<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The Digital Living Network Alliance (DLNA) uses Universal Plug and Play (UPnP) for media management, discovery, and control. DLNA/UPnP uses SSDP to discover services, similar to how Bonjour uses mDNS for the same. All the SSDP packets coming in on an OmniSwitch are intercepted and tunneled through the GRE tunnel to the WLAN controller (acting as a gateway).

- When SSDP relay is disabled on the switch, SSDP packets are handled in the same manner as conventional packets.

**Example**

```
-> zeroconf ssdp admin-state enable
-> zeroconf ssdp admin-state disable
```

**Release History**

Release 8.4.1 R02; command introduced.
Access Guardian Commands

zeroconf ssdp admin-state

Related Commands

- `zeroconf mdns admin-state` Enables or disables the Multicast DNS (mDNS) relay on the switch.
- `show zeroconf` Displays the zero configuration for the switch.

MIB Objects

- `alaZeroConfSsdpAdminStatus`
zeroconf mode

Configures the mode of the SSDP or MDNS packet processing.

zeroconf mode [tunnel [type standard] | gateway | responder]

Syntax Definitions

tunnel This is Aruba mode. The packets are sent to the responder through the configured GRE tunnel with protocol value of 0x0. The tunnel mode is configured on the edge switch.

tunnel type standard The packets are sent to the responder through the configured GRE tunnel with protocol value of 0x6558.

gateway The received packets are forwarded to all the VLANs in the gateway VLAN list. The gateway mode is configured on the gateway switch.

responder This is responder mode. The responder mode is configured on the core switch. Responder mode is not supported on an OmniSwitch 6360 or OmniSwitch 9900.

Defaults

The tunnel mode (Aruba mode) is enabled by default.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- In tunnel mode (both Aruba and Standard), the responder IP address must be configured to tunnel the mDNS or SSDP packets. The operational status will be DOWN until the responder IP address is configured.

- In tunnel mode (both Aruba and Standard) or responder mode, the mDNS and SSDP packets are processed only when the Loopback0 IP address is configured, which is considered as the source IP address for the tunneled packets. Use the `ip interface` command to configure the interface address.

- In responder mode, the tunnel for each edge switch must be configured manually.

- In responder mode if there are no service rules configured, the responder switch will learn all the services but will not process any query received from the mDNS or SSDP client.

- The switch can operate in only one mode at a time.
**Example**

```
-> zeroconf mode gateway
-> zeroconf mode tunnel
-> zeroconf mode responder
```

**Release History**

Release 8.4.1 R02; command introduced.

**Related Commands**

- `zeroconf mdns admin-state` Enables or disables the Multicast DNS (mDNS) relay on the switch.
- `zeroconf ssdp admin-state` Enables or disables the Simple Service Discovery Protocol (SSDP) relay on the switch.
- `zeroconf responder-ip` Configures the IP address of the tunnel endpoint (zero configuration responder).
- `zeroconf gateway-vlan-list` Adds or deletes a VLAN from the gateway VLAN list
- `zeroconf access-vlan-list` Adds or deletes a VLAN from the access VLAN list.
- `show zeroconf` Displays the zero configuration for the switch.

**MIB Objects**

```
alafZeroConfMode
    alafZeroConfTunnelMode
```
zeroconf responder-ip

Configures the IP address of the tunnel endpoint (zero configuration responder) on the edge switch.

zeroconf responder-ip ip_address

no zeroconf responder-ip ip_address

Syntax Definitions

ip_address The IPv4 address of the zero configuration responder.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>V72/C32</th>
<th>6900</th>
<th>X48C6/T48C6/</th>
<th>6900</th>
<th>X48C4E/V48C8/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Only IPv4 address can be configured as a responder IP address.
- In gateway mode, the responder IP address must not be configured.
- In tunnel mode, the responder IP address must be configured to tunnel the mDNS or SSDP packets. The operational status will be DOWN until the responder IP address is configured.
- To remove the responder IP address configuration, use the no form of the command.

