: Sets the accept mode to the default mode.
- **version**: Sets the VRRP version for IPv4 virtual routers to the default value.
- **all**: Sets all the parameters value to the new default value.
- **none**: Resets all the parameter values to their default values.
- **override**: Overrides the specified parameters configured value with the new default value.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval</td>
<td>all</td>
</tr>
<tr>
<td>priority</td>
<td>all</td>
</tr>
<tr>
<td>preempt</td>
<td>all</td>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- All the IPv4 or IPv6 virtual routers must be disabled before using this command.
- When a new IPv4 or IPv6 virtual router is created, pre-defined default values for the advertising interval, priority, preempt mode, accept mode, and version (IPv4 only) parameters are applied to the new virtual router. These default parameter values are configurable. For example, the `ip vrrp interval` or `ipv6 vrrp interval` command is used to change the default interval value that is applied to IPv4 or IPv6 virtual routers.
• When a default parameter value is changed, however, it is not automatically applied to existing virtual routers. To apply default values that have changed to existing virtual routers, do the following:

1. Administratively disable all the virtual routers.
2. Use the `ip vrrp set` or `ipv6 vrrp set` command to apply the changed parameter value.
3. Administratively enable all the virtual routers.

• If any of the IPv4 or IPv6 virtual routers are running with their own individually configured value or group value, then that value takes priority over the default parameter value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the `ip vrrp set` or `ipv6 vrrp set` command with the `override` option and enable the virtual routers again.

**Examples**

```
-> ip vrrp admin-state disable
-> ip vrrp set priority
-> ip vrrp set priority override
-> ip vrrp admin-state enable
-> ipv6 vrrp admin-state disable
-> ipv6 vrrp set interval
-> ipv6 vrrp set interval override
-> ipv6 vrrp admin-state enable
```

**Release History**

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added; `accept` and `version` parameters added.

**Related Commands**

- `vrrp version` Modifies the default VRRP version assigned to the IPv4 virtual routers on the switch.
- `vrrp interval` Modifies the default advertising interval value assigned to the virtual routers on the switch.
- `vrrp priority` Modifies the default priority value assigned to the virtual routers on the switch.
- `vrrp preempt` Modifies the default preempt mode assigned to the virtual routers on the switch.
- `vrrp accept` Modifies the default accept mode assigned to the virtual routers on the switch.
- `vrrp admin-state` Changes the administrative status of all the virtual routers on the switch.
- `show vrrp` Displays the virtual router configuration for all virtual routers or for a specific virtual router.
MIB Objects

alaVRRPv3IPv4Config
  alaVRRPv3IPv4SetParam
  alaVRRPv3IPv4Override
alaVRRPv3IPv6Config
  alaVRRPv3IPv6SetParam
  alaVRRPv3IPv6Override
vrrp group

Creates a new IPv4 or IPv6 virtual router group or modifies the configuration parameters of an existing IPv4 or IPv6 virtual router group.

```
{ip | ipv6} vrrp group vrgid [interval centiseconds] [priority priority] [preempt | no preempt] [accept | no accept] [version {v2 | v3}]
```

no {ip | ipv6} vrrp group vrgid

### Syntax Definitions

- **ip**: Configures an IPv4 virtual router group.
- **ipv6**: Configures an IPv6 virtual router group.
- **vrgid**: The virtual router group ID. The valid range is 1–255.
- **centiseconds**: The interval in centiseconds after which the master router will send VRRP advertisements.
  - 1–25500 centiseconds for a VRRP version 2 router.
  - 1–4095 centiseconds for a VRRP version 3 router.
- **priority**: The default priority value for the virtual router group. The valid range is 1–255.
- **preempt**: Specifies that a higher priority router may preempt a lower priority master router.
- **no preempt**: Specifies that a higher priority router may not preempt a lower priority master router by default.
- **accept**: Specifies that the master router, which is not the IP address owner, will accept the packets addressed to the IP address owner as its own. This parameter applies only to IPv4 version 3 and IPv6 virtual routers.
- **no accept**: Specifies that the master router, which is not the IP address owner, will not accept the packets addressed to the IP address owner as its own. This parameter applies only to IPv4 version 3 and IPv6 virtual routers.
- **v2**: Converts an IPv4 VRRP router as a version 2 virtual router. This parameter applies only to IPv4 virtual routers.
- **v3**: Converts an IPv4 VRRP router to a version 3 virtual router. This parameter applies only to IPv4 virtual routers.

### Defaults

</tbody>
</table>

Usage Guidelines

- Use the no form of this command to delete the virtual router group.
- The configuration parameters can be modified at any time, but will not have any effect on the virtual routers in the group until the virtual routers are enabled again. To apply the group default values to the virtual routers in a group, you must first disable the virtual router group, then apply the group default value using the ip vrrp group set or ipv6 vrrp group set command and enable the virtual router group again.
- If any of the virtual routers in the group are running with their individually configured value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual router group, then override the configured value by using the ip vrrp group set or ipv6 vrrp group set command with the override option and enable the virtual router group again.
- The VRRP router version (v2 or v3) determines the advertising interval value range and the level of granularity that is used to specify the interval value. For example:
  - The advertising interval range for VRRP version 2 is 1–25500 and cannot be less than 100 centiseconds. The interval value should also be entered in increments of 100 (for example, 100, 200, 300) up to the maximum allowed. If an interval value is not specified in an increment of 100, then the value is rounded down to the next increment of 100. For example, if a value of 209 is specified, then that value is rounded down to 200.
  - The advertising interval range for VRRP version 3 is 1–4095 and cannot be less than 10 centiseconds. The interval value should also be entered in increments of 10 (for example, 10, 20, 30) up to the maximum allowed. If the interval value is not specified in an increment of 10, then the value is rounded down to the next increment of 10. For example, if a value of 15 is specified, then that value is rounded down to 10.
- When a virtual router group is deleted, the virtual routers assigned to the group become unassigned. However, this does not have any impact on the virtual routers.

Examples

-> ip vrrp group 25 interval 200 priority 50 no preempt version v3
-> no ip vrrp group 25

-> ipv6 vrrp group 30 interval 200 priority 75 preempt no accept
-> no ipv6 vrrp group 30

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added; accept and version parameters added.
Release 8.7R2; VRRP router advertising interval range updated.
Related Commands

**vrrp group admin-state**  Changes the administrative status of all the virtual routers in a virtual router group using a single command.

**vrrp group set**  Sets the new modified default value to all the virtual routers in a virtual router group.

**vrrp group-association**  Adds a virtual router to a virtual router group.

**show vrrp group**  Displays the default parameter values for all the virtual router groups or a specific virtual router group.

vrrp group admin-state

Changes the administrative status of all the IPv4 or IPv6 virtual routers in an IPv4 or IPv6 virtual router group using a single command.

{ip | ipv6} vrrp group vrgid admin-state [disable | enable | enable-all]

Syntax Definitions

- **ip**: Changes the administrative status of all IPv4 virtual routers in the IPv4 group.
- **ipv6**: Changes the administrative status of all IPv6 virtual routers in the IPv6 group.
- **vrgid**: The virtual router group ID. The valid range is 1–255.
- **disable**: Disables all the virtual routers in the group.
- **enable**: Enables those virtual routers that have not previously been disabled individually in the group.
- **enable-all**: Enables all the virtual routers in the group including those virtual routers that have been disabled individually.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>

</tr>
</tbody>
</table>

Usage Guidelines

- If an IPv4 or IPv6 virtual router in a group is disabled on an individual basis, it can only be re-enabled by using the **enable-all** option in this command.
- This command will not affect the ability to change the administrative status of an individual IPv4 or IPv6 virtual router.

Examples

- `-> ip vrrp group 25 admin-state disable`
- `-> ip vrrp group 25 admin-state enable`
- `-> ip vrrp group 25 admin-state enable-all`
- `-> ipv6 vrrp group 30 admin-state disable`
- `-> ipv6 vrrp group 30 admin-state enable`
-> ipv6 vrrp group 30 admin-state enable-all

**Release History**

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added.

**Related Commands**

- `vrrp group` Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.
- `vrrp group set` Sets the new modified default value to all the virtual routers in a virtual router group.
- `show vrrp` Displays the virtual router configuration for all virtual routers or for a specific virtual router.
- `show vrrp group` Displays the default parameter values for all the virtual router groups or a specific virtual router group.

**MIB Objects**

alaVrrpv3GroupTable
  alaVrrpv3GroupAdminState
**vrrp group set**

Applies the group default parameter values to all virtual routers in an IPv4 or IPv6 virtual router group. When this command is used, IPv4 or IPv6 virtual routers revert to using the group default parameter values.

```
{ip | ipv6} vrrp group vrgid set [interval | priority | preempt | accept | version | all] [override]
```

</tr>
</tbody>
</table>

---

**Usage Guidelines**

- All the virtual routers in an IPv4 or IPv6 group must be disabled before using this command.
- To apply the group default value to the virtual routers in a group, first disable the virtual router group, then apply the group default value using the `ip vrrp group set` or `ipv6 vrrp group set` command and enable the virtual router group again.
- If any of the virtual routers in the group are running with their own configured parameter value, then that value will take priority over the group default value. To override the configured value with the
group default value, first disable the virtual router group, then override the configured value by using the `ip vrrp group set` or `ipv6 vrrp group set` command with the `override` option and enable the virtual router group again.

**Examples**

- `ip vrrp group 10 admin-state disable`
- `ip vrrp group 10 set priority`
- `ip vrrp group 10 set priority override`
- `ip vrrp group 10 admin-state disable`

- `ipv6 vrrp group 20 admin-state disable`
- `ipv6 vrrp group 20 set interval`
- `ipv6 vrrp group 20 set interval override`
- `ipv6 vrrp group 20 admin-state enable`

**Release History**

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added; **accept** and **version** parameters added.

**Related Commands**

- `vrrp group` Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.
- `vrrp group admin-state` Changes the administrative status of all the virtual routers in a virtual router group using a single command.
- `show vrrp` Displays the virtual router configuration for all virtual routers or for a specific virtual router.
- `show vrrp group` Displays the default parameter values for all the virtual router groups or a specific virtual router group.

**MIB Objects**

- `alaVrrpv3GroupTable`
  - `alaVrrpv3GroupSetParam`
  - `alaVrrpv3GroupOverride`
vrrp group-association

Adds an IPv4 or IPv6 virtual router to an IPv4 or IPv6 virtual router group.

```
{ip | ipv6} vrrp vrid interface if_name group-association vrgid
{ip | ipv6} vrrp vrid interface if_name no group-association vrgid
```

Syntax Definitions

- **ip**: Adds an IPv4 virtual router to an IPv4 virtual router group.
- **ipv6**: Adds an IPv6 virtual router to an IPv6 virtual router group.
- **vrid**: The virtual router ID. The valid range is 1–255.
- **if_name**: The name of an existing IPv4 or IPv6 interface on which the virtual router is configured.
- **vrgid**: An existing virtual router group ID. The valid range is 1–255.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>

<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the **no** form of this command to remove the IPv4 or IPv6 virtual router from the virtual router group.
- It is not necessary to disable an IPv4 or IPv6 virtual router before adding the virtual router to a group. However, the virtual router will not adopt the group’s default parameter values until it is re-enabled.
- It is not necessary to disable an IPv4 or IPv6 virtual router before removing the virtual router from a group.
- Create separate groups for each combination of protocol and version. For example, if IPv4 group 10 specifies VRRP version 2, then only assign IPv4 version 2 virtual routers to group 10.
  - The first virtual router assigned to the group will determine the protocol and version of the group.
  - IPv6 virtual router groups will always be version 3.
  - IPv4 version 3 virtual routers cannot be assigned to a version 2 group and vice versa. However, the version for an IPv4 group can be changed.
**Examples**

-> ip vrrp 25 interface ipv4-100 group-association 10  
-> ip vrrp 25 interface ipv4-100 no group-association 10  
-> ipv6 vrrp 30 interface ipv6-200 group-association 20  
-> ipv6 vrrp 30 interface ipv6-200 no group-association 20

**Release History**

Release 7.1.1; command was introduced.  
Release 8.5R2; IPv6 virtual router support and `interface` parameter added; `vlan_id` parameter deprecated.

**Related Commands**

`show vrrp group-association` Displays the virtual routers that are associated with a group.

**MIB Objects**

alaVrrpv3AssoGroupTable  
alaVrrpv3AssoGroupRowStatus
**show vrrp**

Displays the virtual router configuration for all virtual routers or for a specific virtual router.

```
show {ip | ipv6} vrrp [vrid]
```

---

**Syntax Definitions**

output definitions

VRRP default advertisement interval
The default advertising interval for all virtual routers on the switch.
Configured through the `vrrp interval` command.

VRRP default priority
The default priority value for all virtual routers on the switch.
Configured through the `vrrp priority` command.

VRRP default preempt
The default preempt mode for all virtual routers on the switch.
Configured through the `vrrp preempt` command.

VRRP default accept
The default accept mode for all virtual routers on the switch.
Configured through the `vrrp accept` command.

VRRP default version
The default VRRP version assigned to all IPv4 virtual routers. IPv6 virtual routers support only version 3. Configured through the `vrrp version` command.
output definitions (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VRRP startup delay</td>
<td>The amount of time after a reboot that virtual routers will wait before they go active; allows time for routing tables to stabilize. Configured through the <code>vrrp delay</code> command.</td>
</tr>
<tr>
<td>VRRP BFD-STATUS</td>
<td>Indicates whether or not (Enabled or Disabled) VRRP is registered to interact with the Bidirectional Forwarding Detection (BFD) protocol. Configured through the <code>vrrp bfd-state</code> command.</td>

output definitions

Checksum Errors
The total number of VRRP packets received with an invalid checksum value.

Version Errors
The total number of VRRP packets received with an invalid version number.

VRID Errors
The total number of VRRP packets received with invalid VRIDs.

VRID
The virtual router identifier.

Interface Name
The name of the IPv4 or IPv6 interface associated with the VRRP instance.

State
The operational state of the VRRP router instance:
- initialize—the interface is either disabled or down, or the startup delay timer has not expired.
- backup—this instance is monitoring the availability and state of the master router.
- master—this instance is functioning as the master router.

UpTime
Time interval (in hundredths of a second) since this virtual router was last initialized.

Become Master
The total number of times this virtual router’s state has transitioned from backup to master.

Adv. Rcvd
The total number of VRRP advertisements received by this instance.

-> show ip vrrp 1 statistics

output definitions

<table>
<thead>
<tr>
<th>VRID</th>
<th>The virtual router identifier.</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTERFACE</td>
<td>The name of the IPv4 or IPv6 interface associated with the VRRP instance.</td>
</tr>
<tr>
<td>State</td>
<td>The operational state of the VRRP router instance:</td>
</tr>
<tr>
<td></td>
<td>• initialize—the interface is either disabled or down, or the startup delay timer has not expired.</td>
</tr>
<tr>
<td></td>
<td>• backup—this instance is monitoring the availability of the master router.</td>
</tr>
<tr>
<td></td>
<td>• master—this instance is functioning as the master router.</td>
</tr>
<tr>
<td>UpTime</td>
<td>Time interval (in hundredths of a second) since this virtual router was last initialized.</td>
</tr>
<tr>
<td>Become master</td>
<td>The total number of times this virtual router’s state has transitioned from backup to master.</td>
</tr>
<tr>
<td>Advertisements received</td>
<td>The total number of VRRP advertisement packets received by this instance.</td>
</tr>
<tr>
<td>Type errors</td>
<td>The total number of VRRP packets received with an invalid value in the VRRP type field.</td>
</tr>
<tr>
<td>Advertisement interval errors</td>
<td>The total number of VRRP packets received in which the advertisement interval differs from the one configured for the virtual router.</td>
</tr>
<tr>
<td>IP TTL errors</td>
<td>The total number of VRRP packets received with a TTL (Time-To-Live) value other than 255.</td>
</tr>
<tr>
<td>IP address list errors</td>
<td>The total number of VRRP packets in which the IP address list does not match the configured list for the virtual router.</td>
</tr>
<tr>
<td>Packet length errors</td>
<td>The total number of VRRP packets received with a length less than the length of the VRRP header.</td>
</tr>
<tr>
<td>Zero priority advertisements sent</td>
<td>The total number of VRRP advertisements with a priority of 0 sent by the virtual router.</td>
</tr>
<tr>
<td>Zero priority advertisements received</td>
<td>The total number of VRRP advertisements with a priority of 0 received by the virtual router.</td>
</tr>
</tbody>

**show vrrp track**

Displays information about tracking policies on the switch.

show ip vrrp track [track_id]

---

**Syntax Definitions**

track_id

The ID of the tracking policy to display.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6865</th>
<th>6900 V72/C32</th>

<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

Enter the tracking ID to display information about a particular policy; if no tracking policy ID is entered, information for all tracking policies is displayed.

---

**Examples**

```shell
-> show ip vrrp track
Track ID  Policy             Admin  Oper  Pri  BFD
---------+---------------------------+-------+-------+-----+-------+
  1      | PORT 1/1/1                 | Enabled|Up     | 25  | Enabled|
  2      | 192.10.150.42              | Enabled|Down   | 25  | Disabled|
  3      | INTF02-01                  | Enabled|Up     | 25  | Enabled|
```

```shell
-> show ip vrrp track 2
Tracking Policy TRACKID = 2
  Policy = 192.10.150.42
  Dec. Priority = 25
  Admin. Status = Enabled
  Oper. Status = Down
  BFD Status = Disabled
  Delay: 0
```

---

**output definitions**

<table>
<thead>
<tr>

<td>Delay</td>
<td>The amount of time, in seconds, to wait after a VRRP address track is detected as operationally up and before the associated virtual router's priority value is incremented by the tracking policy's priority value.</td>
</tr>
</tbody>
</table>
**show vrrp track-association**

Displays the tracking policies associated with virtual routers.

`show {ip | ipv6} [vrid] track-association [track_id]`

### Syntax Definitions

- **ip**
  - Displays the tracking policies associated with IPv4 virtual routers.

- **ipv6**
  - Displays the tracking policies associated with IPv6 virtual routers.

- **vrid**
  - The virtual router ID. The valid range is 1–255.

- **track_id**
  - The ID of the tracking policy to display.

### Defaults

show vrrp group

Displays the default parameter values for all the virtual router groups or for a specific virtual router group.

show {ip | ipv6} vrrp group [vrgid]

Syntax Definitions

*ip* Displays the IPv4 virtual routers that belong to a group.

*ipv6* Displays the IPv6 virtual routers that belong to a group.

*vrgid* The virtual router group ID, in the range from 1–255.

Defaults

By default, the default parameter values are displayed for all the virtual router groups.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>

Usage Guidelines

Use the *vrgid* parameter with this command to display the default values for a specific virtual router group.

Examples

```bash
-> show ip vrrp group
Group    Adv     Preempt   Accept
ID  Interval Priority Mode   Mode   Version
-------+--------+----------+--------+--------+-------
10     200    75       Yes    No     V3
20     150    75       Yes    No     V2

-> show ip vrrp group 20
Virtual Router Group GROUPID = 20
  Interval = 150
  Priority = 75
  Preempt Mode = Yes
  Accept Mode = No
  Version = V2
  2 Associated Virtual Routers

-> show ipv6 vrrp group
Group      Adv     Preempt   Accept
ID  Interval Priority Mode   Mode   Version
-------+--------+----------+--------+--------+-------
```
show vrrp group

```
--+--------+----------+--------+--------+-------
|30| 100    | 75       | Yes    | No    | V3    |
|40| 125    | 75       | Yes    | Yes   | V3    |
```

`-> show ipv6 vrrp group 30
Virtual Router Group GROUPID = 30
   Interval = 100
   Priority = 75
   Preempt Mode = Yes
   Accept Mode = No
   Version = V3
   2 Associated Virtual Routers

**output definitions**

<table>
<thead>
<tr>
<th>Group ID</th>
<th>The virtual router group identifier.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adv Interval</td>
<td>The default advertisement time interval, in centiseconds, for the VRRP group. Only the master router sends advertisements.</td>
</tr>

  - `alaVrrpv3GroupInterval`
  - `alaVrrpv3GroupPriority`
  - `alaVrrpv3GroupPreemptMode`
  - `alaVrrpv3GroupAcceptMode`
  - `alaVrrpv3GroupVersion`
**show vrrp group-association**

Displays the virtual routers that are associated with a virtual router group.

**show {ip | ipv6} vrrp group-association [vrgid]**

---

**Syntax Definitions**

- **ip**: Displays the IPv4 virtual routers that belong to a group.
- **ipv6**: Displays the IPv6 virtual routers that belong to a group.
- **vrgid**: The virtual router group ID, in the range from 1–255.

**Defaults**

By default, all virtual router group associations are displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Command Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>Yes</td>
</tr>
<tr>
<td>6465</td>

27 OSPF Commands

Open Shortest Path First routing (OSPF) is a shortest path first (SPF) or link-state protocol. OSPF is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPF chooses the least-cost path as the best path.

Each participating router distributes its local state (i.e., the router’s usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPF allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an area. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

The OmniSwitch version of OSPF complies with RFCs 1370, 1850, 2328, 2370, 3101, and 3623.

MIB information for OSPF is as follows:

- **Filename**: ALCATEL-IND1-VIRTUALROUTER-MIB.mib
  - **Module**: alcatelIND1VirtualRouterMIB

- **Filename**: ALCATEL-IND1-OSPF-MIB.mib
  - **Module**: alcatelIND1OSPFMIB

- **Filename**: OSPF-MIB.mib
  - **Module**: OSPF
The following is a list of the commands for configuring OSPF:

<table>

Release History

Release 7.1.1; command was introduced.

Related Commands

N/A

MIB Objects

alaVrConfigTable
  alaVrConfigOspfStatus
**ip ospf admin-state**

Enables or disables the administration status of OSPF on the router.

```
ip ospf admin-state {enable | disable}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables OSPF.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables OSPF.</td>
</tr>
</tbody>
</table>

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The OSPF protocol must be enabled for it to route traffic.

### Examples

```
-> ip ospf admin-state enable
-> ip ospf admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- `show ip ospf` Displays OSPF status and general configuration parameters.

### MIB Objects

- `ospfGeneralGroup`
- `ospfAdminStat`
**ip ospf asbr**

Configures the router as an Autonomous System Border Router (ASBR). A router running multiple protocols or acting as a gateway to other exterior routers is an ASBR.

- **ip ospf asbr**
- **no ip ospf asbr**

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

Not supported in this release.

**Usage Guidelines**

- Autonomous System Border Routers (ASBRs) are routers that exchange information with routers from another autonomous system (AS).
- The `no` variant of this command removes the ASBR classification of the selected router.

**Examples**

- `-> ip ospf asbr`
- `-> no ip ospf asbr`

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `show ip ospf` Displays OSPF status and general configuration parameters.

**MIB Objects**

- `alaProtocolOspf`
- `alaOspfAsBdRtr`
**ip ospf exit-overflow-interval**

This command sets the overflow interval value.

`ip ospf exit-overflow-interval seconds`

---

**Syntax Definitions**

seconds: The number of seconds the router waits before attempting to leave the overflow state.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>0</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- The overflow interval is the time whereby the routing router will wait before attempting to leave the database overflow state; the interval begins upon the routing router’s arrival into this state.

- When the routing router leaves the overflow state, it can once again create non-default and external link state advertisements (LSAs) for autonomous systems (AS).

- Note that the router will not leave the overflow state (until it is restarted) when the overflow interval value is set to 0.

---

**Example**

```
-> ip ospf exit-overflow-interval 10
```

---

**Release History**

Release 7.1.1; command was introduced.
Related Commands

show ip ospf

Displays the OSPF status and general configuration parameters.

MIB Objects

ospfGeneralGroup

ospfExitOverflowInterval
**ip ospf extlsdb-limit**

Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.

```
ip ospf extlsdb-limit limit
```

### Syntax Definitions

- **limit**: The maximum number of LSDB entries allowed on the router. The accepted value is any number greater than or equal to 1. If 0 is entered, there is no limit.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>-1</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C4E/V48C8/C32E/T24C2/X24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command allows you to set a limit to the number of external LSDBs learned by the router. An external LSDB is created when the router learns a link address that exists outside of its Autonomous System (AS).

- When the limit is set, and it is exceeded, older addresses that were previously learned are removed from the routing table to make room for the new external LSDB.

### Example

```
-> ip ospf extlsdb-limit 25
```

### Release History

Release 7.1.1; command was introduced.
**Related Commands**

- `show ip ospf` Displays OSPF status and general configuration parameters.

**MIB Objects**

- `ospfGeneralGroup`
- `ospfExtLsdbLimit`
**ip ospf host**

Creates and deletes an OSPF entry for directly attached hosts. Allows for the modification of the host parameters of Type of Service (ToS) and metric.

```
ip ospf host ip_address tos tos [metric metric]
no ip ospf host ip_address tos tos
```

**Syntax Definitions**

- **ip_address**
  - The 32-bit IP address in dotted decimal format of the OSPF host. See the example below for more information.

- **tos**
  - The type of service (ToS) of the specified OSPF host. The valid range is 0-15. Only ToS value 0 is supported at this time.

- **metric**
  - The cost metric value assigned to the specified host. The valid range is 0 and up.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>metric</td>
<td>0</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The **no** variant of this command removes the record of the OSPF host.

- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. ToS routing is the ability to make a forwarding decision based on a destination address and a desired Quality of Service (QoS). ToS routing allows link selection based on QoS when more than one path exists between a source and a destination. A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path.

**Examples**

```
-> ip ospf host 172.22.2.115 tos 1 metric 10
-> no ip ospf host 172.22.2.115 tos 1
```
**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

`show ip ospf host` Displays information on configured OSPF hosts.

**MIB Objects**

`ospfHostTable`
- `ospfHostStatus`
- `ospfHostIpAddress`
- `ospfHostTOS`
- `ospfHostMetric`
ip ospf mtu-checking

Enables or disables the use of Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

ip ospf mtu-checking
no ip ospf mtu-checking

Syntax Definitions
N/A

Defaults
N/A

Platforms Supported
This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines
- The no form of this command disables MTU checking.
- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

Examples
- ip ospf mtu-checking
- no ip ospf mtu-checking

Release History
Release 7.1.1; command was introduced.
Related Commands

show ip ospf

Displays the OSPF status and general configuration parameters.

MIB Objects

alaProtocolOspf
alaOspfMTUCheck
**ip ospf default-originate**

Configures a default external route into the OSPF routing domain.

**ip ospf default-originate {only | always} [metric-type {type1 | type2}] [metric value]**

**no ip ospf default-originate**

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>only</td>
<td>Advertises only when there is a default route in the routing table.</td>
</tr>
<tr>
<td>always</td>
<td>Advertises the default route regardless of whether the routing table has a default route.</td>
</tr>
<tr>
<td>type1</td>
<td>Sets the external route as type1.</td>
</tr>
<tr>
<td>type2</td>
<td>Sets the external route as type2.</td>
</tr>
<tr>
<td>value</td>
<td>The metric value. The valid range is 1-65535.</td>
</tr>
</tbody>
</table>

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>type1</td>
<td>type2</td>
</tr>
<tr>
<td>value</td>
<td>1</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **no** form of the command to delete redistributed default routes.

**Examples**

- `ip ospf default-originate always`
- `ip ospf default-originate only metric 10`
- `ip ospf default-originate always metric-type type1 metric 5`
- `no ip ospf default-originate`

**Release History**

Release 7.1.1; command was introduced.
Related Commands

**show ip ospf**
Displays the OSPF status and general configuration parameters.

MIB Objects

alaProtocolOspf

alaOspfDefaultOriginate
alaOspfDefaultOriginateMetricType
alaOspfDefaultOriginateMetric
**ip ospf route-tag**

Configures a tag value that is applied to internal routes for potential redistribution.

**ip ospf route-tag tag**

---

### Syntax Definitions

**tag**

The set tag value. The valid range is 0–2147483647.

---

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>0</td>
</tr>
</tbody>
</table>

---

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

### Usage Guidelines

A 32-bit value tagged to each OSPF internal route that is redistributed into other routing protocol domains. The lower 16-bits typically indicate the autonomous system number.

---

### Example

```
-> ip ospf route-tag 2
```

---

### Release History

Release 7.1.1; command was introduced.

---

### Related Commands

- **show ip ospf**
  
  Displays OSPF status and general configuration parameters.

---

### MIB Objects

- `alaProtocolOspf`
- `alaOspfRedistRouteTag`
ip ospf spf-timer

Configures timers for Shortest Path First (SPF) calculation.

ip ospf spf-timer [delay delay_seconds] [hold hold_seconds]

Syntax Definitions

delay_seconds  
Specifies time (from 0 to 65535 seconds) between the reception of an OSPF topology change and the start of an SPF calculation.

hold_seconds  
 Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>delay_seconds</td>
<td>5</td>
</tr>
<tr>
<td>hold_seconds</td>
<td>10</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- This command allows you to configure the time between SPF calculations. Using the delay timer, you can determine how much time to postpone an SPF calculation after the router receives a topology change. Using the hold timer, you can configure the amount of time that must elapse between consecutive SPF calculations.

- Note that if either of these values is set to 0, there will be no delay in the SPF calculation. This means that SPF calculations will occur immediately upon the reception of a topology change and/or that back-to-back SPF calculations can take place with no break in-between the two.

Example

-> ip ospf spf-timer delay 20 hold 35

Release History

Release 7.1.1; command was introduced.
Related Commands

**show ip ospf**
Displays the OSPF status and general configuration parameters.

MIB Objects

alaProtocolOspf
  - alaOspfTimerSpfDelay
  - alaOspfTimerSpfHold
**ip ospf virtual-link**

Creates or deletes a virtual link. A virtual link is used to restore backbone connectivity if the backbone is not physically contiguous.

```
ip ospf virtual-link area_id router_id [auth-type {none | simple | md5}] [auth-key key_string] [dead-interval seconds] [hello-interval seconds] [retrans-interval seconds] [transit-delay seconds]
```

```
no ip ospf virtual-link area_id router_id
```

### Syntax Definitions

- **area_id**: A unique 32-bit value in IP address format.
- **router_id**: A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
- **none**: Sets the virtual link authorization type to no authentication.
- **simple**: Sets the virtual link authorization type to simple authentication. If `simple` is selected, a key must be specified as well.
- **md5**: Sets the virtual link authorization type to MD5 authentication.
- **key_string**: Sets the virtual link authorization key. The key can be up to 8 ASCII characters. See the example for more details.
- **dead-interval seconds**: Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647.
- **hello-interval seconds**: Sets the virtual link hello interval, which is the time interval between OSPF hellos sent on this virtual link. The valid range is 1–65535.
- **retrans-interval seconds**: Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPF packets. The valid range is 0–3600.
- **transit-delay seconds**: Sets the virtual link transit delay, which is the number of seconds to transmit OSPF packets over this link. The valid range is 0–3600.
**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>simple</td>
</tr>
<tr>
<td>key_string</td>
<td>null string</td>
</tr>
<tr>
<td>dead-interval</td>
<td>seconds</td>
</tr>
<tr>
<td>hello-interval</td>
<td>seconds</td>
</tr>
<tr>
<td>retrans-interval</td>
<td>seconds</td>
</tr>
<tr>
<td>transit-delay</td>
<td>seconds</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The **no** form of the command deletes the virtual link.
- It is possible to define areas in such a way that the backbone is no longer contiguous. In this case the system administrator can ensure backbone connectivity physically.
- Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.
- If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.
- The **dead-interval** value should be the same for all routers on the same network. This value should be some multiple of the value given for the **hello interval**.

**Examples**

```bash
-> ip ospf virtual-link 0.0.0.1 172.22.2.115
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 auth-key "techpubs"
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 auth-type simple
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 dead-interval 50
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 hello-interval 20
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 retrans-interval 20
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 transit-delay 50
-> no ip ospf virtual-link 0.0.0.1 172.22.2.115
```
**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `show ip ospf virtual-link` Displays the virtual link information.

**MIB Objects**

- `ospfVirtIfTable`
  - `ospfVirtIfAreaId`
  - `ospfVirtIfNeighbor`
  - `ospfVirtIfAuthKey`
  - `ospfVirtIfStatus`
  - `ospfVirtIfAuthType`
  - `ospfVirtIfRtrDeadInterval`
  - `ospfVirtIfHelloInterval`
  - `ospfVirtIfRetransInterval`
  - `ospfVirtIfTransitDelay`
ip ospf neighbor

Creates a static neighbor on a non-broadcast interface.

```
ip ospf neighbor neighbor_id {eligible | ineligible}
no ip ospf neighbor neighbor_id
```

### Syntax Definitions

- **neighbor_id**: A unique 32-bit IP address identical to the neighbor’s interface address.
- **eligible**: Sets this router as eligible to be the DR.
- **non-eligible**: Sets this router as not eligible to be the DR.

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>eligible</td>
<td>ineligible</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Available</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- NBMA (Non Broadcast Multi Access), PMP (Point-to-Multipoint), and P2P (Point-to-Point) OSPF non-broadcast modes are supported over Ethernet interfaces (broadcast media).

- Neighboring routers on non-broadcast OSPF networks must be statically configured, because lack of OSPF multicast capabilities prevents using normal OSPF Hello protocol discovery.

- In the case of NBMA interface the static neighbor eligibility for becoming a DR can be configured while it is not necessary for point-to-multipoint and point-to-point interfaces.

- An interface connected to this neighbor must also be configured as a non-broadcast interface, which can be either point-to-multipoint or point-to-point, by using the `ip ospf interface type` command.

- For the correct working of an OSPF NBMA network, a fully meshed network is mandatory. Also, the neighbor eligibility configuration for a router on every other router should match the routers interface priority configuration.

### Examples

```
-> ip ospf neighbor 1.1.1.1 ineligible
-> no ip ospf neighbor 1.1.1.1
```
**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `ip ospf interface type` Configures the OSPF interface type.
- `show ip ospf neighbor` Displays information on OSPF non-virtual neighbor routers.

**MIB Objects**

- `ospfNbrTable`
  - `ospfNbrPriority`
  - `ospfNbmaNbrStatus`
ip ospf redist-bgp-internal

Redistributes internal BGP routes (from the same AS) into OSPF protocol.

ip ospf redist-bgp-internal
no ip ospf redist-bgp-internal

Syntax Definitions
N/A

Defaults
By default, redistribution of iBGP routes is not allowed into OSPF protocol.

Platforms Supported
This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines
N/A

Examples
-> ip ospf redist-bgp-internal
-> no ip ospf redist-bgp-internal

Release History
Release 8.7R2; command introduced.

Related Commands
show ip ospf
Displays the OSPF status and general configuration parameters.

MIB Objects
alaOspfRedistBgpInternal
ip ospf area

Assigns an OSPF interface to a specified area.

ip ospf area area_id [summary {enable | disable}] | [type {normal | stub | nssa}]

no ip ospf area area_id

Syntax Definitions

<table>
<thead>
<tr>
<th>area_id</th>
<th>A unique 32-bit value in IP address format.</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables summarization.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables summarization.</td>
</tr>
<tr>
<td>normal</td>
<td>Sets the area as a regular OSPF area. This parameter is not supported on an OmniSwitch 6560.</td>
</tr>
<tr>
<td>stub</td>
<td>Configures an OSPF area as a stub area.</td>
</tr>
<tr>
<td>nssa</td>
<td>Configures an OSPF area as a Not So Stubby Area (NSSA). This parameter is not supported on an OmniSwitch 6560.</td>
</tr>
</tbody>
</table>

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
<tr>
<td>normal</td>
<td>stub</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<p>| | | | | | | | | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The no form deletes the area.
- The summary options are used to enable or disable route summarization for stub and NSSA areas. Stub and NSSA areas will not receive LSA type 3 unless summary is enabled.
- The type command allows you to chose what type of area this is going to be.
- Consider the following when configuring an OSPF area ID on an OmniSwitch 6560:
  - Only one non-zero stub area is supported (configuring a 0.0.0.0 area ID is not allowed).
  - Only two IP OSPF interfaces can be associated with the area.
Examples
- `ip ospf area 0.0.0.1`
- `ip ospf area 0.0.0.1 type stub`
- `ip ospf area 0.0.0.1 type normal`
- `no ip ospf area 0.0.0.1`

Release History
Release 7.1.1; command was introduced.

Related Commands
- `ip ospf area default-metric` Creates or deletes an OSPF default metric.
- `ip ospf area range` Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
- `show ip ospf area` Displays either all OSPF areas, or a specified OSPF area.

MIB Objects
- `ospfAreaTable`
  - `ospfImportAsExtern`
  - `ospfAreaSummary`
  - `ospfAreaId`
ip ospf area default-metric

Creates or deletes a default metric for stub or Not So Stubby Area (NSSA) areas. The default metric configures the type of cost metric that a default area border router (ABR) will advertise in the default summary Link State Advertisement (LSA).

```
ip ospf area area_id default-metric tos [[cost cost] | [type {ospf | type 1 | type 2}]]
no ip ospf area area_id default-metric tos
```

**Syntax Definitions**

- `area_id` A unique 32-bit value in IP address format.
- `tos` Type of service. The valid range is 0–15. Only ToS value 0 is supported at this time.
- `cost` The numerical cost of this area and ToS. Only 0 is supported in the current release.
- `ospf` Advertises external routes as OSPF autonomous system external (ASE) routes.
- `type1` Advertises external routes as a Type 1 (non-OSPF) metric.
- `type2` Advertises external routes as a Type 2 (calculated weight value from non-OSPF protocol) metric.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>tos</td>
<td>0</td>
</tr>
<tr>
<td>ospf</td>
<td>type 1</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The **no** form deletes the default metric from the specified area.
- The **type** command configures the type of cost metric for the specified ToS. To ensure that internal routers receiving external route advertisements choose the correct route, all border routers advertising a particular external network should be configured to advertise the route using the same metric type. That is, they must all advertise the route using an OSPF, Type 1, or Type 2 metric.
Examples

`-> ip ospf area 1.1.1.1 default-metric 0`
`-> no ip ospf area 1.1.1.1 default-metric 0`

Release History

Release 7.1.1; command was introduced.

Related Commands

- `ip ospf area` Creates or deletes an OSPF area.
- `ip ospf area range` Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
- `show ip ospf area` Displays either all OSPF areas, or a specified OSPF area.

MIB Objects

- `ospfStubAreaTable`
  - `ospfStubAreaId`
  - `ospfStubTOS`
  - `ospfStubStatus`
  - `ospfStubMetric`
  - `ospfStubMetricType`
**ip ospf area range**

Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

```
ip ospf area area_id range {summary | nssa} ip_address subnet_mask [effect {admatching | noMatching}] no ip ospf area area_id range {summary | nssa} ip_address subnet_mask
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>area_id</td>
<td>A unique 32-bit value in IP address format.</td>
</tr>
<tr>
<td>summary</td>
<td>Advertises the address range as a summary link state advertisement (LSA).</td>
</tr>
<tr>
<td>nssa</td>
<td>Advertises the address range of Not So Stubby Area (NSSA) routes as a Type 5 advertisement. <em>This parameter is not supported on an OmniSwitch 6560.</em></td>
</tr>
<tr>
<td>ip_address</td>
<td>A 32-bit IP address for the range’s area.</td>
</tr>
<tr>
<td>subnet_mask</td>
<td>A 32-bit subnet mask that determines how many bits of the IP address denote the network number.</td>
</tr>
<tr>
<td>admatching</td>
<td>Determines that routes specified falling within the specified range will be advertised.</td>
</tr>
<tr>
<td>noMatching</td>
<td>Determines that any route falling within the specified range will not be advertised.</td>
</tr>
</tbody>
</table>

### Defaults

<table>
<thead>
<tr>

<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Usage Guidelines

- Route summarization is the consolidation of addresses within an area which are advertised as a single route. When network numbers in an area are assigned consecutively, the area border router can be configured, using this command, to advertise a route that aggregates all the individual networks within the range.

- Using this command causes a single route to be advertised, for an address range in the specified area, to other areas.

- An NSSA (Not So Stubby Area) is similar to a stub area. However, where autonomous system (AS) external routes cannot be imported into a stub area, an NSSA will allow the importing of some AS external routes.

- Area ranges, once created, are enabled by default. Classless Inter-Domain Routing (CIDR) can work with OSPF to make route summarization more efficient. This is especially true for the summarization of routes in the global database. OSPF area address ranges can be configured on area border routers.

Examples

-> ip ospf area 1.1.1.1 range summary 172.22.2.0 255.255.255.0
-> no ip ospf area 1.1.1.1 range summary 172.22.2.0 255.255.255.0

Release History

Release 7.1.1; command was introduced.

Related Commands

- **ip ospf area** Creates or deletes an OSPF area.
- **ip ospf area default-metric** Creates or deletes an OSPF default metric.
- **show ip ospf area range** Displays all or specified route summaries in a given area.

MIB Objects

- **ospfAreaAggregateTable**
- **ospfAreaAggregateAreaId**
- **ospfAreaAggregateLsdbType**
- **ospfAreaAggregateNet**
- **ospfAreaAggregateMask**
- **ospfAreaAggregateEffect**

**ip ospf interface**

Creates and deletes an OSPF interface.

```
ip ospf interface {interface_name}
no ip ospf interface {interface_name}
```

**Syntax Definitions**

```
interface_name
```
The name of the interface.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of the command to delete an OSPF interface.
- The interface name cannot contain spaces.

**Examples**

```
-> ip ospf interface vlan-101
-> no ip ospf interface vlan-101
```

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

**show ip ospf interface**

Displays the status and statistics of an OSPF interface.

**MIB Objects**

- `ospfIfTable`
  - `ospfIfIpAddress`
- `alaOspfIfAugTable`
- `alaOspfIfIntfName`
**ip ospf interface admin-state**

Enables or disables the administrative status on an OSPF interface.

```
ip ospf interface {interface_name} admin-state {enable | disable}
no ip ospf interface {interface_name} admin-state {enable | disable}
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface_name</td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>enable</td>
</tr>
<tr>
<td>disable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
<tr>
<td>disable</td>
<td>enable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>64C2</td>
<td>Yes</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

- Use the `no` form of the command to delete an OSPF interface.
- The OSPF interface must be enabled for it to participate in the OSPF protocol.

**Examples**

- `-> ip ospf interface vlan-101 admin-state enable`
- `-> ip ospf interface vlan-101 admin-state disable`
- `-> no ip ospf interface vlan-101 admin-state enable`
- `-> no ip ospf interface vlan-101 admin-state disable`

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

*show ip ospf interface*  
Displays the status and statistics of an OSPF interface.

**MIB Objects**

*ospfIfTable*

*ospfIfAdminStat*
**ip ospf interface area**

Configures an OSPF area identifier for this interface.

`ip ospf interface {interface_name} area area_id`

**Syntax Definitions**

- `interface_name`: The name of the interface.
- `area_id`: A unique 32-bit value in IP address format.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Support</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

An interface must be assigned to an area to become operational.

**Examples**

```
-> ip ospf interface vlan-101 area 0.0.0.1
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `show ip ospf area`: Displays either all the OSPF areas, or a specified OSPF area.
- `show ip ospf interface`: Displays the status and statistics of an OSPF interface.

**MIB Objects**

- `ospfIfTable`
- `ospfIfAreaId`
**ip ospf interface auth-key**

Configures an OSPF authentication key for simple authentication on an interface.

```
ip ospf interface {interface_name} auth-key key_string
```

### Syntax Definitions

- **interface_name**: The name of the interface.
- **key_string**: An authentication key (8 characters maximum).

### Defaults

The default for the authentication key string is a null string.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Sets a password as a simple text string of 8 ASCII characters.
- Must be used in conjunction with the **auth-type** command, described on page 27-37, set to **simple**.

### Examples

```
-> ip ospf interface vlan-101 auth-key pass
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- **ip ospf interface auth-type**: Sets the authentication type.
- **show ip ospf interface**: Displays the status and statistics of an OSPF interface.

### MIB Objects

- ospfIfTable
  - ospfIfAuthKey
**ip ospf interface auth-type**

Sets the OSPF interface authentication type. Authentication allows the router to only respond to other routers that have the correct authentication information.

`ip ospf interface {interface_name} auth-type {none | simple | md5 | key-chain key-chain-id}`

---

**Syntax Definitions**

- **interface_name**: The name of the interface.
- **none**: No authentication.
- **simple**: Simple, clear text authentication.
- **md5**: MD5 encrypted authentication.
- **key-chain-id**: The configured key-chain ID.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>simple</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Use this command to set the type of authentication that the OSPF interface uses to validate requests for route information from other OSPF neighbors on this interface.

- Simple authentication is authentication that uses only a text string as the password. The authentication type **simple** is used in conjunction with the **auth-key** keyword described, on page 27-36.

- MD5 authentication is encrypted authentication that uses an encryption key string and a key identification number. Both of these are necessary as the password. The authentication type **md5** is used in conjunction with the commands described on page 27-43 and page 27-45. One command enables MD5 and the other sets the key identification number.

- Use **keychain** to configure a keychain authentication type for an interface. When the OSPF interface receives a packet, the authentication information is carried in the hello packet. If the authentication succeeds, then adjacency is formed. The two remote machines must have the same active current key ID and same authentication type. Use **ip ospf interface auth-type none** to disassociate the keychain from the interface.
The authentication type can be set to SHA256 when using the `key-chain` parameter. The key ID and key must match between neighbors that are communicating with each other and must use a valid `start-time`. Refer to the `security key` and `security key-chain` commands for information on configuring the key-chain.

**Examples**

`-> ip ospf interface vlan-101 auth-type simple`

`-> ip ospf interface vlan-101 auth-type key-chain 1`

**Release History**

Release 7.1.1; command was introduced.
Release 8.4.1; `key-chain` parameter added.

**Related Commands**

`ip ospf interface auth-key` Sets the password for simple authentication.

`show ip ospf interface` Displays the status and statistics of an OSPF interface.

`show ip ospf interface auth-info` Displays authentication information for the interface.

**MIB Objects**

`ospfIfTable`

`ospfIfAuthType`  
`alaOspfIfKeyChainId`
**ip ospf interface dead-interval**

Configures the OSPF interface dead interval.

```
ip ospf interface {interface_name} dead-interval seconds
```

**Syntax Definitions**

- `interface_name`: The name of the interface.
- `seconds`: The dead interval, in seconds. The valid range is 1–65535.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>seconds</code></td>
<td>40 (broadcast and point-to-point)</td>
</tr>
<tr>
<td></td>
<td>120 (NBMA and point-to-multipoint)</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This is the interval, in seconds, after which a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or the multiple of the hello interval.

**Examples**

```
-> ip ospf interface vlan-101 dead-interval 50
```

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- ip ospf interface hello-interval  Configures the OSPF interface hello interval.
- show ip ospf interface  Displays the status and statistics of an OSPF interface.

**MIB Objects**

ospfIfTable
  ospfIfRtrDeadInterval
ip ospf interface hello-interval

Configures the OSPF interface hello interval.

\texttt{ip ospf interface \{interface\_name\} hello-interval seconds}

### Syntax Definitions

<table>
<thead>
<tr>
<th>parameter</th>

<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>10</td>
</tr>
<tr>
<td>(broadcast and point-to-point)</td>
<td></td>
</tr>
<tr>
<td>seconds</td>
<td>30</td>
</tr>
<tr>
<td>(NBMA and point-to-multipoint)</td>
<td></td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

This is the interval between two consecutive hello packets sent out on this interface.

### Examples

```
-> ip ospf interface vlan-101 hello-interval 50
```

### Release History

Release 7.1.1; command was introduced.
Related Commands

show ip ospf interface
Displays the status and statistics of an OSPF interface.

MIB Objects

ospfIfTable

ospfIfHelloInterval
ip ospf interface md5

Creates and deletes the OSPF interface MD5 key identification number.

**ip ospf interface** *(interface_name)* md5 *key_id* [enable | disable]

### Syntax Definitions

- **interface_name**: The name of the interface.
- **key_id**: A key identification number. The key identification number specifies a number that allows MD5 encrypted routers to communicate. Both routers must use the same key ID. The valid range is 1–255.
- **enable**: Enables the interface key.
- **disable**: Disables the interface key.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>enable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- MD5 authentication can be used to encrypt information sent over the network. MD5 authentication works by using shared secret keys. Keys are used to sign the packets with an MD5 checksum, and they cannot be forged or tampered with. Since the keys are not included in the packet, snooping the key is not possible.
- This command is used in conjunction with the commands described on page 27-37 and page 27-45.
- The no variant deletes the key ID number.

### Examples

- `-> ip ospf interface vlan-101 md5 100`
- `-> ip ospf interface vlan-101 md5 10 disable`
- `-> ip ospf interface vlan-101 md5 10 enable`
**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **ip ospf interface auth-type**  
  Sets the OSPF interface authentication type.
- **ip ospf interface md5 key**  
  Configures the OSPF key ID and key.
- **show ip ospf interface**  
  Displays the status and statistics of an OSPF interface.

**MIB Objects**

- **alaOspfIfMd5Table**
  - **alaOspfIfMd5IpAddress**
  - **alaOspfIfMd5KeyId**
ip ospf interface md5 key

Configures the OSPF key string. This interface MD5 string, along with the key identification number, enables the interface to encode MD5 encryption.

ip ospf interface {interface_name} md5 key_id key key_string

Syntax Definitions

interface_name The name of the interface.
key_id The key ID. The valid range is 1–255.
key_string A key string.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

• This command is used in conjunction with the commands described above on page 27-37 and page 27-43.

• For MD5 authentication to function properly the same key string must be configured on the neighboring router for that interface.

Examples

-> ip ospf interface vlan-101 md5 100 key 1

Release History

Release 7.1.1; command was introduced.
**Related Commands**

- `ip ospf interface auth-type`  Sets the OSPF interface authentication type.
- `ip ospf interface md5`  Creates and deletes the OSPF interface MD5 key identification number.
- `show ip ospf interface`  Displays the status and statistics of an OSPF interface.

**MIB Objects**

`alaOspfIfMd5Table`

- `alaOspfIfMd5IpAddress`
- `alaOspfIfMd5KeyId`
- `alaOspfIfMd5Key`
**ip ospf interface type**

Configures the OSPF interface type.

**ip ospf interface** `{interface_name}` type {point-to-point | point-to-multipoint | broadcast | non-broadcast}

---

**Syntax Definitions**

- **interface_name**
  - The name of the interface.
- **point-to-point**
  - Sets the interface to be a point-to-point OSPF interface.
- **point-to-multipoint**
  - Sets the interface to be a point-to-multipoint OSPF interface.
- **broadcast**
  - Sets the interface to be a broadcast OSPF interface.
- **non-broadcast**
  - Sets the interface to be NBMA (Non Broadcast Multi Access) OSPF interface.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>broadcast</td>
<td>No</td>
</tr>
<tr>
<td>non-broadcast</td>
<td>No</td>
</tr>
<tr>
<td>point-to-point</td>
<td>Yes</td>
</tr>
<tr>
<td>point-to-multipoint</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- This command sets an interface to be broadcast, non-broadcast, point-to-point, or point-to-multipoint.
- If the type is non-broadcast or point-to-multipoint, static neighbors should be configured.

---

**Examples**

- `-> ip ospf interface vlan-101 type non-broadcast`

---

**Release History**

Release 7.1.1; command was introduced.
Related Commands

**ip ospf neighbor**  Creates a static neighbor on a Non Broadcast Multi Access (NBMA) interface.

**show ip ospf interface**  Displays the status and statistics of an OSPF interface.

MIB Objects

ospfIfTable
ospfIfType
ip ospf interface cost

Configures the OSPF interface cost.

ip ospf interface {interface_name} cost cost

Syntax Definitions

interface_name  The name of the interface.
cost            The interface cost. The valid range is 0–65535.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>cost</td>
<td>1</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

The configured interface cost, if any, is used during OSPF route calculations.

Examples

-> ip ospf interface vlan-101 cost 10

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf interface  Displays the status and statistics of an OSPF interface.

MIB Objects

ospfIfMetricTable
  ospfIfMetricIpAddress
  ospfIfMetricValue
**ip ospf interface poll-interval**

Configures the OSPF poll interval for a Non Broadcast Multi Access (NBMA) interface.

```
ip ospf interface {interface_name} poll-interval seconds
```

### Syntax Definitions

- `interface_name` - The name of the interface.
- `seconds` - The poll interval, in seconds. The valid range is 1–2147483647.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>120</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>supported</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This parameter configures the larger time interval, in seconds, between hello packets sent to an inactive neighbor.

### Examples

```
-> ip ospf interface vlan-101 poll-interval 500
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- **show ip ospf interface** - Displays the status and statistics of an OSPF interface.

### MIB Objects

- `ospfIfTable` -
  - `ospfIfPollInterval`
**ip ospf interface priority**

Configures the OSPF interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

`ip ospf interface {interface_name} priority priority`

---

**Syntax Definitions**

- `interface_name`: The name of the interface.
- `priority`: The interface priority. The valid range is 0–255.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>1</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

**Examples**

`-> ip ospf interface vlan-101 priority 100`

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

*show ip ospf interface*  Displays the status and statistics of an OSPF interface.

**MIB Objects**

ospfIfTable
  
  ospfIfRtrPriority
**ip ospf interface retrans-interval**

Configures the OSPF interface retransmit interval.

```
ip ospf interface {interface_name} retrans-interval seconds
```

---

**Syntax Definitions**

- `interface_name` The name of the interface.
- `seconds` The retransmit interval, in seconds. The valid range 0–3600.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>5</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>
```

---

**Usage Guidelines**

The number of seconds between link retransmission of OSPF packets on this interface.

---

**Examples**

```
-> ip ospf interface vlan-101 retrans-interval 500
```

---

**Release History**

Release 7.1.1; command was introduced.

---

**Related Commands**

- `show ip ospf interface` Displays the status and statistics of an OSPF interface.

---

**MIB Objects**

- `ospfIfTable`
- `ospfIfRetransInterval`
**ip ospf interface transit-delay**

Configures the OSPF interface transit delay.

```
ip ospf interface {interface_name} transit-delay seconds
```

### Syntax Definitions

- `interface_name`  
  The name of the interface.