Example

-> zeroconf responder-ip 10.0.0.1
-> no zeroconf responder-ip 10.0.0.1

Release History

Release 8.4.1 R02; command introduced.
**Related Commands**

- **zeroconf mdns admin-state**: Enables or disables the Multicast DNS (mDNS) relay on the switch.
- **zeroconf ssdp admin-state**: Enables or disables the Simple Service Discovery Protocol (SSDP) relay on the switch.
- **zeroconf mode**: Configures the mode of the SSDP or MDNS packet processing.
- **show zeroconf**: Displays the zero configuration for the switch.

**MIB Objects**

- `alaZeroConfResponderIpAddr`
- `alaZeroConfResponderIpAddressType`
zeroconf gateway-vlan-list

Adds or deletes a VLAN from the gateway VLAN list.

zeroconf gateway-vlan-list vlan_id1...vlan_idn

no zeroconf gateway-vlan-list vlan_id1...vlan_idn

Syntax Definitions

- **vlan_id**: The existing VLAN ID to be added or deleted from the gateway VLAN list. The valid range is 1-4094.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The gateway VLAN list can be configured only in the gateway mode.
- A maximum of 10 gateway VLANs is supported.
- To remove a VLAN from the gateway VLAN list, use the **no** form of the command.

Example

- `-> zeroconf gateway-vlan-list 1 2 4`
- `-> no zeroconf gateway-vlan-list 4`

Release History

Release 8.4.1 R02; command introduced.

Related Commands

- **zeroconf mode**: Configures the mode of the SSDP or mDNS packet processing.
- **show zeroconf**: Displays the zero configuration for the switch.
MIB Objects

alaZeroConfGatewayVlanTable
alaZeroConfGatewayVlanEntry
zeroconf access-vlan-list

Adds or deletes a VLAN from the access VLAN list.

```
zeroconf access-vlan-list vlan_id1...vlan_idn
no zeroconf access-vlan-list vlan_id1...vlan_idn
```

**Syntax Definitions**

- `vlan_id` The existing VLAN ID to be added or deleted from the access VLAN list. The valid range is 1-4094.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The access VLAN list must be configured when the tunnel mode use GRE tunnel type standard.
- The query packets from the responder is sent to the VLANs configured in the access VLAN list.
- A maximum of 16 access VLANs is supported.
- To remove a VLAN from the access VLAN list, use the `no` form of the command.

**Example**

```
-> zeroconf access-vlan-list 6 7 9
-> no zeroconf access-vlan-list 7
```

**Release History**

Release 8.4.1 R02; command introduced.
Related Commands

zeroconf mode
Configures the mode of the SSDP or mDNS packet processing.

show zeroconf
Displays the zero configuration for the switch.

MIB Objects

alaZeroConfAccessVlanTable
alaZeroConfAccessVlanEntry
zeroconf server-policy

Configures the server policy.

```
zeroconf server-policy policy_name [role | vlan | location | username | mac-address]
```

```
no zeroconf server-policy policy_name [role | vlan | location | username | mac-address]
```

### Syntax Definitions

- **policy_name**
  - The name of the zero configuration server policy. The policy name can be maximum 31 characters in length.

- **unp-name**
  - The name of a user-defined UNP role to map to the server policy. Multiple roles can be mapped to a server policy. The role name can be maximum 32 characters in length.

- **vlan**
  - The VLAN ID to be mapped with the server policy. Multiple VLAN IDs can be mapped to a server policy.

- **location**
  - The location name to be mapped with the server policy. Multiple locations can be mapped to a server policy. The location name can be maximum 63 characters in length.

- **username**
  - The user name to be mapped with the server policy. Multiple user names can be mapped to a server policy. The user name can be maximum 63 characters in length.

- **mac-address**
  - The MAC address to be mapped with the server policy. Multiple mac-address can be mapped to a server policy. Maximum size of mac-address allowed is six bytes.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The configured server policy is not applied unless it is mapped to a service rule.

- A maximum of 16 roles, 16 locations, 16 VLANs, 16 username, and 16 MAC address can be configured for a server policy.

- The server policy can be modified even when it is mapped to a service rule.
The server policy cannot be deleted if it is being used by a service rule.

The server policy attribute can be deleted even when it is mapped to a service rule unless any one of the policy attributes remains configured for that policy.

To remove the server policy, use the `no` form of the command. To remove specific attribute associated to the policy mention the attribute along with the `no` command.

**Example**

```plaintext
-> zeroconf server-policy SP1 role employee
-> zeroconf server-policy SP1 vlan 10 20 30
-> zeroconf server-policy SP1 location meetingroom1 meetingroom2
-> zeroconf server-policy SP1 username user1 user2
-> zeroconf server-policy SP1 mac-address e8:e7:32:9a:53:3 e8:e7:32:9a:53:3
-> no zeroconf server-policy SP1
-> no zeroconf server-policy SP1 role employee
-> no zeroconf server-policy SP1 vlan 10 20
-> no zeroconf server-policy SP1 location meetingroom1
-> no zeroconf server-policy SP1 username user2
-> no zeroconf server-policy SP1 mac-address e8:e7:32:9a:53:3
```

**Release History**

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; `username` and `mac-address` parameters included.
Release 8.7.R2; `role` parameter name changed to `unp-name`; `policy_name`, `username`, and `location` maximum numbers updated.

**Related Commands**

- `zeroconf mode` Configures the mode of the SSDP or mDNS packet processing.
- `zeroconf client-policy` Configures the client policy.
- `zeroconf service-rule policy` Defines service rules for selective sharing of services with the clients.
- `show zeroconf` Displays the zero configuration for the switch.
- `show zeroconf server policies` Displays the information of the server policies configured.

**MIB Objects**

- `alaZeroConfServerPolicyTable` Contains the server policy table.
- `alaZeroConfServerPolicyEntry` Represents a server policy entry.
- `alaZeroConfServerPolicyName` Policy name.
- `alaZeroConfServerRoleMappingName` Role mapping name.
- `alaZeroConfServerVlanMappingId` Vlan mapping id.
- `alaZeroConfServerLocationMappingString` Location mapping string.
- `alaZeroConfServerUsernameMappingString` Username mapping string.
- `alaZeroConfServerMacAddressMapping` Mac address mapping.
**zeroconf client-policy**

Configures the client policy.

```
zeroconf client-policy policy_name [role | vlan | location | username | mac-address]
```

```
no zeroconf client-policy policy_name [role | vlan | location | username | mac-address]
```

**Syntax Definitions**

- `policy_name`: The name of the zero configuration client policy. The policy name can be maximum 31 characters in length.
- `unp-name`: The name of a user-defined UNP role to map to the client policy. A maximum of 16 roles can be mapped to a client policy. The role name can be maximum 32 characters in length.
- `vlan`: The VLAN ID to be mapped with the client policy. Multiple VLAN IDs can be mapped to a client policy.
- `location`: The location name to be mapped with the client policy. Multiple locations can be mapped to a client policy. The location name can be maximum 63 characters in length.
- `username`: The user name to be mapped with the client policy. Multiple user names can be mapped to a client policy. The user name can be maximum 63 characters in length.
- `mac-address`: The MAC address to be mapped with the client policy. Multiple MAC addresses can be mapped to a client policy. Maximum size of MAC address allowed is 6 bytes.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The configured client policy is not applied unless it is mapped to a service rule.
- A maximum of 64 service rules can be configured.
- A maximum of 16 roles, 16 locations, 16 VLANs, 16 username, and 16 MAC address can be configured for a client policy.
The client policy can be modified even when it is mapped to a service rule.

The client policy cannot be deleted if it is being used by a service rule.

The client policy attribute can be deleted even when it is mapped to a service rule unless any one of the policy attributes remains configured for that policy.

To remove the client policy, use the no form of the command. To remove specific attribute associated to the policy mention the attribute along with the no command.

**Example**

```
- zeroconf client-policy SP1 role employee
- zeroconf client-policy SP1 vlan 10 20 30
- zeroconf client-policy SP1 location meetingroom1 meetingroom2
- zeroconf client-policy SP1 username username1 username2
- zeroconf client-policy SP1 mac-address e8:e7:32:9a:53:3 e8:e7:32:9a:53:3
- no zeroconf client-policy SP1
- no zeroconf client-policy SP1 role employee
- no zeroconf client-policy SP1 vlan 10 20
- no zeroconf client-policy SP1 location meetingroom1
- no zeroconf client-policy SP1 username user2
- no zeroconf client-policy SP1 mac-address e8:e7:32:9a:53:3
```

**Release History**

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; **username** and **mac-address** parameters included.
Release 8.7R2; **role** parameter name changed to **unp-name**; **policy_name**, **username**, and **location** maximum numbers updated.