- `seconds`  
  The transit delay, in seconds. The valid range is 0–3600.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>1</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

### Examples

```
-> ip ospf interface vlan-101 transit-delay 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- `show ip ospf interface`  
  Displays the status and statistics of an OSPF interface.

### MIB Objects

- `ospfIfTable`  
  - `ospfIfTransitDelay`
ip ospf bfd-state

Enables or disables the registration of OSPF with the BFD protocol.

ip ospf bfd-state {enable | disable}

**Syntax Definitions**

<table>
<thead>
<tr>
<th>enable</th>
<th>disable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables BFD for OSPF.</td>
<td>Disables BFD for OSPF.</td>
</tr>
</tbody>
</table>

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- BFD must be globally enabled for the switch and OSPF must be registered with BFD at the protocol level before OSPF can interact with BFD.
- All the status changes on the neighbors are received from the BFD level and the OSPF protocol acts based upon the BFD message.
- Whenever a neighbor goes down, OSPF will inform BFD to remove that neighbor from the BFD active list.

**Examples**

Globally enables the BFD protocol for the switch:

```
-> ip bfd admin-state enable
```

Enables and disables the registration of OSPF with the BFD protocol:

```
-> ip ospf bfd-state enable
-> ip ospf bfd-state disable
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- **ip bfd admin-state**
  Enables or disables the global BFD protocol status for the switch.

- **ip ospf bfd-state all-interfaces**
  Enables or disables BFD for all OSPF interfaces configured.

- **ip ospf interface bfd-state**
  Enables or disables BFD for a specific OSPF interface.

- **ip ospf interface bfd-state drs-only**
  Establishes BFD sessions only on neighbors in full state.

- **ip ospf interface bfd-state all-neighbors**
  Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

- **show ip ospf**
  Displays OSPF status and general configuration parameters.

MIB Objects

- **alaProtocolospf**
- **alaOspfBfdStatus**
ip ospf bfd-state all-interfaces

Enables or disables BFD for all OSPF interfaces in the switch configuration.

ip ospf bfd-state all-interfaces {enable | disable}

---

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables BFD for all the OSPF interfaces.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables BFD for all the OSPF interfaces.</td>
</tr>
</tbody>
</table>

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The BFD status for OSPF must be enabled before OSPF can interact with BFD.

**Examples**

- `-> ip ospf bfd-state all-interfaces enable`
- `-> ip ospf bfd-state all-interfaces disable`

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- **ip ospf bfd-state**  
  Enables or disables the BFD status for the OSPF protocol.

- **ip ospf interface bfd-state**  
  Enables or disables BFD for a specific OSPF interface.

- **ip ospf interface bfd-state drs-only**  
  Establishes BFD sessions only on neighbors in full state.

- **ip ospf interface bfd-state all-neighbors**  
  Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

- **show ip ospf interface**  
  Displays configuration information for an OSPF interface.

**MIB Objects**

- **alaProtocolospf**

  - **alaOspfBfdAllInterfaces**
ip ospf interface bfd-state

Enables or disables BFD for a specific OSPF interface.

**ip ospf interface if_name bfd-state {enable | disable}**

---

**Syntax Definitions**

- `if_name`: The name of an existing OSPF interface.
- `enable`: Enables BFD for the OSPF interface.
- `disable`: Disables BFD for the OSPF interface.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

The BFD status for OSPF must be enabled before OSPF can interact with BFD.

---

**Examples**

-> ip ospf interface int1 bfd-state enable
-> ip ospf interface int2 bfd-state disable

---

**Release History**

Release 7.1.1; command was introduced.
OSPF Commands

ip ospf interface bfd-state

Enables or disables the BFD status for the OSPF protocol.

ip ospf bfd-state all-interfaces

Enables or disables BFD for all OSPF interfaces configured.

ip ospf interface bfd-state drs-only

Establishes BFD sessions only on neighbors in full state.

ip ospf interface bfd-state all-neighbors

Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

show ip ospf interface

Displays configuration information for an OSPF interface.

MIB Objects

alaOspfIfAugEntry

ospfIfIpAddress

alaOspfIfBfdStatus
**ip ospf interface bfd-state drs-only**

Establishes BFD sessions only with neighbors that are in the full state.

```
ip ospf interface if_name bfd-state drs-only
```

---

**Syntax Definitions**

`if_name` The name of an existing OSPF interface.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>drs-only</td>
<td>disable</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>

### Usage Guidelines

- The specified OSPF interface must be enabled to interact with BFD.
- The BFD status for OSPF must be enabled before OSPF can interact with BFD.

### Examples

- `-> ip ospf interface int1 bfd-state all-neighbors enable`
- `-> ip ospf interface int1 bfd-state all-neighbors disable`

### Release History

Release 7.1.1; command was introduced.
**Related Commands**

- `ip ospf bfd-state` Enables or disables the BFD status for OSPF protocol.
- `ip ospf bfd-state all-interfaces` Enables or disables BFD for all OSPF interfaces configured.
- `ip ospf interface bfd-state` Enables or disables BFD for a specific OSPF interface.
- `ip ospf interface bfd-state drs-only` Establishes BFD sessions only on neighbors in full state.
- `show ip ospf interface` Displays configuration information for an OSPF interface.

**MIB Objects**

- `alaOspfIfAugEntry`
  - `ospfIfIpAddress`
  - `alaOspfIfBfdDrsOnly`
**ip ospf restart-support**

Configures support for the graceful restart feature on an OSPF router.

```
ip ospf restart-support {planned-unplanned | planned-only}
no ip ospf restart-support
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>planned-unplanned</td>
<td>Specifies support for planned and unplanned restarts.</td>
</tr>
<tr>
<td>planned-only</td>
<td>This parameter is currently not supported.</td>
</tr>
</tbody>
</table>

**Defaults**

Graceful restart is disabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>

<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of the command to disable support for the graceful restart feature on an OSPF router.
- The minimum hardware configuration for this command is a redundant CMM configuration.

**Examples**

```
-> ip ospf restart-support planned-unplanned
-> no ip ospf restart-support
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

```
show ip ospf restart
```

Displays the OSPF graceful restart related configuration and status.

**MIB Objects**

```
alaProtocolOspf
alaOspfRestartSupport
```
ip ospf restart-interval

Configures the grace period for achieving a graceful OSPF restart.

`ip ospf restart-interval [seconds]`

**Syntax Definitions**

*seconds* The hitless restart timeout interval. The valid range is 0–1800 seconds.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>120</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
No     No     Yes    No     Yes    Yes    Yes    Yes    Yes    Yes    Yes    Yes
```

**Usage Guidelines**

The minimum hardware configuration for this command is a redundant CMM configuration.

**Example**

```
-> ip ospf restart-interval 600
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `ip ospf restart-support` Administratively enables and disables support for the graceful restart feature on an OSPF router.
- `show ip ospf restart` Displays the OSPF graceful restart related configuration and status.

**MIB Objects**

alaProtocolOspf
    alaOspfRestartInterval
**ip ospf restart-helper admin-state**

Administratively enables and disables the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart.

**ip ospf restart-helper [admin-state {enable | disable}]**

---

**Syntax Definitions**

<table>
<thead>
<tr>
<th>enable</th>
<th>Enables the capability of an OSPF router to operate in helper mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables the capability of an OSPF router to operate in helper mode.</td>
</tr>
</tbody>
</table>

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The minimum hardware configuration for this command is a redundant CMM configuration.

**Examples**

-> ip ospf restart-helper admin-state disable
-> ip ospf restart-helper admin-state enable

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- **ip ospf restart-support**
  
  Administratively enables and disables support for the graceful restart feature on an OSPF router.

- **ip ospf restart-helper strict-lsa-checking admin-state**
  
  Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

- **show ip ospf restart**
  
  Displays the OSPF graceful restart related configuration and status.

**MIB Objects**

- `alaProtocolOspf`  
  - `alaOspfRestartHelperSupport`
**ip ospf restart-helper strict-lsa-checking admin-state**

Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

`ip ospf restart-helper strict-lsa-checking admin-state {enable | disable}`

---

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>enable</td>
</tr>
<tr>
<td>disable</td>
<td>enable</td>
</tr>
</tbody>
</table>

Enables whether or not a changed LSA will result in termination of graceful restart by a helping router.

Disables whether or not a changed LSA will result in termination of graceful restart by a helping router.

---

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>disable</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

### Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration.

---

### Examples

- `-> ip ospf restart-helper strict-lsa-checking admin-state disable`
- `-> ip ospf restart-helper strict-lsa-checking admin-state enable`

---

### Release History

Release 7.1.1; command was introduced.
**Related Commands**

- **ip ospf restart-support**  
  Administratively enables and disables support for the graceful restart feature on an OSPF router.

- **ip ospf restart-helper admin-state**  
  Administratively enables and disables the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart.

- **show ip ospf restart**  
  Displays the OSPF graceful restart related configuration and status.

**MIB Objects**

- alaProtocolOspf  
- alaOspfRestartHelperSupport
**ip ospf restart initiate**

Initiates a planned graceful restart.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- You must execute this command on the primary CMM before executing a **takeover** command.
- The minimum hardware configuration for this command is a redundant CMM configuration.

**Example**

-> ip ospf restart initiate

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

`show ip ospf restart` Displays the OSPF graceful restart related configuration and status.

**MIB Objects**

alaProtocolOspf
alaOspfRestartInitiate
**show ip ospf**

Displays the OSPF status and general configuration parameters.

```
show ip ospf
```

### Syntax Definitions

Release History

Release 7.1.1; command was introduced.
Release 8.7R2; “Redistribute internal BGP routes” field added.

Related Commands

- `ip router router-id` Configures the router ID for the router.
- `ip ospf admin-state` Enables or disables the administration of OSPF on the router.
- `ip ospf route-tag` Configures a tag value for Autonomous System External (ASE) routes created.
- `ip ospf spf-timer` Configures timers for SPF calculation.
- `ip ospf mtu-checking` Enables or disables the use of Maximum Transfer Unit (MTU) checking.
- `ip ospf extlsdb-limit` Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.
- `ip ospf exit-overflow-interval` This command sets the overflow interval value.
- `ip ospf default-originate` Enables or disables OSPF redistribution
- `ip ospf area default-metric` Creates or deletes a default metric for stub or Not So Stubby Area (NSSA) areas.
- `ip ospf bfd-state` Enables or disables the registration of OSPF with the BFD protocol.
- `ip ospf redist-bgp-internal` This command allows redistribution of internal BGP routes into OSPF protocol.

**show ip ospf border-routers**

Displays information regarding all or specified border routers.

**show ip ospf border-routers [area_id] [router_id] [tos] [gateway]**

### Syntax Definitions

- **area_id**: A unique 32-bit value in IP address format.
- **router_id**: A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
- **tos**: The Type of Service. The valid range is 0–15. Only ToS value 0 is supported at this time.
- **gateway**: The 32-bit IP address of the gateway for the border router being displayed.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command is used to display a list of border routers known by this OSPF router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.
- See the related commands sections below to modify the list.

### Examples

```
-> show ip ospf border-routers 10.0.0.0

  Router Id | Area Id | Gateway | TOS | Metric
-------------+---------+---------+-----+--------
```

OmniSwitch AOS Release 8 CLI Reference Guide   April 2023   page 27-76

</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**show ip ospf**

Displays the OSPF status and general configuration parameters.

**MIB Objects**

alaOspfBdrRouterAreaId
alaOspfBdrRouterId
alaOspfBdrRouterTos
alaOspfBdrRouterMetric
**show ip ospf ext-lsdb**

Displays external Link State Advertisements known by this router.

```
show ip ospf ext-lsdb [linkstate-id ls_id] [router-id router_id]
```

### Syntax Definitions

- **ls_id**
  - The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database.

- **router_id**
  - The Router ID. The ID is a unique 32-bit value such as an IP address.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6</th>
<th>6900 X48C4E/V48C8</th>

<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command is used to display the external link state database (LSDB) for the OSPF router.

- This command can be used for OSPF debugging purposes, specifically to narrow down sections of attached areas to determine which sections are receiving the specified external LSAs. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.

- See the Related Commands section below to modify the list.

### Examples

```
-> show ip ospf ext-lsdb

<table>
<thead>
<tr>
<th>LS Id</th>
<th>Orig Router-Id</th>
<th>SeqNo</th>
<th>Age</th>
<th>Protocol</th>
</tr>
</thead>
<tbody>
<tr>
<td>198.168.100.100</td>
<td>198.168.100.100</td>
<td>10</td>
<td>100</td>
<td>STATIC</td>
</tr>
</tbody>
</table>
```

### Output Definitions

- **LS Id**: The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.

- **Orig Router-Id**: The router ID of the router that originated the external LSDB.
**output definitions (continued)**

<table>
<thead>
<tr>

**show ip ospf lsdb**

Displays LSAs in the Link State Database associated with each area.

```
show ip ospf lsdb [area_id] [rtr | net | netsum | asbrsum] [linkstate-id ls_id] [router-id router_id]
```

### Syntax Definitions

- **area_id**: A unique 32-bit value in IP address format.
- **rtr**: Specifies router LSAs.
- **net**: Specifies network LSAs.
- **netsum**: Specifies network summary LSAs.
- **asbrsum**: Specifies Autonomous System Border Router summary LSAs.
- **ls_id**: The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
- **router_id**: The Router ID. The ID is a unique 32-bit value such as an IP address.

### Usage Guidelines

- This command is used to display the Link State Database (LSDB) of the OSPF router. This command can be used for OSPF debugging purposes, specifically to narrow down sections of an area to determine which sections are receiving the specified link state advertisements. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.

- You can view link state advertisements by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you must also supply a valid link state ID.

### Examples

```
-> show ip ospf lsdb
Area Id  Type  LS Id        Orig Router-Id  SeqNo  Age
--------------------------------------------------------
0.0.0.1  OSPF  198.168.100.100  198.168.100.100  1    100
```

**show ip ospf neighbor**

Displays information on OSPF non-virtual neighbor routers.

`show ip ospf neighbor [ip_address]`

---

**Syntax Definitions**

`ip_address` A 32-bit IP address of the neighboring router.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

            13.1.1.2      0.0.0.1  3.3.3.3   Service      1200   Full   Dynamic
```

---

**output definitions**

- **IP Address** The IP address of the neighbor.
- **Area Id** A unique 32-bit value, such as an IP address, that identifies the neighboring router in the Autonomous System.
- **Router Id** The unique identification for the neighboring router.
- **Domain Name** The domain on which the neighbor is reachable (VLAN, Service, or Tunnel).
- **Domain ID** The VLAN ID or service ID on which the neighbor is reachable. This field displays “NA” for IP tunnels.
### show ip ospf neighbor

**show ip ospf routes**

Displays the OSPF routes known to the router.

`show ip ospf routes [ip_address mask tos gateway]`

---

**Syntax Definitions**

- **ip_address**: A 32-bit IP address of the route destination in dotted decimal format.
- **mask**: The IP subnet mask of the route destination.
- **tos**: The Type of Service of the route.
- **gateway**: The next hop IP address for this router.

---

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Supported</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If no variables are entered, all routes are displayed. If the variables are entered, then only routes matching the specified criteria are shown. All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

**Examples**

```
-> show ip ospf routes
```

<table>
<thead>
<tr>
<th>Destination/Mask</th>
<th>Gateway</th>
<th>Metric</th>
<th>Domain Name</th>
<th>Domain ID</th>
<th>Type</th>
</tr>

</tr>
</tbody>
</table>

output definitions

AreaId
The area identification for the area of which the virtual neighbor is a part.

RouterId
The router identification of the virtual neighbor.

Priority
The number used to determine whether the virtual neighbor will become the designated router for its area.

Events
The number of OSPF control message sent by the neighbor to the router.

RxmtQlen
The length (in number of packets) of the retransmit queue.
-> show ip ospf virtual-neighbor 0.0.0.1 2.0.0.254

show ip ospf area

Displays either all OSPF areas, or a specified OSPF area.

show ip ospf area [area_id]

Syntax Definitions

area_id A unique 32-bit value in IP address format.

Defaults
N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

  - `alaOspfIfIntfName`
show ip ospf area range

Displays all or specified route summaries in a given area.

**show ip ospf area area_id range [summary | nssa] ip_address ip_mask**

**Syntax Definitions**

- **area_id**: A unique 32-bit value in IP address format.
- **summary**: Specifies that routes are summarized.
- **nssa**: Specifies the Not So Stubby Area (NSSA) routers are summarized. *This parameter is not supported on an OmniSwitch 6560.*
- **ip_address**: A 32-bit IP address.
- **ip_mask**: A 32-bit subnet mask.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Allows you to view the details of a specified OSPF area range.
- See the Related Commands section below for information on modifying an area.

**Examples**

-> show ip ospf area 0.0.0.0 range

<table>
<thead>
<tr>
<th>AreaId</th>
<th>Type</th>
<th>Destination</th>
<th>Advertise</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0.0.0</td>
<td>Summary</td>
<td>192.168.12.1/24</td>
<td>Matching</td>
</tr>
<tr>
<td>0.0.0.0</td>
<td>NSSA</td>
<td>143.209.92.71/24</td>
<td>noMatching</td>
</tr>
</tbody>
</table>

**output definitions**

- **AreaId**: The area identification for the area range.
- **Type**: The type of area the range is associated with.
**output definitions (continued)**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Destination</strong></td>
<td>The destination address of the range.</td>
</tr>
<tr>
<td><strong>Advertise</strong></td>
<td>Shows the filter effect of the range. LSAs in the range are either advertised (Matching) or not advertised (noMatching).</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**ip ospf area range**

Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

**MIB Objects**

ospfAreaRangeTable
- ospfAreaRangeAreaId
- ospfAreaRangeNet
- ospfAreaRangeMask
- ospfAreaRangeStatus
- ospfAreaRangeEffect
**show ip ospf area stub**

Displays stub default area metrics, if configured.

**show ip ospf area area_id stub**

---

**Syntax Definitions**

`area_id`  
A unique 32-bit value in IP address format.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</tr>
</tbody>
</table>

---

**Usage Guidelines**

Not specifying an interface name displays all known interfaces for the OSPF router.

---

**Examples**

No interface name is specified:

```
-> show ip ospf interface
```

<table>
<thead>
<tr>
<th>Interface Name</th>
<th>DR Address</th>
<th>Backup DR Address</th>
<th>Admin Status</th>
<th>Oper Status</th>
<th>BFD Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan-213</td>
<td>100.10.10.88</td>
<td>100.10.10.2</td>
<td>enabled</td>
<td>up</td>
<td>BDR</td>
</tr>
<tr>
<td>vlan-215</td>
<td>101.10.10.2</td>
<td>0.0.0.0</td>
<td>enabled</td>
<td>up</td>
<td>DR</td>
</tr>
<tr>
<td>vlan-220</td>
<td>10.10.20.1</td>
<td>0.0.0.0</td>
<td>enabled</td>
<td>up</td>
<td>DR</td>
</tr>
<tr>
<td>service-1200</td>
<td>13.1.1.1</td>
<td>13.1.1.2</td>
<td>enabled</td>
<td>UP</td>
<td>BDR</td>
</tr>
<tr>
<td>tunnel-1</td>
<td>10.1.1.2</td>
<td>0.0.0.0</td>
<td>enabled</td>
<td>UP</td>
<td>DR</td>
</tr>
</tbody>
</table>

**output definitions**

- **Interface Name**: The name of the interface.
- **DR Address**: The designated router IP address on this network segment.
- **Backup DR Address**: The IP address of the backup designated router.
- **Admin Status**: The current administration status of the interface, either enabled or disabled.
- **Oper Status**: Whether the interface is an active OSPF interface.
output definitions (continued)

<table>
<thead>
<tr>
<th>State</th>
<th>The current state of the OSPF interface. It will be down, up, dp, dr, or other.</th>
</tr>
</thead>
<tbody>
<tr>
<td>BFD Status</td>
<td>The current status of BFD for the OSPF interface.</td>
</tr>
</tbody>
</table>

The following is an example of MD5 authentication (an interface name is used in this example):

```plaintext
-> show ip ospf interface vlan-213
Interface IP Name = vlan-213
Interface IP Address = 100.10.10.2,
Interface IP Mask = 255.255.255.0,
Domain Name = Vlan,
Domain ID = 213,
Admin Status = Enabled,
Operational Status = Up,
OSPF Interface State = BDR,
Interface Type = Broadcast,
Area Id = 0.0.0.2,
Designated Router IP Address = 100.10.10.88,
Designated Router RouterId = 100.10.10.88,
Backup Designated Router IP Address = 192.169.1.2,
Backup Designated Router RouterId = 192.169.1.2,
MTU (bytes) = 1500,
Metric Cost = 1,
Priority = 1,
Hello Interval (seconds) = 10,
Transit Delay (seconds) = 1,
Retrans Interval (seconds) = 5,
Dead Interval (seconds) = 40,
Poll Interval (seconds) = 120,
Link Type = Broadcast,
Authentication Type = md5,
# of Events = 2,
# of Init State Neighbors = 0,
# of 2-Way State Neighbors = 0,
# of Exchange State Neighbors = 0,
# of Full State Neighbors = 1
BFD status = Disabled,
DR-Only Option for BFD = Disabled
```

The following is an example of simple authentication (an interface name is used in this example):

```plaintext
-> show ip ospf interface vlan-215
Interface IP Name = vlan-215
Interface IP Address = 101.10.10.2,
Interface IP Mask = 255.255.255.0,
Domain Name = Vlan,
Domain ID = 215,
Admin Status = Enabled,
Operational Status = Up,
OSPF Interface State = DR,
Interface Type = Broadcast,
Area Id = 0.0.0.2,
Designated Router IP Address = 101.10.10.88,
Designated Router RouterId = 192.169.1.2,
Backup Designated Router IP Address = 192.169.1.2,
Backup Designated Router RouterId = 192.169.1.2,
MTU (bytes) = 1500,
Metric Cost = 1,
```

The current state of the OSPF interface. It will be down, up, dp, dr, or other.
The current status of BFD for the OSPF interface.
Priority = 1,
Hello Interval (seconds) = 10,
Transit Delay (seconds) = 1,
Retrans Interval (seconds) = 5,
Dead Interval (seconds) = 40,
Poll Interval (seconds) = 120,
Link Type = Broadcast,
Authentication Type = simple,
Authentication Key = Set,
# of Events = 3,
# of Init State Neighbors = 0,
# of Exchange State Neighbors = 0,
# of 2-Way State Neighbors = 0,
# of Full State Neighbors = 0
BFD Status = Disabled,
DR-Only Option for BFD = Disabled

The following is an example of keychain authentication (an interface name is used in this example):
-> show ip ospf interface vlan-220

Interface IP Name = vlan-220,
Interface IP Address = 10.10.20.1,
Interface IP Mask = 255.255.255.0,
Domain Name = Vlan,
Domain ID = 220,
Admin Status = Enabled,
Operational Status = Up,
OSPF Interface State = DR,
Interface Type = Broadcast,
Area Id = 0.0.0.0,
Designated Router IP Address = 10.10.20.1,
Designated Router RouterId = 10.10.10.1,
Backup Designated Router IP Address = 0.0.0.0,
Backup Designated Router RouterId = 0.0.0.0,
MTU (bytes) = 1500,
Metric Cost = 1,
Priority = 1,
Hello Interval (seconds) = 10,
Transit Delay (seconds) = 1,
Retrans Interval (seconds) = 5,
Dead Interval (seconds) = 40,
Poll Interval (seconds) = 120,
Link Type = Broadcast,
Authentication Type = Keychain(1),
# of Events = 2,
# of Init State Neighbors = 0,
# of 2-Way State Neighbors = 0,
# of Exchange State Neighbors = 0,
# of Full State Neighbors = 0,
# of type-9 LSAs on this interface = 0,
BFD status = Disabled,
DR-Only Option for BFD = Disabled

The following are examples of an OSPF interface configured for an IP interface that is bound to a service and configured for an IP interface that is bound to a tunnel (an interface name is used in each example):
-> show ip ospf interface service-1200

Interface IP Name = service-1200,
Interface IP Address = 13.1.1.2,
Interface IP Mask = 255.255.255.0,
Domain Name = Service,
Domain ID = 1200,
Admin Status = Enabled,
Operational Status = Up,
OSPF Interface State = BDR,
Interface Type = Broadcast,
Area Id = 0.0.0.1,
Designated Router IP Address = 13.1.1.1,
Designated Router RouterId = 172.28.4.133,
Backup Designated Router IP Address = 13.1.1.2,
Backup Designated Router RouterId = 2.2.2.2,
MTU (bytes) = 1500,
Metric Cost = 1,
Priority = 1,
Hello Interval (seconds) = 10,
Transit Delay (seconds) = 1,
Retrans Interval (seconds) = 5,
Dead Interval (seconds) = 40,
Poll Interval (seconds) = 120,
Link Type = Broadcast,
Authentication Type = none,
# of Events = 3,
# of Init State Neighbors = 0,
# of 2-Way State Neighbors = 0,
# of Exchange State Neighbors = 0,
# of Full State Neighbors = 1,
# of type-9 LSAs on this interface = 0,
BFD status = Enabled,
DR-Only Option for BFD = Disabled

-> show ip ospf interface tunnel-1
Interface IP Name = tunnel-1,
Interface IP Address = 10.1.1.2,
Interface IP Mask = 255.255.255.0,
Domain Name = Tunnel,
Domain ID = NA,
Admin Status = Enabled,
Operational Status = Up,
OSPF Interface State = DR,
Interface Type = Broadcast,
Area Id = 0.0.0.0,
Designated Router IP Address = 10.1.1.2,
Designated Router RouterId = 20.1.1.1,
Backup Designated Router IP Address = 0.0.0.0,
Backup Designated Router RouterId = 0.0.0.0,
MTU (bytes) = 1480,
Metric Cost = 1,
Priority = 1,
Hello Interval (seconds) = 10,
Transit Delay (seconds) = 1,
Retrans Interval (seconds) = 5,
Dead Interval (seconds) = 40,
Poll Interval (seconds) = 120,
Link Type = Broadcast,
Authentication Type = none,
# of Events = 3,
# of Init State Neighbors = 0,
# of 2-Way State Neighbors = 0,
# of Exchange State Neighbors = 0,
# of Full State Neighbors = 0,
# of type-9 LSAs on this interface = 0,
BFD status = Enabled,
DR-Only Option for BFD = Disabled

Output fields when an interface name is specified are described below:
output definitions

<table>
<thead>
<tr>
<th><strong>Interface IP Name</strong></th>
<th>The name of the IP interface on which OSPF is configured.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Interface IP Address</strong></td>
<td>The IP address assigned to the interface.</td>
</tr>
<tr>
<td><strong>Interface IP Mask</strong></td>
<td>The IP mask associated with the IP address assigned to the interface.</td>
</tr>
<tr>
<td><strong>Domain Name</strong></td>
<td>The domain on which the IP interface was configured (VLAN, Service, or Tunnel).</td>
</tr>
<tr>
<td><strong>Domain ID</strong></td>
<td>The VLAN ID or service ID on which the IP interface was configured. This field displays “NA” for IP tunnels.</td>
</tr>
<tr>
<td><strong>Admin Status</strong></td>
<td>The current administration status of the interface (enabled or disabled).</td>
</tr>
<tr>
<td><strong>Operational Status</strong></td>
<td>Whether the interface is an active OSPF interface.</td>
</tr>
<tr>
<td><strong>OSPF Interface State</strong></td>
<td>The current state of the OSPF interface (down, up, dp, dr, or other).</td>
</tr>
<tr>
<td><strong>Interface Type</strong></td>
<td>The OSPF interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint.</td>
</tr>
<tr>
<td><strong>Area Id</strong></td>
<td>The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area.</td>
</tr>
<tr>
<td><strong>Designated Router IP Address</strong></td>
<td>The designated router IP address.</td>
</tr>
<tr>
<td><strong>Designated Router RouterId</strong></td>
<td>The identification number of the designated router.</td>
</tr>
<tr>
<td><strong>Backup Designated Router IP Address</strong></td>
<td>The IP address of the backup designated router.</td>
</tr>
<tr>
<td><strong>Backup Designated Router RouterId</strong></td>
<td>The identification number of the backup designated router.</td>
</tr>
<tr>
<td><strong>MTU</strong></td>
<td>The Maximum Transfer Unit (in bytes) for the interface.</td>
</tr>
<tr>
<td><strong>Metric Cost</strong></td>
<td>The cost added to routes learned on this interface.</td>
</tr>
<tr>
<td><strong>Priority</strong></td>
<td>The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.</td>
</tr>
<tr>
<td><strong>Hello Interval</strong></td>
<td>The number of seconds between hello messages sent out on the interface.</td>
</tr>
<tr>
<td><strong>Transit Delay</strong></td>
<td>The estimated number of seconds required to transmit a link state update over this interface.</td>
</tr>
<tr>
<td><strong>Retrans Interval</strong></td>
<td>The number of seconds the interface waits before resending hello messages.</td>
</tr>
<tr>
<td><strong>Dead Interval</strong></td>
<td>The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead.</td>
</tr>
<tr>
<td><strong>Poll Interval</strong></td>
<td>The larger time interval, in seconds, between hello messages sent to inactive neighbors.</td>
</tr>
<tr>
<td><strong>Link Type</strong></td>
<td>The IP interface type (broadcast or non broadcast).</td>
</tr>
<tr>
<td><strong>Authentication Type</strong></td>
<td>The type of authentication used by this interface (None, Simple, MD5, or Keychain).</td>
</tr>
<tr>
<td><strong>#</strong></td>
<td>The indexing of the MD5 key. (This field is only displayed for MD5 authentication.)</td>
</tr>
</tbody>
</table>
output definitions (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Id</td>
<td>A key identifier that identifies the algorithm and MD5 secret key associated with this interface. (This field is only displayed for MD5 authentication.)</td>
</tr>
<tr>
<td>Key</td>
<td>Indicates whether the MD5 key has been set or not. (This field is only displayed for MD5 authentication.)</td>
</tr>
<tr>
<td>Status</td>
<td>The status of the configured MD5 authentication key. (This field is only displayed for MD5 authentication.)</td>
</tr>
<tr>
<td>StartAccept</td>
<td>The time that the OSPF router will start accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.)</td>
</tr>
<tr>
<td>StopAccept</td>
<td>The time that the OSPF router will stop accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.)</td>
</tr>
<tr>
<td>StartGen</td>
<td>The time that the OSPF router will start using this key for packet generation. (This field is only displayed for MD5 authentication.)</td>
</tr>
<tr>
<td>StopGen</td>
<td>The time that the OSPF router will stop using this key for packet generation. (This field is only displayed for MD5 authentication.)</td>
</tr>
<tr>
<td>Authentication Key</td>
<td>This field displays whether the authentication key has been configured or not. (This field is only displayed for simple and no authentication.)</td>
</tr>
<tr>
<td># of Events</td>
<td>The number of interface state machine events.</td>
</tr>
<tr>
<td># of Init State Neighbors</td>
<td>The number of OSPF neighbors in the initialization state.</td>
</tr>
<tr>
<td># of 2-Way State Neighbors</td>
<td>The number of OSPF 2-way state neighbors on this interface.</td>
</tr>
<tr>
<td># of Exchange State Neighbors</td>
<td>The number of OSPF neighbors in the exchange state.</td>
</tr>
<tr>
<td># of Full State Neighbors</td>
<td>The number of OSPF neighbors in the full state. The full state is a neighbor that is recognized and passing data between itself and the interface.</td>
</tr>
<tr>
<td># of type-9 LSAs on this interface</td>
<td>Number of type-9 LSA on this interface. (This field is only displayed for keychain authentication.)</td>
</tr>
<tr>
<td>BFD Status</td>
<td>The status of BFD on this interface.</td>
</tr>
<tr>
<td>DR-Only Option for BFD</td>
<td>The BFD setting for this interface. If DR-Only only is disabled then the setting is All Neighbors.</td>
</tr>
</tbody>
</table>

Release History

Release 7.1.1; command was introduced.
Release 8.6R2; “Domain Name” and “Domain ID” fields added.

**show ip ospf interface auth-info**

Displays authentication information for the interface.

```
show ip ospf interface auth-info [interface_name]
```

**Syntax Definitions**

`interface_name` The name of the interface.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Not specifying an interface name displays all known interfaces for the OSPF router.
- When keychain authentication type is used for the interface, only the keychain ID is displayed. To view the keys associated with the keychain, use the keychain commands. For more information on keychain management commands, refer to the “Chassis Management and Monitoring Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide*.

**Examples**

```
-> show ip ospf interface auth-info

Interface Name       Key-chain KeyId Key   Status   AuthMode
---------------------+------------+-------+--------+----------+-----------
               vlan-30-int        1     --     --      Enabled keychain
               vlan-20-int       --     10     Set     Enabled Keyed-MD5
```

**output definitions**

Release History

Release 8.4.1; command introduced.

Related Commands

ip ospf interface auth-type

Sets the OSPF interface authentication type. Authentication allows the router to only respond to other routers that have the correct authentication information.

MIB Objects

N/A
**show ip ospf restart**

Displays the OSPF graceful restart related configuration and status.

```
show ip ospf restart
```

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration.

### Examples

```
-> show ip ospf restart
Restart Support = Enabled,
Restart Interval (in seconds) = 120,
Restart Status = Not Restarting,
Restart Age (in seconds) = 0,
Last Restart Exit Reason = None,
Restart Helper Support = Enabled,
Restart Helper Strict Checking = Enabled,
Restart Helper Mode = NotHelping
```

### output definitions

- **Restart Support**: The administrative status of OSPF graceful restart, which can be **Enabled** or **Disabled**.
- **Restart Interval**: The configured OSPF hitless restart timeout interval, in seconds. Use the `ip ospf restart-interval` command to modify this parameter.
- **Restart Status**: The current status of OSPF graceful restart, which can be **Not Restarting**, **Unplanned Restart** (after a CMM takeover), or **Planned Restart** (before CMM takeover).
**output definitions (continued)**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Restart Age</strong></td>
<td>The remaining time, in seconds, for the current OSPF graceful restart interval.</td>
</tr>
<tr>
<td><strong>Last Restart Exit Reason</strong></td>
<td>The outcome of the last attempt at a graceful restart. If the value is None, then no restart has yet been attempted. If the value is In Progress, then a restart attempt is currently underway. Other possible values include Completed (successfully completed), Timed Out (timed out), and Topology Changed (aborted due to topology change).</td>
</tr>
<tr>
<td><strong>Restart Helper Support</strong></td>
<td>The administrative status of the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart, which can be Enabled or Disabled. Use the ip ospf restart-helper admin-state command to modify this parameter.</td>
</tr>
<tr>
<td><strong>Restart Helper Strict Checking</strong></td>
<td>The administrative status of whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router, which can be Enabled or Disabled. Use the ip ospf restart-helper strict-lsa-checking admin-state command to modify this parameter.</td>
</tr>
<tr>
<td><strong>Restart Helper Mode</strong></td>
<td>Whether this OSPF router is operating as a helper to a restarting router.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **ip ospf restart-support** Configures support for the graceful restart feature on an OSPF router.
- **ip ospf restart initiate** Initiates a planned graceful restart.

Open Shortest Path First version 3 (OSPFv3) routing is a shortest path first (SPF) or link-state protocol. This protocol is compatible with 128-bit IPv6 address space, while OSPF is compatible with 32-bit IPv4 address space. OSPFv3 is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPFv3 chooses the least-cost path as the best path.

Each participating router distributes its local state (i.e., the router’s usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPFv3 allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an area. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

The OmniSwitch version of OSPFv3 complies with RFCs 2740, 1826, 1827, 2553, 2373, 2374, and 2460.

MIB information for OSPFv3 is as follows:

- **Filename:** ALCATEL-IND1-VIRTUALROUTER-MIB.mib
  **Module:** alcatelIND1VirtualRouterMIB

- **Filename:** ALCATEL-IND1-OSPF3-MIB.mib
  **Module:** alcatelIND1OSPF3MIB

- **Filename:** OSPFV3-MIB.mib
  **Module:** ospfv3MIB
The following is a list of the commands for configuring OSPFv3:

| Global OSPFv3 Commands       | ipv6 load ospf               |
|                              | ipv6 ospf admin-state        |
|                              | ipv6 ospf host               |
|                              | ipv6 ospf mtu-checking       |
|                              | ipv6 ospf route-tag          |
|                              | ipv6 ospf spf-timer          |
|                              | ipv6 ospf virtual-link       |
|                              | show ipv6 ospf               |
|                              | show ipv6 ospf border-routers|
|                              | show ipv6 ospf host          |
|                              | show ipv6 ospf lsdb          |
|                              | show ipv6 ospf neighbor      |
|                              | show ipv6 ospf routes        |
|                              | show ipv6 ospf virtual-link  |

| OSPFv3 Area Commands         | ipv6 ospf area               |
|                              | ipv6 ospf area area-summary  |
|                              | ipv6 ospf area nssa-translator-role |
|                              | ipv6 ospf area nssa-translator-stab-interval |
|                              | ipv6 ospf area nssa-summarize |
|                              | show ipv6 ospf area          |

| OSPFv3 Interface Commands    | ipv6 ospf interface          |
|                              | ipv6 ospf interface admin-state |
|                              | ipv6 ospf interface suppress-link-lsa |
|                              | ipv6 ospf interface type      |
|                              | ipv6 ospf neighbor            |
|                              | ipv6 ospf interface area      |
|                              | ipv6 ospf interface dead-interval |
|                              | ipv6 ospf interface hello-interval |
|                              | ipv6 ospf interface cost      |
|                              | ipv6 ospf interface priority  |
|                              | ipv6 ospf interface retrans-interval |
|                              | ipv6 ospf interface transit-delay |
|                              | show ipv6 ospf interface      |

| OSPFv3 BFD Commands          | ipv6 ospf bfd-state          |
|                              | ipv6 ospf bfd-state all-interfaces |
|                              | ipv6 ospf interface bfd-state |
|                              | ipv6 ospf interface bfd-state drs-only |
|                              | ipv6 ospf interface bfd-state all-neighbors |

| OSPFv3 Graceful Restart Commands | ipv6 ospf restart          |
|                                  | ipv6 ospf restart initiate |
|                                  | ipv6 ospf restart interval  |
|                                  | ipv6 ospf restart-helper    |
|                                  | ipv6 ospf restart-helper strict-lsa-check |
|                                  | show ipv6 ospf restart      |
ipv6 load ospf

Loads the OSPFv3 software on the router.

**Usage Guidelines**

The OSPFv3 protocol should be enabled to route traffic.

**Examples**

-> `ipv6 ospf admin-state enable`

-> `ipv6 ospf admin-state disable`

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

`show ipv6 ospf` Displays OSPFv3 status and general configuration parameters.

**MIB Objects**

- `ospfv3GeneralGroup`
- `ospfv3AdminStat`
**ipv6 ospf host**

Creates or deletes an OSPFv3 entry for directly attached hosts.

```plaintext
ipv6 ospf host ipv6_address [area area_id] [metric metric]
no ipv6 ospf host ipv6_address area area_id
```

**Syntax Definitions**

- `ipv6_address`: The 128-bit IP address of the OSPFv3 host.
- `area_id`: Area to which the host route belongs.
- `metric`: The cost metric value assigned to the specified host. The valid range is 0–65535.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>metric</td>
<td>0</td>
</tr>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of the command to remove the record of the OSPFv3 host.
- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path.
- This command allows you to modify the host parameter `metric`.

**Examples**

```plaintext
- ipv6 ospf host 2001::1/64 metric 10
- no ipv6 ospf host 2001::1/64 metric 10
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

show ipv6 ospf host

Displays information on the configured OSPFv3 hosts.

MIB Objects

ospfv3HostTable

ospfv3HostStatus
ospfv3HostAreaID
ospfv3HostAddress
ospfv3HostMetric
ipv6 ospf mtu-checking

Enables or disables Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

*ipv6 ospf mtu-checking*

*no ipv6 ospf mtu-checking*

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of the command to disable MTU checking.

- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

**Examples**

```
-> ipv6 ospf mtu-checking
-> no ipv6 ospf mtu-checking
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

show ipv6 ospf
Displays the OSPFv3 status and general configuration parameters.

MIB Objects

alaProtocolOspf3
alaOspf3MTUCheck
ipv6 ospf route-tag

Configures a tag value for the Autonomous System External (ASE) routes created.

ipv6 ospf route-tag tag

Syntax Definitions

tag The set tag value. The valid range is 0–2, 147, 483, 647.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>0</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- This command allows you to set a tag value for ASE routes that are learned by this OSPFv3 router. The tag value allows for quick identification.
- OSPFv3 ASE route advertisements contain a tag value field. This field allows the exchange of information between autonomous system border routers (ASBRs).

Examples

-> ipv6 ospf route-tag 2

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf Displays OSPFv3 status and general configuration parameters.

MIB Objects

alaProtocolOspf3
alaOspf3RedistRouteTag
**ipv6 ospf spf-timer**

Configures timers for Shortest Path First (SPF) calculation.

**ipv6 ospf spf-timer [delay delay_seconds] [hold hold_seconds]**

---

**Syntax Definitions**

- **delay_seconds**: Specifies time (from 0 to 65535 seconds) between the reception of an OSPFv3 topology change and the start of an SPF calculation.
- **hold_seconds**: Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations.

---

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>delay_seconds</td>
<td>5</td>
</tr>
<tr>
<td>hold_seconds</td>
<td>10</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- This command allows you to configure the time interval between SPF calculations.
- Use the delay timer to determine how much time to postpone an SPF calculation after the router receives a topology change.
- Use the hold timer to configure the amount of time that must elapse between consecutive SPF calculations.
- There will be no delay in the SPF calculation if either the delay timer or hold timer is set to 0. The SPF calculations will occur immediately upon the reception of a topology change and/or that back-to-back SPF calculations can take place with no break in-between the two.

---

**Examples**

```
-> ipv6 ospf spf-timer delay 20 hold 35
```

---

**Release History**

Release 7.1.1; command was introduced.
Related Commands

show ipv6 ospf

Displays the OSPFv3 status and general configuration parameters.

MIB Objects

alaProtocolOspf3

alaOspf3TimerSpfDelay
alaOspf3TimerSpfHold
**ipv6 ospf virtual-link**

Creates or deletes a virtual link. A virtual link restores the backbone connectivity if the backbone is not physically contiguous.

```
ipv6 ospf virtual-link area_area_id router_router_id [dead-interval seconds] [hello-interval seconds] [retrans-interval seconds] [transit-delay seconds]
```

```
no ipv6 ospf virtual-link area_area_id router_router_id
```

### Syntax Definitions

- `area_id` - A unique 32-bit value in IP address format.
- `router_id` - A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
- `dead-interval seconds` - Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647.
- `hello-interval seconds` - Sets the virtual link hello interval, which is the time interval between OSPFv3 hellos sent on this virtual link. The valid range is 1–65535.
- `retrans-interval seconds` - Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPFv3 packets. The valid range is 0–3600.
- `transit-delay seconds` - Sets the virtual link transit delay, which is the number of seconds to transmit OSPFv3 packets over this link. The valid range is 0–3600.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dead-interval seconds</code></td>
<td>40</td>
</tr>
<tr>
<td><code>hello-interval seconds</code></td>
<td>10</td>
</tr>
<tr>
<td><code>retrans-interval seconds</code></td>
<td>5</td>
</tr>
<tr>
<td><code>transit-delay seconds</code></td>
<td>1</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of the command to delete the virtual link.
• You can define areas in such a way that the backbone is no longer contiguous. In this case, the system administrator can ensure backbone connectivity physically.

• Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.

• If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.

• The **dead-interval** value should be the same for all the routers on the same network. This value should be a multiple of the value provided for the **hello-interval**.

**Examples**

-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
dead-interval 50
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 hello-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 retrans-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 transit-delay 50
-> no ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115

**Release History**

**ipv6 ospf area**

Assigns an OSPFv3 interface to a specified area.

`ipv6 ospf area area_id [type {normal | stub [default-metric metric] | nssa [default-metric metric]}] [summarize [filter]]`

`no ipv6 ospf area area_id`

---

**Syntax Definitions**

- **area_id**: A unique 32-bit value in IP address format or a unique identification number in the range 0 to 4294967295.
- **normal**: Sets the area as a regular OSPFv3 area.
- **stub**: Configures an OSPFv3 area as a stub area.
- **nssa**: Configures an OSPFv3 area as a NSSA (Not-So-Stubby Area).
- **metric**: Defines the metric to be used for default routes injected into the stub or NSSA. The range is 0 to 4294967295.
- **summarize**: Configures the inter-area route summarization. Prefixes that fall within the summary range can be shared with another area through the summary prefix.
- **filter**: Configure to filter the routes specified in the summarization range. These filtered routes are not advertised into another area.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal</td>
<td>normal</td>
</tr>
<tr>
<td>stub</td>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of the command to delete the OSPFv3 area.
- To change the area type, first delete the area, and then recreate it with the new type.
- The `default-metric` parameter defines the metric to be used for default routes injected into the stub or NSSA.
- The OS6560 supports stub area only.
**Examples**

- `ipv6 ospf area 0.0.0.1`
- `ipv6 ospf area 0.0.0.1 stub default-metric 15`
- `ipv6 ospf area 0.0.0.1 type normal`
- `ipv6 ospf area 0.0.0.1 type nssa`
- `ipv6 ospf area 0.0.0.1 summarize 2001:1::/64`
- `no ipv6 ospf area 0.0.0.1`

**Release History**

Release 7.1.1; command was introduced.
Release 8.4.1; nssa keyword added.

**Related Commands**

- `show ipv6 ospf area` Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

**MIB Objects**

- `ospfv3AreaTable`
  - `ospfv3ImportAsExtern`
  - `ospfv3AreaSummary`
  - `ospfv3StubMetric`
  - `ospfv3AreaId`
  - `ospfv3AreaImportAsExtern`
**ipv6 ospf area area-summary**

Configures whether or not summary routes are imported into the stub or NSSA as Type-3 summary-LSAs.

```
ipv6 ospf area area_id [area-summary {noareasummary | sendareasummary}]
```

---

**Syntax Definitions**

- `area_id` The area ID configured for a stub or NSSA.
- `noareasummary` When set to this option, inter-area LSAs will neither originate or propagate into the NSSA. Only a default route will be advertised into the NSSA.
- `sendareasummary` When set to this option, inter-area LSAs will be summarized and propagated into the NSSA.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>noareasummary</td>
<td>sendareasummary</td>
</tr>
<tr>
<td>sendareasummary</td>
<td></td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

N/A

**Examples**

```
-> ipv6 ospf area 0.0.0.1 area-summary noAreaSummary
```

**Release History**

Release 8.4.1; command introduced.
Related Commands

- **ipv6 ospf area** Assigns an OSPFv3 interface to a specified area.
- **show ipv6 ospf area** Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

MIB Objects

- **ospfv3AreaSummary**
**ipv6 ospf area nssa-translator-role**

Configures whether or not an NSSA border router will unconditionally translate Type-7 LSAs into Type-5 LSAs.

```
ipv6 ospf area area_id [nssa-translator-role {always | candidate}]
```

---

**Syntax Definitions**

- **area_id**: A unique 32-bit value in IP address format.
- **always**: When set to this option, NSSA border router always translates Type-7 LSAs into Type-5 LSAs regardless of the translator state of other NSSA border routers.
- **candidate**: When set to this option, NSSA border router participates in the translator election process.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>always</td>
<td>candidate</td>
</tr>
</tbody>
</table>

default

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
  No  No Yes No  Yes  Yes  Yes  Yes  Yes  Yes
```

---

**Usage Guidelines**

When translator role is set to **candidate**, NSSA border router invokes a translator election process. The translator is then established by the NSSA border router whose router LSA has the greatest router ID.

---

**Examples**

```
-> ipv6 ospf area 0.0.0.1 nssa-translator role always
```

---

**Release History**

Release 8.4.1; command introduced.
**Related Commands**

- **ipv6 ospf area**
  Assigns an OSPFv3 interface to a specified area.

- **show ipv6 ospf area**
  Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

**MIB Objects**

- `ospfv3AreaNssaTranslatorRole`
**ipv6 ospf area nssa-translator-stab-interval**

Configures the duration for which a Type-7 translator will continue in the translator role after another NSSA border router translator has assumed the role.

`ipv6 ospf area area_id [nssa-translator-stab-interval interval]`

**Syntax Definitions**

- **area_id**: A unique 32-bit value in IP address format.
- **interval**: NSSA translator stability interval value in seconds. The range is 0 to 4294967295.

**Defaults**

The default value is 40 seconds.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

N/A

**Examples**

`-> ipv6 ospf area 0.0.0.1 nssa-translator-stab-interval 60`

**Release History**

Release 8.4.1; command introduced.

**Related Commands**

- `ipv6 ospf area`: Assigns an OSPFv3 interface to a specified area.
- `show ipv6 ospf area`: Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

**MIB Objects**

- `ospfv3AreaNssaTranslatorStabInterval`
**ipv6 ospf area nssa-summarize**

Configures an NSSA summary of IPv6 prefix in the given area. Any NSSA LSAs within the area subsumed by IPv6 prefix will be summarized into other areas as an external LSA with a prefix of IPv6 prefix.

```
ipv6 ospf area area_id nssa-summarize ipv6_address_prefix [filter]
```

### Syntax Definitions

- **area_id**: A unique 32-bit value in IP address format.
- **ipv6_address_prefix**: The 128-bit IPv6 address in hexadecimal format.
- **filter**: Use filter option to suppress the external LSA.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

N/A

### Examples

```
-> ipv6 ospf area 2 nssa-summarize c000::/64
```

### Release History

Release 8.4.1 R03; command introduced.

### Related Commands

- **ipv6 ospf area**: Assigns an OSPFv3 interface to a specified area.
- **show ipv6 ospf area**: Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

### MIB Objects

- `ospfv3AreaAggregateTable`
ipv6 ospf interface

Creates or deletes an OSPFv3 interface.

ipv6 ospf interface interface_name

no ipv6 ospf interface interface_name

Syntax Definitions

interface_name The name of the interface.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Support</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of the command to delete an OSPFv3 interface.
- The interface name cannot contain spaces.

Examples

-> ipv6 ospf interface vlan-101
-> no ipv6 ospf interface vlan-101

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf interface Displays the status and statistics of an OSPFv3 interface.

MIB Objects

ospfv3IfTable
ospfv3IfIndex
**ipv6 ospf interface admin-state**

Enables or disables the administration status on an OSPFv3 interface.

```
ipv6 ospf interface interface_name admin-state {enable | disable}
no ipv6 ospf interface interface_name
```

### Syntax Definitions

- **interface_name**: The name of the interface.
- **enable**: Enables the OSPFv3 interface.
- **disable**: Disables the OSPFv3 interface.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of the command to delete an OSPFv3 interface.
- The OSPFv3 interface must be enabled to participate in the OSPFv3 protocol.

### Examples

```
-> ipv6 ospf interface vlan-101 admin-state enable
-> ipv6 ospf interface vlan-101 admin-state disable
-> no ipv6 ospf interface vlan-101
-> no ipv6 ospf interface vlan-101
```

### Release History

Release 7.1.1; command was introduced.
Related Commands

show ipv6 ospf interface  
Displays the status and statistics of an OSPFv3 interface.

MIB Objects

ospfv3IfTable
  ospfv3IfIndex
  ospfv3IfAdminStat
**ipv6 ospf interface suppress-link-lsa**

Allows to suppress the announcements of the Link State Advertisements (LSAs).

```
ipv6 ospf interface interface_name suppress-link-lsa
```

```
no ipv6 ospf interface interface_name suppress-link-lsa
```

**Syntax Definitions**

```
interface_name
```

The name of the interface.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `no` form of the command to disable LSA suppression.

**Examples**

```
-> ipv6 ospf interface vlan-101 suppress-link-lsa
-> no ipv6 ospf interface vlan-101 suppress-link-lsa
```

**Release History**

Release 8.1.1; command introduced.

**Related Commands**

**show ipv6 ospf interface**

Displays the status and statistics of an OSPFv3 interface.

**MIB Objects**

`ospfv3IfTable`

`ospfv3IfIndex`

`alaOspf3SuppressLinkLsa`
ipv6 ospf interface type

Allows to configure the type of OSPFv3 interface.

ipv6 ospf interface interface_name type {broadcast | point-to-point | point-to-multipoint | nbma}

Syntax Definitions

- **interface_name**: The name of the interface.
- **broadcast**: The interface is a broadcast interface.
- **point-to-point**: The interface is a point-to-point interface.
- **point-to-multipoint**: The interface is a point-to-multipoint interface.
- **nbma**: The interface is a NBMA interface.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>broadcast</td>
<td>broadcast</td>
</tr>
<tr>
<td>point-to-point</td>
<td>broadcast</td>
</tr>
<tr>
<td>point-to-multipoint</td>
<td>broadcast</td>
</tr>
<tr>
<td>nbma</td>
<td>broadcast</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

The OSPFv3 interface must be enabled to participate in the OSPFv3 protocol.

Examples

- `ipv6 ospf interface vlan-101 type nbma`
- `ipv6 ospf interface vlan-101 type point-to-point`
- `ipv6 ospf interface vlan-101 type point-to-multipoint`
- `ipv6 ospf interface vlan-101 type broadcast`

Release History

Release 8.1.1; command introduced.
**Related Commands**

`show ipv6 ospf interface`  Displays the status and statistics of an OSPFv3 interface.

**MIB Objects**

ospfv3IfTable
  ospfv3IfStatus
  ospfv3IfType
**ipv6 ospf neighbor**

Allows to configure OSPFv3 neighbor on non-broadcast interface type. The neighbor configuration is required on NBMA and point-to-multipoint interface to run OSPFv3.

```
ipv6 ospf neighbor nbr_ipv6_address interface interface_name {eligible | ineligible}
no ipv6 ospf neighbor nbr_ipv6_address
```

### Syntax Definitions

- **nbr_ipv6_address**: Link-local address of the neighbor to be linked.
- **interface_name**: The name of the interface on which the neighbor is reachable.
- **eligible**: Indicates the neighbor is eligible to become the designated router.
- **ineligible**: Indicates the neighbor is ineligible to become the designated router.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>eligible</td>
<td>ineligible</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6</th>
<th>X48C8/C32E/T24C2/ X24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **no** form of the command to delete the neighbor configuration.
- The OSPFv3 interface must be configured before configuring the OSPFv3 neighbor.
- This command is not applicable for broadcast interface type and is optional for point-to-point interface type.

### Examples

```
-> ipv6 ospf neighbor fe80::2e0:blff:fe7e:5f1e interface vlan-101 eligible
-> ipv6 ospf neighbor fe80::2e0:blff:fe7e:5f1e interface vlan-101 ineligible
-> no ipv6 ospf neighbor fe80::2e0:blff:fe7e:5f1e interface vlan-101
```

### Release History

Release 8.1.1; command introduced.
**Related Commands**

`show ipv6 ospf interface` Displays the status and statistics of an OSPFv3 interface.
`ipv6 ospf interface admin-state` Allows to configure the type of OSPFv3 interface.