**Related Commands**

- **zeroconf mode** Configures the mode of the SSDP or mDNS packet processing.
- **zeroconf server-policy** Configures the server policy.
- **zeroconf service-rule policy** Allows to define service rules for selective sharing of services with the clients.
- **show zeroconf** Displays the zero configuration for the switch.
- **show zeroconf client policies** Displays the information of the client policies configured on the responder.

**MIB Objects**

- a1aZeroConfClientPolicyTable
  - a1aZeroConfClientPolicyEntry
  - a1aZeroConfClientPolicyName
  - a1aZeroConfClientRoleMappingName
  - a1aZeroConfClientVlanMappingId
  - a1aZeroConfClientLocationMappingString
  - a1aZeroConfClientUsernameMappingString
  - a1aZeroConfClientMacAddressMapping
**zeroconf service-rule policy**

Defines service rules for selective sharing of services with the clients.

`zeroconf service-rule rule_name server-policy server_policy_name client-policy client_policy_name`

`no zeroconf service-rule rule_name`

---

**Syntax Definitions**

- `rule_name` The name of the service rule. The rule name can be maximum 31 characters in length.
- `server_policy_name` Name of the server policy to be mapped with service rule. A server policy cannot be mapped to multiple service rules.
- `client_policy_name` The name of the client policy to be mapped with the service rule. A client policy cannot be mapped to multiple service rules.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- There must be one-to-one mapping between the server and client policy.
- The responder will respond to a service query only when the server and client policy is matched.
- A service rule with an existing server and client policy mapping cannot be linked to a new server and client policy without deleting the existing mapping.
- A maximum of 64 service rule configuration is supported on a responder.
- To remove a service rule, use the `no` form of the command.

---

**Example**

```
-> zeroconf service-rule SR1 server-policy SP1 client-policy CP1
-> no zeroconf service-rule SR1
```
**Release History**

Release 8.4.1 R02; command introduced.
Release 8.7R2; rule_name maximum number changed.

**Related Commands**

- **zeroconf mode** Configures the mode of the SSDP or mDNS packet processing.
- **zeroconf server-policy** Configures the server policy.
- **zeroconf client-policy** Configures the client policy.
- **zeroconf service-rule service-id** Configures selective services for a service rule to be shared with the clients.
- **show zeroconf** Displays the zero configuration for the switch.
- **show zeroconf service rules** Displays the information of the service rules configured on the responder.

**MIB Objects**

alaZeroConfServiceRuleTable
  - alaZeroConfServiceRuleEntry
  - alaZeroConfServiceRuleName
  - alaZeroConfServiceRuleServerPolicyName
  - alaZeroConfServiceRuleClientPolicyName
**zeroconf service-rule service-id**

Configures selective services for a service rule.

```
zeroconf service-rule rule_name [mdns-service-id | ssdp-service-id] service_id1....[service_idn]
no zeroconf service-rule rule_name [mdns-service-id | ssdp-service-id] service_id1....[service_idn]
```

**Syntax Definitions**

- **rule_name**
  The name of the service rule.

- **mdns-service-id**
  Configures the mDNS service ID list to be mapped with the service rule.

- **ssdp-service-id**
  Configures the SSDP service ID list to be mapped with the service rule.

- **service_id**
  The service ID to be mapped with the service rule. Multiple service IDs can be mapped with a service rule.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- A service ID can be part of multiple service rule or multiple service IDs can be mapped to a service rule.

- A service ID can be mapped or removed from a service rule without deleting the service rule.

- The responder will respond to a service query only when the server and client policy is matched.

- A maximum of 64 service IDs can be configured for a service rule.

- To remove a service ID, use the **no** form of the command.