**MIB Objects**

`ospfv3NbrTable`
  `ospfv3NbrPriority`
  `ospfv3NbmaNbrStatus`
**ipv6 ospf interface area**

Configures an OSPFv3 area identifier for this interface.

```
ipv6 ospf interface interface_name area area_id
```

### Syntax Definitions

- **interface_name**  The name of the interface.
- **area_id**  A unique 32-bit value in IP address format.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

An interface must be assigned to an area to become operational.

### Examples

```
-> ipv6 ospf interface vlan-101 area 0.0.0.1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- **show ipv6 ospf area**  Displays either all the OSPFv3 areas, or a specified OSPFv3 area.
- **show ipv6 ospf interface**  Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

- **ospfv3IfTable**
  - **ospfv3IfIndex**
  - **ospfv3IfAreaId**
ipv6 ospf interface dead-interval

Configures the OSPFv3 interface dead interval.

`ipv6 ospf interface interface_name dead-interval seconds`

**Syntax Definitions**

- `interface_name`: The name of the interface.
- `seconds`: The dead interval, in seconds. The valid range is 1–65535.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>40</td>
</tr>
<tr>
<td>(broadcast and point-to-point)</td>
<td></td>
</tr>
<tr>
<td>seconds</td>
<td>120</td>
</tr>
<tr>
<td>(NBMA and point-to-multipoint)</td>
<td></td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- After the dead interval, a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or multiples of the hello interval.

**Examples**

```
-> ipv6 ospf interface vlan-101 dead-interval 50
```

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- **ipv6 ospf interface hello-interval**  
  Configures the OSPFv3 interface hello interval.

- **show ipv6 ospf interface**  
  Displays the status and statistics of an OSPFv3 interface.

**MIB Objects**

- ospfv3IfTable

  - ospfv3IfIndex
  - ospfv3IfRtrDeadInterval
**ipv6 ospf interface hello-interval**

Configures the OSPFv3 interface hello interval.

```
ipv6 ospf interface interface_name hello-interval seconds
```

**Syntax Definitions**

- `interface_name` The name of the interface.
- `seconds` The hello interval, in seconds. The valid range is 0–65535. A value of 0 creates a passive OSPFv3 interface.

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>10</td>
</tr>
<tr>
<td>(broadcast and point-to-point)</td>
<td></td>
</tr>
<tr>
<td>seconds</td>
<td>30</td>
</tr>
<tr>
<td>(NBMA and point-to-multipoint)</td>
<td></td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This is the interval between two consecutive hello packets sent out on this interface.

**Examples**

```
-> ipv6 ospf interface vlan-101 hello-interval 50
```

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- **ipv6 ospf interface dead-interval**  
  Configures the OSPFv3 interface dead interval.

- **show ipv6 ospf interface**  
  Displays the status and statistics of an OSPFv3 interface.

**MIB Objects**

ospfv3IfTable

  ospfv3IfIndex

  ospfv3IfHelloInterval
**ipv6 ospf interface cost**

Configures the OSPFv3 interface cost.

```
ipv6 ospf interface interface_name cost cost
```

**Syntax Definitions**

- `interface_name` The name of the interface.
- `cost` The interface cost. The valid range is 0–65535.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>cost</td>
<td>1</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The configured interface cost (if any) is used during OSPFv3 route calculations.

**Examples**

```
-> ipv6 ospf interface vlan-101 cost 10
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `show ipv6 ospf interface` Displays the status and statistics of an OSPFv3 interface.

**MIB Objects**

- `ospfv3IfTable`
  - `ospfv3IfIndex`
  - `ospfv3IfMetricValue`
**ipv6 ospf interface priority**

Configures the OSPFv3 interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

```
ip ospf interface interface_name priority priority
```

**Syntax Definitions**

- `interface_name`: The name of the interface.
- `priority`: The interface priority. The valid range is 0–255.

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>1</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Support</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

**Examples**

```
-> ipv6 ospf interface vlan-101 priority 100
```

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

*show ipv6 ospf interface* Displays the status and statistics of an OSPFv3 interface.

**MIB Objects**

ospfv3IfTable

  - ospfv3IfIndex
  - ospfv3IfRtrPriority
**ipv6 ospf interface retrans-interval**

Configures the OSPFv3 interface retransmit time interval.

```
ipv6 ospf interface interface_name retrans-interval interval
```

**Syntax Definitions**

- `interface_name` The name of the interface.
- `seconds` The retransmit interval, in seconds. The valid range 0–3600.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval</td>
<td>5</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The number of seconds between link retransmission of OSPFv3 packets on this interface.

**Examples**

```
-> ipv6 ospf interface vlan-101 retrans-interval 500
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `show ipv6 ospf interface` Displays the status and statistics of an OSPFv3 interface.

**MIB Objects**

- `ospfv3IfTable` (part of `ospfv3IfTable`)
  - `ospfv3IfIndex` (part of `ospfv3IfTable`)
  - `ospfv3IfRetransInterval` (part of `ospfv3IfTable`)
**ipv6 ospf interface transit-delay**

Configures the OSPFv3 interface transit time delay.

```
ipv6 ospf interface interface_name transit-delay delay
```

### Syntax Definitions

- `interface_name` - The name of the interface.
- `delay` - The transit delay, in seconds. The valid range is 0–3600.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>1</td>
</tr>
</tbody>
</table>

### Platforms Supported

</tr>
</tbody>
</table>

### Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

### Examples

```
-> ipv6 ospf interface vlan-101 transit-delay 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- `show ipv6 ospf interface` - Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

- `ospfv3IfTable`
  - `ospfv3IfIndex`
  - `ospfv3IfTransitDelay`
**ipv6 ospf bfd-state**

Enables or disables the registration of OSPFv3 with the BFD protocol.

`ipv6 ospf bfd-state {enable | disable}`

---

**Syntax Definitions**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables BFD for OSPFv3.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables BFD for OSPFv3.</td>
</tr>
</tbody>
</table>

---

**Defaults**

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>disable</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- BFD must be globally enabled for the switch and OSPFv3 must be registered with BFD at the protocol level before OSPFv3 can interact with BFD.
- All the status changes on the neighbors are received from the BFD level and the OSPFv3 protocol acts based upon the BFD message.
- Whenever a neighbor goes down, OSPFv3 will inform BFD to remove that neighbor from the BFD active list.

---

**Examples**

Globally enables the BFD protocol for the switch:

```
-> ip bfd admin-state enable
```

Enables and disables the registration of OSPFv3 with the BFD protocol:

```
-> ipv6 ospf bfd-state enable
-> ipv6 ospf bfd-state disable
```

---

**Release History**

Release 8.4.1.R03; command was introduced.

show ipv6 ospf border-routers

Displays information regarding all or specified border routers.

show ipv6 ospf border-routers [area area_id] [router router_id]

Syntax Definitions

area_id A unique 32-bit value in IP address format.

router_id A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- This command is used to display a list of border routers known by this OSPFv3 router.

- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.

- See the Related Commands sections below to modify the list.

Examples

-> show ipv6 ospf border-routers

<table>
<thead>
<tr>
<th>Router ID</th>
<th>Area</th>
<th>Metric</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.6.6.6</td>

</tbody>
</table>

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**show ipv6 ospf**

Displays the OSPFv3 status and general configuration parameters.

**MIB Objects**

N/A
**show ipv6 ospf host**

Displays information on the configured OSPFv3 hosts.

```
show ipv6 ospf host [ipv6_address]
```

### Syntax Definitions

`ipv6_address`  
A 128-bit IP address for a directly attached host.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command is used to display general information for OSPFv3 hosts directly attached to this router.
- See the Related Commands section below to modify the list.

### Examples

```
-> show ipv6 ospf host

Area     Metric Address
----------+-----------+-----------
0.0.0.1   1  2001::1/64
```

**output definitions**

- **Area**: A 32-bit IP address for a directly attached host. This can be set using the `ipv6 ospf host` command.
- **Metric**: The metric assigned to the host. Metric is set using the `ipv6 ospf host` command.
- **Address**: IPv6 address of the host.

### Release History

Release 7.1.1; command was introduced.
Related Commands

**ipv6 ospf host**   Creates or deletes an OSPFv3 entry for directly attached hosts.

MIB Objects

ospfv3HostTable
  ospfv3HostIpAddress
  ospfv3HostMetric
  ospfHostStatus
  ospfv3HostAreaID
**show ipv6 ospf lsdb**

Displays Link State Advertisements (LSAs) in the Link State Database (LSDB) associated with each area.

```
show ipv6 ospf lsdb [area area_id] [rtr | net | netsum | asbrsum] [linkstate-id ls_id] [router-id router_id]
```

**Syntax Definitions**

- `area_id`: A unique 32-bit value in IP address format.
- `rtr`: Specifies router LSAs.
- `net`: Specifies network LSAs.
- `netsum`: Specifies network summary LSAs.
- `asbrsum`: Specifies Autonomous System Border Router summary LSAs.
- `ls_id`: The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
- `router_id`: The Router ID. The ID is a unique 32-bit value such as an IP address.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td></td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command is used to display the LSDB of the OSPFv3 router. It can be used for OSPFv3 debugging, specifically to narrow down sections of an area to determine which sections are receiving the specified LSAs. You can specify the parameters of only the area LSDB using the optional command parameters.
- You can view LSAs by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you also need to supply a valid link state ID.

**Examples**

```
-> show ipv6 ospf lsdb
```

<table>
<thead>
<tr>
<th>Area</th>
<th>Type</th>
<th>Link ID</th>
<th>Advertising Rtr</th>
<th>Sequence #</th>
<th>Age</th>
</tr>

show ipv6 ospf neighbor

Displays information on OSPFv3 non-virtual neighbors.

show ipv6 ospf neighbor [router ipv4_address][interface interface_name]

**Syntax Definitions**

- `ipv4_address`: A 32-bit router ID of the neighboring router.
- `interface_name`: The name of the interface.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command is used to display all non-virtual neighbors of the OSPFv3 router.
- See the Related Commands section below to modify the list.

**Examples**

```
-> show ipv6 ospf neighbor
Router ID          Area/Transit Area  State  Interface
----------------+--------------------+-----+----------------------------------
1.1.1.1           0.0.0.0              FULL  vlan-2071
3.3.3.3           0.0.0.0              FULL  vlan-2071
5.5.5.5           0.0.0.0              FULL  vlan-2071
23.23.23.23       0.0.0.1              FULL  vlan-2055
23.23.23.23       0.0.0.1              FULL  vlan-2056
24.24.24.24       0.0.0.1              FULL  vlan-2065
24.24.24.24       0.0.0.1              FULL  vlan-2066
```

**output definitions**

- **Router ID**: The unique identification for the router.
- **Area/Transit Area**: The area identifier.
- **State**: The state of the OSPFv3 neighbor adjacency.
- **Interface**: The name of the interface.
-> show ipv6 ospf neighbor router 24.24.24.24

<table>
<thead>
<tr>
<th>Router ID</th>
<th>Area/Transit Area</th>
<th>State</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>24.24.24.24</td>

</tr>
<tr>
<td>24.24.24.24</td>
<td>0.0.0.1</td>
<td>FULL</td>
<td>vlan-2073</td>
</tr>
</tbody>
</table>

**output definitions**

**Router ID**
The unique identification for the router.

**Area/Transit Area**
The area identifier.

**State**
The state of the OSPFv3 neighbor adjacency.

**Interface**
The name of the interface.

-> show ipv6 ospf neighbor router 1.1.1.1 interface v14

Details for Neighbor 1.1.1.1

<table>
<thead>
<tr>
<th>State</th>

</tbody>
</table>

**Neighbor options:**

V6 bit is set
E bit is set
MC bit is not set
N bit is not set
R bit is set
DC bit is not set

**output definitions**

**State**
The state of the OSPFv3 neighbor adjacency.

**Type**
Specifies the type of neighbor.

**Interface**
The name of the interface.

**Neighbor i/f index**
The unique value assigned to the neighbor.

**Priority**
The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.

**Address**
The IPv6 address of the host.

**Neighbor is reporting DR as**
The address of the neighbors designated router.

**Neighbor is reporting BDR as**
The address of the neighbors Backup Designated Router.

**Neighbor is Master/Slave**
The role the neighbor has with the local router during DD Exchange, which can be Master or Slave.
### Output Definitions (Continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Seconds since last Hello seen</td>
<td>The amount of time (in seconds) since the last HELLO messages was received from this neighbor.</td>
</tr>
<tr>
<td># of LSAs on retransmit list</td>
<td>The number of Link State updates to the neighbor that need to be retransmitted by the OSPFv3 router.</td>
</tr>
<tr>
<td># of LSAs on request list</td>
<td>The number of Link State requests to this neighbor that have not received a response from this neighbor.</td>
</tr>
<tr>
<td># of State Changes</td>
<td>The number of times this OSPFv3 interface has changed its state.</td>
</tr>
<tr>
<td>Restart Helper Status</td>
<td>Indicates whether the router is acting as a restart helper for the neighbor.</td>
</tr>
<tr>
<td>Restart Age</td>
<td>The remaining time, in seconds, for the current OSPFv3 restart interval if the router is acting as a restart helper for the neighbor.</td>
</tr>
<tr>
<td>Last Restart Helper Exit Reason</td>
<td>The outcome of the last attempt at acting as a restart helper for the neighbor.</td>
</tr>
<tr>
<td>Neighbor options</td>
<td>If set:</td>
</tr>
<tr>
<td>V6 - V6 support</td>
<td></td>
</tr>
<tr>
<td>R - If clear, a node can participate in OSPFv3 topology distribution without being used to forward transit traffic</td>

  - `ospfv3NbrRestartHelperExitReason`
  - `ospfv3VirtNbrRestartHelperStatus`
  - `ospfv3VirtNbrRestartHelperAge`
  - `ospfv3VirtNbrRestartHelperExitReason`
show ipv6 ospf routes

Displays the OSPFv3 routes known to the router.

**show ipv6 ospf routes [prefix ipv6_address_prefix][gateway gateway]**

### Syntax Definitions

- **ipv6_address_prefix**
  The 128-bit IPv6 address of the route destination in hexadecimal format.
- **gateway**
  The next hop IPv6 address for this router.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>V72/C32</td>
<td>X48C6/T48C6/X48C4E/V48C8/C32E/T24C2/X24C2</td>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- If no variables are entered, all routes are displayed.
- If the variables are entered, then only routes matching the specified criteria are shown.
- All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

### Examples

```
-> show ipv6 ospf routes

Prefix                             Path Type  Metric
                                      1 : 2
::/0                                INTER       2 : -
   fe80::2d0:95ff:fee0:710c -> vlan-2071
2051::/64                            INTRA       2 : -
   fe80::2d0:95ff:feac:a59f -> vlan-2055
   fe80::2d0:95ff:feac:a59f -> vlan-2056
   fe80::2d0:95ff:fed7:747e -> vlan-2065
   fe80::2d0:95ff:fed7:747e -> vlan-2066
```

### output definitions

- **Prefix**
  The destination address of the IPv6 route in the hexadecimal format.
output definitions

| Path Type | The type of routes specified (intra or inter). |
| Metric    | The cost of the route.                        |

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 ospf admin-state Displays the OSPFv3 status and general configuration parameters.

MIB Objects

N/A
show ipv6 ospf virtual-link

Displays virtual link information. A virtual link is used to connect OSPFv3 backbone routers that are not physically contiguous.

show ipv6 ospf virtual-link [router_id]

Syntax Definitions

router_id

The router ID of the remote end of the virtual link.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

Usage Guidelines

N/A

Examples

-> show ipv6 ospf virtual-link

Transit Area Peer Router ID Intf Nbr
-----------------------------------------------
0.0.0.1 6.6.6.6 P2P  FULL 2

output definitions

Transit Area The area identification for the area assigned to the virtual link.
Peer Router ID The destination router identification for the virtual link.
Intf State The state of the virtual link with regards to the local router.
Nbr State The state of the virtual link adjacency.
Cost The cost metric of the route.

Release History

Release 7.1.1; command was introduced.
**Related Commands**

`ipv6 ospf virtual-link`  
Creates or deletes a virtual link.

**MIB Objects**

`ospfv3VirtIfTable`
- `ospfv3VirtIfAreaId`
- `ospfv3VirtIfNeighbor`

**output definitions**

**Area Type**
The area type. This field will be normal, stub, or NSSA.

**Area Stub Metric**
Indicates whether the area is enabled or disabled.

**# Router LSAs**
The total number of Link State Advertisements for the Area.

**# Network LSAs**
The total number of inter-area Link State Advertisements.

**# of SPF calculations**
The number of times the area has calculated the Shortest Path.

**# Interfaces**
The number of OSPFv3 interfaces.

**# Intra-area-prefix LSAs**
The number of intra-area-prefix LSAs, which associates a list of IPv6 address prefixes with a router by referencing a router-LSA.
output definitions (continued)

<table>
<thead>
<tr>
<th># Inter-area-prefix LSAs</th>
<th>The number of inter-area-prefix LSAs. Corresponds to Type 3 summary-LSA of OSPFv3.</th>
</tr>
</thead>
<tbody>
<tr>
<td># Inter-area-router LSAs</td>
<td>The number of inter-area-router LSAs. Corresponds to Type 4 summary-LSA of OSPFv3.</td>

show ipv6 ospf interface

Displays OSPFv3 interface information.

show ipv6 ospf interface [interface_name]

Syntax Definitions

interface_name: The name of the interface.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform Code</th>
<th>Supported Platforms</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>6360, 6465, 6560, 6570M, 6860, 6860N, 6865, 6900, 6900, 6900 V72/C32, 6900 X48C6/T48C6, X48C4E/V48C8, C32E/T24C2, X24C2</td>
</tr>
</tbody>
</table>

Usage Guidelines

Not specifying the interface name displays all known interfaces for the OSPFv3 router.

Examples

```
-> show ipv6 ospf interface
```

output definitions

<table>
<thead>
<tr>

Output fields when an IP address or interface name is specified are described below:

output definitions (continued)

<table>
<thead>
<tr>
<th>Intf State</th>
<th>The current state of the OSPFv3 interface. It will be DR, BDR, other.</th>
</tr>
</thead>
<tbody>
<tr>
<td>BFD Status</td>
<td>The current status of BFD for the OSPFv3 interface.</td>
</tr>
</tbody>
</table>

Type
The OSPFv3 interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint.

Admin Status
The current administrative status of the interface, either enabled or disabled.

IPv6 Interface Status
The current administrative status of the IPv6 interface, either up or down.

Oper Status
Indicates whether the interface is an active OSPFv3 interface.

State
The current state of the OSPFv3 interface. It will be down, up, dp, dr, or other.

Area
The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area.

Priority
The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.

Cost
The cost added to routes learned on this interface.

Designated Router
The identification number of the designated router.

Backup Designated Router
The identification number of the backup designated router.
**output definitions (continued)**

**Release History**

Release 7.1.1; command was introduced.
Release 8.4.1.R03; **bfd status** field added.

**Related Commands**

- `ipv6 ospf interface` Creates and deletes an OSPFv3 interface.
- `ipv6 ospf interface dead-interval` Configures the OSPFv3 interface dead interval.
- `ipv6 ospf interface hello-interval` Configures the OSPFv3 interface hello interval.
- `ipv6 ospf interface cost` Configures the OSPFv3 interface cost.
- `ipv6 ospf interface priority` Configures the OSPFv3 interface priority.
- `ipv6 ospf interface retrans-interval` Configures the OSPFv3 interface retransmit interval.
- `ipv6 ospf interface transit-delay` Configures the OSPFv3 interface transit delay.
- `ipv6 ospf interface area` Configures an OSPFv3 interface area.
- `ipv6 ospf interface admin-state` Enables or disables the administration status on an OSPFv3 interface.
- `ipv6 ospf interface suppress-link-lsa` Configures whether or not link LSA origination is suppressed for broadcast or NBMA interface types.
- `ipv6 ospf interface bfd-state` Enables or disables the status of BFD for an OSPFv3 interface.

**ipv6 ospf restart**

Configures graceful restart feature on an OSPFv3 router.

`ipv6 ospf restart`

---

**Syntax Definitions**

N/A

**Defaults**

Graceful restart is enabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6 X48C4E/V48C8 C32E/T24C2 X24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of the command to disable support for the graceful restart feature on an OSPFv3 router.

- The minimum hardware configuration for this command is a dual CMM configuration. The chassis based products (OmniSwitch 9900) running in a standalone or VC-1 mode must have dual CMMs. Stackable switches (such as the OmniSwitch 6860, OmniSwitch 6865, and OmniSwitch 6900) or chassis based switches running with single CMM must have two or more chassis in the VC.

- This command enables both planned and unplanned restarts.

**Examples**

```
-> ipv6 ospf restart
-> no ipv6 ospf restart
```

**Release History**

Release 8.4.1; command introduced
**Related Commands**

- **show ipv6 ospf restart** Displays the OSPFv3 graceful restart related configuration and status.
- **show ipv6 ospf** Displays the OSPFv3 status and general configuration parameters.
- **show ipv6 ospf neighbor** Displays information on OSPFv3 non-virtual neighbors.

**MIB Objects**

- ospfv3RestartSupport
- ospfv3RestartStatus
- ospfv3RestartAge
- ospfv3RestartExitReason
- ospfv3RestartTime
ipv6 ospf restart initiate

Initiates a planned OSPFv3 graceful restart.

ipv6 ospf restart initiate

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

This command must be executed before executing the `takeover` or `vctakeover` command.

Example

-> ipv6 ospf restart initiate

Release History

Release 8.4.1; command introduced

Related Commands

show ipv6 ospf restart

Displays the OSPFv3 graceful restart related configuration and status.

MIB Objects

alaOspf3RestartInitiate
**ipv6 ospf restart interval**

Configures the grace period for achieving a graceful OSPFv3 restart.

**ipv6 ospf restart interval [seconds]**

---

**Syntax Definitions**

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>Restart timeout interval. The valid range is 1–1800 seconds.</td>
</tr>
</tbody>
</table>

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>120</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Restart interval must be configured based on the databases size, number of neighbors, and number of OSPFv3 areas of the restarting router. If this is configured too low, there is a chance that graceful restart may fail prematurely.

**Example**

```
-> ipv6 ospf restart interval 180
-> no ipv6 ospf restart interval
```

**Release History**

Release 8.4.1; command introduced
Related Commands

- **ipv6 ospf restart**
  - Configures graceful restart feature on an OSPFv3 router.

- **show ipv6 ospf restart**
  - Displays the OSPFv3 graceful restart related configuration and status.

MIB Objects

- **ospfv3RestartInterval**
**ipv6 ospf restart-helper**

Enables the graceful restart helper functionality.

**ipv6 ospf restart-helper**

---

**Syntax Definitions**

N/A

**Defaults**

By default, graceful restart helper functionality is enabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of the command to disable restart helper functionality.
- A router that has configured as a helper may reject helping or stop helping in the half way if there is any topology change in the OSPFv3 network.
- The graceful restart helper does not have a requirement of having dual CMMs.

**Examples**

- `ipv6 ospf restart-helper`
- `no ipv6 ospf restart-helper`

**Release History**

Release 8.4.1; command introduced
**Related Commands**

- `ipv6 ospf restart` Configures graceful restart feature on an OSPFv3 router.
- `ipv6 ospf restart-helper strict-lsa-check` Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.
- `show ipv6 ospf restart` Displays the OSPFv3 graceful restart related configuration and status.

**MIB Objects**

- `ospfv3VirtNbrRestartHelperExitReason`
**ipv6 ospf restart-helper strict-lsa-check**

Enables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

**IPv6 ospf restart-helper strict-lsa-check**

**Syntax Definitions**

N/A

**Defaults**

By default, strict-lsa-checking is enabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the no form of the command to disable this functionality.
- Disabling this functionality may create sub-optimal or black hole routes during the graceful restart period.
- This functionality does not have a requirement of having dual CMMs.

**Examples**

- `-> ipv6 ospf restart-helper strict-lsa-check`
- `-> no ipv6 ospf restart-helper strict-lsa-check`

**Release History**

Release 8.4.1; command introduced
Related Commands

- **ipv6 ospf restart**: Configures graceful restart feature on an OSPFv3 router.

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

N/A

**Examples**

```plaintext
-> show ipv6 ospf restart
Restart Support = Enabled (planned-unplanned),
Restart Status = Not Restarting,
Restart Interval = 120,
Restart Age = 0,
Last Restart Exit Reason = None,
Restart Helper Support = Enabled,
Restart Helper Strict Checking = Enabled,
Restart Helper Status = NotHelping,
Time Since Exit Reason Updated = 21:09:58
```

**output definitions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Restart Support</td>
<td>The administrative status of OSPFv3 graceful restart.</td>
</tr>
<tr>
<td>Restart Status</td>
<td>The current status of OSPFv3 graceful restart, which can be <strong>Not Restarting</strong>, <strong>Unplanned Restart</strong> (after a CMM takeover), or <strong>Planned Restart</strong> (before CMM takeover).</td>
</tr>
<tr>
<td>Restart Interval</td>
<td>The configured OSPFv3 restart timeout interval, in seconds.</td>
</tr>
<tr>
<td>Restart Age</td>
<td>The remaining time, in seconds, for the current OSPFv3 graceful restart interval.</td>
</tr>
</tbody>
</table>
**OSPFv3 Commands**

**show ipv6 ospf restart**

---

**Last Restart Exit Reason**
The outcome of the last attempt at a graceful restart. If the value is **None**, then no restart has yet been attempted. If the value is **In Progress**, then a restart attempt is currently underway. Other possible values include **Completed** (successfully completed), **Timed Out** (timed out), and **Topology Changed** (aborted due to topology change).

**Restart Helper Support**
The administrative status of the capability of an OSPFv3 router to operate in helper mode in response to a router performing a graceful restart.

**Restart Helper Strict Checking**
The administrative status of whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

**Restart Helper Status**
Indicates whether the router is acting as a graceful restart helper for the neighbor.

**Time Since Exit Reason Updated**
The elapsed time since the last time the exit reason was updated.

Intermediate System-Intermediate System (IS-IS) is a shortest path first (SPF) or link-state protocol. IS-IS is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS) for IP (IPv4 and IPv6) as well as OSI environments. This feature allows a single routing protocol to support pure IP and OSI environments, and dual environments. Integrated IS-IS is also deployed extensively in an IP-only environment.

Each participating router distributes its local state (that is, the usable interfaces of the router and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. IS-IS routers have adjacencies with other routers on point-to-point links. In a multi-access network, routers report their adjacencies to a Designated Intermediate System (DIS), which generates an additional Link State PDU (LSP), commonly known as the pseudo-node LSP. The DIS is responsible for flooding the LAN with LSP and also for synchronizing the entire AS topology. This database is built from the collected link state advertisements of all routers.

IS-IS is a hierarchical protocol where the autonomous system is divided into multiple areas to reduce the size of the Routing table. Routing within an area is referred to as Level-1 routing and that between two or more areas is referred to as Level 2 routing. Each area runs a separate copy of the basic link-state routing algorithm.

The OmniSwitch version of IS-IS complies with RFC 1142.

OmniSwitch AOS Release 8 CLI Reference Guide  April 2023  page 29-3
ip load isis

Loads the IS-IS software on the router.

ip load isis

Syntax Definitions

N/A

Defaults

By default, IS-IS is not loaded on the switch.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- You need to load IS-IS on the switch before executing any IS-IS configuration command.
- To unload IS-IS, remove all the IS-IS configuration from “boot.cfg”.

Examples

-> ip load isis

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip protocols Displays switch routing protocol information and status.

MIB Objects

alaVrConfigTable

alaVrConfigIsisStatus
**ip isis admin-state**

Enables or disables the administrative status of IS-IS on the switch.

`ip isis admin-state {enable | disable}`

---

**Syntax Definitions**

</tr>
</tbody>
</table>

**Usage Guidelines**

When IS-IS status is disabled, the configuration settings and related statistics of the protocol remain unaffected.

**Examples**

```
-> ip isis admin-state enable
-> ip isis admin-state disable
```

**Release History**

Release 7.3.3; command was introduced.

**Related Commands**

- `show ip isis status` Displays the IS-IS status.

**MIB Objects**

- `isisSysTable`
- `isisSysAdminState`
**ip isis area-id**

Configures the area ID for the switch.

```
ip isis area-id area address
no ip isis area-id area address
```

### Syntax Definitions

`area address`  
A 1–13 byte variable length integer, which specifies the area address.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to remove the area ID.
- The area ID is part of the Network Service Access Point (NSAP) address.
- Other parts of NSAP address (system ID and selector ID) are not configurable. System ID is derived from router ID and selector ID remains always as 00.
- You can configure a maximum of three area addresses.

### Examples

```
-> ip isis area-id 49.0001
-> no ip isis area-id 49.0001
```

### Release History

Release 7.3.3; command was introduced.
**Related Commands**

`show ip isis status`  
Displays the IS-IS status.

**MIB Objects**

`isisManAreaAddrTable`  
`isisManAreaAddrExistState`
ip isis level-capability

Configures the router level of the IS-IS protocol globally.

`ip isis level-capability {level-1 | level-2 | level-1/2}`

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>level-1</td>
<td>Specifies that the router can operate at Level-1 only.</td>
</tr>
<tr>
<td>level-2</td>
<td>Specifies that the router can operate at Level-2 only.</td>
</tr>
<tr>
<td>level-1/2</td>
<td>Specifies that the router can operate at both Level-1 and Level-2.</td>
</tr>
</tbody>
</table>

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>level-1</td>
<td>level-1/2</td>
</tr>
<tr>
<td>level-2</td>
<td>level-1/2</td>
</tr>
<tr>
<td>level-1/2</td>
<td>level-1/2</td>
</tr>
</tbody>

</tr>
</tbody>
</table>
```

**Usage Guidelines**

- Changing the level capability restarts the IS-IS protocol.
- Configuring the level capability at the IS-IS circuit level is also possible.

**Examples**

- `-> ip isis level-capability level-1`
- `-> ip isis level-capability level-2`

**Release History**

Release 7.3.3; command was introduced.
Related Commands

- **ip isis vlan level-capability** Configures the IS-IS level on the specified circuit.
- **show ip isis status** Displays the IS-IS status.

MIB Objects

- `isisSysTable`
- `isisSysType`
ip isis auth-check

Enables or disables authentication check for IS-IS PDUs.

ip isis auth-check {enable | disable}

Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables authentication check for IS-IS PDUs.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables authentication check for IS-IS PDUs.</td>
</tr>
</tbody>
</table>

Defaults

By default, authentication check is enabled.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- If enabled, IS-IS PDUs that fail to match either of the authentication type and key requirements are rejected.
- If disabled, the authentication PDUs are generated and the IS-IS PDUs are authenticated on receipt. An error message will be generated in case of a mismatch; but PDUs will not be rejected.

Examples

- ip isis auth-check enable
- ip isis auth-check disable

Release History

Release 7.3.3; command was introduced;
**Related Commands**

- **ip isis auth-type**
  Enables authentication and configures the authentication type of IS-IS protocol globally.

- **ip isis level auth-type**
  Enables authentication and configures the authentication types for specific IS-IS levels.

- **show ip isis status**
  Displays the IS-IS status.

**MIB Objects**

- `vRtrIsisTable`
  - `vRtrIsisAuthCheck`
ip isis auth-type

Enables authentication and configures the authentication type of IS-IS protocol globally.

```
ip isis auth-type {simple {key key | encrypt-key encrypt_key} | md5 {key key | encrypt-key encrypt_key} | key-chain key_chain_id | none}
```

### Syntax Definitions

**simple**

Simple authentication will be used.

**md5**

Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.

**key**

Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.

**encrypt_key**

The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.

**key_chain_id**

The configured keychain ID.

**none**

No authentication will be used.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>simple</td>
<td>md5</td>
</tr>
<tr>
<td>none</td>
<td>none</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.

- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.

- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the `encrypt_key` parameter to configure the password by supplying the encrypted form of the password.
as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this key parameter during the CLI configuration.

- If the encrypt_key parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.

- This command configures the authentication type of IS-IS protocol globally. These settings can be overridden at each level.

- By default, the authentication is disabled and no authentication type is configured.

- If a keychain is applied globally, the authentication algorithm of its active key will be used for adjacency formation with all peers. Use ip isis auth-type none to remove the keychain from IS-IS adjacency configurations.

**Examples**

```
-> ip isis auth-type simple key rachel
-> ip isis auth-type md5 encrypt-key 7a1e441a014b4030
-> ip isis auth-type key-chain 2
```

**Release History**

Release 7.3.3; command was introduced.
Release 8.4.1; key-chain parameter added.

**Related Commands**

**ip isis lsp-lifetime**

Configures the time interval for which Link State PDUs generated by a router are considered valid by other routers in the same domain.

`ip isis lsp-lifetime seconds`

`no ip isis lsp-lifetime`

---

### Syntax Definitions

**seconds**

Validity interval in seconds. The valid range is 350–65535.

---

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>1200</td>
</tr>
</tbody>
</table>

---

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

ip isis lsp-wait

Configures the intervals between the first, second and subsequently generated LSPs.

`ip isis lsp-wait {max-wait | initial-wait | second-wait} seconds`

`no ip isis lsp-wait {max-wait | initial-wait | second-wait}`

**Syntax Definitions**

<table>
<thead>
<tr>
<th>parameter</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>max-wait</td>
<td>Specifies the maximum interval between two successive LSPs, in seconds. The valid range is 1–120.</td>
</tr>
<tr>
<td>initial-wait</td>
<td>Specifies the initial LSP generation delay, in seconds. The valid range is 0–100.</td>
</tr>
<tr>
<td>second-wait</td>
<td>Specifies the time interval between the first and second generated LSPs, in seconds. The valid range is 1–100.</td>
</tr>
<tr>
<td>seconds</td>
<td>Specifies the time interval.</td>
</tr>
</tbody>
</table>

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds (max-wait)</td>
<td>5</td>
</tr>
<tr>
<td>seconds (initial-wait)</td>
<td>0</td>
</tr>
<tr>
<td>seconds (second-wait)</td>
<td>1</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to restore the default value.
- Successive LSPs are generated at increasing `second-wait` interval until a maximum value is reached.

**Examples**

-> `ip isis lsp-wait max-wait 25`
-> `no ip isis lsp-wait initial-wait`
**Release History**

Release 7.3.3; command was introduced.

**Related Commands**

- `ip isis vlan lsp-pacing-interval` Configures the interval between IS-IS LSP PDUs sent from the specified circuit.
- `show ip isis status` Displays the IS-IS status.

**MIB Objects**

- `vRtrIsisTable`
  - `vRtrIsisLspInitialWait`
  - `vRtrIsisLspSecondWait`
  - `vRtrIsisLspMaxWait`
**ip isis spf-wait**

Configures the intervals between the first, second, and subsequent SPF calculations.

```
ip isis spf-wait {max-wait seconds | initial-wait milliseconds| second-wait milliseconds}
no ip isis spf-wait {max-wait | initial-wait | second-wait}
```

### Syntax Definitions

- **max-wait seconds**
  Specifies the maximum interval between two successive SPF calculations, in seconds. The valid range is 1–120 seconds.

- **initial-wait milliseconds**
  Specifies the initial SPF calculation delay, in milliseconds. The valid range is 10–100000 milliseconds.

- **second-wait milliseconds**
  Specifies the interval between first and second generated SPFs, in milliseconds. The valid range is 1–100000 milliseconds.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>max-wait seconds</td>
<td>10</td>
</tr>
<tr>
<td>initial-wait milliseconds</td>
<td>1000</td>
</tr>
<tr>
<td>second-wait milliseconds</td>
<td>1000</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Successive SPF calculations are generated at exponentially increasing **second-wait** interval until a maximum value is reached.

### Examples

```
-> ip isis spf-wait max-wait 25
-> no ip isis spf-wait initial-wait
```

### Release History

Release 7.3.3; command was introduced.
Related Commands

show ip isis status
Displays the IS-IS status.

MIB Objects

  vRtrIsisSpfInitialWait
  vRtrIsisSpfSecondWait
ip isis summary-address

Adds or deletes the summary address.

```
ip isis summary-address {ip_prefix/mask | ip_prefix [/netmask]} {level-1 | level-2 | level-1/2}
no ip isis summary-address {ip_prefix/mask | ip_prefix [/netmask]}
```

**Syntax Definitions**

- `ip_prefix/mask` Specifies the IP prefix in dotted decimal notation and the mask length.
- `ip_prefix` Specifies the IP prefix in dotted decimal notation.
- `/netmask` Specifies the subnet mask in dotted decimal notation.
- `level-1` Specifies the IS-IS level as Level-1.
- `level-2` Specifies the IS-IS level as Level-2.
- `level-1/2` Specifies the IS-IS level as Level-1/2.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>level-1</td>
<td>level-2</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

- Use the `no` form of this command to remove an already configured summary address.
- Native IS-IS routes can only be summarized into Level-2 from the Level-1 database.
- It is not possible to summarize IS-IS internal routes at Level-1, although it is possible to summarize external (redistributed) routes at Level-1.
- IS-IS routes are not summarized by default.

**Examples**

```
-> ip isis summary-address 10.0.0.0/8 level-2
-> no ip isis summary-address 10.0.0.0/8
```
Release History
Release 7.3.3; command was introduced.

Related Commands
show ip isis summary-address  Displays the IS-IS summary address database.

MIB Objects
vRtrIIsisSummaryTable
  vRtrIIsisSummRowStatus
**ip isis overload**

Enables and configures the IS-IS router to operate in the overload state for a specified time period.

```
ip isis overload [timeout seconds]
no ip isis overload [timeout]
```

**Syntax Definitions**

```
timeout seconds  
```

Specifies the timeout interval, in seconds. The valid range is 60–1800.

**Defaults**

By default, the IS-IS overload state is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to make the router exit the overload state.
- If the time period is not specified, the router remains in the overload state for an infinite period.
- During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is used only if the destination route is directly reachable by the router i.e., it will not be used for other transit traffic.
- This command can be used when the router is overloaded or before executing a shutdown command to divert traffic around the router.

**Examples**

```
-> ip isis overload timeout 70
-> no ip isis overload timeout
```

**Release History**

Release 7.3.3; command was introduced.
Related Commands

- **ip isis overload-on-boot**
  Configures the IS-IS router to be in the overload state during bootup for a specified time period.

- **show ip isis status**
  Displays the IS-IS status.

MIB Objects

- **isisSysTable**
  - isisSysSetOverload

- **vRtrIsisTable**
  - vRtrIsisOverloadTimeout
**ip isis overload-on-boot**

Configures the IS-IS router to be in the overload state after bootup for a specified time period.

`ip isis overload-on-boot [timeout seconds]`

`no ip isis overload-on-boot [timeout seconds]`

---

**Syntax Definitions**

`timeout seconds` Specifies the timeout interval, in seconds. The valid range is 60–1800.

**Defaults**

By default, the IS-IS router will not be in the overload state.

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout seconds</td>
<td>60</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to prevent the router from entering the overload state after bootup.
- The router in the overload state is used only if there is no alternate path to reach the destination.
- This command configures the router after bootup in the overload state until the timeout timer expires or a timeout value is specified in the `no` form of this command.
- The `no overload` command does not influence the overload-on-boot function.

**Examples**

```
-> ip isis overload-on-boot timeout 80
-> no ip isis overload-on-boot timeout
```

**Release History**

Release 7.3.3; command was introduced.
**Related Commands**

- **ip isis overload**  Sets the IS-IS router to operate in the overload state.
- **show ip isis status**  Displays the IS-IS status.

**MIB Objects**

- **vRtrIsisTable**
  - **vRtrIsisOverloadOnBoot**
  - **vRtrIsisOverloadOnBootTimeout**
**ip isis graceful-restart**

Configures graceful restart of the router. It allows routing protocols to reconverge faster, minimizing service interruption.

```
ip isis graceful-restart
no ip isis graceful-restart
```

**Syntax Definitions**

N/A

**Defaults**

Graceful restart is disabled on the router by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to disable graceful restart and remove the graceful restart configuration from the IS-IS router.

- When graceful restart is enabled, the router can either be a helper (which helps a neighbor router to restart) or a restarting router, or both. In the current release, only the helper mode of a router is supported.

**Examples**

```
-> ip isis graceful-restart
-> no ip isis graceful-restart
```

**Release History**

Release 7.3.3; command was introduced.
Related Commands

- **ip isis graceful-restart helper** Configures the helper mode of routers for graceful restart.
- **show ip isis status** Displays the IS-IS status.

MIB Objects

- vRtrIsisTable
  - vRtrIsisGracefulRestart
ip isis graceful-restart helper

Administratively enables and disables the IS-IS router to operate in the helper mode in response to a router performing a graceful restart.

ip isis graceful-restart helper {enable | disable}

Syntax Definitions

| enable | Enables the helper mode on the router. |
| disable | Disables the helper mode on the router. |

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- When graceful restart is enabled, the helper mode is enabled by default.
- When graceful restart helper is enabled on a router, it can help other restarting routers.

Examples

```bash
-> ip isis graceful-restart helper disable
```

Release History

Release 7.3.3; command was introduced.
**Related Commands**

- `ip isis graceful-restart`  
  Configures graceful restart on the router.

- `show ip isis status`  
  Displays the IS-IS status.

**MIB Objects**

- `vRtrIsisTable`
  - `vRtrIsisGRHelperMode`
**ip isis strict-adjacency-check**

Enables or disables the adjacency check configuration on the router.

```
ip isis strict-adjacency-check {enable | disable}
```

**Syntax Definitions**

- **enable**: Enables the adjacency check configuration on the router.
- **disable**: Disables the adjacency check configuration on the router.

**Defaults**

By default, the adjacency check configuration is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When the adjacency check configuration is enabled, both routers have to run the same IP version only in the IS-IS protocol to form an adjacency.
- When the adjacency check configuration is disabled, one common IP version running between two routers is enough to form an adjacency in the IS-IS protocol.

**Examples**

```
-> ip isis strict-adjacency-check enable
```

**Release History**

Release 7.3.3; command was introduced.

**Related Commands**

- `show ip isis status`: Displays the IS-IS status.

**MIB Objects**

- vRtrIsisTable
  - vRtrIsisStrictAdjacencyCheck
**ip isis level auth-type**

Enables authentication and configures the authentication types for specific IS-IS levels.

```
ip isis level {1 | 2} auth-type {simple {key key | encrypt-key encrypt_key} | md5 {key key | encrypt-key encrypt_key} | key-chain key_chain_id | none}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>simple</td>
<td>none</td>
</tr>
<tr>
<td>md5</td>
<td>none</td>
</tr>
<tr>
<td>key-chain</td>
<td>none</td>
</tr>
<tr>
<td>none</td>
<td>none</td>
</tr>
</tbody>
</table>

1. Specifies the IS-IS level as Level-1.
2. Specifies the IS-IS level as Level-2.

- **simple**
  - Simple authentication will be used.
- **md5**
  - Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
  - **key**
    - Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
  - **encrypt_key**
    - The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
- **key_chain_id**
  - The configured keychain ID.
- **none**
  - No authentication will be used.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>simple</td>
<td>none</td>
</tr>
<tr>
<td>md5</td>
<td>none</td>
</tr>
<tr>
<td>key-chain</td>
<td>none</td>
</tr>
<tr>
<td>none</td>
<td>none</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
• Use the `key` parameter to configure the password for Simple or MD5 authentication. Alternatively, use the `encrypt_key` parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this `key` parameter during the CLI configuration.

• If the `encrypt_key` parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.

• This command overrides the global configuration of IS-IS authentication type.

• This command also sets the password or hash-key according to the type of authentication.

• Use `key-chain` parameter to apply a keychain to IS-IS adjacency at the capability level. Use `ip isis level auth-type none` to remove the capability level keychain authentication.

• By default, the authentication is disabled and no authentication type is configured.

**Examples**

```
-> ip isis level 2 auth-type simple key rachel
-> ip isis level 2 auth-type md5 encrypt-key 7a1e441a014b4030
-> ip isis level 2 auth-type key-chain 1
-> ip isis level 2 auth-type none
```

**Release History**

Release 7.3.3; command was introduced.
Release 8.4.1; `key-chain` parameter added.

**Related Commands**

`ip isis auth-type` Enables authentication and configures the authentication type for the IS-IS protocol globally.

`show ip isis status` Displays the IS-IS status.

**ip isis level hello-auth**

Enables or disables the authentication of Hello PDUs for specific IS-IS levels.

```
ip isis level {1 | 2} hello-auth
no ip isis level {1 | 2} hello-auth
```

**Syntax Definitions**

| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

**Defaults**

Authentication check of Level Hello PDUs is enabled by default.

**Platorms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

MIB Objects

- **vRtrIsisLevelTable**
  - **vRtrIsisLevelPsnpAuthentication**
**ip isis level wide-metrics-only**

Enables the wide metrics in LSPs for specific IS-IS levels.

```
ip isis level {1 | 2} wide-metrics-only
no ip isis level {1 | 2} wide-metrics-only
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th></th>
<th>Specifies the IS-IS level as Level-1.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
</tbody>
</table>

**Defaults**

By default, wide metrics is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

- Use the `no` form of this command to restore the narrow metric (1–63).
- Wide metrics are used for improved granularity of metrics.
- Numeric values above 63 indicate wide metrics.

**Examples**

```
-> ip isis level 1 wide-metrics-only
-> no ip isis level 1 wide-metrics-only
```

**Release History**

Release 7.3.3; command was introduced.
**Related Commands**

- **show ip isis status**
  Displays the IS-IS status.

ip isis activate-ipv6|ipv4

Configures the IPv6 or IPv4 routing in IS-IS.

ip isis {activate-ipv6 | activate-ipv4}

no ip isis {activate-ipv6 | activate-ipv4}

Syntax Definitions

activate-ipv6       Enables IPv6 routing in IS-IS.
activate-ipv4       Enables IPv4 routing in IS-IS.

Defaults

By default, both IPv4 and IPv6 routing is enabled in IS-IS.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

The no form of this command disables the IPv4/IPv6 routing in IS-IS.

Examples

-> ip isis activate-ipv6
-> ip isis activate-ipv4
-> no ip isis activate-ipv4

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis status       Displays the IS-IS status.

MIB Objects

vRtrIsisActivateIPV4
vRtrIsisActivateIPV6
ip isis vlan

Configures IPv4 or IPv6 IS-IS circuit on a particular VLAN. This command enables IS-IS routing on a particular VLAN. This is used to add both the IPv4 and IPv6 interfaces on a particular VLAN to the IS-IS circuit.

ip isis vlan vlan_id [address-family {v4 | v6 | v4v6}]

Syntax Definitions

- **vlan_id**: The VLAN ID of a given VLAN on which IS-IS is to be enabled.
- **v4 | v6 | v4v6**: The address family extension. The type of interface (IPv4 or IPv6) is controlled by the address-family extension.

Defaults

By default, both address families (IPv4 and IPv6) are disabled.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

The no form of this command disables IPv4/IPv6 IS-IS circuit on a particular VLAN.

Examples

- -> ip isis vlan 10
- -> ip isis vlan 10 address-family v6
- -> no ip isis vlan 10 address-family v6

Release History

Release 7.3.3; command was introduced.
Related Commands

show ip isis vlan  Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

vRtrIsisIfTable
  vRtrIsisIfRowStatus
**ip isis vlan admin-state**

Enables or disables IS-IS on a circuit.

`ip isis vlan vlan_id admin-state {enable | disable}`

**Syntax Definitions**

- `vlan_id`: The VLAN ID of a given VLAN on which IS-IS routing is to be enabled.
- `enable`: Administratively enables IS-IS on the VLAN.
- `disable`: Administratively disables IS-IS on the VLAN.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</table>

**Usage Guidelines**

The no form of this command reverts the time interval to the default value.

**Examples**

- `-> ip isis vlan 10 csnp-interval 10`
- `-> no ip isis vlan 10 csnp-interval`

**Release History**

Release 7.3.3; command was introduced.
**Related Commands**

*show ip isis status*  
Displays the IS-IS status.

**MIB Objects**

vRtrIsisIfCsnpInterval
### ip isis vlan hello-auth-type

Configures the authentication settings for the hello protocol at a circuit level.

```
ip isis vlan vlan_id hello-auth-type {simple {key key | encrypt-key encrypt_key} | md5 {key key | encrypt-key encrypt_key} | key-chain key_chain_id | none}
```

#### Syntax Definitions

- **vlan_id**: The VLAN ID of a given VLAN.
- **simple**: Simple authentication will be used.
- **md5**: Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
- **key**: Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
- **encrypt_key**: The key in hexadecimal format to provide security considerations on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
- **key_chain_id**: The configured keychain ID.
- **none**: No authentication will be used.

#### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>simple</td>
<td>md5</td>
</tr>
</tbody>
</table>

#### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.

- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
• Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the encrypt_key parameter to configure the password by supplying the encrypted form of the password as the encrypt_key. The Configuration snapshot always displays the password in the encrypted form. You must use only this key parameter during the CLI configuration.

• If the encrypt_key parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt_key.

• Use key-chain parameter to apply a keychain at a circuit level. Use `ip isis vlan hello-auth-type none` to remove the circuit level keychain authentication.

• By default, the authentication is disabled and no authentication type is configured.

Examples

-> ip isis vlan 10 hello-auth-type md5 key asddfgfhno
-> ip isis vlan 10 hello-auth-type simple key sdsdff
-> ip isis vlan 100 hello-auth-type key-chain 1
-> ip isis vlan 100 hello-auth-type none

Release History

Release 7.3.3; command was introduced.
Release 8.4.1; `key-chain` parameter added.

Related Commands

Configures the IS-IS level on the specified circuit.

```
ip isis vlan vlan_id level-capability [level-1 | level-2 | level-1/2]
```

**Syntax Definitions**

- **vlan_id**
  - The VLAN ID of a given VLAN.

- **level-1**
  - Specifies that the interface can operate at Level-1 only.

- **level-2**
  - Specifies that the interface can operate at Level-2 only.

- **level-1/2**
  - Specifies that the interface can operate at both Level-1 and Level-2.

**Defaults**

<table>

</tr>
</tbody>
</table>

**Usage Guidelines**

- Changing the level capability restarts the IS-IS protocol on the interface.

- If the level capability is configured globally and on a specific interface, the combination of the two settings will decide the potential adjacency.

**Examples**

```
-> ip isis vlan 10 level-capability level-1
-> ip isis vlan 10 level-capability level-1/2
```

**Release History**

Release 7.3.3; command was introduced.
**Related Commands**

- **ip isis level-capability**
  Configures the router level of the IS-IS protocol globally.

- **show ip isis vlan**
  Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

**MIB Objects**

- **isisCircTable**
  - **isisCircLevel**
ip isis vlan lsp-pacing-interval

Configures the interval between IS-IS LSP PDUs sent from the specified circuit.

ip isis vlan vlan_id lsp-pacing-interval milliseconds

no ip isis vlan vlan_id lsp-pacing-interval

Syntax Definitions

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>milliseconds</td>
<td>100</td>
</tr>
</tbody>
</table>

Defaults

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to restore the default settings.
- No LSPs are sent from the specified interface if the time interval is set to 0.

Examples

- -> ip isis vlan 10 lsp-pacing-interval 1000
- -> no ip isis vlan 10 lsp-pacing-interval

Release History

Release 7.3.3; command was introduced.
**Related Commands**

- **ip isis lsp-lifetime**
  Configures the time interval for which LSPs generated by a router is considered valid by other routers in the same domain.

- **ip isis lsp-wait**
  Configures the time interval between successively generated LSPs.

- **show ip isis vlan**
  Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

**MIB Objects**

- `vRtrIsisIfTable`
  - `vRtrIsisIfLspPacingInterval`
ip isis vlan passive

Configures the IS-IS circuit as passive.

ip isis vlan vlan_id passive

no ip isis vlan vlan_id passive

Syntax Definitions

vlan_id

The VLAN ID of a given VLAN.

Defaults

By default, the interface is not passive.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to remove the passive attribute.
- This command adds the passive attribute that causes the IS-IS circuit to be advertised as an IS-IS circuit without running the IS-IS protocol. Normally, only interface addresses that are configured for IS-IS are advertised as IS-IS interface at the level that they are configured. When the passive mode is enabled, the interface or the interface at the level ignores ingress IS-IS PDUs (Protocol Data Unit) and will not transmit IS-IS protocol PDUs.

Examples

- ip isis vlan 10 passive
- no ip isis vlan 10 passive

Release History

Release 7.3.3; command was introduced.
Related Commands

- `ip isis vlan level passive` Configures the IS-IS circuit as passive at the specified IS-IS level.
- `show ip isis vlan` Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

- `isisCircTable`
  - `isisCircPassiveCircuit`
**ip isis vlan retransmit-interval**

Configures the minimum time interval between LSP (Link State Packet) retransmissions on a point-to-point interface.

`ip isis vlan vlan_id retransmit-interval seconds`

`no ip isis vlan vlan_id retransmit-interval`

**Syntax Definitions**

- `vlan_id` The VLAN ID of a given VLAN.
- `seconds` The minimum time interval (1–65535) in seconds between LSP transmissions on a point-to-point interface.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>seconds</code></td>
<td>5</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to restore the default settings.
- The retransmit interval should be greater than the expected round-trip delay between two devices to avoid any needless retransmission of PDUs.

**Examples**

- `-> ip isis vlan 10 retransmit-interval 130`
- `-> no ip isis vlan 10 retransmit-interval`

**Release History**

Release 7.3.3; command was introduced.
Related Commands

show ip isis vlan         Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

vRtrIsisIfTbale
- vRtrIsisIfRetransmitInterval
**ip isis vlan default-type**

Sets the interface type to default, that is, broadcast.

```
ip isis vlan vlan_id default-type
```

### Syntax Definitions

- `vlan_id` The VLAN ID of a given VLAN.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

N/A

### Examples

```
-> ip isis vlan 10 default-type
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

- **ip isis vlan interface-type** Configures the IS-IS interface (circuit) type as broadcast or point-to-point.

### MIB Objects

- `vRtrIsisIfTable`
  - `vRtrIsisIfTypeDefault`
ip isis vlan level hello-auth-type

Configures the authentication of Hello PDUs for the specified IS-IS level of an IS-IS Circuit.

```
ip isis vlan vlan_id level {1 | 2} hello-auth-type {simple {key key | encrypt-key encrypt_key} | md5 {key key | encrypt-key encrypt_key} | key-chain key_chain_id | none}
```

**Syntax Definitions**

- `vlan_id`: The VLAN ID of a given VLAN.
- `1`: Specifies the IS-IS level as Level-1.
- `2`: Specifies the IS-IS level as Level-2.
- `simple`: Simple authentication will be used.
- `md5`: Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
- `key`: Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
- `encrypt_key`: The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
- `key_chain_id`: The configured keychain ID.
- `none`: No authentication will be used.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>simple</td>
<td>none</td>
</tr>
<tr>
<td>md5</td>
<td>none</td>
</tr>
<tr>
<td>key-chain</td>
<td>none</td>
</tr>
<tr>
<td>none</td>
<td>none</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.

- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to
sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.

- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the encrypt_key parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this key parameter during the CLI configuration.

- If the encrypt_key parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.

- This command also configures the authentication type and the corresponding key. These settings override the configuration done at an interface level.

- Use key-chain parameter to apply a keychain at the capability level per circuit. Use ip isis vlan level hello-auth-type none to remove the capability level keychain authentication per circuit.

- By default, the authentication is disabled and no authentication type is configured.

**Examples**

-> ip isis vlan 10 level 1 hello-auth-type md5 key xyz123
-> ip isis vlan 10 level 2 hello-auth-type none
-> ip isis vlan 100 level 2 hello-auth-type key-chain 1
-> ip isis vlan 100 level 2 hello-auth-type none

**Release History**

Release 7.3.3; command was introduced.
Release 8.4.1; key-chain parameter added.

**Related Commands**

- **ip isis vlan hello-auth-type** Configures the authentication settings for the hello protocol at a circuit level.

- **show ip isis vlan** Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

**MIB Objects**

vRtrIsisIfLevelTable
  vRtrIsisIfLevelHelloAuthType
  vRtrIsisIfLevelHelloAuthKey
  vRtrIsisIfLevel
  vRtrIsisIfLevelHelloAuthKeyChainId
ip isis vlan level hello-interval

Configures the time interval between the successive Hello PDUs for the specified IS-IS level on a circuit.

**ip isis vlan vlan_id level {1 | 2} hello-interval seconds**

**no ip isis vlan vlan_id level {1 | 2} hello-interval**

### Syntax Definitions

- **vlan_id**
  - The VLAN ID of a given VLAN.
- **1**
  - Specifies the IS-IS level as Level-1.
- **2**
  - Specifies the IS-IS level as Level-2.
- **seconds**
  - The hello interval, in seconds. The valid range is 1–20000.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds (designated routers)</td>
<td>3</td>
</tr>
<tr>
<td>seconds (non-designated routers)</td>
<td>9</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the **no** form of this command to restore the default settings.

### Examples

- `-> ip isis vlan 10 level 1 hello-interval 50`
- `-> no ip isis vlan 10 level 2 hello-interval`

### Release History

Release 7.3.3; command was introduced.
Related Commands

**show ip isis vlan**  Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

vRtrIsisIfLevelTable  vRtrIsisIfLevelHelloTimer
**ip isis vlan level hello-multiplier**

Configures the number of missing Hello PDUs from a neighbor, after which the adjacency is declared as down.

```
ip isis vlan vlan_id level {1 | 2} hello-multiplier number
no ip isis vlan vlan_id level {1 | 2} hello-multiplier
```

### Syntax Definitions

- **vlan_id**: The VLAN ID of a given VLAN.
- **1**: Specifies the IS-IS level as Level-1.
- **2**: Specifies the IS-IS level as Level-2.
- **number**: The multiplier (2–100) of the hello interval.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>3</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `no` form of this command to restore the default settings.

### Examples

```
-> ip isis vlan 10 level 1 hello-multiplier 10
-> no ip isis vlan 10 level 2 hello-multiplier
```

### Release History

Release 7.3.3; command was introduced.
Related Commands

show ip isis vlan

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

isisCircLevelTable
isisCircLevelHelloMultiplier
**ip isis vlan level metric**

Configures the metric value of the specified IS-IS level of the circuit.

```
ip isis vlan vlan_id level {1 | 2} metric number
no ip isis vlan vlan_id level {1 | 2} metric
```

**Syntax Definitions**

- `vlan_id`: The VLAN ID of a given VLAN.
- `1`: Specifies the IS-IS level as Level-1.
- `2`: Specifies the IS-IS level as Level-2.
- `number`: The metric value (1–16777215) assigned for the specified level of the circuit.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>10</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to restore the default value.
- To calculate the lowest cost to reach a destination, each configured level on each circuit must have a cost. The costs for each level on a circuit may be different. If the metric is not configured, the default of 10 is used.

**Examples**

```
-> ip isis vlan 10 level 1 metric 25
-> no ip isis vlan 10 level 2 metric
```

**Release History**

Release 7.3.3; command was introduced.
Related Commands

**show ip isis vlan**

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

- `vRtrIsisIfLevelTable`
- `vRtrIsisIfLevelAdminMetric`
**ip isis vlan level passive**

Configures the IS-IS circuit as passive at the specified IS-IS level.

```
ip isis vlan vlan_id level {1 | 2} passive
no ip isis vlan vlan_id level {1 | 2} passive
```

**Syntax Definitions**

- `vlan_id` The VLAN ID of a given VLAN.
- `1` Specifies the IS-IS level as Level-1.
- `2` Specifies the IS-IS level as Level-2.

**Defaults**

By default, the interface level passive configuration is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove the passive attribute.
  - This command adds the passive attribute that causes the IS-IS circuit at the given level to be advertised as an IS-IS circuit without running the IS-IS protocol. Normally, only interface addresses that are configured for IS-IS are advertised as IS-IS interface at the level that they are configured. When the passive mode is enabled, the interface or the interface at the level ignores ingress IS-IS protocol PDUs and will not transmit IS-IS protocol PDUs.

**Examples**

```
-> ip isis vlan 10 level 1 passive
-> no ip isis vlan 10 level 1 passive
```

**Release History**

Release 7.3.3; command was introduced.
Related Commands

- **ip isis vlan passive**: Configures the IS-IS circuit as passive.
- **show ip isis vlan**: Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

- **vRtrIsisIfLevelTable**
- **vRtrIsisIfLevelPassive**
ip isis vlan level priority

Configures the priority of the IS-IS circuit for the designated router election on a multi-access network.

```
ip isis vlan vlan_id level [1 | 2] priority number
no ip isis vlan vlan_id level [1 | 2] priority
```

**Syntax Definitions**

- `vlan_id`: The VLAN ID of a given VLAN.
- `1`: Specifies the IS-IS level as Level-1.
- `2`: Specifies the IS-IS level as Level-2.
- `number`: The priority value of the IS-IS circuit at this level. The valid range is 0–127.

**Defaults**

```
<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>64</td>
</tr>
</tbody>
</table>
```

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

- Use the `no` form of this command to restore the default value.
- This priority is included in hello PDUs transmitted by the circuit on a multi-access network.
- The router with the highest priority is the preferred designated router.
- The designated router sends LSPs to this network and also to the routers that are attached to it.

**Examples**

```
-> ip isis vlan 10 level 1 priority 4
-> ip isis vlan 10 level 2 priority 4
-> no ip isis vlan 10 level 1 priority
```

**Release History**

Release 7.3.3; command was introduced.
**Related Commands**

`show ip isis vlan` Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

**MIB Objects**

- `vRtrIsisIfLevelTable`
- `vRtrIsisIfLevelISPriority`
ip isis summary-address6

Configures the IPv6 summary address.

ip isis summary-address6 {ipv6_prefix/prefix_length | ipv6_address} {level-1 | level-2 | level-1/2}

no ip isis summary-address6 {ipv6_prefix/prefix_length | ipv6_address} {level-1 | level-2 | level-1/2}

**Syntax Definitions**

- `ipv6_prefix/prefix_length`: IPv6 prefix and prefix length.
- `ipv6_address`: IPv6 address.
- `level-1`: Specifies that the routes can be summarized at Level-1 only.
- `level-2`: Specifies that the routes can be summarized at Level-2 only.
- `level-1/2`: Specifies that the routes can be summarized at both Level-1 and Level-2.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `no` form of this command to remove an already configured summary address.

**Examples**

- `-> ip isis summary-address6 4001::/16 level-1`
- `-> no ip isis summary-address6 4001::/16`

**Release History**

Release 7.3.3; command was introduced.
**Related Commands**

*show ip isis summary-address6* Displays the IS-IS IPv6 summary address database.

**MIB Objects**

- `vRtrIsisInetSummLevel`
- `vRtrIsisInetSummRowStatus`
ip isis bfd-state

Enables or disables the registration of IS-IS with the BFD protocol.

ip isis bfd-state {enable | disable}

Syntax Definitions

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables BFD for IS-IS.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables BFD for IS-IS.</td>
</tr>
</tbody>
</table>

Defaults

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- BFD must be globally enabled for the switch and IS-IS must be registered with BFD at the protocol level before IS-IS can interact with BFD.
- All the status changes on the neighbors are received from the BFD level and IS-IS acts based upon the BFD message.
- Whenever a neighbor goes down, IS-IS will inform BFD to remove that neighbor from the BFD active list.

Examples

Globally enables the BFD protocol for the switch:

-> ip bfd admin-state enable

Enables and disables the registration of IS-IS with the BFD protocol:

-> ip isis bfd-state enable
-> ip isis bfd-state disable

Release History

Release 8.4.1.R03; command was introduced.
### Related Commands

### MIB Objects

- vRtrIsisIfTable
  - vRtrIsisBfdStatus
**ip isis bfd-state all-vlans**

Enables or disables BFD monitoring for all IS-IS VLANs in the switch configuration.

```
ip isis bfd-state all-vlans {enable | disable}
```

### Syntax Definitions

- **enable**: Enables BFD for all the IS-IS VLANs.
- **disable**: Disables BFD for all the IS-IS VLANs.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The BFD status for IS-IS must be enabled before IS-IS can interact with BFD.

### Examples

- `-> ip isis bfd-state all-vlans enable`
- `-> ip isis bfd-state all-vlans disable`

### Release History

Release 8.4.1.R03; command was introduced.

### Related Commands

- **ip isis bfd-state**: Enables or disables the registration of IS-IS with the BFD protocol.
- **ip isis vlan bfd-state**: Enables or disables BFD monitoring on a specific IS-IS VLAN.
- **show ip isis vlan**: Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

### MIB Objects

- **vRtrIsisTable**
- **vRtrIsisBfdAllVlanStatus**
ip isis vlan bfd-state

Enables or disables BFD monitoring for a specific IS-IS VLAN.

```
ip isis vlan vlan_id bfd-state {enable | disable}
```

**Syntax Definitions**

- `vlan_id` The VLAN ID of a given VLAN.
- `enable` Enables BFD for the specified IS-IS VLAN.
- `disable` Disables BFD for the specified IS-IS VLAN.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Registering IS-IS with BFD is required at the protocol level before IS-IS can interact with BFD.
- When BFD is enabled on the specified IS-IS VLAN, BFD is applied to all IPv4 and IPv6 interfaces configured for the VLAN.
- A single IS-IS adjacency covers both IPv4 and IPv6 interfaces, but the interfaces are treated independently within the adjacency. If an IS-IS adjacency has both interface types, there will be two BFD sessions (one for each interface). When one interface goes down, only the routes learned through that interface are removed.

**Examples**

```
-> ip isis vlan 10 bfd-state enable
-> ip isis vlan 10 bfd-state disable
```

**Release History**

Release 8.4.3.R03; command was introduced.
**Related Commands**

- `ip isis bfd-state` Enables or disables the registration of IS-IS with the BFD protocol.
- `ip isis bfd-state all-vlans` Enables or disables BFD monitoring for all IS-IS interfaces in the switch configuration.
- `show ip isis vlan` Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

**MIB Objects**

- `vRtrIsisIfTable`
  - `vRtrIsisIfBfdStatus`
show ip isis adjacency

Displays information about IS-IS adjacent routers.

```
show ip isis adjacency [{system-id nbr_sys_id | vlan vlan_id}] [detail]
```

### Syntax Definitions

- `nbr_sys_id`: The system ID of the neighbor router.
- `vlan_id`: The VLAN ID of a given VLAN.

### Defaults

By default adjacency information for all the neighbor routers are displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `nbr_sys_id` or `vlan_id` parameter with this command to view the adjacency information for a specific neighbor.

### Examples

```
-> show ip isis adjacency
==============================================================
ISIS Adjacency
==============================================================
System ID | Type | State | Hold | VlanID | MT IDs | Hostname
----------|------|-------|------|--------|--------|----------
0000.0000.0001 | L1 | UP    | 25   | 20     | 0, 2   | Router-A
0000.0000.0002 | L2 | UP    | 21   | 30     | None   | Router-B

Adjacency : 2
==============================================================
```

### output definitions

- **System ID**: The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
- **Type**: The level (L1, L2, or L1/L2) of the adjacent router.
- **State**: The state of the adjacent router (Up or Down).

**show ip isis database**

Displays IS-IS LSP database information of the adjacent routers.

`show ip isis database [\{system_id system_id | lsp_id lsp_id\} \[detail\] \[level \{1 | 2\}\]`

### Syntax Definitions

- `system_id` The system ID of the router.
- `lsp_id` The LSP ID.
- `detail` Indicates that the output is displayed in a detailed manner.
- `level` Indicates the IS-IS level, either 1 or 2.

### Defaults

By default, the entire LSP database is displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</tr>
</tbody>
</table>

### Usage Guidelines

The SPF path table is common for both IPv4 and IPv6.

### Examples

```
-> show ip isis spf
---------------------------------------------------------------------------------------------
ISIS Path Table
---------------------------------------------------------------------------------------------
Node        VlanId        Nexthop
---------------------------------------------------------------------------------------------
0000.0000.0001.00  6    0000.0000.0001
---------------------------------------------------------------------------------------------
SPF count: 1
---------------------------------------------------------------------------------------------
```

**output definitions**

- **Node**: The system ID of the routers.
- **VlanId**: The VLAN ID.
- **Nexthop**: The system ID of the Next Hop router.
-> show ip isis spf detail

IS-IS Path Table

Node : 0000.0000.0001.00   Metric : 10
VlanId : 6   SNPA : None
Nexthop : 0000.0000.0001

SPF count: 1

Output Definitions

<table>
<thead>
<tr>
<th>Node</th>
<th>The system ID of the routers.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metric</td>
<td>The metric value used for SPF calculations.</td>
</tr>
<tr>
<td>VlanID</td>
<td>The VLAN ID.</td>
</tr>
<tr>
<td>SNPA</td>
<td>The SNPA address of the router.</td>
</tr>
<tr>
<td>Nexthop</td>
<td>The system ID of the Next Hop router.</td>
</tr>
<tr>
<td>SPF count</td>
<td>The number of SPF calculations done by the router.</td>
</tr>
</tbody>
</table>

show ip isis summary-address

Displays the IS-IS summary address database.

show ip isis summary-address [ip_address [mask]]

Syntax Definitions

ip_address The 32-bit IP address.

/mask The netmask value. The valid range is 1–32.

Defaults

By default summary address information for all the IP addresses is displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the ip_address parameter with this command to view the summary address information for a specific IP address.

Examples

-> show ip isis summary-address
=======================================
ISIS Summary Address
=======================================
Address                     Level
---------------------------------------
1.0.0.0/8                   L1
2.1.0.0/24                  L1L2
3.1.2.3/32                  L2
---------------------------------------
Summary Address : 3
=======================================

output definitions

| Address | The summary address for a range of IPv4 addresses. |
| Level   | The capability level of the router.             |
| Summary Address | The number of summarized addresses. |
**Release History**

Release 7.3.3; command was introduced.

**Related Commands**

*ip isis summary-address*  
Adds or deletes the summary address.

**MIB Objects**

`vRtrIsissummaryTable`
- `vRtrIsisSummPefix`
- `vRtrIsisSummMask`
- `vRtrIsisSummLevel`
**show ip isis vlan**

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

**show ip isis vlan [vlan_id] [detail]**

---

**Syntax Definitions**

- **vlan_id**
  - The VLAN ID.
- **detail**
  - Indicates that the output is displayed in a detailed manner.

---

**Defaults**

By default, the interface information for all the interfaces is displayed.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

Use the `vlan_id` parameter with this command to view information for a specific VLAN.

---

**Examples**

```
-> show ip isis vlan

ISIS VLan
-----------------------------------------------
Interface Address-family Level VlanID Oper-state Admin-state L1/L2-Metric
-----------------------------------------------
  ospf    ipv4 L1L2 1l DOWN  UP  10/10
  vlan11  ipv6 L1L2 1l DOWN  UP  10/10
-----------------------------------------------
Vlans : 2
-----------------------------------------------
```

---

**output definitions**

- **Interface**
  - The name of the IS-IS interface.
- **Address-family**
  - The address family extension: IPv4 or IPv6
- **Level**
  - The level capability of the interface.
- **VlanID**
  - The VLAN ID of the interface.
- **Oper-state**
  - The operational state of the interface (`up` or `down`).
output definitions

**Admin-state**
The administrative state of the interface (**up** or **down**).

**L1/L2-Metric**
The metric value of the router for the corresponding capability level.

**Vlans**
The total number of VLANS.

```
-> show ip isis vlan detail
```

```

show ip isis summary-address6

Displays the IS-IS IPv6 summary address database.

show ip isis summary-address6 [ip_address [/mask]]

**Syntax Definitions**

- **ip_address**
  - The 32-bit IP address.
- **/mask**
  - The netmask value. The valid range is 1–32.

**Defaults**

By default, summary address information for all the IP addresses is displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **ip_address** parameter with this command to view the summary address information for a specific IP address.

**Examples**

```
-> show ip isis summary-address6
==========================================================================
ISISv6 Summary Address
==========================================================================
Address Level
==========================================================================
1111:1::/64 L1
==========================================================================
Summary Address : 1
```

**output definitions**

- **Address**
  - The summary address for a range of IPv6 addresses.
- **Level**
  - The capability level of the router.
- **Summary Address**
  - The number of summarized addresses.
Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis summary-address6  Configures the IPv6 summary address.

MIB Objects

N/A
clear ip isis adjacency

Clears and resets the IS-IS adjacency database information.

`clear ip isis adjacency [system-id nbr_sys_id]`

**Syntax Definitions**

`nbr_sys_id` The system ID of the neighbor router.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

ip isis multi-topology

Enables M-ISIS (multi-topology) capability support for IS-IS. If enabled, IPv6 SPF computation is performed separate from the IPv4 SPF computation.

ip isis multi-topology
no ip isis multi-topology

Syntax Definitions

N/A

Defaults

By default, multi-topology is disabled.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

Changing the multi-topology mode with this command results in internal disabling and re-enabling of the IS-IS protocol with the new mode of operation. This will cause IS-IS adjacencies to be reset.

Examples

-> ip isis multi-topology
-> no ip isis multi-topology

Release History

Release 7.3.4; command was introduced.

Related Commands

- show ip isis status Displays the IS-IS status.
- show ip isis adjacency Displays information about IS-IS adjacent routers.

MIB Objects

- vRtrIsisEntry
- vRtrIsisMTEncabled
This chapter describes the CLI commands used to configure the BGP (Border Gateway Protocol) and Multiprotocol extensions to BGP. BGP is a protocol for exchanging routing information between gateway hosts in a network of ASs (autonomous systems). BGP is the most common protocol used between gateway hosts on the Internet. The routing table exchanged contains a list of known routers, the addresses they can reach, and a preference metrics associated with the path to each router so that the best available route is chosen.

Multiprotocol Extensions to BGP-4 supports the exchange of IPv6 unicast prefixes, as well as the establishment of BGP peering sessions with BGP speakers identified by their IPv6 addresses.

The OmniSwitch implementation of BGP-4 and Multiprotocol Extensions to BGP-4 complies with the following RFCs: 4271, 2439, 3392, 2385, 1997, 4456, 3065, 4273, 4760, 2545, 7947.

**Note.** In the following document, the BGP terms “peer” and “neighbor” are used interchangeably to mean any BGP speaker known to the local router.

MIB information for BGP is as follows:

<table>
<thead>
<tr>
<th>Filename</th>
<th>Module</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALCATEL-IND1-VIRTUALROUTER-MIB.mib</td>
<td>alcatelIND1VirtualRouterMIB</td>

</tbody>
</table>
ip load bgp

Loads the BGP protocol software into running memory on the router. The image file containing BGP should already be resident in flash memory before issuing this command.

ip load bgp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>9900</th>
</tr>
</thead>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

• This command requires that the BGP software be resident in flash memory in the active directory.

• Enter this command in the router’s configuration file (boot.cfg) to ensure BGP software is running after a reboot.

• The command does not administratively enable BGP on the router; BGP will be disabled after issuing this command. You must issue the ip bgp admin-state to start the BGP protocol.

Examples

-> ip load bgp

Release History

Release 7.1.1; command was introduced.
Related Commands

- **ip bgp autonomous-system**: Configures the Autonomous system number for this BGP router.
- **ip bgp admin-state**: Administratively enables or disables BGP.

MIB Objects

- **alaVrConfigTable**
  - **alaVrConfigBgpStatus**
**ip bgp admin-state**

Administratively enables or disables BGP. The BGP protocol will not be active until you enable it using this command.

`ip bgp admin-state {enable | disable}`

<tr>
<td>9900</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- You must first load the BGP software into running memory using the `ip load bgp` command before initiating this command.
- Many BGP commands require that the protocol be disabled (`ip bgp admin-state`) before issuing them.

---

**Examples**

```
-> ip bgp admin-state enable
-> ip bgp admin-state disable
```

---

**Release History**

Release 7.1.1; command was introduced.

---

**Related Commands**

- `ip load bgp` Loads the BGP software.

---

**MIB Objects**

- `alaBgpGlobal`
ip bgp autonomous-system

Configures the Autonomous System (AS) number for this router. This number identifies this BGP speaker (this router) instance to other BGP routers. The AS number for a BGP speaker determines whether it is an internal or an external peer in relation to other BGP speakers. BGP routers in the same AS are internal peers while BGP routers in different ASs are external peers. BGP routers in the same AS exchange different routing information with each other than they exchange with BGP routers in external ASs. BGP speakers append their AS number to routes passing through them; this sequence of AS numbers is known as a route’s AS path.

Syntax Definitions

value The AS number in the asplain, asdot+, or asdot formats.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>1</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Usage Guidelines

- A router can belong to only one AS. Do not specify more than one AS value for each router.
- The BGP protocol must be disabled (using the ip bgp admin-state command) before using this command.
- The 4-octet ASN is represented in one of three ways:
  - asplain (simple decimal notation)
  - asdot+ (two 16-bit values as low-order and high-order)
  - asdot (a mixture of asplain and asdot+).

Examples

- `ip bgp autonomous-system 64724`

The following examples show how to configure the local BGP ASN as 65535 in the three different formats:
- `ip bgp autonomous-system 65535` (asplain format)
-> ip bgp autonomous-system 0.65535 (asdot+ format)
-> ip bgp autonomous-system 65535 (asdot format)
The following examples show how to configure the local BGP ASN as 65538 in the three different formats:
-> ip bgp autonomous-system 65538 (asplain format)
-> ip bgp autonomous-system 1.2 (asdot+ format)
-> ip bgp autonomous-system 1.2 (asdot format)

Release History
Release 7.1.1; command was introduced.
Release 7.3.3; support for 4-octet ASN was added.

Related Commands
ip bgp admin-state Enables and disables the BGP protocol.
ip bgp neighbor remote-as Assigns an AS number to this BGP peer.

MIB Objects
alaBgpGlobal
alaBgpAutonomousSystemNumber
ip bgp bestpath as-path ignore

Indicates whether AS path comparison will be used in route selection. The AS path is the sequence of ASs through which a route has traveled. A shorter AS path is preferred over a longer AS path. The AS path is always advertised in BGP route updates. This command informs BGP to use the length of the AS path as a criteria for determining the best route.

ip bgp bestpath as-path ignore
no ip bgp bestpath as-path ignore

Syntax Definitions

N/A

Defaults

This command is enabled by default.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to disable this feature after it has been enabled.
- AS path comparison does not consider the type of links connecting the ASs along the path. In some cases a longer path over very fast connections may be a better route than a shorter path over slower connections. For this reason the AS path should not be the only criteria used for route selection. BGP considers local preference before AS path when making path selections.
- The BGP protocol must be disabled (using the ip bgp admin-state command) before using this command.

Examples

- -> ip bgp bestpath as-path ignore
- -> no ip bgp bestpath as-path ignore

Release History

Release 7.1.1; command was introduced.
Related Commands

- **ip bgp aggregate-address as-set**: Specifies whether AS path aggregation is to be performed or not.
- **ip bgp policy aspath-list**: Creates or removes an AS path list.
- **ip bgp default local-preference**: Configures the default local preference (lpref) value to be used when advertising routes.

MIB Objects

- **alaBgpGlobal**
  - **alaBgpAsPathCompare**
**ip bgp cluster-id**

Configures a BGP cluster ID when there are multiple, redundant, route reflectors in a cluster. This command is not necessary for configurations containing only one route reflector.

**ip bgp cluster-id ip_address**

---

**Syntax Definitions**

- **ip_address**: 32-bit IP address that is the Cluster ID of the router acting as a route reflector.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip_address</td>
<td>0.0.0.0</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- In a route-reflection configuration where there are multiple route-reflectors in a cluster, use this command to configure this cluster ID. Configuring multiple route-reflectors enhances redundancy and avoids a single point of failure. When there is only one reflector in a cluster, the router ID of the reflector is used as the cluster-ID.

- The BGP protocol must be disabled (using the `ip bgp admin-state` command) before using this command.

- Using many redundant reflectors in a single cluster places demands on the memory required to store routes for all redundant reflectors’ peers.

**Examples**

```
-> ip bgp cluster-id 1.2.3.4
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- `ip bgp admin-state` Enables and disables BGP.
- `ip bgp client-to-client reflection` Enables route reflection and sets this speaker as the route reflector.

MIB Objects

- `alaBgpGlobal`
- `alaBgpClusterId`
**ip bgp default local-preference**

Configures the default local preference (lpref) value to be used when advertising routes. A higher local preference value is preferred over a lower value. The local preference value is sent to all BGP peers in the local autonomous system; it is not advertised to external peers.

**Syntax Definitions**

```plaintext
value
```

The default local preference value for this router. The valid range is 0–4294967295.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>100</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to restore the default value.
- Unless a route is specifically configured for a different local preference value it will default to value you specify in this command. This value is used for routes learned from external autonomous systems (the local preference value is not advertised in routes received from external peers) and for aggregates and networks that do not already contain local preference values.
- This value is specific to the router so it can compare its own local preference to those received in advertised paths. If other routers belong to the same AS, then they should use the same default local preference value.
- The BGP protocol must be disabled (using the `ip bgp admin-state` command) before using this command.

**Examples**

```plaintext
-> ip bgp default local-preference 200
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- **ip bgp aggregate-address local-preference** Sets the local preference for a BGP aggregate.
- **ip bgp network local-preference** Sets the local preference for a BGP network.

MIB Objects

- **alaBgpGlobal**
  - **alaBgpDefaultLocalPref**
ip bgp fast-external-failover

Enables fast external failover (FEFO). When enabled, FEFO resets a session when a link to a directly connected external peer is operationally down. The BGP speaker will fall back to Idle and then wait for a connection retry by the external peer that went down.

- **ip bgp fast-external-failover**
- **no ip bgp fast-external-failover**

**Syntax Definitions**

N/A

**Defaults**

This command is disabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to disable Fast External Failover.
- When enabled, this command allows BGP to take immediate action when a directly connected interface, on which an external BGP session is established, goes down. Normally BGP relies on TCP to manage peer connections. Fast External failover improves upon TCP by resetting connections as soon as they go down.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

**Examples**

- `-> ip bgp fast-external-failover`
- `-> no ip bgp fast-external-failover`

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- **ip bgp neighbor clear**  
  Restarts a BGP peer.

- **ip bgp neighbor auto-restart**  
  Enables or disables BGP peer automatic restart.

- **ip bgp neighbor timers**  
  Configures the time interval between KEEPALIVE messages sent by this peer and the tolerated hold time interval, in seconds, for messages to this peer from other peers.

**MIB Objects**

- `alaBgpFastExternalFailOver`
**ip bgp always-compare-med**

Enables or disables Multi-Exit Discriminator (MED) comparison between peers in different autonomous systems. The MED value is considered when selecting the best path among alternatives; it indicates the weight for a particular exit point from the AS. A path with a lower MED value is preferred over a path with a higher MED value.

**ip bgp always-compare-med**

**no ip bgp always-compare-med**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **no** form of this command to disable MED comparison for external peers.

- By default, BGP only compares MEDs from the same autonomous system when selecting routes. Enabling this command forces BGP to also compare MEDs values received from external peers, or other autonomous systems.

- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

### Examples

```
-> ip bgp always-compare-med
-> no ip bgp always-compare-med
```

### Release History

Release 7.1.1; command was introduced.
**Related Commands**

`ip bgp bestpath med missing-as-worst`  Configures the MED parameter when it is missing in a BGP path.

**MIB Objects**

`alaBgpGlobal`  `alaBgpMedAlways`
ip bgp bestpath med missing-as-worst

Configures the MED parameter when it is missing in a BGP path.

ip bgp bestpath med missing-as-worst
no ip bgp bestpath med missing-as-worst

Syntax Definitions

N/A

Defaults

By default this command is disabled.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

| Platform  | 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900V72/C32 | 6900X48C6/T48C6 | X48C4E/V48C8 | C32E/T24C2 | X24C2 | 9900 |
|-----------|------|------|------|-------|------|-------|------|------|-------------|---------------|-------------|---------|-------|------|------|
| Supported | No   | No   | No   | No    | Yes  | Yes   | Yes  | Yes  | Yes         | Yes           | Yes         | Yes      | Yes   | Yes   |

Usage Guidelines

- Use the **no** form of this command to disable missing MEDs as worst.

- This command is used to specify how a missing MED in an external BGP path is to be treated for route selection purposes. The default behavior is to treat missing MEDs as zero (best). This command allows you to treat missing MEDs as worst (2^{32}-1) for compatibility reasons.

- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

-> ip bgp bestpath med missing-as-worst
-> no ip bgp bestpath med missing-as-worst

Release History

Release 7.1.1; command was introduced.

Related Commands

- **ip bgp always-compare-med** Forces BGP to consider MED values from external routes.

MIB Objects

- alaBgpGlobal
ip bgp bestpath med missing-as-worst
ip bgp client-to-client reflection

Enables or disables this BGP speaker (router) to be a route reflector. Route reflectors advertise routing information to internal BGP peers, referred to as clients. BGP requires all internal routers to know all routes in an AS. This requirement demands a fully meshed (each router has a direct connection to all other routers in the AS) topology. Route reflection loosens the fully meshed restriction by assigning certain BGP routers as route reflectors, which take on the responsibility of advertising routing information to local BGP peers.

ip bgp client-to-client reflection

no ip bgp client-to-client reflection

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to disable the speaker as a route reflector.

- In addition to defining this router as the route reflector, this command also enable route reflection for this cluster. After setting this command this reflector will begin using route reflection behavior when communicating to client and non-client peers.

- Once route reflectors are configured, you need to indicate the clients (those routers receiving routing updates from the reflectors) for each route reflector. Use the ip bgp neighbor route-reflector-client command to configure clients.

- The BGP protocol must be disabled (using the ip bgp admin-state command) before using this command.

Examples

- -> ip bgp client-to-client reflection
- -> no ip bgp client-to-client reflection
**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **ip bgp admin-state**  
  Administratively disables BGP in this router.

- **ip bgp neighbor route-reflector-client**  
  Configures a BGP peer to be a client to the this route reflector.

**MIB Objects**

- **alaBgpGlobal**
  - **alaBgpRouteReflection**
ip bgp as-origin-interval

Specifies the frequency at which routes local to the autonomous system are advertised. These advertisements are also referred to as UPDATE messages. This interval applies to advertisements to internal peers.

ip bgp as-origin-interval seconds

no ip bgp as-origin-interval

Syntax Definitions

seconds The update interval in seconds. The valid range is 1–65535.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>15</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to reset the feature to the default value.
- A lower value may increase the likelihood of route flapping as route status is updated more frequently.

Examples

-> ip bgp as-origin-interval 15

-> no ip bgp as-origin-interval

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor advertisement-interval Set the route advertisement interval for external peers.

MIB Objects

alaBgpGlobal
ip bgp as-origin-interval

alaBgpAsOriginInterval
**ip bgp synchronization**

Enables or disables synchronization of BGP prefixes with AS-internal routing information. Enabling this command will force the BGP speaker to advertise prefixes only if the prefixes are reachable through AS-internal routing protocols (IGPs like RIP and OSPF).

```
ip bgp synchronization
no ip bgp synchronization
```

**Syntax Definitions**

N/A

**Defaults**

This command is disabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to disable IGP synchronization.

- A BGP router is not supposed to advertise routes learned through internal BGP updates unless those routes are also known by the primary internal routing protocol (e.g., RIP or OSPF). However, requiring all routers in an AS to know all external routes places a heavy burden on routers focusing mainly on Intra-AS routing. Therefore, disabling synchronization avoids this extra burden on internal routers. As long as all BGP routers in an AS are fully meshed (each has a direct connection to all other BGP routers in the AS) then the problem of unknown external router should not be a problem and synchronization can be disabled.

- By default, synchronization is disabled and the BGP speaker can advertise a route without waiting for the IGP to learn it. When the autonomous system is providing transit service, BGP should not propagate IGP paths until the IGP prefixes themselves are known to be reachable through IGP. If BGP advertises such routes before the IGP routers have learned the path, they will drop the packets causing a blackhole.

- The BGP protocol must be disabled (using the `ip bgp admin-state` command) before using this command.

**Examples**

```
-> ip bgp synchronization
```
-> no ip bgp synchronization

**Release History**
Release 7.1.1; command was introduced.

**Related Commands**
show ip bgp
Displays the current global settings for the local BGP speaker.

**MIB Objects**
alaBgpGlobal
  alaBgpIgpSynchStatus
**ip bgp confederation identifier**

Sets a confederation identification value for the local BGP speaker (this router). A confederation is a grouping of sub-ASs into a single AS. To peers outside a confederation, the confederation appears to be a single AS. Within the confederation multiple ASs may exist and even exchange information with each other as using external BGP (EBGP).

`ip bgp confederation identifier value`

---

**Syntax Definitions**

`value` The confederation identification value. The valid range is 0–65535.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>0</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Use the `no` form of this command to restore the default value.
- A value of 0 means this local speaker is not a member of any confederation.
- The BGP protocol must be disabled (using the `ip bgp admin-state` command) before using this command.
- Use this command in conjunction with the `ip bgp confederation neighbor` command to specify those peers that are a members of the same confederation as the local BGP speaker.

---

**Examples**

`-> ip bgp confederation identifier 3`

---

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- `ip bgp autonomous-system` Sets the AS number for this router.
- `ip bgp confederation neighbor` Specifies peers that are members of a confederation.

MIB Objects

- `alaBgpGlobal`
- `alaBgpConfId`
ip bgp maximum-paths

Enables or disables support for multiple equal paths. When multipath support is enabled and the path selection process determines that multiple paths are equal when the router-id is disregarded, then all equal paths are installed in the hardware forwarding table. When multipath support is disabled, only the best route entry is installed in the hardware forwarding table.

ip bgp maximum-paths

no ip bgp maximum-paths

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

</tbody>
</table>

**Usage Guidelines**

The BGP protocol must be disabled (using the `ip bgp admin-state` command) before using this command.

**Examples**

```
-> ip bgp log-neighbor-changes
-> no ip bgp log-neighbor-changes
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `ip bgp admin-state` Disables BGP within the router.

**MIB Objects**

- `alaBgpGlobal`
- `alaBgpPeerChanges`
**ip bgp dampening**

Enables or disables BGP route dampening or the suppression of unstable routes. Route dampening helps to control the advertisement of routes that are going up and then down at an abnormally high rate. Routes that are changing states (available then unavailable) are said to be **flapping**.

```
ip bgp dampening [half-life half_life reuse reuse suppress suppress max-suppress-time max_suppress_time]
no ip bgp dampening
```

**Syntax Definitions**

- **half_life**
  The half-life duration, in seconds. The valid range is 0–65535.
- **reuse**
  The number of route withdrawals set for the re-use value. The valid range is 1–9999.
- **suppress**
  The dampening cutoff value. The valid range is 1–9999.
- **max_suppress_time**
  The maximum number of seconds a route can be suppressed. The valid range is 0–65535.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>half_life</td>
<td>300</td>
</tr>
<tr>
<td>reuse</td>
<td>200</td>
</tr>
<tr>
<td>suppress</td>
<td>300</td>
</tr>
<tr>
<td>max_suppress_time</td>
<td>1800</td>
</tr>
</tbody>
</table>

This command is disabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to disable dampening.
- BGP dampening is disabled by default. When enabled, route dampening suppresses routes that are unstable, or “flapping,” and disrupting the network.
- BGP dampening of IPv6 route flaps is currently not supported.
This command enables dampening and can also be used to change the default times for the dampening variables.

Use the dampening variables to set penalties, suppression limits, and reuse values for flapping routes.

The half-life value configures the half-life duration for a reachable route. After the time interval specified in this command, the penalty value for the route will be reduced by half. This command sets the duration in seconds during which the accumulated stability value is reduced by half if the route is considered reachable, whether suppressed or not. A larger value may be desirable for routes that are known for their instability. A larger value will also result in a longer suppression time if the route exceeds the flapping rate.

The reuse value configures the number of route withdrawals necessary to begin readvertising a previously suppressed route. If the penalty value for a suppressed route fall below this value, then it will be advertised again. This command sets the reuse value, expressed as a number of route withdrawals. When the stability value for a route reaches or falls below this value, a previously suppressed route will be advertised again. The instability metric for a route is decreased by becoming more stable and by passing half-life time intervals.

The suppress value configures the cutoff value, or number of route withdrawals, at which a flapping route is suppressed and no longer advertised to BGP peers. This value is expressed as a number of route withdrawals. When the stability value for a route exceeds this cutoff value, the route advertisement is suppressed.

The max-suppress-time value configures the maximum time (in seconds) a route can be suppressed. This time is also known as the maximum holdtime or the maximum instability value. Once this time is reached the route flap history for a route will be deleted and the route will be advertised again (assuming it is still reachable). This maximum holdtime as applied on an individual route basis. Each suppressed route will be held for the amount of time specified in this command unless the route is re-advertised by falling below the reuse value.

Entering the command with no variables returns the variables back to their defaults.

Examples

```
-> ip bgp dampening
-> ip bgp dampening half-life 20 reuse 800 suppress 60 max-suppress-time 40
-> no ip bgp dampening
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- **ip bgp dampening clear**: Clears the dampening history data for all routes on the router, resetting route flap counters and unsuppressing any routes that had been suppressed due to route flapping violations.
- **show ip bgp dampening**: Displays the BGP route dampening settings.
- **show ip bgp dampening-stats**: Displays BGP dampening statistics.
**MIB Objects**

- `alaBgpDampReuse`
- `alaBgpDampCutOff`
ip bgp dampening clear

Clears the dampening history data for all routes on the router, resetting route flap counters and unsuppressing any routes that had been suppressed due to route flapping violations.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use this command to clear all of the currently stored information on routes for dampening purposes. When this command is entered, all route information in regards to dampening is cleared.
- BGP dampening of IPv6 route flaps is currently not supported.

**Examples**

```
-> ip bgp dampening clear
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `ip bgp dampening`: Enables or disables route dampening.

**MIB Objects**

**ip bgp asn-format**

Configures the display format to be used when displaying 4-octet ASNs.

*ip bgp asn-format {asdot | asplain}*

**Syntax Definitions**

- **asdot**: A mixture of asplain and asdot+.
- **asplain**: Simple decimal notation.

**Defaults**

The default is **asplain**.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command configures the display format to be used when displaying 4-octet ASNs. This configuration changes only the output format. The input format can be in any mode.

**Examples**

- `-> ip bgp asn-format asdot`

**Release History**

Release 7.3.3; command was introduced.

**Related Commands**

- **ip bgp autonomous-system**: Configures the Autonomous System (AS) number for this router.
- **show ip bgp**: Displays the current global settings for the local BGP speaker.

**MIB Objects**

- **alaBgpGlobal**
- **alaBgpAsnFormat**
**ip bgp aggregate-address**

Creates and deletes a BGP aggregate route. Aggregate routes are used to reduce the size of routing tables by combining the attributes of several different routes and allowing a single aggregate route to be advertised to peers.

The base command (**ip bgp aggregate-address**) may be used with other keywords to set up aggregate address configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

Note that only one of the following optional keywords is specified with each use of the base command. Keywords are not combined together in a single command.

```plaintext
ip bgp aggregate-address ip_address ip_mask
   [admin-state {enable | disable}]
   [as-set]
   [community string]
   [local-preference value]
   [metric metric]
   [summary-only]

no ip bgp aggregate-address ip_address ip_mask
```

**Syntax Definitions**

- **ip_address** 32-bit IP address to be used as the aggregate address.
- **ip_mask** 32-bit subnet mask that determines how many bits of the IP address denote the network number.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to delete an aggregate route.
- This command allows administrative operations on a BGP aggregate. You must still enable the aggregate route through the **ip bgp aggregate-address admin-state** command.
You cannot aggregate an address (for example, 100.10.0.0) if you do not have at least one more-specific route of the address (for example, 100.10.20.0) in the BGP routing table.

Only the aggregate is advertised unless aggregate summarization is disabled using the `ip bgp aggregate-address summary-only` command.

**Examples**

```bash
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0
-> no ip bgp aggregate-address 172.22.2.0 255.255.255.0
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `ip bgp aggregate-address summary-only`: Enables or disables aggregate summarization, which suppresses more-specific routes.

**MIB Objects**

- `alaBgpAggrAddr`
- `alaBgpAggrSet`
- `alaBgpAggrCommunity`
- `alaBgpAggrLocalPref`
- `alaBgpAggrMetric`
- `alaBgpAggrSummarize`
- `alaBgpAggrMask`
ip bgp aggregate-address admin-state

Enables or disables a BGP aggregate route.

`ip bgp aggregate-address ip_address ip_mask admin-state {enable | disable}`

**Syntax Definitions**

- `ip_address`: 32-bit IP address for this aggregate route.
- `ip_mask`: 32-bit subnet mask that determines how many bits of the network address denote the network number.
- `enable`: Enables this aggregate route.
- `disable`: Disables this aggregate route.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Configure all aggregate route parameters before enabling the aggregate with this command. Use the `ip bgp asn-format` command to configure individual aggregate parameters.
- The `show ip bgp path` command displays every aggregate currently defined.

**Examples**

```
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0 admin-state enable
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0 admin-state disable
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- **ip bgp asn-format**
  - Creates an aggregate route.
- **show ip bgp path**
  - Displays aggregate routes.

MIB Objects

- **alaBgpAggrTable**
  - **alaBgpAggrAddr**
  - **alaBgpAggrMask**
ip bgp aggregate-address as-set

Specifies whether AS path aggregation is to be performed or not. AS path aggregation takes the AS path for all routes in this aggregate and creates a new AS path for the entire aggregate. This aggregated AS path includes all the ASs from the routes in the aggregate, but it does not repeat AS numbers if some routes in the aggregate include the same AS in their path.

Syntax:

*ip bgp aggregate-address ip_address ip_mask as-set*

*no ip bgp aggregate-address ip_address ip_mask as-set*

**Syntax Definitions**

*ip_address* 32-bit IP address.

*ip_mask* 32-bit subnet mask that determines how many bits of the IP address denote the network number.

**Defaults**

This command is disabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the *no* form of this command to disable the *as-set* option.
- When AS path aggregation is disabled (the default), the AS path for the aggregate defaults to the AS number of the local BGP speaker (configured in the *ip bgp autonomous-system* command).
- If AS path aggregation is enabled, a flap in a more specific path’s AS path will cause a flap in the aggregate as well.
- Do not use this command when aggregating many paths because of the numerous withdrawals and updates that must occur as path reachability information for the summarized routes changes.

**Examples**

- `-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 as-set`
- `-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 as-set`

**Release History**

Release 7.1.1; command was introduced.
Related Commands

**ip bgp asn-format**

Creates and deletes a BGP aggregate route.

MIB Objects

alaBgpAggrTable

- alaBgpAggrAddr
- alaBgpAggrMask
- alaBgpAggrSet
**ip bgp aggregate-address community**

Defines a community for an aggregate route created by the `ip bgp aggregate-address` command. Communities are a way of grouping BGP peers that do not share an IP subnet or an AS number.

`ip bgp aggregate-address ip_address ip_mask community {none | no-export | no-advertise | no-export-subconfed | num:num}`

**Syntax Definitions**

- `ip_address`: 32-bit IP address of the aggregate route.
- `ip_mask`: 32-bit subnet mask that determines how many bits of the IP address denote the network number.
- `none`: Removes the community restrictions on the community section of the route map.
- `no-export`: Routes in this community are advertised within the AS but not beyond the local AS.
- `no-advertise`: Routes in this community are not advertised to any peer.
- `no-export-subconfed`: Routes in this community are not advertised to any external BGP peer.
- `num:num`: The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>no-export</td>
</tr>
<tr>
<td>none</td>
<td>none</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The value of AS:NN is `num:num:num` if using asdot or asdot+ notation and is `num:num` if using asplain format.
- To revert the aggregate community string to the default value, set the community string to `none`. 
**Examples**

-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 community no-export
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 community none

**Release History**

Release 7.1.1; command was introduced.
Release 7.3.4; syntax added to `community` string.

**Related Commands**

*ip bgp asn-format* Creates and deletes a BGP aggregate route.

**MIB Objects**

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to set the local preference back to the default value.
- You can specify that this route use the default local preference value for the AS by specifying zero (0). In this case the local preference for this route will take the default local preference value set for this AS (defined in the ip bgp default local-preference command).

Examples

- `-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 local-preference 200`
- `-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 local-preference 200`

Release History

Release 7.1.1; command was introduced.
Related Commands

**ip bgp default local-preference**  Sets the default local preference value for this AS.

MIB Objects

alaBgpAggrTable
  alaBgpAggrAddr
  alaBgpAggrMask
  alaBgpAggrLocalPref
ip bgp aggregate-address metric

Configures the MED attribute value for a BGP aggregate. This value is used when announcing this aggregate to internal peers; it indicates the best exit point from the AS.

```
ip bgp aggregate-address ip_address ip_mask metric value
no ip bgp aggregate-address ip_address ip_mask metric value
```

Syntax Definitions

- **ip_address**: A 32-bit IP address.
- **ip_mask**: 32-bit subnet mask that determines how many bits of the IP address denote the network number.
- **value**: The MED attribute. The valid range is 0–4294967295.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>0</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the **no** form of this command to reset the aggregate metric back to its default value.
- The default value of zero indicates that a MED will not be sent for this aggregate. When a MED value is missing for a route, BGP will determine a MED value based upon the settings specified in the **ip bgp bestpath med missing-as-worst** command.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 metric 0
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 metric 0
```

Release History

Release 7.1.1; command was introduced.
Related Commands

- **ip bgp bestpath med missing-as-worst**
  Configures the MED for paths that do not contain a MED value.

- **ip bgp always-compare-med**
  Forces BGP to use the MED for comparison of external routes.

MIB Objects

- **alaBgpAggrTable**
  alaBgpAggrAddr
  alaBgpAggrMask
  alaBgpAggrMetric
ip bgp aggregate-address summary-only

Enables or disables aggregate summarization, which suppresses more-specific routes. Disabling aggregate summarization means that more-specific routes will be announced to BGP peers (internal and external peers).

ip bgp aggregate-address ip_address ip_mask summary-only

no ip bgp aggregate-address ip_address ip_mask summary-only

Syntax Definitions

- ip_address: IP address for the aggregate route.
- ip_mask: 32-bit subnet mask that determines how many bits of the IP address denote the network number.

Defaults

This command is enabled by default.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to disable this feature.
- This command specifies whether more-specific routes should be announced or suppressed.
- By default, aggregate summarization is enabled, which means that only the aggregate entry (for example, 100.10.0.0) is advertised. Advertisements of more-specific routes (for example, 100.10.20.0) are suppressed.

Examples

- -> ip bgp aggregate-address 172.22.2.115 255.255.255.0 summary-only
- -> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 summary-only

Release History

Release 7.1.1; command was introduced.
Related Commands

**ip bgp asn-format**

Creates and deletes a BGP aggregate route.

MIB Objects

alaBgpAggrTable
  - alaBgpAggrAddr
  - alaBgpAggrMask
  - alaBgpAggrSummarize
ip bgp network

Creates or deletes a BGP network. A network must be known to the local BGP speaker; it also must originate from the local BGP speaker. The network may be directly connected, dynamically learned, or static.

In lieu of these options, the base command (ip bgp network) may be used with other keywords to set up network configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a no form to remove the parameter or return it to its default.

```
ip bgp network ip_address ip_mask
    [community string]
    [local-preference value]
    [metric metric]
    [admin-state {enable | disable}]
```

```
no ip bgp network ip_address ip_mask
```

### Syntax Definitions

- **ip_address**: 32-bit IP address.
- **ip_mask**: 32-bit subnet mask that determines how many bits of the IP address denote the network number.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the no form of this command to delete a local network.
- Creating and enabling a network entry indicates to BGP that this network should originate from this router. The network specified must be known to the router, whether it is connected, static, or dynamically learned.
- You can create up to 200 network entries. The basic `show ip bgp path` command will display every network currently defined.
- This command allows administrative operations on a BGP network. You must still enable the network through the `ip bgp network admin-state` command.
Examples

-> ip bgp network 172.22.2.115 255.255.255.0
-> no ip bgp network 172.22.2.115 255.255.255.0

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp network admin-state    Enables a BGP network.

MIB Objects

alaBgpNetworkTable
  alaBgpNetworkAddr
  alaBgpNetworkMetric
  alaBgpNetworkLocalPref
  alaBgpNetworkCommunity
  alaBgpNetworkMask
ip bgp network admin-state

Enables or disables a BGP network.

```
ip bgp network ip_address ip_mask admin-state {enable | disable}
```

### Syntax Definitions

- **ip_address**: 32-bit IP address.
- **ip_mask**: 32-bit subnet mask that determines how many bits of the IP address denote the network number.
- **enable**: Enables this network.
- **disable**: Disables this network.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Configure all network parameters before enabling this BGP network with this command. Use the **ip bgp network** command to configure individual aggregate parameters.

- You can create up 200 network entries. The **show ip bgp path** command displays every network currently defined.

### Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 admin-state enable
```

### Release History

Release 7.1.1; command was introduced.
**Related Commands**

- **ip bgp network**  
  Create a BGP network.
- **show ip bgp path**  
  Display currently defined BGP networks.

**MIB Objects**

- `alaBgpNetworkTable`
- `alaBgpNetworkAddr`
- `alaBgpNetworkMask`
**ip bgp network community**

Defines a community for a route created by the `ip bgp network` command. Communities are a way of grouping BGP peers that do not share an IP subnet or an AS.

**ip bgp network ip_address ip_mask community {none | no-export | no-advertise | no-export-subconfed | num:num}**

### Syntax Definitions

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip_address</code></td>
<td>32-bit IP address of the network.</td>
</tr>
<tr>
<td><code>ip_mask</code></td>
<td>32-bit subnet mask that determines how many bits of the IP address denote the network number.</td>
</tr>
<tr>
<td><code>none</code></td>
<td>Removes the community restrictions on the community section of the route map.</td>
</tr>
<tr>
<td><code>no-export</code></td>
<td>Routes in this community are advertised within the AS but not beyond the local AS.</td>
</tr>
<tr>
<td><code>no-advertise</code></td>
<td>Routes in this community are not advertised to any peer.</td>
</tr>
<tr>
<td><code>no-export-subconfed</code></td>
<td>Routes in this community are not advertised to any external BGP peer.</td>
</tr>
<tr>
<td><code>num:num</code></td>
<td>The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997.</td>
</tr>
</tbody>
</table>

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>none</code></td>
<td><code>none</code></td>
</tr>
<tr>
<td><code>no-export</code></td>
<td><code>none</code></td>
</tr>
<tr>
<td><code>no-advertise</code></td>
<td><code>none</code></td>
</tr>
<tr>
<td><code>no-export-subconfed</code></td>
<td><code>none</code></td>
</tr>
<tr>
<td><code>num:num</code></td>
<td><code>none</code></td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The value of AS:NN is `num.num:num` if using asdot or asdot+ notation and is `num:num` if using asplain format.
- To revert the network community string to the default value, set the community string to `none`. 

**Examples**

-> ip bgp network 172.22.2.115 255.255.255.0 community export
-> ip bgp network 172.22.2.115 255.255.255.0 community none

**Release History**

Release 7.1.1; command was introduced.
Release 7.3.4; syntax added to **community** string.

**Related Commands**

ip bgp network  
Creates or deletes a BGP network

**MIB Objects**

alaBgpNetworkTable  
alaBgpNetworkAddr  
alaBgpNetworkMask  
alaBgpNetworkCommunity
ip bgp network local-preference

Defines the local preference value for a route generated by the ip bgp network command. This value will override the default local preference value; it is used when announcing this network to internal peers.

**ip bgp network ip_address ip_mask local-preference value**

**no ip bgp network ip_address ip_mask local-preference value**

**Syntax Definitions**

- **ip_address**: 32-bit IP address.
- **ip_mask**: 32-bit subnet mask that determines how many bits of the IP address denote the network number.
- **value**: The local preference attribute value. The valid range is 0–4294967295.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>0</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to return the local preference of the specified network to its default setting.

- You can specify that this route use the default local preference value for the AS by specifying zero (0). In this case the local preference for this route will take the default local preference value set for this AS (defined in the **ip bgp default local-preference** command).

**Examples**

- `-> ip bgp network 172.22.2.115 255.255.255.0 local-preference 600`
- `-> no ip bgp network 172.22.2.115 255.255.255.0 local-preference 600`

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- **ip bgp network**  Creates or deletes a BGP network.
- **ip bgp default local-preference**  Sets the default local preference for this AS.

MIB Objects

- alaBgpNetworkTable
  - alaBgpNetworkAddr
  - alaBgpNetworkMask
  - alaBgpNetworkLocalPref
**ip bgp network metric**

Configures the Multi-Exit Discriminator (MED) attribute value for an network generated by the `ip bgp network` command. This value is used when announcing this network to internal peers; it indicates the best exit point from the AS.

```
ip bgp network ip_address ip_mask metric value
no ip bgp network ip_address ip_mask metric value
```

**Syntax Definitions**

- `ip_address`: 32-bit IP address.
- `ip_mask`: 32-bit subnet mask that determines how many bits of the IP address denote the network number.
- `value`: A MED attribute value. The valid range is 0–4294967295.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>0</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to return the metric for this network to its default value.

- The default value of zero indicates that a MED will not be sent for this network. When a MED value is missing for a route, BGP will determine a MED value based upon the settings specified in the `ip bgp bestpath med missing-as-worst` command.

**Examples**

```
-> ip bgp network 172.22.2.115 255.255.255.0 metric 100
-> no ip bgp network 172.22.2.115 255.255.255.0 metric 100
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- **ip bgp network**: Creates or deletes a BGP network.
- **ip bgp bestpath med missing-as-worst**: Specifies the MED value when it is missing.

MIB Objects

  - **alaBgpNetworkAddr**
  - **alaBgpNetworkMask**
  - **alaBgpNetworkMetric**
ip bgp neighbor

Creates or deletes a BGP peer.

**ip bgp neighbor ip_address**

**no ip bgp neighbor ip_address**

---

**Syntax Definitions**

**ip_address**

32-bit IP address of the new BGP peer.

**Defaults**

No peers configured.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to delete a BGP peer.
- You must still enable a BGP peer after creating it. A BGP peer is enabled using the **ip bgp neighbor admin-state** command.
- Once created, a BGP peer cannot be enabled until it is assigned an autonomous system number using the **ip bgp neighbor remote-as** command.

**Examples**

- `-> ip bgp neighbor 172.22.2.115`
- `-> no ip bgp neighbor 172.22.2.115`

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- `ip bgp neighbor admin-state`  
  Enable or disable a BGP peer.
- `ip bgp neighbor remote-as`  
  Configure the AS number for the peer.

**MIB Objects**

- `alaBgpPeerTable`
- `alaBgpPeerAddr`
**ip bgp neighbor ttl-security**

Configures the Generalized TTL Security Mechanism (GTSM) for the BGP peer. GTSM allows to set the maximum number of hops for the IP packets between the switch and the peer. If the maximum number of hops exceeds, the packet is dropped at the NI.

`ip bgp neighbor ip_address ttl-security num`

`ip bgp neighbor ip_address no ttl-security`

**Syntax Definitions**

- `ip_address` : 32-bit IP address of the BGP peer.
- `num` : The maximum number of hops between the switch and the peer. The valid range for GTSM is 0 to 255.

**Defaults**

By default GTSM is disabled for communication with the peer.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- GTSM must be manually enabled on both peers in a connection.
- When GTSM is enabled, eBGP multihop must be disabled or vise-versa.
- Use the `no` form of this command to disable GTSM.

**Examples**

- `-> ip bgp neighbor 172.22.2.115 ttl-security 6`
- `-> ip bgp neighbor 172.22.2.115 no ttl-security`

**Release History**

Release 8.4.1; command was introduced.
Related Commands

show ip bgp neighbors

Displays the configured IPv4 BGP peers.

MIB Objects

alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerTTLSecurityHops
**ip bgp neighbor activate-ipv4**

Enables the advertisement of IPv4 unicast capability to the IPv4 BGP peer.

```
ip bgp neighbor ip_address [activate-ipv4]
no ip bgp neighbor ip_address [activate-ipv4]
```

---

**Syntax Definitions**

- `ip_address` 32-bit IP address of the BGP peer.
- `activate-ipv4` Enable the advertisement of IPv4 unicast capability to the IPv4 BGP peer.

**Defaults**

By default, the command is enabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</table>

### Usage Guidelines

- You must first create a peer and assign it an IP address using the `ip bgp neighbor` command before enabling the peer.
- Configure all BGP peer related commands before enabling a peer using this command. Once you enable the peer it will begin sending BGP connection and route advertisement messages.

### Examples

```
-> ip bgp neighbor 172.22.2.115 admin-state enable
-> ip bgp neighbor 172.22.2.115 admin-state disable
```

### Release History

Release 7.1.1; command was introduced.
Related Commands

- **ip bgp neighbor**: Creates a BGP peer.
- **show ip bgp neighbors**: Displays peer parameters.

MIB Objects

- **alaBgpPeerTable**
- **alaBgpPeerAddr**
ip bgp neighbor advertisement-interval

Configures the time interval for updates between external BGP peers.

```
ip bgp neighbor ip_address advertisement-interval value
```

**Syntax Definitions**

- **ip_address**: 32-bit IP address of the neighbor.
- **value**: An advertisement time interval in seconds. The valid range is 0–65535.

**Defaults**

<table>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Internal peers sharing the same AS as the local BGP speaker (configured in the `ip bgp autonomous-system` command) use the global route advertisement update interval. This command sets the interval this peer uses to send BGP UPDATE messages to external peers.

**Examples**

````
-> ip bgp neighbor 172.22.2.115 255.255.255.0 advertisement-interval 60
```

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

*show ip bgp neighbors*  
Displays BGP peer main status.

**MIB Objects**

alaBgpPeerTable

- alaBgpPeerAddr
- bgpPeerMinRouteAdvertisementTinterval
**ip bgp neighbor clear**

Restarts a BGP peer. The peer will be unavailable during this restart.

**Syntax Definitions**

`ip bgp neighbor ip_address clear`

- **ip_address**: 32-bit IP address of the neighbor.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use this command whenever changes occur to BGP-related access lists, weights, distribution lists, timer specifications, or administrative distance.

- Many peer commands restart the peer as soon as they are configured. The following commands restart the BGP peer for which they are configured:
  - `ip bgp neighbor remote-as`
  - `ip bgp neighbor md5 key`
  - `ip bgp neighbor passive`
  - `ip bgp neighbor ebgp-multihop`
  - `ip bgp neighbor maximum-prefix`
  - `ip bgp neighbor update-source`
  - `ip bgp neighbor next-hop-self`
  - `ip bgp neighbor soft-reconfiguration`
  - `ip bgp neighbor route-reflector-client`
  - `ip bgp confederation neighbor`
  - `ip bgp neighbor remove-private-as`
  - `ip bgp neighbor update-source`.

- You do not need to issue the **ip bgp neighbor clear** command after issuing any of the above commands.
**Examples**

-> ip bgp neighbor 172.22.2.115 clear

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**ip bgp neighbor auto-restart**  
Automatically attempts to restart a BGP peer session after a session terminates.

**MIB Objects**

alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerRestart
ip bgp neighbor route-reflector-client

Configures this peer as a client to the local route reflector.

ip bgp neighbor ip_address route-reflector-client
no ip bgp neighbor ip_address route-reflector-client

Syntax Definitions

ip_address 32-bit IP address of the neighbor.

Defaults

This command is disabled by default.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to remove this peer as a client to the local route reflector.
- This command configures this peer as one of the clients to the local route reflector.
- All of the peers configured using this command become part of the client group. The remaining peers are members of the non-client group for the local route reflector.
- When route reflection is configured, all of the internal BGP speakers in an autonomous system need not be fully meshed. The route reflector takes responsibility for passing internal BGP-learned routes to its peers.

Examples

-> ip bgp neighbor 172.22.2.115 route-reflector-client
-> no ip bgp neighbor 172.22.2.115 route-reflector-client

Release History

Release 7.1.1; command was introduced.
**Related Commands**

*ip bgp client-to-client reflection*  Configures the local BGP speaker as a route reflector

**MIB Objects**

*alaBgpPeerTable*
  - *alaBgpPeerAddr*
  - *alaBgpPeerClientStatus*
ip bgp neighbor default-originate

Enables or disables BGP peer default origination.

**ip bgp neighbor ip_address default-originate**

**no ip bgp neighbor ip_address default-originate**

### Syntax Definitions

*ip_address*  
32-bit IP address of the neighbor.

### Defaults

This command is disabled by default.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/V48C8/C32E/T24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **no** form of this command to disable this feature.

- When this command is enabled, the local BGP speaker advertises itself as a default to the peer. Such a default route overrides any learned default (propagation) and outbound policy. The default route 0.0.0.0 does not need to exist on the local router.

### Examples

-> ip bgp neighbor 172.22.2.115 default-originate

-> no ip bgp neighbor 172.22.2.115 default-originate

### Release History

Release 7.1.1; command was introduced.
Related Commands

**ip bgp neighbor**  Creates or deletes a BGP peer.

**MIB Objects**

- **alaBgpPeerTable**
  - **alaBgpPeerAddr**
  - **alaBgpPeerDefaultOriginate**
**ip bgp neighbor timers**

Configures the KEEPALIVE message interval and hold time interval (in seconds) with regards to the specified peer.

```
ip bgp neighbor ip_address timers keepalive holdtime
```

### Syntax Definitions

- `ip_address`: 32-bit IP address for the BGP peer.
- `keepalive`: The interval (in seconds) between KEEPALIVE messages. The valid values are zero (0) or the range 1–21845.
- `holdtime`: The hold time interval between updates to peers, in seconds. The valid range is 0, 3–65535.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>keepalive</td>
<td>30</td>
</tr>
<tr>
<td>holdtime</td>
<td>90</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6</th>
<th>X48C4E/V48C8</th>
<th>6900 C32E/T24C2</th>
<th>9900 X24C2</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Configures the time interval between KEEPALIVE messages sent by this peer. KEEPALIVE messages do not contain route updates or indicate a change in the status of the BGP peer; they serve only to tell the receiving BGP peer that the connection is still live and the peer is reachable.
- By default, the keep alive interval of 30 seconds is one-third the default hold-time interval of 90 seconds. The keep alive interval can never be more than one-third the value of the hold-time interval. When the hold interval is reached without receiving keep alive or other updates messages, the peer is considered dead.
- Setting the keep alive value to zero means no keep alive messages will be sent.
- Once a connection is established with a peer and a time period of the length specified in this command transpires with no messages from the remote peer, then the connection with that remote peer will be considered dead.
- Configures the tolerated hold time interval, in seconds, for messages to this peer from other peers. The hold timer is used during the connection setup process and in on-going connection maintenance with
BGP peers. If this peer does not receive a KEEPALIVE, UPDATE, or NOTIFICATION message within this time period, then the BGP connection will be closed.

- By default, the hold-interval of 180 seconds is three times the default keep-alive interval of 60 seconds. The hold-interval can never be less than three times the keep-alive value.
- You must restart the peer (using the `ip bgp neighbor clear` command) after issuing this command before the new hold time interval takes effect.
- Both values must be set at the same time.
- Entering this command without the variables resets the variables to their default value.

**Examples**

```
-> ip bgp neighbor 172.22.2.115 timers 80 240
-> ip bgp neighbor 172.22.2.115 timers
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

`ip bgp neighbor conn-retry-interval`  
The interval, in seconds, between BGP retries to set up a connection through the transport protocol with another peer.

**MIB Objects**

`alaBgpPeerTable`  
`alaBgpPeerAddr`  
`bgpPeerHoldTimeConfigured`  
`bgpPeerKeepAliveConfigured`
**ip bgp neighbor conn-retry-interval**

The interval, in seconds, between BGP retries to set up a connection through the transport protocol with another peer. In the connect state, BGP tries to set up a connection with a remote peer. If the connection fails, then the connect retry interval is started. Once this interval elapses, BGP retries setting up the connection.

```
ip bgp neighbor ip_address conn-retry-interval seconds
```

**Syntax Definitions**

- `ip_address`: 32-bit IP address for the neighbor.
- `seconds`: The time interval (in seconds) between retries. The valid range is 0–65535.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>seconds</code></td>
<td>120</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The time interval is started when a connection to a peer is lost.
- Other BGP peers may automatically attempt to restart a connection with this peer if they have configured automatic peer session restart (using the `ip bgp neighbor auto-restart` command).
- You must restart the peer (using the `ip bgp neighbor clear` command) after issuing this command before the new connection retry interval takes effect.
- Entering this command without the `seconds` variable resets the variable to its default value.

**Examples**

- `-> ip bgp neighbor 172.22.2.115 connect-interval 60`
- `-> ip bgp neighbor 172.22.2.115 connect-interval`

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- `ip bgp neighbor auto-restart`: Enable automatic session restart after a session termination.
- `ip bgp neighbor clear`: Restarts the peer.

MIB Objects

- `alaBgpPeerTable`
  - `alaBgpPeerAddr`
  - `bgpPeerConnectRetryInterval`
ip bgp neighbor auto-restart

Enables or disables BGP peer automatic restart. When enabled, this peer will automatically attempt to restart a session with another peer after a session with that peer terminates. When disabled, this peer will not try to re-establish a session with another peer after the session terminates; in such a case, the other peer will have to restart the session for the two peers to resume communication.

**ip bgp neighbor ip_address auto-restart**

**Syntax Definitions**

| ip_address | 32-bit IP address for the neighbor. |

**Defaults**

This command is enabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the no form of this command to disable automatic peer restart.

- After a session with another peer terminates, the local BGP speaker will wait 60 seconds before attempting to restart the session. If the session does not start on the first attempt a second attempt will be made after another 120 seconds (60x2). On each unsuccessful session attempt, the previous delay between restarts is multiplied by 2, up to a maximum delay of 240 seconds. An exception to this rule occurs when the peer session terminates on receipt of a NOTIFY message with 'unsupported option' code or 'unsupported capability' code; in these cases the delay between restart attempts will begin at 1 second and multiply by 2 after each unsuccessful restart attempt (up to a maximum of 240 second delay).

- Disabling this option can be helpful in cases where other peers are prone to frequent flapping or sending many NOTIFY messages. By not restarting sessions with unstable neighbors, the local BGP speaker forces those unstable neighbors to re-initialize the connection.

**Examples**

```bash
-> ip bgp neighbor 172.22.2.115 auto-restart
-> no ip bgp neighbor 172.22.2.115 auto-restart
```

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

`ip bgp neighbor` Creates a BGP peer.

`ip bgp neighbor admin-state` Enables a BGP peer.

**MIB Objects**

- `alaBgpPeerTable`
  - `alaBgpPeerAddr`
  - `alaBgpPeerAutoRestart`
ip bgp neighbor maximum-prefix

Configures the maximum number of prefixes, or paths, the local router can receive from this peer in UPDATE messages.

**ip bgp neighbor ip_address maximum-prefix maximum [warning-only]**

---

**Syntax Definitions**

- **ip_address**: 32-bit IP address for the BGP peer.
- **maximum**: The maximum number of prefixes. The valid range is 0–4294967295.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>threshold</td>
<td>5000</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When the number of prefixes sent by this peer reaches this limit, the peer is restarted.
- You can use BGP logging to receive a warning when the number of prefixes received from this peer reaches 80 percent of the value you configure in this command.
- If the **warning-only** prefix is used, the operator will be warned when the peer exceeds 80 percent of the configured number of maximum prefixes.
- The BGP peer is restarted after issuing this command.

**Examples**

```bash
-> ip bgp neighbor 172.22.2.115 maximum-prefix 1000
-> ip bgp neighbor 172.22.2.115 maximum-prefix 1000 warning only
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

```markdown
**ip bgp neighbor clear**
Restarts the BGP peer.
```

MIB Objects

```markdown
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerMaxPrefixWarnOnly
  alaBgpPeerMaxPrefix
```
ip bgp neighbor md5 key

Sets an encrypted MD5 signature for TCP sessions with this peer in compliance with RFC 2385.

ip bgp neighbor ip_address md5 key {string | none}

Syntax Definitions

- **ip_address**: 32-bit IP address of the BGP peer.
- **string**: The MD5 public key. Maximum character length is 200.
- **none**: Removes the MD5 public key.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>no password</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td>V72/C32</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>X48C6/T48C6/V48C8/C32E/T24C2/X24C2</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>

<tr>
<td>9900</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Entering the keyword **none** in place of a key removes the password and disables authentication.

- Due to security concerns the actual password that you specify in this command is encrypted using a 3DES algorithm before it appears in a saved snapshot file. Also, if you were to view this command in a snapshot file, or **boot.cfg** file, it would appear in a different syntax. The syntax for this command used in snapshot files is as follows:

  **ip bgp neighbor ip_address md5 key-encrypt encrypted_string**

  However, you should not use this syntax to actually set an MD5 password; it will not work.

- The BGP peer is restarted after issuing this command.

Examples

-> ip bgp neighbor 172.22.2.115 md5 key openpeer5

Release History

Release 7.1.1; command was introduced.
**Related Commands**

**ip bgp neighbor clear**

Restarts the BGP peer.

**MIB Objects**

alaBgpPeerTable

alaBgpPeerAddr
alaBgpPeerMD5Key
ip bgp neighbor ebgp-multihop

Allows external peers to communicate with each other even when they are not directly connected. The absence of communication between disconnected peers can occur when a router that is not running BGP sits between two BGP speakers; in such a scenario the BGP speakers are multiple hops from each other. By enabling this command, you allow the BGP peers to speak to each other despite the non-BGP router that sits between them.

ip bgp neighbor ip_address ebgp-multihop [ttl]
no ip bgp neighbor ip_address ebgp-multihop

Syntax Definitions

- **ip_address**: 32-bit IP address of the BGP peer.
- **ttl**: The Time to Live for the multi-hop connection, in seconds. The range is 1 to 255.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>ttl</td>
<td>255</td>
</tr>
</tbody>
</table>

This command is disabled by default.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the **no** form of this command to disable multi-hop connections.
- By default an external BGP peer is on a directly connected subnet. This command allows you to configure an external BGP peer that is not directly connected and may be multiple hops away. It should be used with caution and only with the guidance of qualified technical support.
- As a safeguard against loops, the multi-hop connection will not be made if the only route to a multi-hop peer is the default route (0.0.0.0).
- The BGP peer is restarted after issuing this command.
- When eBGP multihop is enabled, GTSM must be disabled or vice-versa.
Examples

-> ip bgp neighbor 172.22.2.115 ebgp-multihop 250
-> no ip bgp neighbor 172.22.2.115 ebgp-multihop 50

Release History

Release 7.1.1; command was introduced.

Related Commands

- **ip bgp neighbor**  
  Creates or deletes a BGP peer.
- **ip bgp neighbor next-hop-self**  
  Sets the BGP peer to use next hop processing behavior.

MIB Objects

- **alaBgpPeerTable**
  - **alaBgpPeerAddr**
  - **alaBgpPeerMultiHop**
### ip bgp neighbor description

Configures the BGP peer name.

```plaintext
ip bgp neighbor ip_address description string
```

#### Syntax Definitions

- `ip_address` 32-bit IP address of the BGP peer.
- `string` Peer name (1–20 characters).

#### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>string</code></td>
<td>peer(ip_address)</td>
</tr>
</tbody>
</table>

#### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

- The peer name is a text identifier that, by default, follows the format “peer(x.x.x.x)” where x.x.x.x is the IP address of the BGP peer. For example, the default name of a peer at address 198.216.14.23 would be “peer(198.216.14.23)”.
- A peer name with embedded spaces must be enclosed in quotation marks.

#### Examples

```plaintext
-> ip bgp neighbor 172.22.2.115 description "peer for building 3"
```

#### Release History

Release 7.1.1; command was introduced.

#### Related Commands

- `ip bgp neighbor` Sets the IP address for the peer.

#### MIB Objects

- `alaBgpPeerTable`
- `alaBgpPeerAddr`
alaBgpPeerName
ip bgp neighbor next-hop-self

Sets the BGP peer to use next hop processing behavior. By default, the next-hop processing of BGP updates is disabled. Using this command to enable next-hop behavior may be useful in non-meshed networks where BGP peers do not have direct access to other peers.

`ip bgp neighbor ip_address next-hop-self`

`no ip bgp neighbor ip_address next-hop-self`

---

**Syntax Definitions**

N/A

**Defaults**

This command is disabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to disable next hop processing behavior.

- In partially meshed networks a BGP peer may not have direct connections to other peers. When such a peer receives route updates from these distant peers (through other peers), it may treat the remote peer as if it were the next hop in the routing path. Packet forwarding will not work in such a case because no direct connection exists. This command allows this peer to deem itself the next hop on the routing path so that the two non-connected peers can route packets. This peer would have a direct connection to both peers that want to exchange packets.

- The BGP peer is restarted after issuing this command.

**Examples**

`-> ip bgp neighbor 172.22.2.115 next-hop-self`

`-> no ip bgp neighbor 172.22.2.115 next-hop-self`

**Release History**

Release 7.1.1; command was introduced.
Related Commands

**ip bgp neighbor**  Creates or deletes a BGP peer.

MIB Objects

alaBgpPeerTable
- alaBgpPeerAddr
- alaBgpPeerNextHopSelf
ip bgp neighbor passive

Configures the local BGP speaker to wait for this peer to establish a connection. When enabled, the local BGP speaker will not initiate a peer session with this peer; in this sense, the BGP speaker is “passive.” When disabled, the local BGP speaker will attempt to set up a session with this peer.

ip bgp neighbor ip_address passive

no ip bgp neighbor ip_address passive

Syntax Definitions

ip_address 32-bit IP address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to disable passive peer behavior.
- By default BGP will initiate a session to a peer once the peer is configured, has an AS number, and is enabled. You can use this command to configure the local BGP speaker as passive and an outbound session will not be initiated to this peer. For such peers, BGP will always wait passively for the inbound session attempt.
- The BGP peer is restarted after issuing this command.

Examples

-> ip bgp neighbor 172.22.2.115 passive
-> no ip bgp neighbor 172.22.2.115 passive

Release History

Release 7.1.1; command was introduced.
Related Commands

**ip bgp neighbor**
Creates or deletes a BGP peer.

MIB Objects

*alaBgpPeerTable*
  *alaBgpPeerAddr*
  *alaBgpPeerPassive*
**ip bgp neighbor remote-as**

Assigns an AS number to this BGP peer.

`ip bgp neighbor ip_address remote-as value`

### Syntax Definitions

- `ip_address`: 32-bit IP address of the BGP peer.
- `value`: Autonomous system number in the asplain, asdot+, or asdot formats.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>1</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

### Usage Guidelines

- A BGP peer created with the `ip bgp neighbor` command cannot be enabled (**ip bgp neighbor admin-state enable**) until it is assigned an autonomous system number. If the AS number matches the AS number assigned to the local BGP speaker (assigned using the `ip bgp autonomous-system` command), the peer is considered internal to the local autonomous system. Otherwise, the peer is consider external to the local BGP speaker’s AS.
- This BGP peer may not be operational within this router and it may be in an external AS, but it must still be configured on this router before the local BGP speaker can establish a connection to the peer. The local BGP speaker does not auto-discover peers in other routers; it initially learns about peers through the peer commands.
- The BGP peer is restarted after issuing this command.
- The 4-octet ASN is represented in one of three ways:
  - asplain (simple decimal notation)
  - asdot+ (two 16-bit values as low-order and high-order)
  - asdot (a mixture of asplain and asdot+).
**Examples**

-> ip bgp neighbor 172.22.2.115 remote-as 100

The following examples show how to configure the BGP neighbor ASN as 65535 in the three different formats:

-> ip bgp neighbor 2.2.2.2 remote-as 65535        (asplain format)
-> ip bgp neighbor 2.2.2.2 remote-as 0.65535      (asdot+ format)
-> ip bgp neighbor 2.2.2.2 remote-as 65535        (asdot format)

**Release History**

Release 7.1.1; command was introduced.
Release 7.3.3; support for 4-octet ASN was added.

**Related Commands**

- **ip bgp autonomous-system** Set the AS for the local BGP speaker.
- **ip bgp neighbor** Create a BGP peer.
- **ip bgp neighbor admin-state enable** Enables a BGP peer.

**MIB Objects**

alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerAS
**ip bgp neighbor remove-private-as**

Enables or disables the stripping of private autonomous system numbers from the AS path of routes destined to this peer.

```plaintext
ip bgp neighbor ip_address remove-private-as
no ip bgp neighbor ip_address remove-private-as
```

**Syntax Definitions**

*ip_address*  
32-bit IP address of the BGP peer.

**Defaults**

This command is disabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to disable stripping of private AS numbers.
- By default all AS numbers in the AS path are passed to peers. Enabling this command strips any private AS numbers in the AS path before sending updates to this peer. AS numbers in the range 64512 to 65535 are considered private ASs; they intended for internal use within an organization (such as an enterprise network), but they are not intended for use on public networks (such as the Internet).
- This command has no effect if you are not using ASs in the range 64512 to 65535.
- The BGP peer is restarted after issuing this command.

**Examples**

```plaintext
-> ip bgp neighbor 172.22.2.115 remove-private-as
-> no ip bgp neighbor 172.22.2.115 remove-private-as
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

`ip bgp neighbor remote-as`  Configures the AS number for this peer.

MIB Objects

alaBgpPeerTable
- alaBgpPeerAddr
- alaBgpPeerRemovePrivateAs
**ip bgp neighbor soft-reconfiguration**

Enables or disables BGP peer soft reconfiguration. Soft reconfiguration increases the stability of the peer by allowing you to reconfigure attributes that require peer resets without halting the TCP connection with other peers.

```
ip bgp neighbor ip_address soft-reconfiguration
no ip bgp neighbor ip_address soft-reconfiguration
```

**Syntax Definitions**

*ip_address* 32-bit IP address of the BGP peer.

**Default**

This command is enabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the *no* form of this command to disable this feature.
- This feature stores routes and other configuration information in local memory. When you make configuration changes that require a peer reset, the routing cache is not cleared and connections with other peers are not interrupted.
- If a peer is not route-refresh capable, by default, BGP stores all paths from peers, even those that are policy rejected, in anticipation of policy changes in the future. Storing these paths consumes memory. You can use this command to disable the storing of these paths, or soft reconfiguration. However, if soft reconfiguration is disabled and the peer is not route-refresh capable and the inbound policy changes, the peer will have to be restarted using the *ip bgp neighbor clear* command.
- If the peer is route-refresh capable and soft reconfiguration is disabled, inbound policy changes are still supported without re-starting the peer.

**Examples**

```
-> ip bgp neighbor 172.22.2.115 soft-reconfiguration
-> no ip bgp neighbor 172.22.2.115 soft-reconfiguration
```
BGP Commands

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **ip bgp neighbor clear** Reverts this BGP peer.
- **ip bgp neighbor clear soft** Invokes an inbound or outbound policy reconfiguration for a BGP peer.

**MIB Objects**

- **alaBgpPeerTable**
  - **alaBgpPeerAddr**
  - **alaBgpPeerSoftReconfig**
**ip bgp neighbor stats-clear**

Clears the statistics for a peer.

`ip bgp neighbor ip_address stats-clear`

**Syntax Definitions**

`ip_address` 32-bit IP address of the BGP peer.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command clears the statistical variables for a peer so they can accumulate from a known point.

- The cleared statistics include the total messages sent and received from this peer, the total UPDATE messages sent and received from this peer, the total NOTIFY messages sent and received from this peer, and the total peer state transition messages sent and received from this peer. These statistics can be displayed through `show ip bgp neighbors statistics`.

**Examples**

`-> ip bgp neighbor 172.22.2.115 stats-clear`

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

`show ip bgp neighbors statistics` Displays peer statistics.

**MIB Objects**

alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerClearCounter
**ip bgp confederation neighbor**

Configures this peer as a member of the same confederation as the local BGP speaker.

**ip bgp confederation neighbor** *ip_address*

**no ip bgp confederation neighbor** *ip_address*

---

**Syntax Definitions**

*ip_address* 32-bit IP address of the BGP peer.

**Defaults**

This command is disabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes/Deterministic</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to disable this feature.
- You must first assign a confederation number to the local BGP speaker before assigning peers to the confederation. Use the **ip bgp confederation identifier** command to assign a confederation number to the local BGP speaker.
- The BGP peer is restarted after issuing this command.

**Examples**

- `-> ip bgp confederation neighbor 172.22.2.115`
- `-> no ip bgp confederation neighbor 172.22.2.115`

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **ip bgp confederation identifier** Sets a confederation identification value for the local BGP speaker (this router).

**MIB Objects**

- `alaBgpPeerTable`
- `alaBgpPeerAddr`
alaBgpPeerConfedStatus
ip bgp neighbor update-source

Configures the local address from which this peer will be contacted. This local address can be configured for internal and external BGP peers.

`ip bgp neighbor ip_address update-source [interface_name]`

### Syntax Definitions

- `ip_address` 32-bit IP address of the BGP peer.
- `interface_name` The name of the interface.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface_address</code></td>
<td>0.0.0.0</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This address does not override the router identification for this BGP peer (configured in the `ip bgp neighbor` command). It is the address through which this peer can be contacted within this router. The router identification for a peer, especially an external peer, may not exist in the local router, but that distant peer can still be contacted through this router. This command sets the local address through which this distant peer can be contacted.
- The default is restored by entering the command without a IP address.
- The BGP peer is restarted after issuing this command.
- The update-source is not related to the router-id, it specifies the interface to be used for the TCP connection endpoint. By default, the nearest interface is selected.

### Examples

- `-> ip bgp neighbor 172.22.5.115 update-source 172.22.2.117`
- `-> ip bgp neighbor 172.22.5.115 update-source vlan-22`
- `-> ip bgp neighbor 172.22.5.115 update-source`
**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **ip bgp neighbor**

  Sets the router identification for a BGP peer.

**MIB Objects**

- **alaBgpPeerTable**
  - **alaBgpPeerAddr**
  - **alaBgpPeerLocalAddr**
  - **alaBgpPeerLocalIntfName**
ip bgp neighbor in-aspathlist

Assigns an inbound AS path list filter to a BGP peer.

\texttt{ip bgp neighbor ip\_address in-aspathlist \{string | none\}}

**Syntax Definitions**

- \texttt{ip\_address} \hspace{1cm} 32-bit IP address of the BGP peer.
- \texttt{string} \hspace{1cm} Inbound AS path list (0 to 70 characters). This name is case sensitive.
- \texttt{none} \hspace{1cm} Removes this AS path list from the peer.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The AS path list name (\texttt{InboundASpath} in the example below) is created using the \texttt{ip bgp policy aspath-list} command. Any inbound routes from the BGP peer must match this AS path filter before being accepted or passed to inbound policy.
- To deassign an input AS path filter list, use this command to assign a value of \texttt{none}.

**Examples**

- \texttt{-> ip bgp neighbor 172.22.2.115 in-aspathlist InboundASPath}
- \texttt{-> ip bgp neighbor 172.22.2.115 in-aspathlist none}

**Release History**

Release 7.1.1; command was introduced.
Related Commands

ip bgp policy aspath-list  Creates or removes an AS path list.

MIB Objects

alaBgpPeerTable
  alaBgpPeerAspathListIn
**ip bgp neighbor in-communitylist**

Assigns an inbound community list filter to a BGP peer.

```
ip bgp neighbor ip_address in-communitylist {string | none}
```

### Syntax Definitions

- **ip_address**: 32-bit IP address of the BGP peer.
- **string**: Input community list (0 to 70 characters). This name is case sensitive.
- **none**: Removes this community list from the peer.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

  alaBgpPeerPrefixListIn
**ip bgp neighbor in-prefix6list**

Assigns an inbound prefix6 list to a BGP peer.

`ip bgp neighbor ip_address in-prefix6list {string | none}`

---

### Syntax Definitions

- **ip_address**: 32-bit IP address of the BGP peer.
- **string**: Input prefix6 filter list (0 to 70 characters). This name is case sensitive.
- **none**: Removes this prefix6 list from the peer.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The prefix6 list name (**InboundPrefix6** in the example below) is created using the `ip bgp policy prefix6-list` command. Any inbound IPv6 routes from the BGP peer must match this prefix6 filter before being accepted or passed to inbound policy.
- To deassign an input prefix6 filter list, use this command to assign a value of “**none**.”

### Examples

- `-> ip bgp neighbor 172.22.2.115 in-prefix6list InboundPrefix6`
- `-> ip bgp neighbor 172.22.2.115 in-prefix6list none`

### Release History

Release 7.1.1; command was introduced.
**Related Commands**

*ip bgp policy prefix6-list*  
Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

**MIB Objects**

*alaBgpPeerTable*  
*alaBgpPeerPrefix6ListIn*
**ip bgp neighbor out-aspathlist**

Assigns an outbound AS path filter list to a BGP peer.

```
ip bgp neighbor ip_address out-aspathlist {string | none}
```

### Syntax Definitions

- **ip_address**: 32-bit IP address of the BGP peer.
- **string**: Outbound AS path list (0 - 70 characters).
- **none**: Removes the AS path list from the peer.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</table>

**Usage Guidelines**

- The prefix6 list name (OutboundPrefix6 in the example below) is created using the `ip bgp policy prefix6-list` command. Any outbound IPv6 routes from the BGP peer must match this prefix6 filter before being advertised or passed to outbound policy.
- To deassign an output prefix6 filter list, use this command to assign a value of “none”.

**Examples**

- `-> ip bgp neighbor 172.22.2.115 out-prefix6list OutboundPrefix6`
- `-> ip bgp neighbor 172.22.2.115 out-prefix6list none`

**Release History**

Release 7.1.1; command was introduced.
BGP Commands

ip bgp neighbor out-prefix6list

Related Commands

ip bgp policy prefix6-list Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

MIB Objects

alaBgpPeerTable
  alaBgpPeerPrefix6ListOut
**ip bgp neighbor route-map**

Assigns a policy map (inbound or outbound) to a BGP peer.

```
ip bgp neighbor ip_address route-map {string | none} {in | out}
oip bgp neighbor ip_address route-map {in | out}
```

**Syntax Definitions**

- `ip_address` 32-bit IP address of the peer.
- `string` Policy map name (0 to 70 characters). This name is case sensitive.
- `none` Deletes the route map if entered rather than a text string.
- `in` Designates this route map policy as an inbound policy.
- `out` Designates this route map policy as an outbound policy.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to deassign an inbound or an outbound policy.
- The policy route map name (**InboundRoute** in the example below) is created using the `ip bgp policy route-map` command. Any inbound routes from the BGP peer must match this route map filter before being accepted or passed to inbound policy.
- The policy route map name (**OutboundRoute** in the example below) is created using the `ip bgp policy route-map` command. Any outbound routes for the BGP peer must match this route map filter before being advertised or passed to outbound policy.
- It is also possible to deassign a route map by entering `none` in place of a route map name.

**Examples**

```
-> ip bgp neighbor 172.22.2.115 route-map InboundRoute in
-> ip bgp neighbor 172.22.2.115 route-map OutboundRoute out
-> ip bgp neighbor 172.22.2.115 route-map none in
-> no ip bgp neighbor 172.22.2.115 route-map in
```
Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map

Creates or deletes a policy route map.

MIB Objects

alaBgpPeerTable
  alaBgpPeerRouteMapOut
  alaBgpPeerRouteMapIn
**ip bgp neighbor clear soft**

Invokes an inbound or outbound policy reconfiguration for a BGP peer.

```
ip bgp neighbor ip_address clear soft {in | out}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip_address</code></td>
<td>32-bit IP address of the BGP peer.</td>
</tr>
<tr>
<td><code>in</code></td>
<td>Applies reconfiguration to the inbound policies.</td>
</tr>
<tr>
<td><code>out</code></td>
<td>Applies reconfiguration to the outbound policies.</td>
</tr>
</tbody>
</table>

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command reconfigures (or reapplies) all inbound or outbound policies to existing routes without restarting the peer session.
- This command is useful if policies have been changed.

### Examples

```
-> ip bgp neighbor 172.22.2.115 clear soft in
-> ip bgp neighbor 172.22.2.115 clear soft out
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- `ip bgp neighbor soft-reconfiguration` Enables or disables BGP peer soft reconfiguration.

### MIB Objects

- `alaBgpPeerTable`
- `alaBgpPeerReconfigureInBound`
BGP Commands

ip bgp neighbor clear soft

alaBgpPeerReconfigureOutBound
bgp neighbor check-first-as

Configures the check for the first AS in the ASPATH list while processing UPDATE message from BGP neighbor.

```bash
{ip | ipv6} bgp neighbor {ipv4_address | ipv6_address} check-first-as
no {ip | ipv6} bgp neighbor {ipv4_address | ipv6_address} check-first-as
```

**Syntax Definitions**

- `ipv4_address | ipv6_address`: IPv4 or IPv6 address of the BGP neighbor based on the IP address type selected.

**Defaults**

By default, the first AS in the ASPATH list will be checked.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `ip` keyword to configure the check for the first AS in the ASPATH from an IPv4 BGP neighbor.
- Use the `ipv6` keyword to configure the check for the first AS in the ASPATH from an IPv6 BGP neighbor.
- Use the `no` form of the command to remove the check for the first AS in the ASPATH list while processing an update message from BGP neighbor.

**Examples**

- `ip bgp neighbor 172.22.2.115 check-first-as`
- `ipv6 bgp neighbor fe80::2efa:a2ff:fe13:e402 check-first-as`
- `no ip bgp neighbor 172.22.2.115 check-first-as`
- `no ipv6 bgp neighbor fe80::2efa:a2ff:fe13:e402 check-first-as`

**Release History**

Release 8.7 R1; command was introduced.
**Related Commands**

- `show ip bgp neighbors` Displays the configured IPv4 BGP peers.
- `show ipv6 bgp neighbors` Displays the configured IPv6 BGP peers.

**MIB Objects**

- `alaBgpPeerTable`
  - `alaBgpPeerCheckFirstAS`
  - `alaBgpPeer6CheckFirstAS`
**ip bgp bfd-state**

Enables or disables the registration of BGP with the BFD protocol.

`ip bgp bfd-state {enable | disable}`

---

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables BFD for BGP.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables BFD for BGP.</td>
</tr>
</tbody>
</table>

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- BFD must be globally enabled for the switch and BGP must be registered with BFD at the protocol level before BGP can interact with BFD.
- All the status changes on the neighbors are received from the BFD level and the BGP protocol acts based upon the BFD message.
- Whenever a neighbor goes down, BGP will inform BFD to remove that neighbor from the BFD active list.

**Examples**

Globally enables the BFD protocol for the switch:

`-> ip bfd admin-state enable`

Enables and disables the registration of BGP with the BFD protocol:

`-> ip bgp bfd-state enable`

`-> ip bgp bfd-state disable`

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- **ip bfd admin-state**: Enables or disables the global BFD protocol status for the switch.
- **ip bgp bfd-state all-neighbors**: Enables or disables BFD for all BGP neighbors.
- **ip|ipv6 bgp neighbor bfd-state**: Enables or disables BFD for a specific neighbor.
- **show ip bgp**: Displays the current global settings for the local BGP speaker.

MIB Objects

- **alaBgpGlobal**
  - **alaBgpBfdStatus**
**ip bgp bfd-state all-neighbors**

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The BFD status for BGP must be enabled before BGP can interact with BFD.

**Examples**

```plaintext
-> ip bgp bfd-state all-neighbors enable
-> ip bgp bfd-state all-neighbors disable
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `bgp neighbor check-first-as` Enables or disables BGP with BFD protocol.
- `ip|ipv6 bgp neighbor bfd-state` Enables or disables the BFD for a specific BGP neighbor.
- `show ip bgp neighbors` Displays the configured IPv4 BGP peers.

**MIB Objects**

- `alaBgpGlobal` alaBgpBfdAllNeighbors
**ip|ipv6 bgp neighbor bfd-state**

Enables or disables BFD for a specific IPv4 or IPv6 BGP neighbor.

```
{ip | ipv6} bgp neighbor {ipv4_address | ipv6_address} bfd-state {enable | disable}
```

### Syntax Definitions

- `ipv4_address`: The IPv4 address of the BGP neighbor.
- `ipv6_address`: The IPv6 address of the BGP neighbor.
- `enable`: Enables BGP neighbor.
- `disable`: Disables BGP neighbor.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>

  - `alaBgpBfdAllNeighbors`
**ip bgp policy aspath-list**

Creates or removes an AS path list.

**ip bgp policy aspath-list name “regular_expression”**

**no ip bgp policy aspath-list name “regular_expression”**

---

**Syntax Definitions**

*name*  
AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.

*regular_expression*  
Regular expression, for example, “^100 200$” where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.

---

**Defaults**

No IP BGP peer policy AS path-list exists.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Use the **no** form of this command to remove an AS path list.
- To create an AS path list, use the **ip bgp policy aspath-list** command.
- A regular expression consists of a character string presented in the form of a pattern, e.g., “^100 200$.” Valid regular expression characters (metacharacters) are shown in the table below. See also “Configuring BGP” in your Advanced Routing Guide for more information on using regular expressions in BGP commands.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^</td>
<td>Matches the beginning of the AS path list.</td>
</tr>
<tr>
<td>123</td>
<td>Matches the AS number 123.</td>
</tr>
<tr>
<td>.</td>
<td>Matches any single AS number.</td>
</tr>
<tr>
<td>?</td>
<td>Matches zero or one occurrence of the previous token, which must be an AS number, a dot, an alternation or a range.</td>
</tr>
<tr>
<td>+</td>
<td>Matches one or more occurrences of the previous token, which must be an AS number, a dot, an alternation or a range.</td>
</tr>
</tbody>
</table>
When using a regular expression in the CLI, the regular expression must be enclosed in quotation marks.

This command creates AS path lists that can be applied to a peer’s inbound and outbound routes using the `ip bgp neighbor in-aspathlist`, `ip bgp neighbor out-aspathlist`, `ipv6 bgp neighbor in-aspathlist`, and `ipv6 bgp neighbor out-aspathlist` commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the `permit` or `deny` action (i.e., policy) associated with the regular expression applies.

If a BGP AS path list is configured to deny routes from a particular string of regular expression, then by default all of the routes coming from any AS would be denied. You must configure the policy instance in the same policy to allow other routes to come in, to be permitted from other ASs.

General or more specific AS path list information can be displayed by varying the use of the `show ip bgp policy aspath-list` command.

**Examples**

- `-> ip bgp policy aspath-list InboundAspath "^100 200$"`
- `-> ip bgp policy aspath-list OutboundAspath "^300 400$"`
- `-> no ip bgp policy aspath-list InboundAspath "^100 200$"

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- `ip bgp neighbor in-aspathlist` Assigns an inbound AS path list filter to a BGP peer.
- `ip bgp neighbor out-aspathlist` Assigns an outbound AS path list filter to a BGP peer.
- `ip bgp policy aspath-list action` Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found.
- `ip bgp policy aspath-list priority` Configures priority for processing regular expressions in an AS path list.
- `ipv6 bgp neighbor in-aspathlist` Assigns an inbound AS path list filter to an IPv6 BGP peer.
- `ipv6 bgp neighbor out-aspathlist` Assigns an outbound AS path filter list to an IPv6 BGP peer.

**MIB Objects**

- `alaBgpAspathMatchListTable`  
  - `alaBgpAspathMatchListRowStatus`
ip bgp policy aspath-list action

Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found. Matching criteria are specified in the regular expression.

```
ip bgp policy aspath-list name "regular_expression" action {permit | deny}
```

### Syntax Definitions

- **name**: AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
- **regular_expression**: Regular expression, e.g., “^100 200$” where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.
- **permit**: Allows matching routes to pass.
- **deny**: Stops matching routes from passing.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>permit</td>
<td>deny</td>
</tr>
<tr>
<td>permit</td>
<td>deny</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

MIB Objects

alaBgpAspathMatchListTable
alaBgpAspathMatchListAction
ip bgp policy aspath-list priority

Configures the priority for processing regular expressions in an AS path list.

```
ip bgp policy aspath-list name "regular_expression" priority value
```

**Syntax Definitions**

- **name**: AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
- **regular_expression**: Regular expression, e.g., “^100 200$” where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.
- **value**: A priority value, e.g., 1, assigned to the policy action. Valid priority range is from 1 - 255.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>1</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>6900 X48C4E/V48C8/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- A regular expression consists of a character string presented in the form of a pattern, e.g., ‘^100 200$’. Refer to [ip bgp policy aspath-list](#) on page 30-136 for a table of valid regular expression characters (metacharacters). See also “Configuring BGP” in your Advanced Routing Guide for more information on using regular expressions in BGP commands.

- This command specifies the priority of an AS path list filter being applied to a peer’s inbound and outbound routes configured through the [ip bgp neighbor in-aspathlist](#), [ip bgp neighbor out-aspathlist](#), [ipv6 bgp neighbor in-aspathlist](#), and [ipv6 bgp neighbor out-aspathlist](#) commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the permit or deny action (i.e., policy) associated with the regular expression applies, but only in the order designated by the priority value.

- The higher the priority value specified in the command, the later the matching is processed. For example, regular expressions with a priority of 1 (the default) are processed before an expression assigned a priority of 3. When regular expressions have an equal priority, the processing order is indeterminate.
• General or more specific AS path list information can be displayed by varying the use of the `show ip bgp policy aspath-list` command.

**Examples**

```
-> ip bgp policy aspath-list InboundAspath "^100 200$" priority 1
-> ip bgp policy aspath-list OutboundAspath "^300 400$" priority 5
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `ip bgp neighbor in-aspathlist` Assigns an inbound AS path list filter to a BGP peer.
- `ip bgp neighbor out-aspathlist` Assigns an outbound AS path list filter to a BGP peer.
- `ip bgp policy aspath-list` Creates or removes an AS path list.
- `ip bgp policy aspath-list action` Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found.
- `ipv6 bgp neighbor in-aspathlist` Assigns an inbound AS path list filter to an IPv6 BGP peer.
- `ipv6 bgp neighbor out-aspathlist` Assigns an outbound AS path filter list to an IPv6 BGP peer.

**MIB Objects**

- `alaBgpAspathMatchListTable` Assigns an inbound AS path list filter to an IPv6 BGP peer.
- `alaBgpAspathMatchListPriority` Assigns an outbound AS path filter list to an IPv6 BGP peer.
**ip bgp policy community-list**

Creates or deletes a community list.

```
ip bgp policy community-list name {num:num | num.num:num | num}
no ip bgp policy community-list name {num:num | num.num:num | num}
```

### Syntax Definitions

- **name**
  Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.

- **num:num**
  The community number, given in the form of the AS number in the asplain format and the community number, separated by a colon.

- **num.num:num**
  The community number, given in the form of the AS number in the asdot or asdot+ format and the community number, separated by a colon.

### Defaults

No IP BGP peer policy community-list exists.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **no** form of this command to remove a community-list.

- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.

- This command creates community lists that can be applied to a peer’s inbound and outbound routes using the `ip bgp neighbor in-communitylist`, `ip bgp neighbor out-communitylist`, `ipv6 bgp neighbor in-communitylist` and `ipv6 bgp neighbor out-communitylist` commands. The community list filters routes based on one or more community match list strings, as shown in the example below. If the route matches the community list filter, according to the matching type `exact` or `occur`, then the `permit` or `deny` policy action associated with the match list string applies.

- General or more specific community list information can be displayed by varying the use of the `show ip bgp policy community-list` command.

### Examples

```
-> ip bgp policy community-list CommListAIn 40:40
```
ip bgp policy community-list CommListAOut 400:20
no ip bgp policy community-list CommListAIn 40:40

Release History
Release 7.1.1; command was introduced.

Related Commands

- ip bgp neighbor inbound-community
  Assigns an inbound AS community list filter to a BGP peer.
- ip bgp neighbor outbound-community
  Assigns an outbound AS community list filter to a BGP peer.
- ip bgp policy community-list action
  Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
- ip bgp policy community-list match-type
  Configures type of matching to be performed with a community string list.
- ip bgp policy community-list priority
  Configures priority for processing multiple items in a community list filter.
- ipv6 bgp neighbor inbound-community
  Assigns an inbound community list filter to an IPv6 BGP peer.
- ipv6 bgp neighbor outbound-community
  Assigns an outbound community filter list to an IPv6 BGP peer.

MIB Objects
alaBgpCommunityMatchListTable
  alaBgpCommunityMatchListRowStatus
ip bgp policy community-list action

Configures the action to be taken for a community list when a match is found.

```
ip bgp policy community-list name {none | no-export | no-advertise | no-export-subconfed | num:num} action {permit | deny}
```

### Syntax Definitions

- **name**: Community name, e.g., CommListAIIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
- **none**: Removes the community restrictions on the community section of the route map.
- **no-export**: Routes in this community are advertised within the AS but not beyond the local AS.
- **no-advertise**: Routes in this community are not advertised to any peer.
- **no-export-subconfed**: Routes in this community are not advertised to any external BGP peer.
- **num:num**: The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997.
- **permit**: Allows matching routes to pass.
- **deny**: Stops matching routes from passing.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>permit</td>
<td>permit</td>
</tr>
<tr>
<td>deny</td>
<td>deny</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- By default, this command allows routes that match the criteria specified in the community list to pass.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.

### Examples

```
-> ip bgp policy community-list commListAIIn 600:1 action permit
```
-> ip bgp policy community-list commListAIn 600:1 action deny

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; syntax added to community string.

  alaBgpCommunityMatchListAction
**ip bgp policy community-list match-type**

Configures the type of matching to be performed with a community string list.

```
ip bgp policy community-list name {none | no-export | no-advertise | no-export-subconfed | num:num} match-type {exact | occur}
```

---

**Syntax Definitions**

- **name**: Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
- **none**: Removes the community restrictions on the community section of the route map.
- **no-export**: Routes in this community are advertised within the AS but not beyond the local AS.
- **no-advertise**: Routes in this community are not advertised to any peer.
- **no-export-subconfed**: Routes in this community are not advertised to any external BGP peer.
- **num:num**: The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
- **exact**: Checks for an exact match of the community string and the community attribute.
- **occur**: Checks for an occurrence of the community string anywhere in the community attribute.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>exact</td>
<td>occur</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, this command only allows routes to pass if the community string exactly matches the community attribute of the route.

**Examples**

```
-> ip bgp policy community-list commListC 600:1 match-type exact
```
**Release History**

Release 7.1.1; command was introduced.
Release 7.3.4; syntax added to `community` string.

**Related Commands**

- `ip bgp neighbor in-communitylist` Assigns an inbound AS community list filter to a BGP peer.
- `ip bgp neighbor out-communitylist` Assigns an outbound AS community list filter to a BGP peer.
- `ip bgp policy community-list action` Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
- `ip bgp policy community-list priority` Configures priority for processing multiple items in a community list filter.
- `ipv6 bgp neighbor in-communitylist` Assigns an inbound community list filter to an IPv6 BGP peer.
- `ipv6 bgp neighbor out-communitylist` Assigns an outbound community filter list to an IPv6 BGP peer.

**MIB Objects**

- `alaBgpCommunityMatchListTable`
  - `alaBgpCommunityMatchListType`
ip bgp policy community-list priority

Configures the priority for processing multiple items in a community list filter.

```
ip bgp policy community-list name {none | no-export | no-advertise | no-export-subconfed | num:num} priority value
```

**Syntax Definitions**

- **name**: Community name, e.g., CommListA1n, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
- **none**: Removes the community restrictions on the community section of the route map.
- **no-export**: Routes in this community are advertised within the AS but not beyond the local AS.
- **no-advertise**: Routes in this community are not advertised to any peer.
- **no-export-subconfed**: Routes in this community are not advertised to any external BGP peer.
- **num:num**: The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
- **value**: Priority value in the range 0 - 255.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>1</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The higher the priority value specified in the command, the later the matching is processed. For example, items with a priority of 1 (the default) are processed before items assigned a priority of 3. When items have an equal priority, the processing order is indeterminate.

**Examples**

```
-> ip bgp policy community-list commListB 500:1 priority 3
```
Release History

Release 7.1.1; command was introduced.
Release 7.3.4; syntax added to community string.

MIB Objects

alaBgpCommunityMatchListTable
alaBgpCommunityMatchListPriority
ip bgp policy prefix-list

Creates or deletes a prefix match list.

`ip bgp policy prefix-list name ip_address ip_mask`

`no ip bgp policy prefix-list name ip_address ip_mask`

**Syntax Definitions**

- `name`  Prefix list name.
- `ip_address`  IP address for the prefix list.
- `ip_mask`  Mask for the prefix list.

**Defaults**

No IP BGP policy prefix-list exists.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command creates prefix lists that can be applied to a peer’s inbound and outbound routes using the `ip bgp neighbor in-prefixlist`, `ip bgp neighbor out-prefixlist`, `ipv6 bgp neighbor in-prefixlist` and `ipv6 bgp neighbor out-prefixlist` commands. The prefix list filters routes based on one or more prefixes, as shown in the example below. If the route matches the prefix list filter, according to the `ge` (lower) and `le` (upper) limits defined, then the `permit` or `deny` action associated with the prefix applies.

- General or more specific prefix list information can be displayed by varying the use of the `show ip bgp policy prefix-list` command.

**Examples**

```
-> ip bgp policy prefix-list prefixListA 12.0.0.0 255.0.0.0
```

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- `ip bgp neighbor in-prefixlist` Assigns an inbound prefix filter list to a BGP peer.
- `ip bgp neighbor out-prefixlist` Assigns an outbound prefix filter list to a BGP peer.
- `ip bgp policy prefix-list action` Configures action to be taken for a prefix list when a match is found.
- `ip bgp policy prefix-list ge` Configures lower limit on length of prefix to be matched.
- `ip bgp policy prefix-list le` Configures upper limit on length of prefix to be matched.
- `ipv6 bgp neighbor in-prefixlist` Assigns an inbound prefix filter list to an IPv6 BGP peer.
- `ipv6 bgp neighbor out-prefixlist` Assigns an outbound prefix filter list to an IPv6 BGP peer.

**MIB Objects**

- `alaBgpPrefixMatchListTable` 
- `alaBgpPrefixMatchListRowStatus`
**ip bgp policy prefix-list action**

Configures the action to be taken for a prefix list when a match is found.

```
ip bgp policy prefix-list name ip_address ip_mask action {permit | deny}
```

### Syntax Definitions

- `name` - Prefix list name.
- `ip_address` - IP address for the prefix list.
- `ip_mask` - Mask for the prefix list.
- `permit` - Allows matching routes to pass.
- `deny` - Stops matching routes from passing.

### Defaults

</table>

### Usage Guidelines

Configures the action to be taken for a prefix list when a match is found.

### Examples

```
-> ip bgp policy prefix-list prefixListA 12.0.0.0 255.0.0.0 action deny
```

### Release History

Release 7.1.1; command was introduced.
**Related Commands**

- `ip bgp policy prefix-list` Creates or deletes a prefix match list.
- `ip bgp policy prefix-list ge` Configures lower limit on length of prefix to be matched.
- `ip bgp policy prefix-list le` Configures upper limit on length of prefix to be matched.

**MIB Objects**

- `alaBgpPrefixMatchListTable`
- `alaBgpPrefixMatchListAction`
ip bgp policy prefix-list ge

Configures the lower limit on the length of the prefix to be matched.

```
ip bgp policy prefix-list name ip_address ip_mask ge value
```

**Syntax Definitions**

- `name` Prefix list name.
- `ip_address` IP address for the prefix list.
- `ip_mask` Mask for the prefix list.
- `value` The lower limit value in the range 0 –32.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>0</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The default value of zero indicates there is no lower limit on the length of the prefix to be matched.
- This command is used in conjunction with the `ip bgp policy prefix-list le` command to set the prefix matching range. The two commands can be combined, as shown in the Example section below.
- The `ge` (lower limit) value must be greater than or equal to the prefix length (8 in the example below) and less than or equal to the `le` (upper limit) value.