**Example**

```
-> zeroconf service-rule SR1 mdns-service-id _scanner._tcp.local _ipp._tcp.local
-> zeroconf service-rule SR2 ssdp-service-id urn:schemas-upnp-org:device:MediaServer:1 upnp:rootdevice
-> no zeroconf service-rule SR1 mdns-service-id _scanner._tcp.local
-> no zeroconf service-rule SR2 ssdp-service-id upnp:rootdevice
```
**Release History**

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; `ssdp-service-id` parameter added.

**Related Commands**

- `zeroconf service-rule policy` Defines service rules for selective sharing of services with the clients.
- `show zeroconf` Displays the zero configuration for the switch.
- `show zeroconf service rules` Displays the information of the service rules configured on the responder.

**MIB Objects**

alaZeroConfServiceRuleMdnsServiceMappingTable
alaZeroConfServiceRuleMdnsServiceMappingEntry
alaZeroConfServiceRuleSsdpServiceMappingEntry
**zeroconf service-list**

Configures a list of known services for mDNS or SSDP service query.

```
zeroconf [mdns service-list | ssdp service-list] service_id1...service_idn
no zeroconf [mdns service-list | ssdp service-list] service_id1...service_idn
```

### Syntax Definitions

- **mdns service-list**: Configures the list of mDNS services for the service query.
- **ssdp service-list**: Configure the list of SSDP services for the service query.
- **service_id**: The service ID to be included in the service list. A maximum of 64 service IDs can be configured in the list. The service ID can be maximum 63 characters in length.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The services in the list are queried for re-learning by the responder, in an event of reload or takeover on the responder.
- A maximum of 64 service IDs can be configured in a service list.
- To remove a service ID from the service list, use the `no` form of the command.

### Example

```
-> zeroconf mdns service-list _scanner._tcp.local _ipp._tcp.local
-> zeroconf ssdp service-list urn:schemas-upnp-org:device:MediaServer:1
upnp:rootdevice
-> no zeroconf mdns service-list _scanner._tcp.local
-> no zeroconf ssdp service-list upnp:rootdevice
```

### Release History

- Release 8.4.1 R02; command introduced.
- Release 8.4.1 R03; ssdp service-list parameter added.
- Release 8.7R2; service_id maximum number changed.
## Related Commands

## MIB Objects

- `alaZeroConfMdnsServiceTable`
- `alaZeroConfMdnsServiceEntry`
- `alaZeroConfSsdpServiceEntry`
zeroconf service-id query-request

Queries a specific service. If the responder does not learn a service, that specific service can be queried for re-learning by the responder.

```
zeroconf {mdns | ssdp} service-id service-id query-request
```

### Syntax Definitions

**mdns**

Sends mDNS query for the service ID to all the configured tunnels to re-learn the service instance.

**ssdp**

Sends SSDP query for the service ID to all the configured tunnels to re-learn the service instance.

**service_id**

The service ID to be queried for learning by the responder.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use this command to manually query for a specific service.

### Example

```
-> zeroconf mdns service-id _scanner._tcp.local query-request
-> zeroconf ssdp service-id upnp:rootdevice
```

### Release History

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; ssdp parameter added.

### Related Commands

- **zeroconf mode**
  Configures the mode of the SSDP or mDNS packet processing.

- **show zeroconf**
  Displays the zero configuration for the switch.
**MIB Objects**

alaZeroConfMdnsServiceTriggerQuery
alaZeroConfSsdpServiceTriggerQuery
zeroconf edge-ip-list

Configures the list of tunnel edge endpoint IP addresses. The edge-ip-list must be configured for the responder.

**zeroconf edge-ip-list** ip_address1...ip_addressn

**no zeroconf edge-ip-list** ip_address1...ip_addressn

---

### Syntax Definitions

| ip_address | The tunnel edge endpoint IP address, which is the Loopback0 IP address of the edge switch. |

---

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6/V48C8/C32E/T24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The configured tunnel edge endpoint IP address in the list must be reachable. If the IP addresses are not reachable then the operational status of the mDNS will be down.

- To remove a tunnel edge endpoint IP address from the list, use the **no** form of the command.