**Examples**

```
-> ip bgp policy prefix-list prefixListA 14.0.0.0 255.0.0.0 ge 8 le 16
```

**Release History**

Release 7.1.1; command was introduced.

</table>

### Usage Guidelines

- The default value of zero indicates there is no upper limit on the length of the prefix to be matched.
  This command is used in conjunction with `ip bgp policy prefix-list ge` to set the prefix matching range. The two commands can be combined, as show in the Example section below.
- The `ge` (lower limit) value must be greater than or equal to the prefix length (8 in the example below) and less than or equal to the `le` (upper limit) value.

### Examples

```
-> ip bgp policy prefix-list prefixListA 14.0.0.0 255.0.0.0 ge 8 le 16
```

### Release History

Release 7.1.1; command was introduced.
Related Commands

- `ip bgp policy prefix-list` Creates or deletes a prefix match list.
- `ip bgp policy prefix-list action` Configures action to be taken for a prefix list when a match is found.
- `ip bgp policy prefix-list ge` Configures lower limit on length of prefix to be matched.

MIB Objects

- `alaBgpPrefixMatchListTable`
- `alaBgpPrefixMatchListLE`
**ip bgp policy prefix6-list**

Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

```
ip bgp policy prefix6-list pfx_list_name prefix6/pfx_length [action {permit | deny}] [admin-state {enable | disable}] [ge [{mask_length}]] [le [{mask_length}]]
```

```
no ip bgp policy prefix6-list pfx_list_name prefix6/pfx_length [action {permit | deny}] [admin-state {enable | disable}] [ge [{mask_length}]] [le [{mask_length}]]
```

**Syntax Definitions**

- `pfx_list_name` Prefix list name.
- `prefix6` Prefix list IPv6 address for the prefix list.
- `pfx_length` Prefix length. Prefix length should be in the range of 0 to 128.
- `permit | deny` Action to be taken which can be either permit or deny.
- `enable | disable` Row Status can be either enabled or disabled.
- `mask_length` Minimum length of the prefix to be matched. The valid range is 0–32.

**Defaults**

NA

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to disable this feature.
- BGP must be configured on the system.
- This command creates prefix6 lists that can be applied to a peer's inbound and outbound routes using the `ip bgp neighbor in-prefix6list`, `ip bgp neighbor out-prefix6list`, `ipv6 bgp neighbor in-prefix6list` and `ipv6 bgp neighbor out-prefix6list`.
- The `ge` (lower limit) value must be greater than or equal to the prefix length and less than or equal to the `le` (upper limit) value.

**Examples**

- `-> ip bgp policy prefix6-list uniqLocal FC00::/48`
- `-> ip bgp policy prefix6-list uniqLocal FC00::/48 action permit`
- `-> ip bgp policy prefix6-list uniqLocal FC00::/48 admin-state enable`
-> no ip bgp policy prefix6-list uniqLocal FC00::/48

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `show ip bgp policy prefix6-list` Displays prefix6 list parameters.
- `show ipv6 bgp neighbors` Displays the configured IPv6 BGP peers.
- `ip bgp neighbor in-prefix6list` Assigns an inbound prefix6 list to a BGP peer.
- `ip bgp neighbor out-prefix6list` Assigns an outbound prefix6 list to a BGP peer.
- `ipv6 bgp neighbor in-prefix6list` Assigns an inbound prefix6 list to an IPv6 BGP peer.
- `ipv6 bgp neighbor out-prefix6list` Assigns an outbound prefix6 list to an IPv6 BGP peer.

**MIB Objects**

- `alaBgpPrefix6MatchListTable`  
  - `alaBgpPrefix6MatchListId`  
  - `alaBgpPrefix6MatchListAddr`  
  - `alaBgpPrefix6MatchListAddrLength`

  - `alaBgpPrefix6MatchListRowStatus`  
  - `alaBgpPrefix6MatchListGE`  
  - `alaBgpPrefix6MatchListLE`
**ip bgp policy route-map**

Creates or deletes a policy route map.

```
ip bgp policy route-map name sequence_number
```

**Syntax Definitions**

- **name**: Route map name. Case-sensitive.
- **sequence_number**: Route map sequence number in the range of 1 to 255. The sequence number allows for multiple instances of the same route map name.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command creates policy route maps. Each route map can be configured using the following match commands to specify the match criteria by which routes are allowed to pass. Match criteria is examined in the order the commands are listed below.
  1. `ip bgp policy route-map aspath-list`
  2. `ip bgp policy route-map prefix-list`
  3. `ip bgp policy route-map prefix6-list`
  4. `ip bgp policy route-map community-list`
  5. `ip bgp policy route-map match-regexp`
  6. `ip bgp policy route-map match-prefix`
  7. `ip bgp policy route-map match-mask`
  8. `ip bgp policy route-map match-prefix6`
  9. `ip bgp policy route-map match-community`

- The route maps which apply to a specific address family (IPv4 or IPv6) are only applied to routes of the same address family. In other words, the prefix-list filter and match-prefix/match-mask route-maps
are only applied to IPv4 routes and are ignored for IPv6 routes. The prefix6-list filter and match-

- Each route map can also be configured using the following set commands to sequentially specify the actions to be taken when a match is found.
  - ip bgp policy route-map community
  - ip bgp policy route-map community-mode
  - ip bgp policy route-map ipref
  - ip bgp policy route-map ipref-mode
  - ip bgp policy route-map med
  - ip bgp policy route-map med-mode
  - ip bgp policy route-map origin
  - ip bgp policy route-map weight

- Route maps can be referenced as a filtering mechanism for displaying paths using the show ip bgp path command. They are also referenced in filtering inbound and outbound routes for BGP peers using the ip bgp neighbor route-map commands.

Examples

-> ip bgp policy route-map routemap1 1

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map action  Configures action to be taken for a route when a match is found.

MIB Objects

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- By default, no AS path list is assigned to a route map.
- This default behavior can be reset by changing the value of the AS path list name to “none”.
- The \textbf{ip bgp policy aspath-list} and \textbf{ip bgp policy aspath-list action} commands are used to create and set permit/deny actions for an AS path list.

### Examples

- -> ip bgp policy route-map routemap1 1 aspath-list aspathlist1
- -> ip bgp policy route-map routemap1 1 aspath-list none

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- \textbf{ip bgp policy route-map}: Creates or deletes a policy route map.

### MIB Objects

- \texttt{alaBgpRouteMapTable}
ip bgp policy route-map aspath-list

alaBgpRouteMapAsPathMatchListId
ip bgp policy route-map asprepend

Configures the AS path prepend action to be taken when a match is found.

```
ip bgp policy route-map name sequence_number asprepend path
```

Syntax Definitions

- `name` - The route map name.
- `sequence_number` - The route map sequence number. The valid range is 1–255.
- `path` - The AS path to prepend or “none”. Note that multiple AS path entries must be enclosed in quotes (e.g., “500 600 700”).

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>none</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

By default, no AS path is prepended. This command allows AS path numbers to be prepended (added to the beginning of the AS path list) to the AS path attribute of a matching route. The default behavior can be reset by changing the value to “none”.

Examples

```
-> ip bgp policy route-map routemap1 1 asprepend "700 800 900"
```

Release History

Release 7.1.1; command was introduced.
**Related Commands**

*ip bgp policy route-map*  
Creates or deletes a policy route map.

**MIB Objects**

alaBgpRouteMapTable

alaBgpRouteMapAsPrepend
ip bgp policy route-map community

Configures the action to be taken on the community attribute when a match is found.

```
ip bgp policy route-map name sequence_number community [none | no-export | no-advertise | no-export-subconfed | num:num]
```

**Syntax Definitions**

- **name**
  - The route map name.
- **sequence_number**
  - The route map sequence number. The valid range is 1–255.
- **none**
  - Removes the community restrictions on the community section of the route map.
- **no-export**
  - Routes in this community are advertised within the AS but not beyond the local AS.
- **no-advertise**
  - Routes in this community are not advertised to any peer.
- **no-export-subconfed**
  - Routes in this community are not advertised to any external BGP peer.
- **num:num**
  - The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>no-export</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- By default, no action is taken on a community attribute when a match on a route is found.
- The default behavior can be reset by setting the value to “none”.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
The **ip bgp policy community-list** and **ip bgp policy community-list action** commands are used to create and set permit/deny actions for a community path list. This command is used in conjunction with **ip bgp policy route-map community-mode**.

**Examples**

```
-> ip bgp policy route-map routemap1 1 community 400:1 500:1
-> ip bgp policy route-map routemap1 1 community 400:1 500:1 community-mode replace
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **ip bgp policy route-map**
  - Creates or deletes a policy route map.

- **ip bgp policy route-map community-mode**
  - Configures the action to be taken for a community string when a match is found.

**MIB Objects**

- **alaBgpRouteMapTable**
  - **alaBgpRouteMapCommunity**
**ip bgp policy route-map community-list**

Assigns a community matching list to the route map.

```
ip bgp policy route-map name sequence_number community-list [list_name | none]
```

**Syntax Definitions**

- **name**
  - The route map name.
- **sequence_number**
  - The route map sequence number. The valid range is 1–255.
- **list_name**
  - The community list name.
- **none**
  - No community list name is specified.

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>list_name</td>
<td>none</td>
</tr>
<tr>
<td>none</td>
<td>none</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, no community list is assigned to the route map. The default behavior can be reset by changing the value to `none`.

**Examples**

- `-> ip bgp policy route-map routemap1 1 community-list listB`
- `-> ip bgp policy route-map routemap1 1 community-list none`

**Release History**

Release 7.1.1; command was introduced.
Release 7.3.4; syntax `none` added to `community-list` string.

**Related Commands**

- `ip bgp policy route-map` Creates or deletes a policy route map.

**MIB Objects**

alaBgpRouteMapTable
BGP Commands

ip bgp policy route-map community-list

alaBgpRouteMapCommunityMatchListId
**ip bgp policy route-map community-mode**

Configures the action to be taken for a community string when a match is found.

```
ip bgp policy route-map name sequence_number community-mode {add | replace}
```

### Syntax Definitions

- **name**
  - The route map name.

- **sequence_number**
  - The route map sequence number. The valid range is 1–255.

- **add**
  - Adds the community string specified in the command `ip bgp policy route-map community`

- **replace**
  - Replaces the community string specified in the command `ip bgp policy route-map community`

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>add</td>
<td>replace</td>
</tr>
<tr>
<td>add</td>
<td>replace</td>
</tr>
</tbody>

- **alaBgpRouteMapSetComunityMode**
ip bgp policy route-map lpref

Configures the local preference value for the route map.

ip bgp policy route-map name sequence_number lpref value

Syntax Definitions

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The route map name.</td>
</tr>
<tr>
<td>sequence_number</td>
<td>The route map sequence number. The valid range is 1–255.</td>
</tr>
<tr>
<td>value</td>
<td>The local preference value. The valid range is 0–4294967295.</td>
</tr>
</tbody>
</table>

Defaults

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</tr>
</tbody>
</table>

Usage Guidelines

- This command is used in conjunction with ip bgp policy route-map lpref-mode. The example on the next line shows the combined usage.

- In this example, the local preference value will be incremented for a matching route by 555.

Examples

- ip bgp policy route-map routemap1 1 lpref 555
- ip bgp policy route-map routemap1 1 lpref 555 lpref-mode inc

Release History

Release 7.1.1; command was introduced.
Related Commands

- **ip bgp policy route-map**
  Creates or deletes a policy route map.

- **ip bgp policy route-map lpref-mode**
  Configures the action to be taken when setting local preference attribute for a local matching route.

MIB Objects

- alaBgpRouteMapTable
  - alaBgpRouteMapLocalPref
**ip bgp policy route-map lpref-mode**

Configures the action to be taken when setting local preference attribute for a local matching route.

```
ip bgp policy route-map name sequence_number lpref-mode {none | inc | dec | rep}
```

**Syntax Definitions**

- **name**: The route map name.
- **sequence_number**: The route map sequence number. The valid range is 1–255.
- **none**: Do not set the local preference attribute.
- **inc**: Increment the local preference attribute in the matching route by the value specified in the `ip bgp policy route-map med` command. No action is taken if no local preference attribute is found in the matching route.
- **dec**: Decrement the local preference attribute in the matching route by the value specified in the `ip bgp policy route-map med` command. No action is taken if no local preference attribute is found in the matching route.
- **rep**: Replace the local preference attribute in the matching route by the value specified in the `ip bgp policy route-map med` command even if no local preference attribute is found in the matching route.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>inc</td>
</tr>
<tr>
<td>none</td>
<td></td>
</tr>
</tbody>

</tbody>
</table>

**Usage Guidelines**

- This command is used in conjunction with `ip bgp policy route-map lpref`. The example below shows the combined usage.
- In this example, the local preference value is incremented for a matching route by 555.

**Examples**

```
-> ip bgp policy route-map routemap1 l lpref-mode none
```
-> ip bgp policy route-map routemap1 1 lpref 555 lpref-mode inc

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `ip bgp policy route-map` Creates or deletes a policy route map.
- `ip bgp policy route-map lpref` Configures the local preference value for the route map.
- `ip bgp policy route-map med` Configures the Multi-Exit Discriminator (MED) value for a route map.

**MIB Objects**

- `alaBgpRouteMapTable`
- `alaBgpRouteMapLocalPrefMode`
ip bgp policy route-map match-community

Configures a matching community primitive for the route map.

```
ip bgp policy route-map name sequence_number match-community [none | no-export | no-advertise | no-export-subconfed | num:num]
```

**Syntax Definitions**

- **name**: The route map name.
- **sequence_number**: The route map sequence number. The valid range is 1–255.
- **none**: Removes the community match from the route-map.
- **no-export**: Routes in this community are advertised within the AS but not beyond the local AS.
- **no-advertise**: Routes matching the community restricting advertisement to any peer.
- **no-export-subconfed**: Routes matching the community restricting advertisement to any external BGP peer.
- **num:num**: The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>no-export</td>
</tr>
<tr>
<td>none</td>
<td>none</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

Related Commands

*ip bgp policy route-map match-mask*  Configures a matching prefix primitive in the route map.

*ip bgp policy route-map*  Creates or deletes a policy route map.

MIB Objects

alaBgpRouteMapTable

alaBgpRouteMapMatchPrefix
ip bgp policy route-map match-prefix6

Configures a matching prefix6 primitive in the route map.

**Syntax**

```
ip bgp policy route-map name sequence_number match-prefix6 ipv6_address/mask_length
```

**Syntax Definitions**

- `name`: The route map name.
- `sequence_number`: The route map sequence number. The valid range is 1–255.
- `ipv6_address/mask_length`: The 128-bit IPv6 address of the matching prefix. The length in bits of the IPv6 prefix to be matched in the Route Map.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</tr>
</tbody>
</table>

**Usage Guidelines**

This command allows a matching prefix6 primitive to be placed directly in the route map. By default, no prefix6 primitive is assigned to the route map. The default behavior can be reset by changing the value to “none”.

**Examples**

- `-> ip bgp policy route-map routemap1 1 match-prefix6 2001:1218:103::/64`
- `-> ip bgp policy route-map routemap1 1 match-prefix6 none`

**Release History**

Release 7.3.4; command introduced.
**Related Commands**

ip bgp policy route-map

Creates or deletes a policy route map.

**MIB Objects**

alaBgpRouteMapTable

alaBgpRouteMapMatchPrefix6
alaBgpRouteMapMatchMaskLength6
ip bgp policy route-map match-regexp

Configures an AS path matching regular expression primitive in the route map.

```
ip bgp policy route-map name sequence_number match-regexp "regular_expression"
```

### Syntax Definitions

- **name**: The route map name.
- **sequence_number**: The route map sequence number. The valid range is 1–255.
- **regular_expression**: Regular expression or “none”. The regular expression must be enclosed by quotation marks.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>regular_expression</td>
<td>none</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command allows a regular expression matching directive to be placed directly in the route map. By default, no matching regular expression is specified. Regular expressions are defined in `ip bgp policy aspath-list` on page 30-136.
- When using regular expressions in the CLI, the regular expression must be enclosed by quotation marks.
- The default behavior can be reset by changing the value to “none”.
- See the *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* for more information on the use of regular expressions in BGP commands.

### Examples

```
-> ip bgp policy route-map routemap1 1 match-regexp "500 .* 400$"
```

### Release History

Release 7.1.1; command was introduced.

---

**Usage Guidelines**

This command is used in conjunction with `ip bgp policy route-map med-mode` command. The first example below shows the combined usage. In the second example, the MED value is incremented for a matching route by 5.

**Examples**

- `-> ip bgp policy route-map routemap1 1 med 555`
- `-> ip bgp policy route-map routemap1 1 med 555 med-mode inc`

---

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- `ip bgp policy route-map med-mode` Configures Multi-Exit Discriminator (MED) value for a route map.
- `ip bgp policy route-map` Creates or deletes a policy route map.

MIB Objects

- `alaBgpRouteMapTable`
- `alaBgpRouteMapMed`
ip bgp policy route-map med-mode

Configures the action to be taken when setting the Multi-Exit Discriminator (MED) attribute for a matching route.

\[ \text{ip bgp policy route-map name sequence_number med-mode \{none | inc | dec | rep\}} \]

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The route map name.</td>
</tr>
<tr>
<td>sequence_number</td>
<td>The route map sequence number. The valid range is 1–255.</td>
</tr>
<tr>
<td>value</td>
<td>The MED value. The valid range is 0–4294967295.</td>
</tr>
<tr>
<td>none</td>
<td>Do not set the MED.</td>
</tr>
<tr>
<td>inc</td>
<td>Increment the MED in the matching route by the value specified in the ip bgp policy route-map med command. No action is taken if no MED is found in the matching route.</td>
</tr>
<tr>
<td>dec</td>
<td>Decrement the MED in the matching route by the value specified in the ip bgp policy route-map med command. No action is taken if no MED is found in the matching route.</td>
</tr>
<tr>
<td>rep</td>
<td>Replace the MED in the matching route by the value specified in the ip bgp policy route-map med command even if no MED is found in the matching route.</td>
</tr>
</tbody>
</table>

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>inc</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is used in conjunction with ip bgp policy route-map med. The first example below shows the combined usage. In the second example, the MED value is incremented for a matching route by 5.

### Examples

- -> ip bgp policy route-map routemap1 1 med-mode inc
- -> ip bgp policy route-map routemap1 1 med 5 med-mode inc
**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `ip bgp policy route-map med` Configures action to take when setting Multi-Exit Discriminator (MED) attribute for a matching route.
- `ip bgp policy route-map` Creates or deletes a policy route map.

**MIB Objects**

- `alaBgpRouteMapTable`
- `alaBgpRouteMapMedMode`
ip bgp policy route-map origin

Configures the action to be taken on the origin attribute when a match is found.

`ip bgp policy route-map name sequence_number origin {igp | egp| incomplete | none}`

**Syntax Definitions**

| name | The route map name. |
| sequence_number | The route map sequence number. The valid range is 1–255. |
| igp | Sets the origin attribute to remote internal BGP (IGP). |
| egp | Sets the origin attribute to local external BGP (EGP). |
| incomplete | Sets the origin attribute to incomplete, meaning the origin is unknown. |
| none | Sets the origin attribute to “none”. |

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>igp</td>
<td>none</td>
</tr>
<tr>
<td>egp</td>
<td>none</td>
</tr>
<tr>
<td>incomplete</td>
<td>none</td>
</tr>
<tr>
<td>none</td>
<td>none</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, no action is taken on the origin attribute when a match is found. The default behavior can be reset by changing the value to “none”.

**Examples**

`-> ip bgp policy route-map routemap1 1 origin egp`

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- `ip bgp policy route-map origin` Configures action to take on origin attribute when a match is found.
- `ip bgp policy route-map` Creates or deletes a policy route map.

**MIB Objects**

- `alaBgpRouteMapTable`
- `alaBgpRouteMapOrigin`
ip bgp policy route-map prefix-list

Assigns a prefix matching list to the route map.

`ip bgp policy route-map name sequence_number prefix-list prefix_name`

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The route map name.</td>
</tr>
<tr>
<td>sequence_number</td>
<td>The route map sequence number. The valid range is 1–255.</td>
</tr>
<tr>
<td>prefix_name</td>
<td>The prefix list name or “none”.</td>
</tr>
</tbody>
</table>

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix_name</td>
<td>none</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- By default, no prefix list is assigned to the route map. The default behavior can be reset by changing the value to “none”.
- The `ip bgp policy prefix-list`, `ip bgp policy prefix-list action`, `ip bgp policy prefix-list ge`, and `ip bgp policy prefix-list le` commands are used to create and set permit/deny actions for a prefix path list.

### Examples

```
-> ip bgp policy route-map routemap1 1 prefix-list listC
```

### Release History

Release 7.1.1; command was introduced.
Related Commands

- `ip bgp policy prefix-list` Assigns a prefix matching list to the route map.
- `ip bgp policy prefix-list action` Configures the action taken for a prefix list when a match is found.
- `ip bgp policy route-map` Creates or deletes a policy route map.

MIB Objects

- `alaBgpRouteMapTable`
  - `alaBgpRouteMapPrefixMatchListId`
**ip bgp policy route-map prefix6-list**

Assigns a prefix6 matching list to the route map, which identifies the matching criteria list of IPv6 prefixes.

```
ip bgp policy route-map name sequence_number prefix6-list prefix6_name
```

---

**Syntax Definitions**

- **name**: The route map name.
- **sequence_number**: The route map sequence number. The valid range is 1–255.
- **prefix6_name**: The prefix6 list name or “none”.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix6_name</td>
<td>none</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- The prefix6-list policy name is created using the `ip bgp policy prefix6-list` command.
- By default, no prefix6 list is assigned to the route map. The default behavior can be reset by changing the value to “none”.

---

**Examples**

```
-> ip bgp policy route-map routemap1 1 prefix6-list listB
-> ip bgp policy route-map routemap1 1 prefix6-list none
```

---

**Release History**

Release 7.1.1; command was introduced.

---

**Related Commands**

- `ip bgp policy prefix6-list`: Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

---

**MIB Objects**

- `alaBgpRouteMapTable`
ip bgp policy route-map prefix6-list

alaBgpRouteMapPrefix6MatchListId
**ip bgp policy route-map weight**

Configures a BGP weight value to be assigned to inbound routes when a match is found.

**Syntax**

```
ip bgp policy route-map name sequence_number weight value
```

**Syntax Definitions**

- `name`: The route map name.
- `sequence_number`: The route map sequence number. The valid range is 1–255.
- `value`: The weight value. The valid range is 0–65535.

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>0</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command sets the weight value for routes that pass the route map match criteria. It is only applicable for the inbound policy. The default value of zero means that the weight is not changed by the route map.

**Examples**

```
-> ip bgp policy route-map routemap1 1 weight 500
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **ip bgp policy route-map**: Creates or deletes a policy route map.

**MIB Objects**

- `alaBgpRouteMapTable`
- `alaBgpRouteMapWeight`
**ip bgp policy route-map community-strip**

Configures the value to strip from the community attribute of the routes matched by this route map instance (sequence number).

```
ip bgp policy route-map name sequence_number community-strip community_list
```

**Syntax Definitions**

- `name`: The route map name.
- `sequence_number`: The route map sequence number. The valid range is 1–255.
- `community_list`: The community list name.

**Defaults**

No IP BGP policy route-map community list exists.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

**Usage Guidelines**

Most of the parameters in this display can be altered through BGP global commands. See the output definitions below for references to the CLI commands used to configure individual parameters.

**Examples**

-> show ip bgp
Admin Status = disabled,
Operational Status = up,
Autonomous system Number = 1,
BGP Router Id = 111.1.1.1,
Confederation Identifier = 0,
IGP Synchronization Status = disabled,
Minimum AS origin interval (seconds) = 15,
Default Local Preference = 100,
Route Reflection = disabled,
Cluster Id = 0.0.0.0,
Missing MED Status = Best,
Aspath Comparison = enabled,
Always Compare MED = disabled,
Fast External Fail Over = disabled,
Log Neighbor Changes = disabled,
Multiple path = enabled,
Graceful Restart = enabled,
Graceful Restart Status = Not Restarting,
Configured Graceful Restart Interval = 90s,
IPv4 Unicast = enabled,
IPv6 Unicast = disabled,
<table>
<thead>
<tr>

<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Admin Status</strong></td>
<td>Indicates whether the BGP protocol has been enabled or disabled through the <code>ip bgp admin-state</code> command.</td>
</tr>
<tr>
<td><strong>Operational Status</strong></td>
<td>Indicates if the local BGP speaker is actively participating in BGP messages, update, routing advertisements.</td>
</tr>
<tr>
<td><strong>Autonomous system Number</strong></td>
<td>The AS assigned to the local BGP speaker through the <code>ip bgp autonomous-system</code> command.</td>
</tr>
<tr>
<td><strong>BGP Router Id</strong></td>
<td>The IP address for the local BGP speaker.</td>
</tr>
<tr>
<td><strong>Confederation Id</strong></td>
<td>Shows the confederation number assigned to the local BGP speaker. If the BGP speaker does not belong to a confederation, then this value will be zero (0). Confederation numbers are assigned through the <code>ip bgp confederation identifier</code> command.</td>
</tr>
<tr>
<td><strong>IGP Synchronization Status</strong></td>
<td>Indicates whether BGP is synchronizing its routing tables with those on non-BGP routers handling IGP traffic (such as a RIP or OSPF router). Configured through the <code>ip bgp synchronization</code> command.</td>
</tr>
<tr>
<td><strong>Minimum AS origin interval</strong></td>
<td>The frequency, in seconds, at which routes local to the autonomous system are advertised. Configured through the <code>ip bgp as-origin-interval</code> command.</td>
</tr>
<tr>
<td><strong>Default Local Preference</strong></td>
<td>The local preference that will be assigned to routes that do not already contain a local preference value. This default value is configured through the <code>ip bgp default local-preference</code> command.</td>
</tr>
<tr>
<td><strong>Route Reflection</strong></td>
<td>Indicates whether the local BGP speaker is acting as a route reflector for its AS. Configured through the <code>ip bgp client-to-client reflection</code> command.</td>
</tr>
<tr>
<td><strong>Cluster Id</strong></td>
<td>The IP address for cluster in route reflector configurations using multiple, redundant route reflectors. A value of 0.0.0.0 indicates that a cluster is not set up. Configured through the <code>ip bgp cluster-id</code> command.</td>
</tr>
<tr>
<td><strong>Missing MED Status</strong></td>
<td>Indicates the MED value that will be assigned to paths that do not contain MED values. Missing MED values will either be assigned to the worst possible value (2^{32}-1) or the best possible value (0). This value is set using the <code>ip bgp bestpath med missing-as-worst</code> command. By default, missing MED values are treated as best.</td>
</tr>
<tr>
<td><strong>Aspath Comparison</strong></td>
<td>Indicates whether the AS path will be in used in determining the best route. Configured through the <code>ip bgp bestpath as-path ignore</code> command.</td>
</tr>
<tr>
<td><strong>Always Compare MED</strong></td>
<td>Indicates whether multi-exit discriminator (MED) values are being compared only for internal peers or also for external peers. Configured through the <code>ip bgp always-compare-med</code> command.</td>
</tr>
<tr>
<td><strong>Fast External Fail Over</strong></td>
<td>Indicates whether Fast External Failover has been enabled or disabled. When enabled a BGP sessions will be reset immediately after a connection to a directly connected external peer goes down. Configured through the <code>ip bgp fast-external-failover</code> command.</td>
</tr>
<tr>
<td><strong>Log Neighbor Changes</strong></td>
<td>Indicates whether logging of peer state changes is enabled or disabled. Configured through the <code>ip bgp log-neighbor-changes</code> command.</td>
</tr>
<tr>
<td><strong>Multi path</strong></td>
<td>Indicates whether support for multiple equal cost paths is enabled or disabled. Configured through the <code>ip bgp maximum-paths</code> command.</td>
</tr>

**Usage Guidelines**

This command show various BGP statistics for the router, such as number of neighbors, active prefixes, number of paths, etc.

**Examples**

```bash
-> show ip bgp statistics
# of Active Prefixes Known = 0,
# of EBGP Neighbors in Established State = 0,
# of IBGP Neighbors in Established State = 0,
# of Feasible Paths = 0,
# of Dampened Paths = 0,
# of Unsynchronized Paths = 0,
# of Policy unfeasible paths = 0,
Total Number of Paths = 0
```

**output definitions**

<table>
<thead>
<tr>
<th># of Active Prefixes Known</th>
<th>The number of prefixes, or route paths, currently known to the local BGP speaker, that are currently up and active.</th>
</tr>
</thead>
<tbody>
<tr>
<td># of EBGP Neighbors in Established State</td>
<td>The number of peers outside the AS of the local BGP speaker that the local BGP speaker can route to.</td>

</tbody>
</table>

Usage Guidelines

This command shows the setting for dampening on the router, assuming it is enabled.

Examples

```bash
-> show ip bgp dampening
Admin Status                   = disabled,
Half life value (seconds)      = 300,
Reuse value                    = 200
Suppress value                 = 300,
Max suppress time (seconds)    = 1800,
```

Output definitions

- **Admin Status**
  Indicates whether route dampening is enabled or disabled. This value is configured through the `ip bgp dampening` command.

- **Half life value**
  The half-life interval, in seconds, after which the penalty value for a reachable route will be reduced by half. This value is configured through the `ip bgp dampening` command.

- **Reuse value**
  The value that the route flapping metric must reach before this route is re-advertised. This value is configured through the `ip bgp dampening` command.
**output definitions (continued)**

<table>
<thead>
<tr>
<th><strong>Suppress value</strong></th>
<th>The number of route withdrawals necessary to begin readvertising a previously suppressed route. This value is configured through the <code>ip bgp dampening</code> command.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Max Suppress time</strong></td>
<td>The maximum time (in seconds) that a route will be suppressed. This value is configured through the <code>ip bgp dampening</code> command.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

`ip bgp dampening` Enables or disables BGP route dampening or the suppression of unstable routes.

**MIB Objects**

alaBgpDampTable

show ip bgp dampening-stats

Displays BGP dampening statistics.

**show ip bgp dampening-stats [ip_address ip_mask] [peer_address]**

### Syntax Definitions

- **ip_address**: A 32-bit IP address.
- **ip_mask**: A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.
- **peer_address**: A 32-bit IP address of peer (neighbor).

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command displays various statistics on routes that have flapped, and are thus subject to the settings of the dampening feature.

### Examples

```
-> show ip bgp dampening-stats
Network Mask From Flaps Duration FOM
----------------- ------------------ ------------- ----------------- -------
155.132.44.73 255.255.255.255 192.40.4.121 8 00h:00m:35s 175
```

### output definitions

- **Network**: The IP address for the local BGP speaker that is responsible for route dampening in this router.
- **Mask**: The mask for the local BGP speaker that is responsible for route dampening in this router.
- **From**: The IP address for the route that is flapping.
output definitions (continued)

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flaps</td>
<td>The number of times this route has moved from an UP state to a DOWN state or from a DOWN state to an UP state. If the route goes down and then comes back up, then this statistics would count 2 flaps.</td>
</tr>
<tr>
<td>Duration</td>
<td>The time since the first route flap occurred. In the above example, this route has flapped 8 times in a 35 second period.</td>
</tr>
<tr>
<td>FOM</td>
<td>The Figure Of Merit, or instability metric, for this route. This value increases with each unreachable event. If it reaches the cutoff value (configured in ip bgp dampening), then this route will no longer be advertised.</td>
</tr>
</tbody>
</table>

Release History

Release 7.1.1; command was introduced.

Related Commands

**ip bgp dampening** Enables and disables route dampening.

MIB Objects

N/A
**show ip bgp path**

Displays BGP paths.

```
show ip bgp path
[ip-addr ip_address ip_mask]
[aspath-list aspathlist_name]
[community-list community_list_name]
[prefix-list prefix_name]
[route-map routemap_name]
[cidr-only]
[community community_number]
[neighbor-rcv recv_peer_address]
[neighbor-adv adv_peer_addr]
-regexp "regular_expression"
[best]
[detail]
```

### Syntax Definitions

- **ip_address**: A 32-bit IP address of the path.
- **ip_mask**: A 32-bit subnet mask of the path.
- **aspathlist_name**: AS path on which to filter.
- **community_list_name**: Community name on which to filter.
- **prefix_name**: Prefix on which to filter.
- **routemap_name**: Route map on which to filter.
- **clidr-only**: Filter out everything except CIDR routes.
- **community_number**: Community number on which to filter.
- **recv_peer_address**: Filter all except paths received from this path.
- **adv_peer_addr**: Filter all except paths sent to this path.
- **regular_expression**: Regular expression on which to filter. Regular expressions must be enclosed by quotes. For example, “$100”.
- **best**: Show only the best path.

### Defaults

N/A
Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The basic command displays every path currently in the table. Since the number of paths may run into the thousands, this command provides a number of parameters for displaying a specific path or matching entries for a portion of a path or peer address.

- ‘Detail’ option displays the AS Path details for a specific route.

Examples

```
-> show ip bgp path
Legends: Sta = Path state
> = best, F = feasible
P = policy changing, U = un-synchronized
D = dampened, N = none
Nbr = Neighbor
(O) = Path Origin (? = incomplete, i = igp, e = egp)
degPref = degree of preference

<table>

  Path atomic = no,
  Path AS aggregator = <none>,
  Path IPaddr aggregator = <none>,
  Path community = <none>,
  Path unknown attribute = <none>

output definitions

| Sta | Status flag. A greater-than sign (>) indicates this is the best route to the destination. |
| Network | The IP address for this route path. This is the destination of the route. |
| Mask | The mask for this route path. |
| Nbr address | The IP or IPv6 address of the BGP peer that is advertising this path. |
| Next Hop | The next hop along the route path. |
| (0) | The origin attribute of this route path. A question mark (?) indicates incomplete, and i indicates IGP, and an e indicates EGP. |
| degPref | The local preference value assigned to this route path. |

output definitions

| Path address | The IP address for route path. |
| Path mask | The mask for this route path. |
| Path protocol | The protocol from which this route path was learned. Possible values for this field are as follows: local, static, directhost, rip, ospf, isis, ibgp, ebgp, and other. |
| Path peer | The IP address of the peer that is advertising this route path. |
| Path nextHop | The next hop along the route path. |
| Path origin | The BGP origin attribute. Possible values will be igp, egp, incomplete, and none. The origin attribute is considered during the route decision process. |
| Path local preference | The local preference value for this route as received in an UPDATE message. A negative value (for example, the -1 in the above display) indicates that the local preference value is missing for this route path. |
**output definitions (continued)**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path state</td>
<td>Path state indicates the state of the path. The possible states are <strong>best</strong>, <strong>feasible</strong>, <strong>policy-wait</strong>, <strong>un-synchronized</strong>, <strong>dampened</strong>, or <strong>none</strong>. When path state is <strong>none</strong>, it indicates that there are no paths to this prefix and the route is being purged from the system.</td>
</tr>
<tr>
<td>Path weight</td>
<td>The path weight as assigned through inbound and outbound policies.</td>
</tr>
<tr>
<td>Path preference degree</td>
<td>The local preference assigned to this route through an inbound or outbound policy, or, if the local preference value is missing, the default local preference (which is assigned through the <code>ip bgp default local-preference</code>).</td>
</tr>
<tr>
<td>Path autonomous systems</td>
<td>The AS path for this route. These numbers show the ASs through which the route has traversed with the most recent AS listed first. In the above example, this route began its path in AS 2 and then traveled through AS 3.</td>
</tr>
<tr>
<td>Path MED</td>
<td>The multi-exit discriminator (MED) value for this route path. A negative value (for example, the <code>-1</code> in the above display) indicates that the MED value is missing for this route path.</td>
</tr>
<tr>
<td>Path atomic</td>
<td>Indicates whether the ATOMIC-AGGREGATE attribute has been set for this route. When set (this field would read <strong>yes</strong>), this attribute indicates that an aggregate has caused a loss of information for this route (a less specific route was chosen over a more specific route included in the aggregate).</td>
</tr>
<tr>
<td>Path AS aggregator</td>
<td>Part of the AGGREGATOR attribute. This field indicates the AS for the BGP speaker that created the aggregate. A value of <code>&lt;none&gt;</code> indicates this is not an aggregate route.</td>
</tr>
<tr>
<td>Path IPaddr aggregator</td>
<td>Part of the AGGREGATOR attribute. This field indicates the IP address for the BGP speaker that created the aggregate. A value of <code>&lt;none&gt;</code> indicates that this is not an aggregate route.</td>
</tr>
<tr>
<td>Path community</td>
<td>Indicates the community to which this route path belongs, if applicable. A value of <code>&lt;none&gt;</code> indicates that this route does not belong to a community.</td>
</tr>
<tr>
<td>Path unknown attribute</td>
<td>Indicates BGP attributes found in UPDATE messages which the router does not support. For example, multi-protocol attributes are not supported by the router in this release, but it is possible for these attributes to appear in a BGP route.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command was introduced.
Release 7.3.4; **detail** keyword added.

**Related Commands**

- `show ip bgp routes` Displays BGP route details.

**MIB Objects**

- `alaBgpPathTable`
- `alaBgpPathEntry`
### show ip bgp routes

Displays BGP route details.

**Syntax**

```
show ip bgp routes [ip_address ip_mask]
```

### Syntax Definitions

- **ip_address**
  - A 32-bit IP address.

- **ip_mask**
  - A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

output definitions

Address: The route destination network address.
Mask: The route destination network mask.
ECL: External BGP change list. When Yes, this route will be advertised as soon as the route advertisement timer expires.
ICC: Internal BGP client change list. When Yes, this route will be advertised to internal non-clients.
ICL: Internal BGP change list. When Yes, this route has changes that need to be advertised.
LCL: Local change list. When Yes, this route is local.
AGG: Aggregation. When Yes, this route is an aggregate route.
AGC: Aggregation contribution. When Yes, this route is part of an aggregate route.
AGL: Aggregation list. When Yes, this route is placed on an aggregate list.
AGW: Aggregation waiting. When Yes, this route is waiting for an aggregate contributor.
AGH: Aggregation hidden. When Yes, this route is hidden as part of an aggregate route.
GDL: Deletion list. When Yes, this route will be deleted.
DMP: Dampening. Indicate whether this route has been dampened. If ‘Yes’, then this route has been dampened and a dampening history exists.
ACT: Active route. When Yes, the route is active.

Release History

Release 7.1.1; command was introduced.

Related Commands

**Usage Guidelines**

This command displays all the configured networks, or a single network.

**Examples**

```
-> show ip bgp network
Network                  Mask                      Admin state     Oper state
-------------------------------+-----------------+-------------------------+-------------------------
155.132.1.2               255.255.255.255        disabled      not_active
155.132.1.3               255.255.255.255        disabled      not_active

-> show ip bgp network 155.132.1.2 255.255.255.255
Network address            = 155.132.1.2,
Network mask               = 255.255.255.255,
Network admin state        = disabled,
Network oper state         = not_active,
Network metric             = 0,
Network local preference   = 0,
Network community string   = 0:500 400:1 300:2
```
output definitions

**Network or Network address**
The IP address configured for this local BGP network. This value is configured through the `ip bgp network` command.

**Mask or Network mask**
The mask configured for this local BGP network. This value is configured through the `ip bgp network` command.

**Admin state or Network admin state**
Indicates whether this local BGP network is administratively enabled or disabled. This value is configured through the `ip bgp network admin-state` command.

**Oper state or Network oper state**
Indicates whether this BGP local network is operationally active or inactive.

**Network metric**
The multi-exit discriminator (MED) value configured for this local BGP network. This value is configured through the `ip bgp network metric` command.

**Network local preference**
The local preference value for this local BGP network. This value is configured through the `ip bgp network local-preference` command.

**Network community string**
The community string value for this local BGP network. This value is configured through the `ip bgp network community` command.

### Release History
Release 7.1.1; command was introduced.

### Related Commands

- **ip bgp network**
  Configures a local BGP network.

### MIB Objects

- **alabgpMIBNetworkGroup**
- **alaBgpNetworkEntry**
**show ip bgp neighbors**

Displays the configured IPv4 BGP peers.

**show ip bgp neighbors [ip_address]**

---

**Syntax Definitions**

\textit{ip\_address} \quad A 32-bit IP address.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>output</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

There are two output options for this command. If you specify show ip bgp peer without a peer IP address, then you see summary information for all peers known to the local BGP speaker. If you enter a specific peer IP address with the command, then you see detailed parameter information for that peer only.

---

**Examples**

\texttt{-> show ip bgp neighbors}

Legends: Nbr = Neighbor  
As = Autonomous System  
Nbr address | As | Admin state | Oper state | BGP Id | Up/Down | BFD Status  
----------------+-----+-------------+------------+--------+---------+-------------
192.40.4.29 | 3   | enabled     | estab      | 192.40.4.29 | 00h:14m:48s | disabled   
192.40.4.121 | 5   | disabled    | idle       | 0.0.0.0    | 00h:00m:00s | enabled    

---

**output definitions**

- **Nbr address**: The IP address for this BGP peer. Assign this address through the \texttt{ip bgp neighbor} command.
- **As**: The autonomous system to which this peer belongs. A peer’s AS number is assigned through the \texttt{ip bgp neighbor remote-as} command.
- **Admin state**: Indicates whether this peer has been enabled or disabled through the \texttt{ip bgp neighbor admin-state} command.
- **Oper state**: The current BGP state for this peer. Possible states are \texttt{idle}, \texttt{connect}, \texttt{active}, \texttt{opensent}, \texttt{openconfirm}, and \texttt{established}. 
**output definitions**

<table>
<thead>
<tr>
<th>BgpId</th>
<th>The unique BGP identifier of the peer. This value is configured through the <code>ip bgp neighbor update-source</code> command.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up/Down</td>
<td>The time since this peer has transitioned to its current UP or DOWN state. If the peer is currently Established, then this is the time that the peer has been UP. If the peer is currently Idle, then this is the time the peer has been DOWN.</td>
</tr>
<tr>
<td>BFD Status</td>
<td>Indicates whether BFD is enabled or disabled for this peer. The BFD status is configured through the `ip</td>
</tr>
</tbody>
</table>

```

**output definitions**

<table>
<thead>
<tr>
<th>Neighbor address</th>
<th>The IP address for this BGP peer. Assign this address through the <code>ip bgp neighbor</code> command.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neighbor autonomous system</td>
<td>The autonomous system to which this peer belongs. A peer’s AS number is assigned through the <code>ip bgp neighbor remote-as</code> command.</td>
</tr>
<tr>
<td>output definitions (continued)</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Neighbor Admin state</strong></td>
<td>Indicates whether this peer has been enabled or disabled through the <code>ip bgp neighbor admin-state</code> command.</td>
</tr>
<tr>
<td><strong>Neighbor Oper state</strong></td>
<td>The current BGP state for this peer. Possible states are <strong>idle</strong>, <strong>connect</strong>, <strong>active</strong>, <strong>opensent</strong>, <strong>openconfirm</strong>, and <strong>established</strong>.</td>
</tr>
<tr>
<td><strong>Neighbor passive status</strong></td>
<td>Indicates whether the local BGP speaker is “passive” (i.e., waiting for this peer to initiate a session). This value is configured through the <code>ip bgp neighbor passive</code> command.</td>
</tr>
<tr>
<td><strong>Neighbor name</strong></td>
<td>The name assigned to this peer through the <code>ip bgp neighbor description</code> command.</td>
</tr>
<tr>
<td><strong>Neighbor local address</strong></td>
<td>The interface assigned to this peer. This value is configured through the <code>ip bgp neighbor update-source</code> command.</td>
</tr>
<tr>
<td><strong>Neighbor EBGP multihop</strong></td>
<td>Indicates whether BGP multi-hop support is enabled or disabled. This supports allows external BGP peers to communicate with each other even when they are not directly connected. This value is configured through the <code>ip bgp neighbor ebgp-multihop</code> command.</td>
</tr>
<tr>
<td><strong>Neighbor next hop self</strong></td>
<td>Indicates whether this peer is using next hop processing. This value is configured through the <code>ip bgp neighbor next-hop-self</code> command.</td>
</tr>
<tr>
<td><strong>Neighbor TTL security</strong></td>
<td>Displays the number of hops between the switch and the peer. If the GTSM is disabled the value is displayed as none.</td>
</tr>
<tr>
<td><strong>Neighbor Route Refresh</strong></td>
<td>Indicates whether this peer supports Route Refresh capability as defined in RFC 2918. This capability is an alternative to soft-reconfiguration that can save CPU and memory resources. It allows peers to dynamically request the re-advertisement of BGP routing tables. Since this router supports route refresh all BGP peers are automatically enabled for this capability.</td>
</tr>
<tr>
<td><strong>Neighbor Ipv4 unicast</strong></td>
<td>Indicates whether this peer is multi-protocol IP version 4 unicast capable. This router is IPv4 unicasts capable so all peers will be enabled for this capability.</td>
</tr>
<tr>
<td><strong>Neighbor Ipv4 multicast</strong></td>
<td>Indicates whether this peer is multi-protocol IP version 4 multicast capable. This router is not IPv4 multicasts capable so all peers will be disabled for this capability.</td>
</tr>
<tr>
<td><strong>Neighbor type</strong></td>
<td>Indicates whether this peer is internal or external to the router.</td>
</tr>
<tr>
<td><strong>Neighbor auto-restart</strong></td>
<td>Indicates whether peer auto-restart is enabled or disabled. This value is configured through the <code>ip bgp neighbor auto-restart</code> command.</td>
</tr>
<tr>
<td><strong>Neighbor route-reflector-client</strong></td>
<td>Indicates whether this peer is a client to the local route reflector, if configured. This value is configured through the <code>ip bgp neighbor route-reflector-client</code> command.</td>
</tr>
<tr>
<td><strong>Neighbor confederation status</strong></td>
<td>Indicates whether this peer is a member of a BGP confederation. This value is configured through the <code>ip bgp confederation neighbor</code> command.</td>
</tr>
<tr>
<td><strong>Neighbor remove private AS</strong></td>
<td>Indicates whether the stripping of private AS numbers (64512 to 65535) from AS paths is enabled or disabled. This value is configured through the <code>ip bgp neighbor remove-private-as</code> command.</td>
</tr>
</tbody>
</table>
**Neighbor default originate**
Indicates whether peer default origination is enabled or disabled. When enabled, the local BGP speaker advertises itself as a default to the peer. This value is configured through the `ip bgp neighbor default-originate` command.

**Neighbor maximum prefixes**
The maximum number of prefixes the local router can receive in UPDATE from this peer. This value is configured through the `ip bgp neighbor maximum-prefix` command.

**Neighbor max prefixes warning**
Indicates whether a warning will be issued when this peer exceeds 80 percent of the maximum prefix value. This value is configured through the `ip bgp neighbor update-source` command.

**# of prefixes received**
Displays the total number of prefixes received by this neighbor.

**Neighbor MD5 key [32-47]**
When present, shows an encrypted version of the MD5 password. When not present, and MD5 password has not been configured. This value is configured through the `ip bgp neighbor md5 key` command.

**Neighbor local port**
The TCP port used for the session with this peer.

**Neighbor TCP window size**
The size of the TCP window for this BGP session. This value will always be 32768 as that is the maximum size of a BGP message.

**Graceful Restart State**
Indicates the graceful restart state. This feature is not supported in Multiprotocol BGP.

**Advertised Restart Interval**
Indicates the restart interval in seconds.

**Forwarding State during restart**
Indicates whether the peer has preserved the forwarding state during the graceful restart.

**Activate IPv6 unicast**
Indicates if the IPv6 unicast updates are enabled or not. Options include `enabled` or `disabled`.

**Configured IPv6 NextHop Address**
Specifies the IPv6 nexthop address. This is specified using the `ipv6 bgp neighbor ipv6-nexthop` command.

**Neighbor IPv6 unicast**
Indicates whether Multiprotocol IPv6 Unicast capability is enabled or disabled between the peers.

**BFD Status**
Indicates whether BFD is enabled or disabled for this peer. The BFD status is configured through the `ip|ipv6 bgp neighbor bfd-state` command.

**Activate IPv4 unicast**
Indicates if the IPv4 unicast updates are enabled or not for this peer.

**Activate check-first-AS**
Displays the operational status of check for first AS in the ASPATH list.

---

**Release History**

Release 7.1.1; command was introduced.
Release 7.3.4; BFD Status and Activate IPv4 unicast output fields added.
Release 8.4.1; ‘Neighbor TTL security’ output field added.
Release 8.7 R1; ‘Activate check-first-AS’ output field added.

<tr>
<td>Time of last DOWN transition</td>
<td>The duration since this peer last went down.</td>
</tr>
</tbody>
</table>
### Last DOWN reason

Provides a message as the last reason why a peer went down. The possible reasons for going down are:

- user_request - user initiated
- conn_timeout - connection timer expired
- hold_timeout - hold timer expired
- bad_msg - received a bad message from neighbor
- fsm_blink - BGP FSM error
- peer_closed - neighbor closed connection
- peer_notify - neighbor sent fatal notification
- tcp_error - Fatal TCP error
- none - None

### # of msgs rcvd

Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received from this peer.

### # of Update msgs rcvd

The number of route UPDATE messages received from this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.

### # of prefixes rcvd

The number of unique route prefixes received by this peer.

### # of Route Refresh msgs rcvd

The number of route refresh requests this peer has received. Route refresh requests all routes learned be a peer.

### # of Notification msgs rcvd

The number of NOTIFY messages received from this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

Usage Guidelines

- This command displays a list of all of the AS path policies for the router, or a single policy selected by the list name or regular expression.

- Regular expressions are defined in the ip bgp policy aspath-list command on page 30-136.

- When using regular expressions in the CLI, the regular expression must be enclosed by quotation marks.

Examples

- show ip bgp policy aspath-list
  Aspath List Name Aspath regular expression
  --------------------+--------------------------------------------------
  aspl1              (500 | 400) ? 300$
  aspl2              (500 | 400)

- show ip bgp policy aspath-list aspl1
  Aspath List name = aspl1
  Aspath Regexp      = (500 | 400) ? 300$
  Admin state        = disabled,
  Priority           = 1,
  Action             = deny,
  Primary index      = 0,
output definitions

```

### Usage Guidelines

This command displays the list of prefix6-list policies configured for the speaker, or a specific list determined by the list name or IPv6 address.

### Examples

```
-> show ip bgp policy prefix6-list
Prefix6 List name  Prefix6 address/Prefix length
-----------------------------------------------
p62                ::/0
p63                4001:1::/32

-> show ip bgp policy prefix6-list p63
Prefix6 List name  = p63
Prefix             = 4001:1::
Prefix Length      = 32
Admin state        = enabled,
Match MaskLength   = (GE) = 32,
Match MaskLength   = (LE) = 0,
```
BGP Commands

show ip bgp policy prefix6-list

Action             = permit

output definitions

Prefix6 List name  The name of the prefix6 list. This is defined using the \texttt{ip bgp policy prefix6-list} command.
Prefix             The IPv6 address of the prefix6 list. This is defined using the \texttt{ip bgp policy prefix6-list} command.
Prefix Length      The prefix length of the prefix6 list. This is defined using the \texttt{ip bgp policy prefix6-list} command.
Admin state        The administrative state of the prefix6 list, either enabled or disabled.
Match MaskLength $\geq$ (GE) The GE match masklength of the prefix6 list. This is defined using the \texttt{ip bgp policy prefix6-list} command.
Match MaskLength $\leq$ (LE) The LE match masklength of the prefix6 list. This is defined using the \texttt{ip bgp policy prefix6-list} command.
Action             The action of the prefix6 list. This is defined using the \texttt{ip bgp policy prefix6-list} command.

Release History

**ip bgp graceful-restart**

Configures support for the graceful restart feature on a BGP router.

```
ip bgp graceful-restart
no ip bgp graceful-restart
```

---

**Syntax Definitions**

N/A

**Defaults**

Graceful restart is enabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to disable support for the graceful restart feature on a BGP router. It has only unplanned graceful restart.
- The minimum hardware configuration for this command is a redundant CMM configuration.
- Note that graceful restart does not support IPv6 prefixes at this time.

**Examples**

```
-> ip bgp graceful restart
-> no ip bgp graceful restart
```

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

`show ip bgp`  
Displays the current global settings for the local BGP speaker.

**MIB Objects**

`alaBgpGlobal`  
- `alaBgpGracefulRestart`
- `alaBgpRestartInterval`
**ip bgp graceful-restart restart-interval**

Configures the grace period for achieving a graceful BGP restart.

```
ip bgp graceful-restart restart-interval [seconds]
```

**Syntax Definitions**

- **seconds**: The hitless restart timeout interval, in seconds. The valid range is 1–3600.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>90</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The minimum hardware configuration for this command is a redundant CMM configuration.
- Note that graceful restart does not support IPv6 prefixes at this time.

**Examples**

```
-> ip bgp graceful-restart restart-interval 600
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **show ip bgp**: Displays the current global settings for the local BGP speaker.

**MIB Objects**

- **alaBgpGlobal**
  - **alaBgpGracefulRestart**
  - **alaBgpRestartInterval**
**ip bgp unicast**

Enables or disables unicast IPv4 advertisements for the BGP routing process.

```plaintext
ip bgp unicast
no ip bgp unicast
```

---

**Syntax Definitions**

N/A

---

**Defaults**

By default, BGP IPv4 advertisements are enabled.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Use the **no** form of this command to turn off IPv4 unicast advertisements.
- BGP should be disabled before enabling or disabling IPv4 unicast advertisements.
- IPv4 unicast advertisements may be turned off on homogeneous IPv6 networks that are not aware of IPv4 routing. In such cases, the command, **ip router router-id**, must be used to explicitly configure the 32-bit unique router identifier.

---

**Examples**

```plaintext
-> ip bgp unicast
-> no ip bgp unicast
```

---

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- **ipv6 bgp unicast**: Enables or disables unicast IPv6 updates for the BGP routing process.
- **show ip bgp**: Displays the current global settings for the local BGP speaker.
- **ip router router-id**: Configures the router ID for the router.

MIB Objects

- **alaBgpGlobal**
  - **alaBgpMultiProtocolIpv4**
ipv6 bgp unicast

Enables or disables unicast IPv6 advertisements for the BGP routing process.

ipv6 bgp unicast

no ipv6 bgp unicast

Syntax Definitions

N/A

Defaults

By default, IPv6 BGP advertisements are disabled.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

**ip bgp neighbor activate-ipv6**

Enables or disables the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv4 addresses.

**ip bgp neighbor ip_address activate-ipv6**

**no ip bgp neighbor ip_address activate-ipv6**

---

**Syntax Definitions**

*ip_address*  
The 32-bit IPv4 address of the neighbor.

**Defaults**

This command is disabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</table>

**Usage Guidelines**

Use the **no** form of this command to disable the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv4 addresses.

**Examples**

```
-> ip bgp neighbor 1.0.0.1 activate-ipv6
-> no ip bgp neighbor 1.0.0.1 activate-ipv6
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

*show ip bgp neighbors*  
Displays BGP peer main status.

**MIB Objects**

alaBgpPeerTable

alaBgpPeerAddr

alaBgpPeerIpv6Unicast
**ip bgp neighbor ipv6-nexthop**

Configures the IPv6 next hop addresses for the IPv6 prefixes advertised between BGP peers. These BGP peers are identified by their IPv4 addresses.

```
ip bgp neighbor ip_address ipv6-nexthop ipv6_address
```

**Syntax Definitions**

- `ip_address`: The 32-bit IPv4 address of the neighbor.
- `ipv6_address`: A 128-bit global IPv6 address to be used as the next hop for IPv6 routes being advertised to this BGP speaker.

**Defaults**

By default, the IPv6 next hop value is set to all zeros.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- To reset the IPv6 next hop value, enter an all-zero address.
- For internal BGP (IBGP) peers, the IPv6 next hop is used only if the peer `next-hop-self` option is configured.
- For external BGP (EBGP) peers, the IPv6 next hop is used for all the advertised IPv6 routes.

**Examples**

- `-> ip bgp neighbor 1.0.0.1 ipv6-nexthop 2001:100:3:4::1`
- `-> ip bgp neighbor 1.0.0.1 ipv6-nexthop ::`

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `show ipv6 bgp neighbors` Displays the configured IPv6 BGP peers.

**MIB Objects**

- `alaBgpPeerTable`
- `alaBgpPeerAddr`
ip bgp neighbor ipv6-next-hop

#### alaBgpPeerIpv6NextHop
**show ipv6 bgp path**

Displays the known IPv6 BGP paths for all the routes or a specific route.

`show ipv6 bgp path [ipv6-address/prefix_length] [detail]`

**Syntax Definitions**

- `ipv6_address`: The 128-bit IPv6 address.
- `/prefix_length`: The number of bits that are significant in the IPv6 address (mask) (3..128).

**Defaults**

By default, IPv6 BGP paths for all the routes will be displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `ipv6_address/prefix_length` parameter to display the IPv6 BGP paths for a specified route.
- Use the `detail` option to display the AS Path details of each route.

**Examples**

```plaintext
-> show ipv6 bgp path
Legends: Sta = Path state
         > = best, F = feasible, S = stale
         U = un-synchronized
         Nbr = Neighbor

output definitions

Sta
Status flag. A greater-than sign (>) indicates this is the best route to the destination.

Prefix
The destination address of the IPv6 route in the hexadecimal format.

Nbr Address
The IP or IPv6 address of the BGP peer that advertises this path.

(0)
The origin attribute of this route path. A question mark (?) indicates incomplete, and i indicates IGP, and an e indicates EGP.

degPref
The local preference value assigned to this route path.

-> show ipv6 bgp path ipv6-addr 2020:100:200:1::/64
BGP Path parameters

output definitions

Path address
The IPv6 address for route path.

Path Length
The prefix length of the IPv6 path.

Path protocol
The protocol from which this route path was learned. Possible values for this field are as follows: local, static, directhost, rip, ospf, isis, ibgp, ebgp, and other.

Path neighbor
The IPv6 address of the BGP peer.
output definitions (continued)

<table>
<thead>
<tr>
<th>Path nextHop</th>
<th>The next hop along the route path.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path origin</td>
<td>The BGP origin attribute. Possible values will be <strong>igp</strong>, <strong>egp</strong>, <strong>incomplete</strong>, and <strong>none</strong>. The origin attribute is considered during the route decision process.</td>
</tr>
<tr>
<td>Path local preference</td>
<td>The local preference value for this route as received in an UPDATE message. A negative value (for example, the <strong>-1</strong> in the above display) indicates that the local preference value is missing for this route path.</td>
</tr>
<tr>
<td>Path state</td>
<td>Indicates the state of the path. The possible states are <strong>best</strong>, <strong>feasible</strong>, <strong>policy-wait</strong>, <strong>un-synchronized</strong>, <strong>dampened</strong>, or <strong>none</strong>. When path state is <strong>none</strong>, it indicates that there are no paths to this prefix and the route is being purged from the system.</td>
</tr>
<tr>
<td>Path weight</td>
<td>The path weight as assigned through inbound and outbound policies.</td>
</tr>
<tr>
<td>Path preference degree</td>
<td>The local preference assigned to this route through an inbound or outbound policy, or, if the local preference value is missing, the default local preference (which is assigned through the <strong>ip bgp default local-preference</strong>).</td>
</tr>
<tr>
<td>Path autonomous systems</td>
<td>The AS path for this route. These numbers show the ASs through which the route has traversed with the most recent AS listed first. In the above example, this route began its path in AS 2 and then traveled through AS 3.</td>
</tr>
<tr>
<td>Path MED</td>
<td>The multi-exit discriminator (MED) value for this route path. A negative value (for example, the <strong>-1</strong> in the above display) indicates that the MED value is missing for this route path.</td>
</tr>
<tr>
<td>Path atomic</td>
<td>Indicates whether the ATOMIC-AGGREGATE attribute has been set for this route. When set (this field would read <strong>yes</strong>), this attribute indicates that an aggregate has caused a loss of information for this route (a less specific route was chosen over a more specific route included in the aggregate).</td>
</tr>
<tr>
<td>Path AS aggregator</td>
<td>Part of the AGGREGATOR attribute. This field indicates the AS for the BGP speaker that created the aggregate. A value of <strong>&lt;none&gt;</strong> indicates this is not an aggregate route.</td>
</tr>
<tr>
<td>Path IPaddr aggregator</td>
<td>Part of the AGGREGATOR attribute. This field indicates the IP address for the BGP speaker that created the aggregate. A value of <strong>&lt;none&gt;</strong> indicates that this is not an aggregate route.</td>
</tr>
<tr>
<td>Path community</td>
<td>Indicates the community to which this route path belongs, if applicable. A value of <strong>&lt;none&gt;</strong> indicates that this route does not belong to a community.</td>
</tr>
<tr>
<td>Path Originator Id</td>
<td>The Router Id of the BGP4 speaker that performed route reflection</td>
</tr>
<tr>
<td>Path Cluster List</td>
<td>Sequence of Cluster Id values representing the reflection path that the route has passed, if this is a reflected route in the local AS.</td>
</tr>
<tr>
<td>Path unknown attribute</td>
<td>Indicates BGP attributes found in UPDATE messages which the router does not support. For example, multi-protocol attributes are not supported by the router in this release, but it is possible for these attributes to appear in a BGP route.</td>
</tr>
</tbody>

### ipv6 bgp network

Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.

**ipv6 bgp network ipv6_address/prefix_length**

**no ipv6 bgp network ipv6_address/prefix_length**

---

**Syntax Definitions**

- **ipv6_address**
  - The 128-bit IPv6 address.

- **/prefix_length**
  - The number of bits that are significant in the IPv6 address (mask) (3..128).

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

Use the **no** form of this command to turn off the advertisement of locally reachable IPv6 networks.

---

**Examples**

`-> ipv6 bgp network 2001::1/64`

`-> no ipv6 bgp network 2001::1/64`

---

**Release History**

Release 7.1.1; command was introduced.

---

**Related Commands**

- **ipv6 bgp network admin-state**
  - Enables or disables a BGP network.

- **show ipv6 bgp network**
  - Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

---

**MIB Objects**

- alaBgpNetwork6Table
- alaBgpNetwork6Addr
ipv6 bgp network

```plaintext
       1 2 3 4
        |---|
       0 1 2 3
        |   |
IPv6 Format:

   a1aBgpNetwork6MaskLen
```

---

BGP Commands

---
**ipv6 bgp network community**

 Defines a community for a route created by the `ipv6 bgp network` command. Communities are a way of grouping BGP peers that do not share an IPv6 subnet or an AS.

```
ipv6 bgp network ipv6_address/prefix_length [community {none | no-export | no-advertise | no-export-subconfed | num | num:num}]
```

**Syntax Definitions**

- `ipv6_address`  
  The 128-bit IPv6 address.

- `/prefix_length`  
  The number of bits that are significant in the IPv6 address (mask). The valid range is 3–128

- `none`  
  Removes a prefix from a community.

- `no-export`  
  Routes in this community are advertised within the AS but not beyond the local AS.

- `no-advertise`  
  Routes in this community are not advertised to any peer.

- `no-export-subconfed`  
  Routes in this community are not advertised to any external BGP peer.

- `num`  
  The community attribute number.

- `num:num`  
  Community attribute in the AS:NN format. AS indicates the autonomous system and NN indicates the community number.

**Defaults**

By default, a route is not assigned to a community.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The IPv6 BGP route created with the `ipv6 bgp network` command should exist before the community attribute is defined.

- The value of AS:NN is num:num:num if using asdot or asdot+ notation and is num:num if using asplain format.

**Examples**

```
-> ipv6 bgp network 2004::2/64 community 23:20
```
Release History

Release 7.1.1; command was introduced.
Release 7.3.4; syntax added to community string.

Related Commands

`ipv6 bgp network`  Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.

`show ipv6 bgp network`  Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

MIB Objects

alaBgpNetwork6Table
  - alaBgpNetwork6Addr
  - alaBgpNetwork6MaskLen
  - alaBgpNetwork6Community
**ipv6 bgp network local-preference**

Defines the local preference value for a route generated by the `ipv6 bgp network` command. This value will override the default local preference value; it is used when announcing this network to internal peers.

```
ipv6 bgp network ipv6_address/prefix_length [local-preference num]
```

### Syntax Definitions

- **ipv6_address**
  - The 128-bit IPv6 address.

- **/prefix_length**
  - The number of bits that are significant in the IPv6 address (mask) (3..128).

- **num**
  - The local preference attribute value. The valid range is 0–4294967295.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>num</td>
<td>0</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

  - alaBgpNetwork6MaskLen
  - alaBgpNetwork6LocalPref
**ipv6 bgp network metric**

Configures the Multi-Exit Discriminator (MED) attribute value for an network generated by the `ipv6 bgp network` command. This value is sent from routers of one AS to another to indicate the path that the remote AS can use to send data to the local AS.

`ipv6 bgp network ipv6_address/prefix_length [metric num]`

### Syntax Definitions

- **ipv6_address**
  The 128-bit IPv6 address.

- **/prefix_length**
  The number of bits that are significant in the IPv6 address (mask) (3..128).

- **num**
  The MED attribute value. The valid range is 0–4294967295.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>num</td>
<td>0</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The IPv6 BGP route created with the `ipv6 bgp network` command should exist before the `metric` attribute is defined for the same route.

### Examples

```
-> ipv6 bgp network 2001::1/64 metric 20
```

### Release History

Release 7.1.1; command was introduced.
# Related Commands

**ipv6 bgp network**
Advertises a locally reachable IPv6 address as a IPv6 BGP network to other BGP peers.

**show ipv6 bgp network**
Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

# MIB Objects

```markdown
alaBgpNetwork6Table
   alaBgpNetwork6Addr
   alaBgpNetwork6MaskLen
   alaBgpNetwork6Metric
```
ipv6 bgp network admin-state

Enables or disables a BGP network. The BGP status must be manually enabled after configuring all the BGP neighbor and network parameters.

`ipv6 bgp network ipv6_address/prefix_length [admin-state {enable | disable}]`

Syntax Definitions

- `ipv6_address`: The 128-bit IPv6 address.
- `/prefix_length`: The number of bits that are significant in the IPv6 address (mask) (3..128).
- `enable`: Enables the BGP network.
- `disable`: Disables the BGP network.

Defaults

By default, the BGP network is disabled.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

The IPv6 BGP route created with the `ipv6 bgp network` command should exist before the `status` attribute is defined.

Examples

```
-> ipv6 bgp network 2001::1/64 admin-state enable
```

Release History

Release 7.1.1; command was introduced.
**Related Commands**

*show ipv6 bgp network* Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

**MIB Objects**

alaBgpNetwork6Table
- alaBgpNetwork6Addr
- alaBgpNetwork6MaskLen
- alaBgpNetwork6RowStatus
**show ipv6 bgp network**

Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

```
show ipv6 bgp network [ipv6_address/prefix_length]
```

### Syntax Definitions

- `<ipv6_address>`: The 128-bit IPv6 address.
- `<prefix_length>`: The number of bits that are significant in the IPv6 address (mask) (3..128).

### Defaults

By default, all IPv6 BGP networks and their status will be displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `<ipv6_address>/prefix_length` parameter to display the status of a specific IPv6 BGP network.

### Examples

```
show ipv6 bgp network
Network --------------------------------+-----------+----------
--------------------------------+-----------+----------
2525:500:600::/64                enabled     active

show ipv6 bgp network 2525:500:600::/64
Network address = 2525:500:600::/64,
Network admin state = enabled,
Network oper state = active,
Network metric = 0,
Network local preference = 0,
Network community string = <none>
```
## Output Definitions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Network or Network address</strong></td>
<td>The IPv6 address configured for this local BGP network. This value is configured through the <code>ipv6 bgp network</code> command.</td>
</tr>
<tr>
<td><strong>Admin state or Network admin state</strong></td>
<td>Indicates whether this local BGP network is administratively enabled or disabled. This value is configured through the <code>ipv6 bgp network admin-state</code> command.</td>
</tr>
<tr>
<td><strong>Oper state or Network oper state</strong></td>
<td>Indicates whether this BGP local network is operationally active or inactive.</td>
</tr>
<tr>
<td><strong>Network metric</strong></td>
<td>The multi-exit discriminator (MED) value configured for this local BGP network. This value is configured through the <code>ipv6 bgp network metric</code> command.</td>
</tr>
<tr>
<td><strong>Network local preference</strong></td>
<td>The local preference value for this local BGP network. This value is configured through the <code>ipv6 bgp network local-preference</code> command.</td>
</tr>
<tr>
<td><strong>Network community string</strong></td>
<td>The community string value for this local BGP network. This value is configured through the <code>ipv6 bgp network community</code> command.</td>
</tr>
</tbody>
</table>

## Release History

Release 7.1.1; command was introduced.

## Related Commands

- **ipv6 bgp network** Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.

## MIB Objects

alaBgpNetwork6Table
- alaBgpNetwork6Addr

- alaBgpNetwork6State
- alaBgpNetwork6Metric
- alaBgpNetwork6LocalPref
- alaBgpNetwork6Community
- alaBgpNetwork6RowStatus
**ipv6 bgp neighbor**

Creates or deletes a BGP peer relationship using IPv6 addresses.

```
ipv6 bgp neighbor ipv6_address
no ipv6 bgp neighbor ipv6_address
```

### Syntax Definitions

`ipv6_address` The 128-bit IPv6 address of the new BGP peer.

### Defaults

By default, no BGP peers are configured in the BGP network.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Release</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to delete a BGP peer.
- To establish a BGP session, the BGP peer should be reachable.
- You must manually enable a BGP peer after creating it. A BGP peer is enabled using the `ipv6 bgp neighbor admin-state` command.
- Once created, a BGP peer must be assigned an autonomous system number using the `ipv6 bgp neighbor remote-as` command.
- Use `update-source` keyword to configure the IPv6 interface when link-local address is used as neighbor address.

### Examples

```
-> ipv6 bgp neighbor 2001::1
-> no ipv6 bgp neighbor 2001::1
```

### Release History

Release 7.1.1; command was introduced.
Related Commands

- **ipv6 bgp neighbor admin-state**  Enables or disables the BGP peer status.
- **ipv6 bgp neighbor remote-as**  Assigns an AS number to the BGP peer.

MIB Objects

- alaBgpPeer6Table
- alaBgpPeer6Addr
**ipv6 bgp neighbor ttl-security**

Configures the Generalized TTL Security Mechanism (GTSM) for the BGP peer. GTSM allows to set the maximum number of hops for the IP packets between the switch and the peer. If the maximum number of hops exceeds, the packet is dropped at the NI.

```
ipv6 bgp neighbor ipv6_address ttl-security num
ipv6 bgp neighbor ipv6_address no ttl-security
```

**Syntax Definitions**

- `ipv6_address`: The 128-bit IPv6 address of the BGP peer.
- `num`: The maximum number of hops between the switch and the peer. The valid range for GTSM is 0 to 255.

**Defaults**

By default GTSM is disabled for communication with the peer.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- GTSM must be manually enabled on both peers in a connection.
- When GTSM is enabled, eBGP multihop must be disabled or vise-versa.
- Use the `no` form of this command to disable GTSM.

**Examples**

```bash
-> ipv6 bgp neighbor 2001::1 ttl-security 6
-> ipv6 bgp neighbor 2001::1 no ttl-security
```

**Release History**

Release 8.4.1; command was introduced.
Related Commands

`show ipv6 bgp neighbors` Displays the configured IPv6 BGP peers.

MIB Objects

`alaBgpPeer6Table`
`alaBgpPeer6Addr`
`alaBgpPeer6TTLSecurityHops`
**ipv6 bgp neighbor activate-ipv4**

Enables the advertisement of IPv4 unicast capability to the IPv6 BGP peer.

```
ipv6 bgp neighbor ipv6_address [activate-ipv4]
no ipv6 bgp neighbor ipv6_address [activate-ipv4]
```

### Syntax Definitions

- **ipv6_address**
  - The 128-bit IPv6 address of the new BGP peer.

- **activate-ipv4**
  - Enable the advertisement of IPv4 unicast capability to the IPv6 BGP peer.

### Defaults

By default, the command is enabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the **no** form of this command to disable the advertisement of IPv4 unicast capability to IPv6 BGP peer.

### Examples

- `-> ipv6 bgp neighbor 2001::1 activate-ipv4`
- `-> no ipv6 bgp neighbor 2001::1 activate-ipv4`

### Release History

Release 7.3.4; command was introduced.
**Related Commands**

`ipv6 bgp neighbor`  
Creates or deletes a BGP peer relationship using IPv6 addresses.

**MIB Objects**

alaBgpPeer6Table

  - alaBgpPeer6Addr
  - alaBgpPeer6ActivateIpv4
**ipv6 bgp neighbor activate-ipv6**

Enables the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv6 addresses.

```
ipv6 bgp neighbor ipv6_address [activate-ipv6]
no ipv6 bgp neighbor ipv6_address [activate-ipv6]
```

### Syntax Definitions

`ipv6_address`  
The 128-bit IPv6 address.

### Defaults

This command is disabled by default.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `no` form of this command to disable the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv6 addresses.

### Examples

```
-> ipv6 bgp neighbor 1.0.0.1 activate-ipv6
-> no ipv6 bgp neighbor 1.0.0.1 activate-ipv6
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- `show ipv6 bgp neighbors` Displays the configured IPv6 BGP peers.

### MIB Objects

- `alaBgpPeer6Table`  
- `alaBgpPeer6Addr`  
- `alaBgpPeer6ActivateIpv6`
**ipv6 bgp neighbor ipv6-nexthop**

Configures the IPv6 next hop addresses for IPv6 prefixes advertised between BGP peers. These BGP peers are identified by their IPv6 addresses.

`ipv6 bgp neighbor ipv6_address [ipv6-nexthop ipv6_address]`

### Syntax Definitions

- `ipv6_address`: The 128-bit IPv6 address of the next hop router.

### Defaults

By default, the IPv6 next hop address is set to all zeros.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- To reset the IPv6 next hop value, enter an all-zero address.
- For internal BGP (IBGP) peers, the IPv6 next hop is used only if the peer `next-hop-self` option is configured.
- For external BGP (EBGP) peers, the IPv6 next hop is used for all the advertised IPv6 routes.
- For BGP peers configured with their link-local addresses, the configured IPv6 next hop is used while advertising IPv6 prefixes.

### Examples

- `-> ipv6 bgp neighbor 2001::1 ipv6-nexthop fe80::/24`
- `-> no ipv6 bgp neighbor 2001::1 ipv6-nexthop fe80::/24`

### Release History

Release 7.1.1; command was introduced.
Related Commands

show ipv6 bgp neighbors  Displays the configured IPv6 BGP peers.

MIB Objects

alaBgpPeer6Table
    alaBgpPeer6Addr
    alaBgpPeerIpv6NextHop
ipv6 bgp neighbor admin-state

Enables or disables the BGP peer status. These peers are identified by their IPv6 addresses.

ipv6 bgp neighbor ipv6_address [admin-state {enable | disable}]

Syntax Definitions

ipv6_address            The 128-bit IPv6 address of the new BGP peer.
enable                  Enables the BGP peer.
disable                 Disables the BGP peer.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- You should first create a BGP peer and assign it an IPv6 address using the ipv6 bgp neighbor command before enabling the peer.
- You should configure all the BGP peer related commands before enabling a BGP peer. Once you have enabled the peer, it will begin sending BGP connection and route advertisement messages.

Examples

-> ipv6 bgp neighbor 2001::1 admin-state enable
-> ipv6 bgp neighbor 2001::1 admin-state disable

Release History

Release 7.1.1; command was introduced.
**Related Commands**

`show ipv6 bgp neighbors`  Displays the configured IPv6 BGP peers.

**MIB Objects**

`alaBgpPeer6Table`  
- `alaBgpPeer6Addr`
- `alaBgpPeer6RowStatus`
ipv6 bgp neighbor clear

Restarts the IPv6 BGP peer. The peer will be unavailable during this restart.

ipv6 bgp neighbor ipv6_address clear

**Syntax Definitions**

*ipv6_address* The 128-bit IPv6 address of the neighbor.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use this command whenever changes occur to BGP-related access lists, weights, distribution lists, timer specifications, or administrative distance.
- Many peer commands restart the peer as soon as they are configured. The following commands restart the BGP peer for which they are configured:
  - ipv6 bgp neighbor remote-as
  - ipv6 bgp neighbor md5 key
  - ipv6 bgp neighbor passive
  - ipv6 bgp neighbor ebgp-multihop
  - ipv6 bgp neighbor maximum-prefix
  - ipv6 bgp neighbor update-source
  - ipv6 bgp neighbor next-hop-self
  - ipv6 bgp neighbor soft-reconfiguration
  - ipv6 bgp neighbor route-reflector-client
  - ip bgp confederation neighbor6
  - ipv6 bgp neighbor remove-private-as
  - ipv6 bgp neighbor update-source-address
- You do not need to issue the *ipv6 bgp neighbor clear* command after issuing any of the above commands.
**Examples**

-> ipv6 bgp neighbor 2001::1 clear

**Release History**

Release 7.3.4; command was introduced.

**Related Commands**

**ipv6 bgp neighbor auto-restart**

Automatically attempts to restart a BGP peer session after a session terminates.

**MIB Objects**

alaBgpPeer6Table

- alaBgpPeer6Restart
**ipv6 bgp neighbor auto-restart**

Enables or disables BGP peer automatic restart. When enabled, this IPv6 peer will automatically attempt to restart a session with another peer after a session with that peer terminates. When disabled, this peer will not try to re-establish a session with another peer after the session terminates; in such a case, the other peer will have to restart the session for the two peers to resume communication.

**ipv6 bgp neighbor ipv6_address auto-restart**

---

**Syntax Definitions**

*ipv6_address* The 128-bit IPv6 address of the neighbor.

**Defaults**

This command is enabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to disable automatic peer restart.

- After a session with another peer terminates, the local BGP speaker will wait 60 seconds before attempting to restart the session. If the session does not start on the first attempt a second attempt will be made after another 120 seconds (60x2). On each unsuccessful session attempt, the previous delay between restarts is multiplied by 2, up to a maximum delay of 240 seconds. An exception to this rule occurs when the peer session terminates on receipt of a NOTIFY message with 'unsupported option' code or 'unsupported capability' code; in these cases the delay between restart attempts will begin at 1 second and multiply by 2 after each unsuccessful restart attempt (up to a maximum of 240 second delay).

- Disabling this option can be helpful in cases where other peers are prone to frequent flapping or sending many NOTIFY messages. By not restarting sessions with unstable neighbors, the local BGP speaker forces those unstable neighbors to re-initialize the connection.

**Examples**

-> ipv6 bgp neighbor 2001::1 auto-restart
-> no ipv6 bgp neighbor 2001::1 auto-restart

**Release History**

Release 7.3.4; command was introduced.
Related Commands

- `ipv6 bgp neighbor` Creates or deletes a BGP peer relationship using IPv6 addresses.
- `ipv6 bgp neighbor admin-state` Enables or disables the BGP peer status.

MIB Objects

- `alaBgpPeer6Table`  
- `alaBgpPeer6AutoRestart`
**ipv6 bgp neighbor remote-as**

Assigns an AS number to the BGP peer.

```
ipv6 bgp neighbor ipv6_address [remote-as value]
```

**Syntax Definitions**

- `ipv6_address`: The 128-bit IPv6 address of the BGP peer.
- `value`: Autonomous system number in the asplain, asdot+, or asdot formats.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>1</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- A BGP peer created with the `ipv6 bgp neighbor` command cannot be enabled until it is assigned an autonomous system number. If the AS number assigned to the peer matches the AS number of the local BGP speaker (assigned using the `ip bgp autonomous-system` command), the peer is considered internal to the local autonomous system. Otherwise, the peer is considered external to the local BGP speaker’s AS.

- The BGP peer is restarted after issuing this command.

**Examples**

```
-> ipv6 bgp neighbor 2001::1 remote-as 100
```

**Release History**

Release 7.1.1; command was introduced.
Release 7.3.4; modified the command.
**Related Commands**

`ip bgp autonomous-system`  Sets the AS for the local BGP speaker.

**MIB Objects**

`alaBgpPeer6Table`
- `alaBgpPeer6Addr`
- `alaBgpPeer6AS`
ipv6 bgp neighbor timers

Configures the KEEPALIVE message interval and hold time interval (in seconds) with regards to the specified BGP peer.

**ipv6 bgp neighbor ipv6_address [timers num num]**

### Syntax Definitions

- **ipv6_address**: The 128-bit IPv6 address for the BGP peer.
- **num**: The KEEPALIVE message interval in seconds.
- **num**: The hold time interval in seconds.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>num (keepalive)</td>
<td>30 seconds</td>
</tr>
<tr>
<td>num (holdtime)</td>
<td>90 seconds</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- KEEPALIVE messages do not contain route updates or indicate a change in the status of the BGP peer; they indicate to the receiving BGP peer that the connection is still live and the peer is reachable.

- By default, the KEEPALIVE interval of 30 seconds is one-third the default hold time interval of 90 seconds. The KEEPALIVE interval can never be more than one-third the value of the hold time interval. When the hold time interval is reached without receiving KEEPALIVE or other updates messages, the peer is considered dead.

- Setting the KEEPALIVE value to zero means no KEEPALIVE messages will be sent.

- Once a connection is established with a peer and a time period of the length specified in this command transpires with no messages from the remote peer, then the connection with that remote peer will be considered dead.

- The hold timer is used during the connection setup process and for on-going connection maintenance with BGP peers. If the peer does not receive a KEEPALIVE, UPDATE, or NOTIFICATION message within this time period, then the BGP connection will be closed.

- Both the KEEPALIVE and hold time interval should be set at the same time.
• Using this command without the variables resets the variables to their default value.

**Examples**

```
-> ipv6 bgp neighbor 2001::1 timers 80 240
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

`ipv6 bgp neighbor conn-retry-interval` The interval, in seconds, between BGP retries to set up a connection with another peer through the transport protocol.

**MIB Objects**

`alaBgpPeer6Table`
  `alaBgpPeer6Addr`
  `alaBgpPeer6HoldTime`
  `alaBgpPeer6KeepAlive`
ipv6 bgp neighbor maximum-prefix

Configures the maximum number of prefixes, or paths, the local router can receive from a BGP peer in UPDATE messages.

ipv6 bgp neighbor ipv6_address [maximum-prefix num [warning-only]]
no ipv6 bgp neighbor ipv6_address [maximum-prefix num [warning-only]]

Syntax Definitions

ipv6_address
   The 128-bit IPv6 address for the BGP peer.

num
   The number of prefixes. The valid range is 0–4294967295.

Defaults

+-----------------+------------------+
<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>num</td>
<td>5000</td>
</tr>
</tbody>
</table>

By default, warning-only is enabled.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- When the number of prefixes sent by the BGP peer reaches the maximum limit, the peer is restarted.
- You can use BGP logging to receive a warning when the number of prefixes received from the peer reaches 80 percent of the value you configure in this command.
- If the warning-only prefix is used, the operator will be warned when the peer exceeds 80 percent of the configured number of maximum prefixes.
- The BGP peer is restarted after issuing this command.

Examples

- ipv6 bgp neighbor 2001::2 maximum-prefix 1000 warning-only
- no ipv6 bgp neighbor 2001::2 maximum-prefix 1000

Release History

Release 7.1.1; command was introduced.
Related Commands

alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6MaxPrefix
  alaBgpPeer6MaxPrefixWarnOnly
**ipv6 bgp neighbor next-hop-self**

Configures router to advertise its peering address as the next hop address for the specified neighbor.

```plaintext
ipv6 bgp neighbor ipv6_address [next-hop-self]
o ipv6 bgp neighbor ipv6_address [next-hop-self]
```

**Syntax Definitions**

`ipv6_address` The 128-bit IPv6 address for the BGP peer.

**Defaults**

By default, the `next-hop-self` parameter of BGP updates is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to disable the `next-hop-self` parameter.

- In meshed networks, the BGP peer may not have direct connections to other peers. When such a peer receives route updates from these distant peers (through other peers), it may treat the remote peer as if it were the next hop in the routing path. Packet forwarding will not work in such a case because no direct connection exists. This command allows the peer to deem itself the next hop on the routing path so that the two non-connected peers can route packets. This peer would have a direct connection to both peers that want to exchange packets.

- The BGP peer is restarted after issuing this command.

**Examples**

```plaintext
-> ipv6 bgp neighbor 2001::2 next-hop-self
-> no ipv6 bgp neighbor 2001::2 next-hop-self
```

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

*show ipv6 bgp neighbors* Displays the configured IPv6 BGP peers.

**MIB Objects**

`alaBgpPeer6Table`
- `alaBgpPeer6Addr`
- `alaBgpPeer6NextHopSelf`
**ipv6 bgp neighbor conn-retry-interval**

The interval, in seconds, between BGP retries to set up a connection with another peer through the transport protocol. In the connect state, BGP tries to set up a connection with a remote peer. If the connection fails, then the connection retry interval starts. Once this interval elapses, BGP retries setting up the connection.

```
ipv6 bgp neighbor ipv6_address [conn-retry-interval num]
```

### Syntax Definitions

- `ipv6_address`: The 128-bit IPv6 address for the BGP neighbor.
- `num`: The time interval (in seconds) between retries. The valid range is 0–65535.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>num</td>
<td>120</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The connection retry time interval starts when a connection to a peer is lost.
- Using this command without the `num` variable resets the variable to its default value.

### Examples

```
-> ipv6 bgp neighbor 2001::2 conn-retry-interval 60
```

### Release History

Release 7.1.1; command was introduced.
Related Commands

`show ipv6 bgp neighbors`  Displays the configured IPv6 BGP peers.

MIB Objects

`alaBgpPeer6Table`
- `alaBgpPeer6Addr`
- `alaBgpPeer6ConnRetryInterval`
**ipv6 bgp neighbor default-originate**

Enables or disables the BGP local speaker to advertise a default route to the peer.

```
ipv6 bgp neighbor ipv6_address [default-originate]
```

```
no ipv6 bgp neighbor ipv6_address [default-originate]
```

**Syntax Definitions**

`ipv6_address`  
The 128-bit IPv6 address for the neighbor.

**Defaults**

This `default-originate` parameter is disabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/V48C8/C32E/T24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to disable the BGP peer default origination.
- When this command is enabled, the local BGP speaker advertises the default route to the peer. Such a default route overrides any learned default (propagation) and outbound policy. The default route `::/0` does not need to exist on the local router.
- If the peer is capable of exchanging IP as well as IPv6 prefixes, the default route for both IP and IPv6 is advertised.

**Examples**

```
-> ipv6 bgp neighbor 2001::1 default-originate
-> no ipv6 bgp neighbor 2001::1 default-originate
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

`show ipv6 bgp neighbors`  
Displays the configured IPv6 BGP peers.

**MIB Objects**

`alaBgpPeer6Table`  
`alaBgpPeer6Addr`
ipv6 bgp neighbor default-originate
**ipv6 bgp neighbor update-source**

Configures the local IPv6 interface from which a BGP peer will be connected. This local IPv6 interface can be configured for internal and external BGP peers.

`ipv6 bgp neighbor ipv6_address [update-source interface_name]`

`no ipv6 bgp neighbor ipv6_address [update-source interface_name]`

---

**Syntax Definitions**

- `ipv6_address`: The 128-bit IPv6 address for the BGP peer.
- `interface_name`: The name of the local IPv6 interface that provides the TCP connection for this BGP peer.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The BGP peer is restarted after issuing this command.
- If a BGP peer is configured with its link-local address, use the `update-source` parameter to specify the name of the IPv6 interface from which this peer is reachable. This is required to establish a BGP peering session.

**Examples**

- `-> ipv6 bgp neighbor 2004::1 update-source bgp_ipv6`
- `-> no ipv6 bgp neighbor 2004::1 update-source bgp_ipv6`

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- **show ipv6 bgp neighbors** Displays the configured IPv6 BGP peers.
- **ipv6 interface** Configures an IPv6 interface on a VLAN or IPv6 tunnel.

**MIB Objects**

- **alaBgpPeer6Table**
  - **alaBgpPeer6Addr**
  - **alaBgpPeer6LocalIntfName**
**ipv6 bgp neighbor ipv4-nexthop**

Configures the IP4 next hop addresses for IP4 prefixes advertised between BGP peers. These BGP peers are identified by their IPv6 addresses.

```
ipv6 bgp neighbor ipv6_address [ipv4-nexthop ip_address]
```

### Syntax Definitions

- `ipv6_address` The 128-bit IPv6 address for the BGP peer.
- `ip_address` The 32-bit IP address of the next hop.

### Defaults

By default, the IPv4 next hop value is set to all zeros.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To reset the IPv4 next hop value, enter an all-zero address.

### Examples

```
-> ipv6 bgp neighbor 2004::1 ipv4-nexthop 172.22.2.115
-> ipv6 bgp neighbor 2004::1 ipv4-nexthop 0.0.0.0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- `show ipv6 bgp neighbors`. Displays the configured IPv6 BGP peers.

### MIB Objects

- `alaBgpPeer6Table`
  - `alaBgpPeer6Addr`
  - `alaBgpPeer6Ipv4NextHop`
**ipv6 bgp neighbor advertisement-interval**

Configures the time interval for updates between external IPv6 BGP peers.

```
ipv6 bgp neighbor ipv6_address advertisement-interval value
```

### Syntax Definitions

- `ipv6_address`: The 128-bit IPv6 address for the neighbor.
- `value`: An advertisement time interval in seconds. The valid range is 0–65535.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>30</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Internal peers sharing the same AS as the local BGP speaker (configured in the `ip bgp autonomous-system` command) use the global route advertisement update interval. This command sets the interval this peer uses to send BGP UPDATE messages to external IPv6 BGP peers.

### Examples

- `ipv6 bgp neighbor 2001::1 advertisement-interval 60`

### Release History

Release 7.3.4; command was introduced.
Related Commands

show ipv6 bgp neighbors Display the configured IPv6 BGP peers.

MIB Objects

alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6MinRouteAdvertisementInterval
**ipv6 bgp neighbor description**

Configures the IPv6 BGP Peer name.

*ipv6 bgp neighbor ipv6_address description string*

**Syntax Definitions**

- **ipv6_address**: The 128-bit IPv6 address for the neighbor.
- **string**: Peer name (1 - 20 characters).

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>peer (ipv6_address)</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The peer name is a text identifier that, by default, follows the format "peer(ipv6-address)" where ipv6-address is the IPv6 address of the BGP peer. For example, the default name of an IPv6 BGP peer at address 2001::1 would be “peer(2001::1)”.
- A peer name with embedded spaces must be enclosed in quotation marks.

**Examples**

```
-> ipv6 bgp neighbor 2001::1 description "peer6 for building 3"
```

**Release History**

Release 7.3.4; command was introduced.

**Related Commands**

- **ipv6 bgp neighbor**: Creates or deletes a BGP peer relationship using IPv6 addresses.

**MIB Objects**

- **alaBgpPeer6Table**
- **alaBgpPeer6Addr**
ipv6 bgp neighbor description

alaBgpPeer6Name
**ipv6 bgp neighbor ebgp-multihop**

Allows external IPv6 BGP peers to communicate with each other even when they are not directly connected. The absence of communication between disconnected peers can occur when a router that is not running BGP sits between two BGP speakers; in such a scenario the BGP speakers are multiple hops from each other. By enabling this command, you allow the IPv6 BGP peers to speak to each other despite the non-BGP router that sits between them.

```
ipv6 bgp neighbor ipv6_address ebgp-multihop [ttl]
```

```
no ipv6 bgp neighbor ipv6_address ebgp-multihop
```

**Syntax Definitions**

- `ipv6_address` - The 128-bit IPv6 address of the BGP peer.
- `ttl` - The Time to Live for the multi-hop connection, in seconds. The range is 1 to 255.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ttl</code></td>
<td>255</td>
</tr>
</tbody>
</table>

This command is disabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to disable multi-hop connections.
- By default an external IPv6 BGP peer is on a directly connected subnet. This command allows you to configure an external IPv6 BGP peer that is not directly connected and may be multiple hops away. It should be used with caution and only with the guidance of qualified technical support.
- The BGP peer is restarted after issuing this command.
- When eBGP multihop is enabled, GTSM must be disabled or vice-versa.

**Examples**

```
-> ipv6 bgp neighbor 2001::1 ebgp-multihop
-> ipv6 bgp neighbor 2001::1 ebgp-multihop 50
```
-> no ipv6 bgp neighbor 2001::1 ebgp-multihop

**Release History**

Release 7.3.4; command was introduced.

**Related Commands**

**ipv6 bgp neighbor**  
Creates or deletes a BGP peer relationship using IPv6 addresses.

**ipv6 bgp neighbor next-hop-self**  
Configures router to advertise its peering address as the next hop address for the specified neighbor.

**MIB Objects**

<table>
<thead>
<tr>
<th>MIB Object</th>

<td>alaBgpPeer6MultiHop</td>
<td></td>
</tr>
</tbody>
</table>
**ipv6 bgp neighbor update-source-address**

Configures the local IPv6 address from which a BGP peer will be connected if the peer is configured with its link-local address. This local IPv6 address can be configured for internal and external BGP peers.

```
ipv6 bgp neighbor ipv6_address update-source-address ipv6_address
no ipv6 bgp neighbor ipv6_address update-source-address ipv6_address
```

**Syntax Definitions**

`ipv6_address`  
The 128-bit IPv6 address of the BGP peer.

**Defaults**

By default, the update-source-address value is set to all zeros.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The BGP peer is restarted after issuing this command.
- The default is restored by using the `no` form of the command or by entering an all-zero address.

**Examples**

```
-> ipv6 bgp neighbor 2001::1 update-source-address 2401::1
-> no ipv6 bgp neighbor 2001::1 update-source-address
```

**Release History**

Release 7.3.4; command was introduced.
**Related Commands**

- **ipv6 bgp neighbor update-source**  
  Configures the local IPv6 interface from which a BGP peer will be connected.

- **show ipv6 bgp neighbors**  
  Displays the configured IPv6 BGP peers.

**MIB Objects**

- `alaBgpPeer6Table`
- `alaBgPeer6LocalAddr`
ipv6 bgp neighbor passive

Configures the local IPv6 BGP speaker to wait for this IPv6 BGP peer to establish a connection. When enabled, the local BGP speaker will not initiate a peer session with this peer; in this sense, the BGP speaker is “passive.” When disabled, the local BGP speaker will attempt to set up a session with this peer.

ipv6 bgp neighbor ipv6_address passive

no ipv6 bgp neighbor ipv6_address passive

Syntax Definitions

ipv6_address

The 128-bit IPv6 address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to disable passive peer behavior.
- By default, BGP will initiate a session to a peer once the peer is configured, has an AS number, and is enabled. You can use this command to configure the local BGP speaker as passive and an outbound session will not be initiated to this peer. For such peers, BGP will always wait passively for the inbound session attempt.
- The BGP peer is restarted after issuing this command.

Examples

-> ipv6 bgp neighbor 2001::1 passive
-> no ipv6 bgp neighbor 2001::1 passive

Release History

Release 7.3.4; command was introduced.
**Related Commands**

*ipv6 bgp neighbor*  
Creates or deletes a BGP peer relationship using IPv6 addresses.

**MIB Objects**

ipv6 bgp neighbor remove-private-as

Enables or disables the stripping of private autonomous system numbers from the AS path of routes destined to this peer.

ipv6 bgp neighbor ipv6_address remove-private-as

no ipv6 bgp neighbor ipv6_address remove-private-as

### Syntax Definitions

*ipv6_address*  
The 128-bit IPv6 address of the BGP peer.

### Defaults

This command is disabled by default.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|                | 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900 V72/C32 | 6900 X48C6/T48C6/ \n|----------------|------|------|------|-------|------|-------|------|------|-----------------| X48C4E/V48C8/ \n|                | No   | No   | No   | No    | Yes  | Yes   | Yes  | Yes  | C32E/T24C2/     \n|                |      |      |      |       |      |       |      |      | X24C2           |

### Usage Guidelines

- Use the *no* form of this command to disable stripping of private AS numbers.
- By default, all AS numbers in the AS path are passed to peers. Enabling this command strips any private AS numbers in the AS path before sending updates to this peer. AS numbers in the range 64512 to 65535 are considered private ASs; they are intended for internal use within an organization (such as an enterprise network), but they are not intended for use on public networks (such as the Internet).
- This command has no effect if you are not using ASs in the range 64512 to 65535.
- The BGP peer is restarted after issuing this command.

### Examples

-> ipv6 bgp neighbor 2001::1 remove-private-as
-> no ipv6 bgp neighbor 2001::1 remove-private-as

### Release History

Release 7.3.4; command was introduced.
Related Commands

**ipv6 bgp neighbor remote-as** Assigns an AS number to the BGP peer.

**MIB Objects**

`alaBgpPeer6Table`  
  `alaBgpPeer6Addr`  
  `alaBgpPeer6RemovePrivateAs`
ipv6 bgp neighbor soft-reconfiguration

Enables or disables IPv6 BGP peer soft reconfiguration. Soft reconfiguration increases the stability of the peer by allowing you to reconfigure attributes that require peer resets without halting the TCP connection with other peers.

ipv6 bgp neighbor ipv6_address soft-reconfiguration

no ipv6 bgp neighbor ipv6_address soft-reconfiguration

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the BGP peer.

Default

This command is enabled by default.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to disable this feature.
- This feature stores routes and other configuration information in local memory. When you make configuration changes that require a peer reset, the routing cache is not cleared and connections with other peers are not interrupted.
- If a peer is not route-refresh capable, by default, BGP stores all paths from peers, even those that are policy rejected, in anticipation of policy changes in the future. Storing these paths consumes memory. You can use this command to disable the storing of these paths, or soft reconfiguration. However, if soft reconfiguration is disabled and the peer is not route-refresh capable and the inbound policy changes, the peer will have to be restarted using the ipv6 bgp neighbor clear command.
- If the peer is route-refresh capable and soft reconfiguration is disabled, inbound policy changes are still supported without re-starting the peer.

Examples

- ipv6 bgp neighbor 2001::1 soft-reconfiguration
- no ipv6 bgp neighbor 2001::1 soft-reconfiguration
**Release History**

Release 7.3.4; command was introduced.

**Related Commands**

- `ipv6 bgp neighbor clear`  
  Restarts the IPv6 BGP peer.

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>6900</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command clears the statistical variables for a peer so they can accumulate from a known point.

- The cleared statistics include the total messages sent and received from this peer, the total UPDATE messages sent and received from this peer, the total NOTIFY messages sent and received from this peer, and the total peer state transition messages sent and received from this peer. These statistics can be displayed through **show ipv6 bgp neighbors statistics**.

**Examples**

```
-> ipv6 bgp neighbor 2001::2 stats-clear
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **show ipv6 bgp neighbors statistics** Displays the neighbor statistics of the configured IPv6 BGP peers.

</table>

Usage Guidelines

- Use the no form of this command to disable this feature.
- You must first assign a confederation number to the local BGP speaker before assigning peers to the confederation. Use the ip bgp confederation identifier command to assign a confederation number to the local BGP speaker.

Examples

-> ip bgp confederation neighbor6 2001::1
-> no ip bgp confederation neighbor6 2001::1

Release History

Release 7.3.4; command was introduced.
Related Commands

**ip bgp confederation identifier** Sets a confederation identification value for the local BGP speaker (this router).

MIB Objects

alaBgpPeer6Table
- alaBgpPeerAddr
- alaBgPeer6ConfedStatus
**ipv6 bgp neighbor in-aspathlist**

Assigns an inbound AS path list filter to a BGP peer.

```
ipv6 bgp neighbor ipv6_address in-aspathlist {string | none}
```

### Syntax Definitions

- **ipv6_address**
  - The 128-bit IPv6 address of the BGP peer.
- **string**
  - Inbound AS path list (0 to 70 characters). This name is case sensitive.
- **none**
  - Removes this AS path list from the peer.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The AS path list name (*InboundASPath* in the example below) is created using the `ip bgp policy aspath-list` command. Any inbound routes from the BGP peer must match this AS path filter before being accepted or passed to an inbound policy.
- Use **none** to deassign an AS path filter list from this peer.

### Examples

- `-> ipv6 bgp neighbor 2001::1 in-aspathlist InBoundASpath`
- `-> ipv6 bgp neighbor 2001::1 in-aspathlist none`

### Release History

Release 7.3.4; command introduced.
Related Commands

*ip bgp policy aspath-list*  Creates or removes an AS path list.

MIB Objects

*alaBgpPeer6Table*

  *alaBgpPeer6AspathListIn*
**ipv6 bgp neighbor in-communitylist**

Assigns an inbound community list filter to a BGP peer.

```
ipv6 bgp neighbor ipv6_address in-communitylist {string | none}
```

**Syntax Definitions**

- `ipv6_address`: The 128-bit IPv6 address of the BGP peer.
- `string`: Input community list (0 to 70 characters). This name is case sensitive.
- `none`: Removes this community list from the peer.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The community filter list name (`InboundCommlist` in the example below) is created using the `ip bgp policy community-list` command. Any inbound routes from the BGP peer must match this community filter before being accepted or passed to inbound policy.

- Use `none` to deassign an input community filter list from this peer.

**Examples**

```
-> ipv6 bgp neighbor 2001::1 in-communitylist InboundCommlist
-> ipv6 bgp neighbor 2001::1 in-communitylist none
```

**Release History**

Release 7.3.4; command was introduced.
Related Commands

**ip bgp policy community-list**  Creates or deletes a community list.

MIB Objects

alaBgpPeer6Table
  alaBgpPeer6CommunityListIn
**ipv6 bgp neighbor in-prefixlist**

Assigns an inbound prefix filter list to a BGP peer.

```
ipv6 bgp neighbor ipv6_address in-prefixlist {string | none}
```

**Syntax Definitions**

- `ipv6_address` The 128-bit IPv6 address of the BGP peer.
- `string` Input prefix filter list (0 to 70 characters). This name is case sensitive.
- `none` Removes the prefix list from the peer.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The prefix list name (**InboundPrefix** in the example below) is created using the `ip bgp policy prefix-list` command. Any inbound IPv4 routes from the BGP peer must match this prefix filter before being accepted or passed to inbound policy.
- Use `none` to deassign an input prefix filter list from this peer.

**Examples**

```
-> ipv6 bgp neighbor 2001::1 in-prefixlist InboundPrefix
-> ipv6 bgp neighbor 2001::1 in-prefixlist none
```

**Release History**

Release 7.3.4; command was introduced.
Related Commands

`ip bgp policy prefix-list` Creates or deletes a prefix match list.

ipv6 bgp neighbor out-aspathlist

Assigns an outbound AS path filter list to a BGP peer.

**ipv6 bgp neighbor ipv6_address out-aspathlist {string | none}**

---

**Syntax Definitions**

*ipv6_address*  
The 128-bit IPv6 address of the BGP peer.

*string*  
Outbound AS path list (0 - 70 characters).

*none*  
Removes the AS path list from the peer.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

**Usage Guidelines**

- The prefix6 list name (OutboundPrefix6 in the example below) is created using the `ip bgp policy prefix6-list` command. Any outbound IPv6 routes from the BGP peer must match this prefix6 filter before being advertised or passed to outbound policy.
- To deassign an output prefix6 filter list, use this command to assign a value of “none”.

**Examples**

```
-> ipv6 bgp neighbor 2001::2 out-prefix6list OutboundPrefix6
-> ipv6 bgp neighbor 2001::2 out-prefix6list none
```

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

**ip bgp policy prefix6-list**  
Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

**MIB Objects**

alaBgpPeer6Table  
alaBgpPeer6Prefix6ListOut
**ipv6 bgp neighbor route-map**

Assigns a policy map to an IPv6 BGP peer.

```
ipv6 bgp neighbor ipv6_address route-map {string | none} {in | out}
no ipv6 bgp neighbor ipv6_address route-map {in | out}
```

### Syntax Definitions

- **ipv6_address**
  - The 128-bit IPv6 address of the peer.

- **string**
  - Policy map name (0 to 70 characters). This name is case sensitive.

- **none**
  - Deletes the route map if entered rather than a text string.

- **in**
  - Designates this route map policy as an inbound policy.

- **out**
  - Designates this route map policy as an outbound policy.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to deassign a policy map.
- The policy route map name (**InboundRoute** and **OutboundRoute** in the example below) is created using the `ip bgp policy route-map` command. Any routes from the BGP peer must match this route map filter before being accepted or passed to a policy.
- It is also possible to deassign a route map by entering `none` in place of a route map name.

### Examples

- `-> ipv6 bgp neighbor 2001::1 route-map InboundRoute in`
- `-> ipv6 bgp neighbor 2001::1 route-map OutboundRoute out`
- `-> ipv6 bgp neighbor 2001::1 route-map none in`
- `-> no ipv6 bgp neighbor 2001::1 route-map in`

### Release History

Release 7.3.4; command introduced.
Related Commands

`ip bgp policy route-map` Creates or deletes a policy route map.

MIB Objects

`alaBgpPeer6Table`

- `alaBgpPeer6RouteMapIn`

**ipv6 bgp neighbor clear soft**

Invokes an inbound or outbound policy reconfiguration for an IPv6 BGP peer.

```
ipv6 bgp neighbor ipv6_address clear soft {in | out}
```

### Syntax Definitions

- **ipv6_address**: The 128-bit IPv6 address for the BGP peer.
- **in**: Applies reconfiguration to the inbound policies.
- **out**: Applies reconfiguration to the outbound policies.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<tr>
<td>{in</td>
<td>out}</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command reconfigures (or reapplies) all inbound or outbound policies to existing routes without restarting the peer session.
- This command is useful if policies have been changed.

### Examples

```
-> ipv6 bgp neighbor 2001::1 clear soft in
-> ipv6 bgp neighbor 2001::1 clear soft out
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- **ipv6 bgp neighbor soft-reconfiguration**: Enables or disables IPv6 BGP peer soft reconfiguration.

### MIB Objects

- `alaBgpPeer6Table`
- `alaBgpPeer6ReconfigureInBound`
alaBgpPeer6ReconfigureOutBound
**ipv6 bgp neighbor route-reflector-client**

Configuration this IPv6 BGP peer as one of the clients to the local route reflector.

`ipv6 bgp neighbor ipv6_address route-reflector-client`

`no ipv6 bgp neighbor ipv6_address route-reflector-client`

### Syntax Definitions

`ipv6_address`  
The 128-bit IPv6 address for the BGP peer.

### Defaults

By default, the command is disabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the no form of this command to disable IPv6 BGP peer as a client to the local route reflector.
- The IPv6 BGP peers configured using this command become part of the client group. The remaining peers become the members of the non-client group for the local route reflector.
- When IPv6 BGP Peer is configured as route reflector client, all internal BGP speakers in an autonomous system need not be fully meshed. Instead, this route reflector takes the responsibility for passing internal BGP-learned routes to its peers.

### Examples

```plaintext
-> ipv6 bgp neighbor 2001::1 route-reflector-client
-> no ipv6 bgp neighbor 2001::1 route-reflector-client
```

### Release History

Release 7.3.4; command was introduced.
Related Commands

show ipv6 bgp neighbors  .Displays the configured IPv6 BGP peers.

MIB Objects
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6ClientStatus
**ipv6 bgp neighbor md5 key**

Configures an encrypted MD5 signature for TCP sessions with this IPv6 peer.

```
ipv6 bgp neighbor ipv6_address md5 key {string | none}
```

### Syntax Definitions

- **ipv6_address**: The 128-bit IPv6 address for the BGP peer.
- **string**: The MD5 public key. The maximum character length is 80.
- **none**: Remove the password and disable authentication.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The BGP peer is restarted after issuing this command.
- The password you specified in this command is encrypted before it appears in a saved snapshot file. However, if you view this command in a snapshot file or **boot.cfg** file, the command is displayed in a different syntax as given below:

```
ipv6 bgp neighbor ipv6_address md5 key-encrypt encrypted_string
```

**Note.** This MD5 password will not work, if this syntax is used to set it.

### Examples

- `-> ipv6 bgp neighbor 2001::1 md5 key openpeer2`
- `-> ipv6 bgp neighbor 2001::1 md5 key none`

### Release History

Release 7.3.4; command was introduced.
Related Commands

**ipv6 bgp neighbor**  Creates or deletes a BGP peer relationship using IPv6 addresses.

MIB Objects

alaBgpPeer6Table
  - alaBgpPeer6Addr
  - alaBgpPeer6MD5Key
**show ipv6 bgp neighbors**

Displays the configured IPv6 BGP peers.

**show ipv6 bgp neighbors [ipv6_address]**

### Syntax Definitions

- **ipv6_address**

  The 128-bit IPv6 address for the BGP neighbor.

### Defaults

By default, all the configured IPv6 BGP peers will be displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

output definitions

<table>
<thead>
<tr>
<th>Nbr address or Neighbor address</th>
<th>The IPv6 address for this BGP peer. Assign this address through the ipv6 bgp neighbor command.</th>
</tr>
</thead>
<tbody>
<tr>
<td>As or Neighbor autonomous system</td>
<td>The autonomous system to which this peer belongs. A peer’s AS number is assigned through the ipv6 bgp neighbor remote-as command.</td>
</tr>
<tr>
<td>Admin state or Neighbor Admin state</td>
<td>Indicates whether this peer has been enabled or disabled through the ipv6 bgp neighbor admin-state command.</td>
</tr>
<tr>
<td>Oper state or Neighbor Oper state</td>
<td>The current BGP state for this peer. Possible states are idle, connect, active, opensent, openconfirm, and established.</td>
</tr>
<tr>
<td>BGP Id</td>
<td>The unique BGP identifier of the peer.</td>
</tr>
<tr>
<td>Up/Down</td>
<td>The time since this peer has transitioned to its current UP or DOWN state. If the peer is currently Established, then this is the time that the peer has been UP. If the peer is currently Idle, then this is the time the peer has been DOWN.</td>
</tr>
<tr>
<td>Neighbor passive status</td>
<td>Indicates whether the local BGP speaker is “passive” (i.e., waiting for this peer to initiate a session).</td>
</tr>
<tr>
<td>Neighbor name</td>
<td>The name assigned to this peer.</td>
</tr>
<tr>
<td>Neighbor local address</td>
<td>The interface assigned to this peer. This value is configured through the ipv6 bgp neighbor update-source command.</td>
</tr>
<tr>
<td>Neighbor EBGP multiHop</td>
<td>Indicates whether BGP multi-hop support is enabled or disabled. This supports allows external BGP peers to communicate with each other even when they are not directly connected.</td>
</tr>
<tr>
<td>Neighbor next hop self</td>
<td>Indicates whether this peer is using next hop processing. This value is configured through the ipv6 bgp neighbor next-hop-self command.</td>
</tr>
<tr>
<td>Neighbor TTL security</td>
<td>Displays the number of hops between the switch and the peer. If the GTSM is disabled the value is displayed as none.</td>
</tr>
</tbody>
</table>
### Neighbor Route Refresh
Indicates whether this peer supports Route Refresh capability as defined in RFC 2918. This capability is an alternative to soft-reconfiguration that can save CPU and memory resources. It allows peers to dynamically request the re-advertisement of BGP routing tables. Since this router supports route refresh all BGP peers are automatically enabled for this capability.

### Neighbor Ipv4 unicast
Indicates whether this peer is multiprotocol IPv4 unicast capable.

### Neighbor Ipv4 multicast
Indicates whether this peer is multiprotocol IPv4 multicast capable.

### Neighbor type
Indicates whether this peer is internal or external to the AS.

### Neighbor auto-restart
Indicates whether peer auto-restart is enabled or disabled.

### Neighbor route-reflector-client
Indicates whether this peer is a client to the local route reflector, if configured.

### Neighbor confederation status
Indicates whether this peer is a member of a BGP confederation.

### Neighbor remove private AS
Indicates whether the stripping of private AS numbers (64512 to 65535) from AS paths is enabled or disabled.

### Neighbor default originate
Indicates whether peer default origination is enabled or disabled. When enabled, the local BGP speaker advertises the default route to the peer. This value is configured through the `ipv6 bgp neighbor default-originate` command.

### Neighbor maximum prefixes
The maximum number of prefixes the local router can receive in UPDATE from this peer. This value is configured through the `ipv6 bgp neighbor maximum-prefix` command.

### Neighbor max prefixes warning
Indicates whether a warning will be issued when this peer exceeds 80 percent of the maximum prefix value. This value is configured through the `ipv6 bgp neighbor update-source` command.

### # of prefixes received
Displays the total number of prefixes received by this neighbor.

### Neighbor MD5 key
When present, shows an encrypted version of the MD5 password. When not present, and MD5 password has not been configured.

### Neighbor local port
The TCP port used for the session with this peer.

### Neighbor TCP window size
The size of the TCP window for this BGP session. This value will always be 32768 as that is the maximum size of a BGP message.

### Graceful Restart State
Indicates the graceful restart state. This feature does not support IPv6 prefixes.

### Advertised Restart Interval
Indicates the restart interval in seconds.

### Forwarding State during restart
Indicates whether the peer has preserved the forwarding state during the graceful restart.

### Activate IPv6 unicast
Indicates whether or not IPv6 unicast advertisements are enabled. Options include `enabled` or `disabled`.

### Configured IPv4 NextHop Address
Specifies the IPv4 nexthop address. This is specified using the `ipv6 bgp neighbor ipv4-nexthop` command.

### Configured IPv6 NextHop Address
Specifies the IPv6 nexthop address. This is specified using the `ipv6 bgp neighbor ipv6-nexthop` command.

### Neighbor Ipv6 unicast
Indicates whether or not IPv6 unicast capability is advertised between the peers. Options include `enabled` or `disabled`.

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; ‘Activate IPv4 unicast’ output field added.
Release 8.4.1; ‘Neighbor TTL security’ output field added.
Release 8.7 R1; ‘Activate check-first-AS’ output field added.

Related Commands

- `ipv6 bgp neighbor` Creates or deletes a BGP peer relationship using IPv6 addresses
- `ipv6 bgp neighbor admin-state` Enables or disables the BGP peer status.
- `ipv6 bgp neighbor ttl-security` Configures the Generalized TTL Security Mechanism (GTSM) for the BGP peer.

**show ipv6 bgp neighbors statistics**

Displays the neighbor statistics of the configured IPv6 BGP peers.

*show ipv6 bgp neighbors statistics [ipv6_address]*

---

**Syntax Definitions**

*ipv6_address*  
The 128-bit IPv6 address.

---

**Defaults**

By default, the neighbor statistics for all the IPv6 BGP peers will be displayed.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

Use the *ipv6_address* parameter to display the neighbor statistics of a specified IPv6 BGP peer.

---

**Examples**

```
-> show ipv6 bgp neighbors statistics
Legends:  Nbr = Neighbor
          As = Autonomous System
          RMSGS = # of received messages
          SMSGS = # of sent messages
          RUPDS = # of Update messages received
          SUPDS = # of Update messages sent
          RNOFY = # of Notify messages received
          SNOFY = # of Notify messages sent
          RPFXS = # of prefixes received
          UPTNS = # of UP transitions
          DNTNS = # of DOWN transitions

Nbr address             As    RMSGS SMSGS RUPDS SUPDS RNOFY SNOFY RPFXS UPTNS DNTNS
-----------------------+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
2001:100:3:4::1         30    225   260   2     3     0     0     10    1     1     
```

---

**output definitions**

- **Nbr address**  
The IPv6 address for this peer. This value is configured using the *ipv6 bgp neighbor* command.

- **As**  
The autonomous system to which this peer belongs. This value is configured using the *ipv6 bgp neighbor remote-as* command.
show ipv6 bgp neighbors statistics

**show ipv6 bgp neighbors policy**

Displays the incoming and outgoing prefix6 list policy identifiers configured for BGP IPv6 peer.

**show ipv6 bgp neighbors policy ipv6_address**

---

**Syntax Definitions**

*ipv6_address* The 128-bit IPv6 address.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

This command displays all of the configured policies for the router, or the policies configured for a specific BGP IPv6 peer.

---

**Examples**

```
-> show ipv6 bgp neighbors policy
Neighbor address = 2001::1,
    Neighbor autonomous system = 1,
    Neighbor output policy map name = <none>,
    Neighbor input policy map name = <none>,
    Neighbor output aspath-list name = <none>,
    Neighbor input aspath-list name = <none>,
    Neighbor output prefix-list name = <none>,
    Neighbor input prefix-list name = <none>,
    Neighbor output community-list name = <none>,
    Neighbor input community-list name = <none>,
    Neighbor soft reconfiguration = enabled
    Neighbor output prefix6-list name = <none>,
    Neighbor input prefix6-list name = <none>
```

---

**output definitions**

- **Neighbor autonomous system** The AS to which the peer is assigned. This can be assigned by using the `ipv6 bgp neighbor remote-as` command.

- **Neighbor output policy map name** The outbound route map policy for the peer. This can be assigned by using the `ipv6 bgp neighbor route-map` command.
**Neighbor input policy map name**
The inbound route map policy for the peer. This can be assigned by using the `ipv6 bgp neighbor route-map` command.

**Neighbor output aspath-list name**
The outbound AS path list policy for the peer. This can be assigned by using the `ipv6 bgp neighbor out-aspathlist` command.

**Neighbor input aspath-list name**
The inbound AS path list policy for the peer. This can be assigned by using the `ipv6 bgp neighbor in-aspathlist` command.

**Neighbor output prefix-list name**
The outbound prefix list policy for the peer. This can be assigned by using the `ipv6 bgp neighbor out-prefixlist` command.

**Neighbor input prefix-list name**
The inbound prefix list policy for the peer. This can be assigned by using the `ipv6 bgp neighbor in-prefixlist` command.

**Neighbor output community-list name**
The outbound community list policy for the peer. This can be assigned by using the `ipv6 bgp neighbor out-communitylist` command.

**Neighbor input community-list name**
The inbound community list policy for the peer. This can be assigned by using the `ipv6 bgp neighbor in-communitylist` command.

**Neighbor soft reconfiguration**
Lists whether soft reconfigurations are enabled or disabled for this peer. This is configured using the `ipv6 bgp neighbor soft-reconfiguration` command.

**Neighbor output prefix6-list name**
The outbound prefix6-list policy for the peer. This is configured using the `ipv6 bgp neighbor out-prefix6list` command.

**Neighbor input prefix6-list name**
The inbound prefix6-list policy for the peer. This is configured using the `ipv6 bgp neighbor in-prefix6list` command.

**Release History**
Release 7.1.1; command was introduced.

**show ipv6 bgp neighbors timers**

Displays the timers for configured IPv6 BGP peers.

*Syntax*

```plaintext
show ipv6 bgp neighbors timers [ipv6_address]
```

**Syntax Definitions**

- `ipv6_address`: The 128-bit IPv6 address.

**Defaults**

By default, the timer values for all the IPv6 BGP peers will be displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `ipv6_address` parameter to display the timer value for a specified IPv6 BGP peer.

**Examples**

```
--> show ipv6 bgp neighbors timers
```

**output definitions**

- **Nbr address**: The IPv6 address for this BGP peer. Assign this address using the `ipv6 bgp neighbor` command.
- **As**: The autonomous system to which this peer belongs. A peer’s AS number is assigned using the `ipv6 bgp neighbor remote-as` command.
- **Hold**: The actual negotiated hold time value.
- **Hold (C)**: The hold time value. This value is configured using the `ipv6 bgp neighbor timers` command.
**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

Server Load Balancing (SLB) allows clients to send requests to servers logically grouped together in clusters. Each cluster logically aggregates a set of servers running identical applications with access to the same content (for example, web servers). Clients access clusters through the use of a Virtual IP (VIP) address.

MIB information for the SLB commands is as follows:

<table>
<thead>
<tr>
<th>Filename</th>
<th>ALCATEL-IND1-SLB-MIB.mib</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module</td>
<td>alcatelIND1SLBMIB</td>
</tr>
</tbody>
</table>

A summary of available commands is listed here:

</tbody>
</table>

Usage Guidelines

Disabling the administrative status for the SLB feature does not delete the SLB configuration from the switch. The next time the feature is enabled, the existing configuration becomes active.

Examples

-> ip slb admin-state enable
-> ip slb admin-state disable

Release History

Release 7.1.1; command introduced.
Related Commands

- **show ip slb**: Displays the status of Server Load Balancing on a switch.
- **ip slb cluster**: Configures a Server Load Balancing cluster on a switch.
- **ip slb server ip cluster**: Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

MIB Objects

- **slbFeatureGroup**
- **slbAdminStatus**
**ip slb reset statistics**

Resets SLB statistics for all clusters configured on the switch.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Note that the *qos apply* command resets both QoS statistics and SLB cluster statistics. The *ip slb reset statistics* command only resets SLB statistics.

**Examples**

`-> ip slb reset statistics`

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `show ip slb clusters`: Displays the status and configuration of all Server Load Balancing clusters on a switch.
- `show ip slb cluster`: Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.

**MIB Objects**

- `slbFeatureGroup`: Provides information about the SLB feature.
- `slbResetStatistics`: Contains information about the reset of SLB statistics.
ip slb cluster

Configures a Server Load Balancing (SLB) cluster on a switch.

**ip slb cluster** name {vip ip_address | condition string} [l3 | l2]

**no ip slb cluster** name

---

**Syntax Definitions**

- **name**
  The name of the Server Load Balancing (SLB) cluster. The name can consist a maximum of 23 characters. Names with spaces must be enclosed within quotation marks (for example, “mail server”).

- **ip_address**
  The Virtual IP (VIP) address for the Server Load Balancing cluster. This IP address must be in dotted decimal format.

- **string**
  The name of an existing QoS policy condition that identifies the Server Load Balancing cluster.

- **l3**
  Specifies Layer 3 Server Load Balancing mode. The source and destination MAC and TTL of each packet is modified before the packet is bridged or routed to the server.

- **l2**
  Specifies Layer 2 Server Load Balancing mode. Packets are not modified before they are bridged to the server. This parameter is only available when using the **condition** parameter.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>l3</td>
<td>l3</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Use the **no** form of this command to delete a Server Load Balancing cluster.

- Once a cluster is created, the Virtual IP or condition cannot be modified. To modify these values, delete the cluster and re-create the cluster with the different VIP and conditions.

- The VIP address of the SLB cluster **must** be an address that is in the same subnet as the servers.
Specifying the l3 parameter when configuring a VIP cluster is not required. VIP clusters only use the Layer-3 mode to route traffic to the servers. Layer-2 mode is not supported with this type of cluster.

The QoS policy condition must exist before it is assigned to an SLB cluster. Use the policy condition command to create the QoS policy condition. See the “QoS Policy Commands” chapter for more information.

SLB clusters are not active if the Server Load Balancing feature is disabled for the switch. Use the ip slb admin-state command to enable this feature.

Note. It is possible to configure clusters and add or remove servers from a cluster even when SLB is disabled for the switch.

Examples

-> ip slb cluster corporate_servers vip 1.2.3.4
-> ip slb cluster "mail servers" vip 1.2.3.6
-> ip slb cluster cluster_1 condition intranet_cond l2
-> ip slb cluster cluster_2 condition slb_cond l3
-> no ip slb cluster hr_servers

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters
Displays the status and configuration of all Server Load Balancing clusters on a switch.

show ip slb cluster
Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.

ip slb admin-state
Enables or disables Server Load Balancing on a switch.

ip slb server ip cluster
Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

MIB Objects

slbClusterTable
  slbClusterName
  slbClusterVIP
  slbClusterRowStatus
  slbClusterPackets
  slbClusterCondition
  slbClusterType
ip slb cluster admin-state

Administratively enables or disables a Server Load Balancing (SLB) cluster on a switch.

`ip slb cluster cluster_name admin-state {enable | disable}

Syntax Definitions

- `cluster_name` The name of an existing Server Load Balancing cluster.
- `enable` Administratively enables a Server Load Balancing cluster on a switch.
- `disable` Administratively disables a Server Load Balancing cluster on a switch.

Defaults

By default, a cluster is administratively enabled when the cluster is created.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

The SLB cluster name specified with this command must already exist in the switch configuration.

Examples

- `-> ip slb cluster hr_servers admin-state enable`
- `-> ip slb cluster "mail servers" admin-state disable`

Release History

Release 7.1.1; command introduced.
Related Commands

- **show ip slb clusters**: Displays the status and configuration of all Server Load Balancing clusters on a switch.
- **show ip slb cluster**: Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
- **ip slb cluster**: Configures Server Load Balancing clusters.
- **ip slb server ip cluster**: Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

MIB Objects

- slbClusterTable
  - slbClusterAdminStatus
**ip slb cluster ping period**

Modifies the number of seconds to check the health of the servers in a Server Load Balancing (SLB) cluster.

```
ip slb cluster cluster_name ping period seconds
```

### Syntax Definitions

- **cluster_name**: The name of the Server Load Balancing cluster.
- **seconds**: The number of seconds for the ping period. Specifying 0 (zero) disables the ping.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>60</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/X48C4E/V48C8/C32/T24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Platform</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you do not set the ping period to zero, then the ping period must be greater than or equal to the ping timeout value divided by 1000. Use the **ip slb cluster ping timeout** command to modify the ping timeout value.

### Examples

```
-> ip slb cluster hr_servers ping period 120
-> ip slb cluster "mail servers" ping period 0
```

### Release History

Release 7.1.1; command introduced.
**Related Commands**

- **show ip slb clusters**
  Displays the status and configuration of all Server Load Balancing clusters on a switch.

- **show ip slb cluster**
  Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.

- **ip slb cluster ping timeout**
  Modifies the ping timeout value.

- **ip slb cluster ping retries**
  Modifies the number of ping retries.

**MIB Objects**

- **slbClusterTable**
  slbClusterPingPeriod
ip slb cluster ping timeout

Configures the ping timeout value for a Server Load Balancing (SLB) cluster before it retries.

```
ip slb cluster cluster_name ping timeout milliseconds
```

**Syntax Definitions**

- `cluster_name` The name of the Server Load Balancing cluster.
- `milliseconds` The number of milliseconds for the ping timeout. The valid range for the ping timeout value is 0 to 1000 times the ping period. For example, if the ping period is 10 seconds, then maximum value for the ping timeout is 10000.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>milliseconds</td>
<td>3000</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `ip slb cluster ping period` command to modify the ping period value.

**Examples**

- `-> ip slb cluster "mail servers" ping timeout 1000`
- `-> ip slb cluster hr_servers ping timeout 6000`

**Release History**

Release 7.1.1; command introduced.

  Modifies the ping period value.

- **ip slb cluster ping timeout**
  Modifies the ping timeout value.

MIB Objects

- **slbClusterTable**
  - **slbClusterPingRetries**
**ip slb cluster probe**

Configures a probe for a Server Load Balancing (SLB) cluster.

```
ip slb cluster cluster_name probe probe_name
```

**Syntax Definitions**

- `cluster_name`  The name of the Server Load Balancing cluster.
- `probe_name`    The name of the Server Load Balancing (SLB) probe.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must create the probe with the `ip slb probe` before you can use this command.

**Examples**

```
-> ip slb cluster mail_servers probe mail_server_probe
```

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `show ip slb clusters` Displays the status and configuration of all Server Load Balancing clusters on a switch.
- `ip slb probe` Configures and deletes SLB probes.
- `show ip slb cluster` Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
- `ip slb server ip cluster` Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

**MIB Objects**

- `slbClusterTable`
slbClusterProbeName
**ip slb server ip cluster**

Adds a physical server to a Server Load Balancing (SLB) cluster, deletes a physical server from an SLB cluster, or modifies the administrative status of a physical server in an SLB cluster.

```
ip slb server ip ip_address cluster cluster_name [admin-state {enable | disable}] [weight weight]
no ip slb server ip ip_address cluster cluster_name
```

**Syntax Definitions**

- `ip_address` The IP address for the physical server.
- `cluster_name` The name of an existing Server Load Balancing cluster.
- `enable` Enables a server.
- `disable` Disables a server.
- `weight` Specifies the weight of the server.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>enable</td>
</tr>
<tr>
<td>weight</td>
<td>1</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove a physical server from a Server Load Balancing cluster.

- Use the weight parameter to assign the server preference value. Each server or server cluster can be assigned a weight to set their preference value for distribution of incoming network traffic. The weights assigned are relative. For example, if Servers A and B have respective weights of 10 and 20 within a cluster, Server A would get half the traffic of Server B.

- Assigning a weight of 0 (zero) to a server prevents the server from being assigned any new connections. This server is a backup server.

- A higher weight value indicates that the server can accept more network traffic.
**Examples**

-> ip slb server ip 10.255.11.127 cluster corporate_servers
-> ip slb server ip 10.255.11.109 cluster "mail servers" admin-state enable weight 5
-> no ip slb server ip 10.255.11.105 cluster hr_servers

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

**MIB Objects**

- slbProbeTable
  - slbProbeName
  - slbProbeMethod
  - slbProbePort
ip slb probe retries

Configures the number of Server Load Balancing (SLB) probe retries that are performed before deciding that a server is out of service.

```
ip slb probe probe_name {ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp} retries retries
```

Syntax Definitions

- `probe_name`: Specifies the name of the Server Load Balancing probe.
- `ftp`: Specifies an FTP probe.
- `http`: Specifies an HTTP probe.
- `https`: Specifies an HTTPS probe.
- `imap`: Specifies an IMAP probe.
- `imaps`: Specifies an IMAPS probe.
- `nntp`: Specifies an NNTP probe.
- `ping`: Specifies a ping probe.
- `pop`: Specifies a POP probe.
- `pops`: Specifies a POPS probe.
- `smtp`: Specifies an SMTP probe.
- `tcp`: Specifies a TCP probe.
- `udp`: Specifies a UDP probe.
- `retries`: Specifies the number of retries.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>

<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

N/A

Examples

-> show ip slb

Admin status : Enabled,
Operational status : In Service,
Number of clusters = 3

output definitions

Admin status The current administrative status of Server Load Balancing (SLB) on this switch (Enabled or Disabled).
Operational status The current operational status of Server Load Balancing (SLB) on this switch, which is either In service (at least one SLB cluster is in service) or Out of service (all SLB clusters are out of service).
Number of clusters The total number of Server Load Balancing (SLB) clusters on this switch.

Release History

Release 7.1.1; command introduced.
Related Commands

**show ip slb servers**  
Displays the status of all physical servers belonging to Server Load Balancing clusters on a switch.

**show ip slb clusters**  
Displays the status and configuration of all Server Load Balancing clusters on a switch.

**show ip slb cluster**  
Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.

**show ip slb cluster server**  
Displays detailed status and configuration information for a single physical server in a Server Load Balancing cluster.

MIB Objects

**slbFeature**

- **slbAdminStatus**
- **slbOperStatus**
- **slbClustersCount**
show ip slb clusters

Displays the status and basic configuration for all Server Load Balancing (SLB) clusters on a switch. This command also displays traffic statistics for QoS policy condition clusters.

show ip slb clusters [statistics]

Syntax Definitions

statistics Displays SLB statistics for QoS policy condition clusters.

Defaults

By default, the status and basic configuration for all clusters is displayed; statistics are not shown.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the statistics parameter to display the total number of packets that were passed to clusters because they met the QoS condition criteria configured for that cluster. The polling interval used to obtain such statistics is every 15 minutes. See the second example below.

Examples

-> show ip slb clusters

<table>
<thead>
<tr>
<th>Cluster Name</th>
<th>VIP/COND</th>
<th>Admin Status</th>
<th>Operational Status</th>
<th># Srv</th>
<th>% Avail</th>
</tr>
</thead>
<tbody>
<tr>
<td>WorldWideWeb</td>
<td>128.241.130.204</td>
<td>Enabled</td>
<td>In Service</td>
<td>3</td>
<td>95</td>
</tr>
<tr>
<td>Intranet</td>
<td>128.241.130.205</td>
<td>Enabled</td>
<td>In Service</td>
<td>2</td>
<td>100</td>
</tr>
<tr>
<td>FileTransfer</td>
<td>128.241.130.206</td>
<td>Enabled</td>
<td>Out of Service</td>
<td>2</td>
<td>50</td>
</tr>
</tbody>
</table>

output definitions

Cluster Name The name of the SLB cluster.

VIP/COND The virtual IP (VIP) address or the policy condition name for the SLB cluster.

Admin Status The administrative status of the SLB cluster (Enabled or Disabled).

Operational Status The operational status of the SLB cluster; In Service (at least one physical server is operational in the cluster) or Out of Service.
Server Load Balancing Commands

```
-> show ip slb clusters statistics

<table>
<thead>
<tr>
<th>Cluster Name</th>
<th>Admin Status</th>
<th>Operational Status</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cluster1</td>
<td>Enabled</td>
<td>In Service</td>
<td>4 Servers</td>
</tr>
<tr>
<td>Cluster2</td>
<td>Enabled</td>
<td>In Service</td>
<td>4 Servers</td>
</tr>
</tbody>
</table>

Src Port 2/49
```

**output definitions**

<table>
<thead>
<tr>
<th># Srv</th>
<th>The total number of physical servers that belong to the SLB cluster.</th>
</tr>
</thead>
<tbody>
<tr>
<td>% Avail</td>
<td>The percentage of time that the physical server has been available for processing client requests. In other words, the actual ratio of up time (In Service plus Retrying) versus down time (No Answer plus Link Down). Please note that the Disabled and the initial Discovery states are not counted as down time.</td>
</tr>
</tbody>
</table>

**output definitions (continued)**

Cluster Name

The name of the SLB cluster. This field also contains the administrative and operational status for the cluster and either the VIP address or QoS policy condition value that identifies the cluster.

Admin Status

The administrative state of this physical server (Enabled or Disabled).

Operational Status

The operational state of this server. The possible states are described as follows:

- **Disabled** (this server is administratively disabled).
- **No Answer** (this server has not responded to ping requests).
- **Link Down** (there is a bad connection to this server).
- **In Service** (this server is used for SLB cluster client connections).
- **Discovery** (the SLB cluster is pinging this physical server).
- **Retrying** (the SLB cluster is making another attempt to bring up this server).

Count

The total number of physical servers that belong to the cluster, and the total number of packets serviced by the cluster.

Dst

The destination Virtual IP address assigned to the cluster.

Src

Source IP address assigned to the cluster.

Src Port

Source slot and port number of the SLB cluster.

**Release History**

Release 7.1.1; command introduced.
Related Commands

- `ip slb reset statistics`  Resets SLB statistics for all clusters.
- `show ip slb cluster`  Displays detailed status and configuration information for a single SLB cluster.

**show ip slb cluster server**

Displays detailed statistics and configuration information for a single physical server in a Server Load Balancing (SLB) cluster.

**show ip slb cluster name server ip_address**

---

**Syntax Definitions**

- **name**: Specifies the name of the SLB cluster.
- **ip_address**: Specifies the IP address for the physical server.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Specifying a value for the *name* and *ip_address* parameters is required.

**Examples**

```bash
-> show ip slb cluster Intranet server 128.220.40.4
Cluster cl1
  VIP 128.220.40.205
  Server 128.220.40.4
    Admin status         : Enabled,
    Oper status          : In Service,
    Probe                = phttp,
    Availability time (%) = 95,
    Ping failures        = 0,
    Last ping round trip time (milliseconds) = 20
    Probe status         = ,
```

**output definitions**

- **Cluster**: The name of the Server Load Balancing (SLB) cluster.
- **VIP**: The virtual IP (VIP) address for this Server Load Balancing (SLB) cluster.
- **Server**: The IP address for this physical server.
**output definitions (continued)**

<table>
<thead>

<td>The period (in seconds) to check the health of servers.</td>
</tr>
<tr>
<td>Retries</td>
<td>The number of probe retries before deciding that a server is out of service.</td>
</tr>
<tr>
<td>Timeout</td>
<td>The timeout (in seconds) used to wait for probe answers.</td>
</tr>
<tr>
<td>Method</td>
<td>The type of probe.</td>
</tr>
</tbody>
</table>
The name of a probe that is not an HTTP/HTTPS probe is specified:

-> show ip slb probes mail_server

Probe mail_server
  Type = SMTP,
  Period (seconds) = 60,
  Timeout (milliseconds) = 3000,
  Retries = 3,
  Port = 0,

The name of an HTTP/HTTPS probe is specified:

-> show ip slb probes phttp

Probe phttp
  Type = HTTP,
  Period (seconds) = 60,
  Timeout (milliseconds) = 3000,
  Retries = 3,
  Port = 0,
  Username = ,
  Password = ,
  Expect = ,
  Status = 200,
  URL = /,

32 IP Multicast Switching Commands

IP Multicast Switching (IPMS) is a one-to-many communication technique employed by emerging applications such as video distribution, news feeds, conferencing, netcasting, and resource discovery (OSPF, RIP2, and BOOTP). Unlike unicast, which sends one packet per destination, multicast sends one packet to all devices in any subnetwork that has at least one device requesting the multicast traffic.

The OmniSwitch IPMS software is compatible with the following RFCs:

- RFC 1112 — Host Extensions for IP Multicasting
- RFC 2236 — Internet Group Management Protocol, Version 2
- RFC 2933 — Internet Group Management Protocol MIB
- RFC 3376 — Internet Group Management Protocol, Version 3

The OmniSwitch IPv6MS software is compatible with the following RFCs:

- RFC 2710 — Multicast Listener Discovery for IPv6
- RFC 3019 — IPv6 MIB for Multicast Listener Discovery Protocol
- RFC 3810 — Multicast Listener Discovery Version 2 for IPv6

MIB information for the IPMS and IPv6MS commands is as follows:

Filename: ALCATEL-IND1-IPMS-MIB.mib
Module: alcatelIND1pmsMIB
The following table summarizes the available IP and IPv6 multicast commands:

<table>
<thead>

</table>
ip multicast admin-state

Enables or disables IP Multicast Switching and Routing on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] admin-state [enable | disable]

no ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] admin-state

Syntax Definitions

- **vlan_id[-vlan_id2]**: VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
- **service_id[-service_id2]**: SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 6570M.*
- **enable**: Enable IP Multicast Switching.
- **disable**: Disable IP Multicast Switching.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The configuration of an IP multicast routing protocol on an IP interface operationally triggers IP Multicast Switching and Routing functionality on any underlying VLAN or SPB service. This occurs regardless of any explicit IPMS configuration, such as attempting to specifically disable IPMS.

- If there is no IP Multicast routing protocol already running on the switch, then the **ip multicast admin-state** or the **ipv6 multicast admin-state** command alone controls IPMS operations.

- Enabling IPMS on individual VLANs or services, as needed, is recommended to conserve switch resources.
- If IPMS is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.

**Note.** Globally enabling the IPMS status for the switch only applies to the VLAN domain (does not apply to the service domain). As a result, IPMS must be explicitly enabled or disabled for each SPB service. However, globally disabling IPMS for all SPB services is supported.

- Use the `no` form of this command to restore the IP Multicast Switching and Routing status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

**Examples**

-> ip multicast admin-state enable
-> ip multicast admin-state disable
-> no ip multicast admin-state
-> ip multicast vlan 2 admin-state enable
-> ip multicast vlan 3-5 admin-state disable
-> no ip multicast vlan 2 admin-state
-> no ip multicast vlan 3-5 admin-state
-> ip multicast service 10 admin-state enable
-> ip multicast service 11-15 admin-state disable
-> no ip multicast service 10 admin-state
-> no ip multicast service 11-15 admin-state

**Release History**

Release 7.1.1; command was introduced.
Release 8.4.1; `service` parameter added.

**Related Commands**

- `show ip multicast` Displays the IP Multicast Switching and Routing status and general configuration parameters.

**MIB Objects**

alaIpmsConfigValue
alaIpmsConfigStatus
ip multicast flood-unknown

Enables or disables the flooding unknown multicast traffic for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified. When a traffic flow is first seen on a port, there is a brief period of time where traffic may get dropped before the forwarding information is calculated. When flooding unknown multicast traffic is enabled, no packets are dropped before the forwarding information is available.

```
ip multicast [vlan vlan_id][-vlan_id2] | service service_id[-service_id2] flood-unknown [enable | disable]
no ip multicast [vlan vlan_id][-vlan_id2] | service service_id[-service_id2] flood-unknown
```

**Syntax Definitions**

- `vlan_id[-vlan_id2]` VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
- `service_id[-service_id2]` SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560, or OmniSwitch 6570M.*
- `enable` Enable flooding of unknown traffic until it is learned.
- `disable` Disable flooding of unknown traffic.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
<tr>
<td>disable</td>
<td></td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If this command function is enabled after the system is up and running, the flooding of unknown multicast traffic only applies to new flows.
- If the flooding of unknown traffic is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
On an OmniSwitch 6860, OmniSwitch 6865, and OmniSwitch 6900:

- The flood unknown behavior configured for any VLAN is enforced only on that VLAN. However, when the behavior is configured with the IPv6 multicast version of this command (ipv6 multicast flood-unknown) for any VLAN, the flood unknown behavior is enforced globally across all VLANs.
- IPv4 multicast snooping for VLANs does not snoop 224.0.0.0/24 and the traffic is allowed to flood even if the flooding of unknown multicast traffic is disabled. Avoid using any multicast groups that map to the excluded IPv4 addresses.
- When IPv4 multicast snooping is enabled for any service, the flooding of unknown multicast traffic is unconditionally enforced for all snooping services; this is the only supported flood unknown behavior for services.
- IPv4 multicast snooping for services does not snoop MAC addresses that fall within the range of 01:00:5e:00:00:00/40 and 33:33:00:00:00:00/40 and the traffic is allowed to flood even if the flooding of unknown multicast traffic is disabled. Avoid using any multicast groups that map to the excluded MAC addresses.

On an OmniSwitch 9900, IPv4 multicast snooping for VLANs or services does not snoop 224.0.0.0/24 and the traffic is allowed to flood even if the flooding of unknown multicast traffic is disabled. Avoid using any multicast groups that map to these excluded IPv4 addresses.

- Use this command to provide an "open failure" strategy for when hardware resource conflicts or software limits prevent the traffic from being registered in the fast path.
- Use the no form of this command to restore the flooding of unknown traffic back to the default value (disabled) on the system or the specified VLAN.

**Examples**

```plaintext
-> ip multicast flood-unknown enable
-> ip multicast flood-unknown disable

```

**Release History**

Release 8.3.1; command introduced.
Release 8.4.1.R02; service parameter added.
Related Commands

**show ip multicast**  Displays the IP Multicast Switching and Routing status and general configuration parameters.

MIB Objects

alaIpmsConfigTable
  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigFloodUnknown
**ip multicast version**

Sets the default version of the IGMP protocol on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

```
ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] version [version]
no ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] version
```

**Syntax Definitions**

- `vlan_id[-vlan_id2]` VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
- `service_id[-service_id2]` SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560, or OmniSwitch 6570M.*
- `version` Default IGMP protocol version to run. Valid range is 1–3.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>2</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- IP Multicast Switching and Routing must be enabled to set the default IGMP protocol version on the system and/or the specified VLANs or SPB services.
- If the default IGMP protocol version is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Due to protocol inter-operation requirements, this command specifies only a default version of the IGMP protocol to run.
- Use the **no** form of this command to restore the IGMP multicast version back to the default value (version 2) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, `ip multicast version 0`).
**Examples**

-> ip multicast version 3  
-> ip multicast version 0  
-> no ip multicast version  
-> ip multicast vlan 2 version 3  
-> ip multicast vlan 3-5 version 3  
-> ip multicast vlan 2 version 0  
-> no ip multicast vlan 2 version  
-> no ip multicast vlan 3-5 version  
-> ip multicast service 2 version 3  
-> ip multicast service 3-5 version 3  
-> ip multicast service 2 version 0  
-> no ip multicast service 2 version  
-> no ip multicast service 3-5 version

**Release History**

Release 7.1.1; command was introduced.  
Release 8.4.1; service parameter added.

**Related Commands**

**show ip multicast** Displays the IP Multicast Switching and Routing status and general configuration parameters.

**MIB Objects**

alaIpmsConfigTable
  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigVersion
**ip multicast port max-group**

Configures the maximum group limit learned per port or per Service Access Point (SAP) port. The group limit is applicable to all VLAN instances associated with the specified port or all Shortest Path Bridging (SPB) service instances associated with the specified SAP port.

```
ip multicast {port chassis/slot/port | sap port sap_id} max-group [num] [action {none | drop | replace}]
```

### Syntax Definitions

- **chassis**
  - The chassis identifier.
- **slot/port**
  - The slot and port number (3/1).
- **sap_id**
  - The SAP ID (chassis/slot/port:encapsulation). *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560, or OmniSwitch 6570M.*
- **num**
  - The maximum IGMP group count. Valid range is 0–4294967295.
- **none**
  - Disables the maximum group limit configuration.
- **drop**
  - Drops the incoming membership request.
- **replace**
  - Replaces an existing membership with the incoming membership request. A leave is not sent to the router for the replaced group.

### Defaults

By default, the maximum group limit is set to zero.

<table>
<thead>
<tr>
<th>parameter</th>
<th>defaults</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>none</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- If group memberships are already registered on a port/VLAN or SAP port/SPB service instance and the group limit is set to a lower value for the instance, the current group memberships are not removed until they expire. The effect of the new lower group limit value is applied when one of the following occurs to help avoid any undetermined behavior:
  - IP multicast memberships are aged out on a port/VLAN or SAP port/SPB service instance.
  - IP multicast memberships are pruned by a leave or when IP multicast is disabled on the specific VLAN or SPB service or globally disabled for the switch.
• If the `num` and `action` parameters are not specified, then the limit is removed.

• When using the `sap port` parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, `ip multicast sap port 1/1/23:10 max-group 10 action drop`, where 1/1/23:10 is the SAP ID).

• A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to Chapter 10, “Service Manager Commands,” for more information.

• IGMP zapping must be enabled when the maximum group limit is enabled and the action is set to drop.

• Configuring a maximum group limit is allowed even when the IP multicast status is disabled.

• The maximum group configuration is applied in the following order of precedence (listed from highest to lowest precedence):
  – Group limit configured for a port or an SPB SAP port.
  – Group limit configured for a specific VLAN or SPB service.
  – Group limit configured for the IPMS profile assigned to a VLAN or SPB service.
  – Group limit configured for a VLAN or SPB service within a specific VRF context.
  – Group limit configured for the IPMS profile assigned to a VLAN or SPB service within a specific VRF context.

**Examples**

```
-> ip multicast port 1/1/12 max-group 10 action drop
-> ip multicast port 1/1/14 max-group 20 action replace
-> ip multicast port 1/1/14 max-group

-> ip multicast sap port 1/1/23:10 max-group 10 action drop
-> ip multicast sap port 1/1/26:20.200 max-group 20 action replace
-> ip multicast sap port 1/1/16:20.200 max-group
```

**Release History**

Release 7.1.1; command was introduced.
Release 8.4.1; `sap port` parameter added.

**Related Commands**

- `show ip multicast` Displays the IP Multicast Switching and Routing status and general configuration parameters.
- `show ip multicast port` Displays the maximum group configuration for VLAN ports or SPB service SAP ports.

**MIB Objects**

- `alaIpmsIntfTable` `alaIpmsIntfConfigType` `alaIpmsIntfAddressType` `alaIpmsIntfMaxGroupLimit` `alaIpmsIntfMaxGroupExceedAction`
**ip multicast max-group**

Configures the maximum group limit learned per port for the specified VLAN, Shortest Path Bridging (SPB) service, or per port on the system if no VLAN or SPB service is specified. The limit is applied to each port that is a member of the given VLAN or SPB service and the specified action is taken when the limit is exceeded.

```
ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] max-group [num] [action {none | drop | replace}]
```

**Syntax Definitions**

- `vlan_id[-vlan_id2]` VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
- `service_id[-service_id2]` SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560, or OmniSwitch 6570M.*
- `num` The maximum IGMP group count. Valid range is 0–4294967295.
- `none` Disables the maximum group limit configuration.
- `drop` Drops the incoming membership request.
- `replace` Replaces an existing membership with the incoming membership request.

**Defaults**

By default, the maximum group limit is set to zero.

<table>
<thead>
<tr>
<th>parameter</th>
<th>defaults</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>none</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If a VLAN or SPB service is not specified, this command configures the global maximum group limit applied to all VLAN ports and SPB Service Access Point (SAP) ports.
- If a VLAN is specified, this command configures the maximum group limit learned per port on a VLAN. The limit is applied to each port that is a member of the given VLAN.
• If an SPB service is specified, this command configures the maximum group limit learned per SAP port on a service. The limit is applied to each SAP port that is a member of the given SPB service.

• Configuring a maximum group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN or SAP port/SPB service instance

• If the num and action parameters are not specified, then the limit is removed.

• The maximum group configuration on a VLAN or SPB service will override the global configuration.

• The maximum group configuration is applied in the following order of precedence (listed from highest to lowest precedence):
  – Group limit configured for a port or an SPB SAP port.
  – Group limit configured for a specific VLAN or SPB service.
  – Group limit configured for the IPMS profile assigned to a VLAN or SPB service.
  – Group limit configured for a VLAN or SPB service within a specific VRF context.
  – Group limit configured for the IPMS profile assigned to a VLAN or SPB service within a specific VRF context.

• IGMP zapping must be enabled when the maximum group limit is enabled and the action is to drop incoming membership requests.

**Examples**

```
-> ip multicast max-group 10 action drop
-> ip multicast max-group 20 action replace
-> ip multicast max-group
-> ip multicast vlan 10 max-group 10 action drop
-> ip multicast vlan 20 max-group action drop
-> ip multicast vlan 11-15 max-group 10 action replace
-> ip multicast vlan 10 max-group
-> ip multicast vlan 11-15 max-group
-> ip multicast service 5 max-group 10 action drop
-> ip multicast service 20 max-group action drop
-> ip multicast service 10-15 max-group 10 action replace
-> ip multicast service 5 max-group
-> ip multicast service 10-15 max-group
```

**Release History**

  alaIpmsConfigMaxGroupExceedAction
**ip multicast static-neighbor**

Creates a static IGMP neighbor entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

```plaintext
ip multicast static-neighbor vlan vlan_id {port chassis/slot/port | linkagg agg_id}
ip multicast static-neighbor service service_id sap {port | linkagg} {sap_id}
no ip multicast static-neighbor vlan vlan_id {port chassis/slot/port | linkagg agg_id}
no ip multicast static-neighbor service service_id sap {port | linkagg} {sap_id}
```

**Syntax Definitions**

- `vlan_id`: VLAN to include as a static IGMP neighbor.
- `chassis`: The chassis identifier.
- `slot/port`: The slot and port number to configure as a static IGMP neighbor.
- `agg_id`: The link aggregate ID number to configure as a static IGMP neighbor.
- `service_id`: SPB service ID to include as a static IGMP neighbor. The valid range is 1–32767. This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560, or OmniSwitch 6570M.
- `sap_id`: The SAP ID (chassis/slot/port:encapsulation). This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560, or OmniSwitch 6570M.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove an IGMP static neighbor entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an IGMP static neighbor entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive all of the IGMP traffic and IPv4 multicast traffic.
- To create an IGMP static neighbor entry on a link aggregate, use the `linkagg` parameter (for example, `ip multicast static-neighbor vlan 2 linkagg 7` or `ip multicast static-neighbor service 10 sap linkagg 10:100`).
- When using the sap port parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, `ip multicast static-neighbor service 10 sap port 1/1/23:10`, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to Chapter 10, “Service Manager Commands,” for more information.

### Examples

```
-> ip multicast static-neighbor vlan 4 port 1/1/5
-> no ip multicast static-neighbor vlan 4 port 1/1/5
-> ip multicast static-neighbor vlan 4 linkagg 7
-> no ip multicast static-neighbor vlan 4 linkagg 7

-> ip multicast static-neighbor service 10 sap port 1/1/2:100
-> no ip multicast static-neighbor service 10 sap port 1/1/2:100
-> ip multicast static-neighbor service 10 sap linkagg 10:100
-> no ip multicast static-neighbor service 10 sap linkagg 10:100
```

### Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **linkagg** parameter was introduced.
Release 8.4.1; **service** and **sap** parameters added.

ip multicast static-querier

Creates a static IGMP querier entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

Syntax:
ip multicast static-querier vlan vlan_id {port chassis/slot/port | linkagg agg_id}  
ip multicast static-querier service service_id sap {port | linkagg} {sap_id}  
no ip multicast static-querier vlan vlan_id {port chassis/slot/port | linkagg agg_id}  
no ip multicast static-querier service service_id sap {port | linkagg} {sap_id}

Syntax Definitions:

- **vlan_id**: VLAN to include as a static IGMP querier.
- **chassis**: The chassis identifier.
- **slot|port**: The slot and port number to configure as a static IGMP querier.
- **agg_id**: The link aggregate ID number to configure as a static IGMP querier.
- **service_id**: SPB service ID to include as a static IGMP querier. The valid range is 1–32767. This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560, or OmniSwitch 6570M.
- **sap_id**: The SAP ID (chassis/slot/port:encapsulation). This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560, or OmniSwitch 6570M.

Defaults:

N/A

Platforms Supported:

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines:

- Use the no form of this command to remove an IGMP static querier entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.

- Creating an IGMP static querier entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive all of the IGMP traffic.

- To create an IGMP static querier entry on a link aggregate, use the linkagg parameter (for example, ip multicast static-querier vlan 2 linkagg 7 or ip multicast static-querier service 10 sap linkagg 10:100).
When using the `sap port` parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, `ip multicast static-querier service 10 sap port 1/1/23:10`, where 1/1/23:10 is the SAP ID).

A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to Chapter 10, “Service Manager Commands,” for more information.

**Examples**

```
-> ip multicast static-querier vlan 4 port 1/1/2
-> no ip multicast static-querier vlan 4 port 1/1/2
-> ip multicast static-querier vlan 4 linkagg 7
-> no ip multicast static-querier vlan 4 linkagg 7

-> ip multicast static-querier service 10 sap port 1/1/2:100
-> no ip multicast static-querier service 10 sap port 1/1/2:100
-> ip multicast static-querier service 10 sap linkagg 10:100
-> no ip multicast static-querier service 10 sap linkagg 10:100
```

**Release History**

Release 7.1.1; command was introduced.
Release 7.3.1; `linkagg` parameter was added.
Release 8.4.1; `service` and `sap` parameters added.

**Related Commands**

`show ip multicast querier` Displays the IGMP querier table entries of IP Multicast Switching and Routing.

**MIB Objects**

- `alaIpmsStaticQuerierTable`
  - `alaIpmsStaticQuerierConfigType`
  - `alaIpmsStaticQuerierAddressType`
  - `alaIpmsStaticQuerierValue`
  - `alaIpmsStaticQuerierIfIndex`
  - `alaIpmsStaticQuerierSubValue`
  - `alaIpmsStaticQuerierRowStatus`
**ip multicast static-group**

Creates a static IGMP group entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

```plaintext
ip multicast static-group ip_address vlan vlan_id {port chassis/slot/port | linkagg agg_id}
ip multicast static-group ip_address service service_id sap {port | linkagg} {sap_id}
no ip multicast static-group ip_address vlan vlan_id {port chassis/slot/port | linkagg agg_id}
no ip multicast static-group ip_address service service_id sap {port | linkagg} {sap_id}
```

**Syntax Definitions**

- **ip_address**
  - The IP address of the multicast group.

- **vlan_id**
  - VLAN to include as a static IGMP group.

- **chassis**
  - The chassis identifier.

- **slot|port**
  - The slot and port number to configure as a static IGMP group.

- **agg_id**
  - The link aggregate ID number to configure as a static IGMP group.

- **service_id**
  - SPB service ID to include as a static IGMP group. The valid range is 1–32767. *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560, or OmniSwitch 6570M.*

- **sap_id**
  - The SAP ID (chassis/slot/port:encapsulation). *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560, or OmniSwitch 6570M.*

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove an IGMP static group entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.

- Creating an IGMP static group entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive IGMP traffic addressed to the specified IP multicast group address.
To create an IGMP static group entry on a link aggregate, use the `linkagg` parameter (for example, `ip multicast static-group 225.0.0.1 vlan 2 linkagg 7` or `ip multicast static-group 225.0.0.1 service 10 sap linkagg 10:100`).

When using the `sap port` parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, `ip multicast static-ququerier service 10 sap port 1/1/23:10`).

A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to Chapter 10, “Service Manager Commands,” for more information.

**Examples**

```
-> ip multicast static-group 229.10.10.10 vlan 4 port 1/1/2  
-> no ip multicast static-group 229.10.10.10 vlan 4 port 1/1/2 
-> ip multicast static-group 225.11.11.11 vlan 4 linkagg 7  
-> no ip multicast static-group 225.11.11.11 vlan 4 linkagg 7 

-> ip multicast static-group 229.10.10.10 service 10 sap port 1/1/2:100 
-> no ip multicast static-group 229.10.10.10 service 10 sap port 1/1/2:100 
-> ip multicast static-group 225.11.11.11 service 10 sap linkagg 10:100  
-> no ip multicast static-group 225.11.11.11 service 10 sap linkagg 10:100 
```

**Release History**

Release 7.1.1; command was introduced.  
Release 7.3.1; `linkagg` parameter was added.  
Release 8.4.1; `service` and `sap` parameters added.

**Related Commands**

- `show ip multicast group` Displays the IGMP group membership table entries of IP Multicast Switching and Routing for the specified IP multicast group address or all entries if no IP multicast group address is specified.

**MIB Objects**

  `alaIgmpStaticMemberRowStatus`
**ip multicast query-interval**

Sets the IGMP query interval on the specified VLAN, Shortest Path Bridging (SPB), or on the system if no VLAN or SPB service is specified.

```
ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2] query-interval [seconds]
```

```
no ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2] query-interval
```

### Syntax Definitions

- **vlan_id[-vlan_id2]**: VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
- **service_id[-service_id2]**: SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 6570M.*
- **seconds**: IGMP query interval in seconds. Valid range is 1–65535.

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP query interval on the system and/or the specified VLANs or SPB services.
- If the IGMP query interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The IGMP query interval refers to the time period between IGMP query messages.
- Due to protocol inter-operation requirements, this command specifies only a default version of the IGMP query interval to use.
- Use the **no** form of this command to restore the IGMP query interval back to the default value (125 seconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a
value of 0 with this command also restores the default value (for example, `ip multicast query-interval 0`).

**Examples**

-> `ip multicast query-interval 100`
-> `ip multicast query-interval 0`
-> `no ip multicast query-interval`
-> `ip multicast vlan 2 query-interval 100`
-> `ip multicast vlan 3-5 query-interval 100`
-> `ip multicast vlan 2 query-interval 0`
-> `no ip multicast vlan 2 query-interval`
-> `no ip multicast vlan 3-5 query-interval`
-> `ip multicast service 2 query-interval 100`
-> `ip multicast service 3-5 query-interval 100`
-> `ip multicast service 2 query-interval 0`
-> `no ip multicast service 2 query-interval`
-> `no ip multicast service 3-5 query-interval`

**Release History**

Release 7.1.1; command was introduced.
Release 8.4.1; `service` parameter added.

**Related Commands**

`show ip multicast` Displays the IP Multicast Switching and Routing status and general configuration parameters.

**MIB Objects**

alaIpmsConfigTable
alaIpmsConfigType
alaIpmsConfigAddressType
alaIpmsConfigValue
alaIpmsConfigQueryInterval
**ip multicast last-member-query-interval**

Sets the IGMP last member query interval value on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or service is specified.

```
ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] last-member-query-interval [tenths_of_seconds]
```

```
no ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] last-member-query-interval
```

**Syntax Definitions**

- **vlan_id[-vlan_id2]**: VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
- **service_id[-service_id2]**: SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560, or OmniSwitch 6570M.*
- **tenths_of_seconds**: IGMP last member query interval in tenths of seconds. The valid range is 1–65535.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>tenths_of_seconds</strong></td>
<td>10</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- IP Multicast Switching and Routing must be enabled to set the IGMP last member query interval on the system and/or the specified VLANs or SPB services.
- If the IGMP last member query interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The IGMP last member query interval refers to the time period to reply to an IGMP query message sent in response to a leave group message.
- Use the **no** form of this command to restore the IGMP last member query interval back to the default value (10 tenths-of-seconds) on the system, the specified VLAN, or the specified SPB service. In
addition, specifying a value of 0 with this command also restores the default value (for example, `ip multicast last-member-query-interval 0`).

**Examples**

```
-> ip multicast last-member-query-interval 22
-> ip multicast last-member-query-interval 0
-> no ip multicast last-member-query-interval
-> ip multicast vlan 2 last-member-query-interval 22
-> ip multicast vlan 3-5 last-member-query-interval 22
-> ip multicast vlan 2 last-member-query-interval 0
-> no ip multicast vlan 2 last-member-query-interval
-> no ip multicast vlan 3-5 last-member-query-interval
-> ip multicast service 2 last-member-query-interval 22
-> ip multicast service 3-5 last-member-query-interval 22
-> ip multicast service 2 last-member-query-interval 0
-> no ip multicast service 2 last-member-query-interval
-> no ip multicast service 3-5 last-member-query-interval
```

**Release History**

Release 7.1.1; command was introduced.
Release 8.4.1; `service` parameter added.

**ip multicast query-response-interval**

Sets the IGMP query response interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

```
```

```
oip multicast [vlan vlan_id[-vlan_id2] | service service_id] query-response-interval
```

**Syntax Definitions**

- `vlan_id[-vlan_id2]` : VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
- `service_id[-service_id2]` : SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560, or OmniSwitch 6570M.*
- `tenths_of_seconds` : IGMP query response interval in tenths of seconds. The valid range is 1–65535.

**Defaults**

**ip multicast unsolicited-report-interval**

Sets the value of the IGMP unsolicited report interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

```
ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] unsolicited-report-interval [seconds]
```

```
no ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] unsolicited-report-interval
```

**Syntax Definitions**

- `vlan_id[-vlan_id2]` VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
- `service_id[-service_id2]` SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560, or OmniSwitch 6570M.
- `seconds` IGMP unsolicited report interval in seconds. Valid range is 1–65535.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>1</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>

**Usage Guidelines**

- IP Multicast Switching and Routing must be enabled to set the IGMP unsolicited report interval on the system and/or the specified VLANs or SPB services.
- If the IGMP query response interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The unsolicited report interval refers to the time period to proxy any changed IGMP membership state.
- Use the `no` form of this command to restore the IGMP unsolicited report interval back to the default value (1 second) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, `ip multicast unsolicited-report-interval 0`).
**Examples**

- `ip multicast unsolicited-report-interval 200`
- `ip multicast unsolicited-report-interval 0`
- `no ip multicast unsolicited-report-interval`
- `ip multicast vlan 2 unsolicited-report-interval 300`
- `ip multicast vlan 3-5 unsolicited-report-interval 300`
- `ip multicast vlan 2 unsolicited-report-interval 0`
- `no ip multicast vlan 2 unsolicited-report-interval`
- `ip multicast service 2 unsolicited-report-interval 300`
- `ip multicast service 3-5 unsolicited-report-interval 300`
- `ip multicast service 2 unsolicited-report-interval 0`
- `no ip multicast service 2 unsolicited-report-interval`
- `no ip multicast service 3-5 unsolicited-report-interval`