### Example

- `-> zeroconf edge-ip-list 10.1.1.1 10.2.2.2 10.3.3.3`
- `-> no zeroconf edge-ip-list 10.1.1.1`

### Release History

Release 8.4.1 R02; command introduced.
**Related Commands**

- **zeroconf mode**  
  Configures the mode of the SSDP or mDNS packet processing.

- **show zeroconf edge-details**  
  Displays the IP address and reachability status of the tunnel endpoints configured on the responder.

- **show zeroconf**  
  Displays the zero configuration for the switch.

**MIB Objects**

- **alaZeroConfEdgeIpTable**
- **alaZeroConfEdgeIpEntry**
zeroconf edge-ip-list mode

Configures the edge IP mode as manual or auto.

zeroconf edge-ip-list mode [manual | auto]

Syntax Definitions

<table>
<thead>
<tr>
<th>manual</th>
<th>auto</th>
</tr>
</thead>
<tbody>
<tr>
<td>In this mode, the admin has to configure the edge IPs manually.</td>
<td>In this mode, edge IPs are automatically learned by the responder.</td>
</tr>
</tbody>
</table>

Defaults

By default, the mode is manual.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- By default, the mode is manual.
- In manual mode, the admin has to configure the edge IPs manually.

Example

- `-> zeroconf edge-ip-list mode manual`
- `-> zeroconf edge-ip-list mode auto`

Release History

Release 8.7 R1; command introduced.
Related Commands

zeroconf mode  Configures the mode of the SSDP or mDNS packet processing.
show zeroconf edge-details  Displays the IP address and reachability status of the tunnel endpoints configured on the responder.
show zeroconf  Displays the zero configuration for the switch.

MIB Objects

alaZeroConfEdgeIpTable
alaZeroConfEdgeIPMode
zeroconf refresh-database

Refreshes the database (mDNS or SSDP records) with latest server policies, client policies, server rules, learned service instances, and service cache entry.

*zeroconf {mdns | ssdp} refresh-database*

**Syntax Definitions**

**mdns**
- Refreshes the mDNS database. The files “mdns_srvr_pley”, “mdns_srvr_pley_inst”, “mdns_clnt_pley” and “mdns_srvc_rule” are updated.

**ssdp**
- Refreshes the SSDP database. The files “ssdp_srvr_pley”, “ssdp_srvr_pley_inst”, “ssdp_clnt_pley” and “ssdp_srvc_rule” are updated.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use this command to update the latest server policies, server policy name along with learned service instance, client policies and server rules configuration.

- After refreshing the database, use the `show zeroconf services-cache` and `show zeroconf server policy-instances` commands to display the latest cache and service instances information.

**Example**

```
-> zeroconf mdns refresh-database
-> zeroconf ssdp refresh-database
```

**Release History**

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; `ssdp` parameter included.
**Related Commands**

- `show zeroconf services-cache` Displays the list of services learned by mDNS or SSDP stack.
- `show zeroconf server policy-instances` Displays the mDNS or SSDP service instance learned on the responder for each server policy.

**MIB Objects**

- `alaZeroConfMdnsActions`  
- `alaZeroConfSdnpActions`
show zeroconf

Displays the basic zero configuration details.

Syntax Definitions

<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

N/A

Example

-> show zeroconf
  zero-conf mode : responder,
  MDNS admin status : enabled,
  SSDP admin status : disabled
  MDNS operational status : up,
  SSDP operational status : down,
  Tunnel Source IP : 172.16.1.1

-> show zeroconf
  zero-conf mode : gateway,
  MDNS admin status : disabled,
  SSDP admin status : disabled
  MDNS operational status : down,
  SSDP operational status : down,
  Gateway vlans list : 1, 2, 3

-> show zeroconf
  zero-conf mode : tunnel,
  zero-conf tunnel type : standard,
  MDNS admin status : disabled,
  SSDP admin status : disabled
  MDNS operational status : down,
  SSDP operational status : down,
show zeroconf

-> show zeroconf

Responder IP            : -
Tunnel source IP        : -
Access vlans list       : 4, 5, 6
zero-conf mode          : tunnel,
zero-conf tunnel type   : aruba,
MDNS admin status       : disabled,
SSDP admin status       : disabled
MDNS operational status : down,
SSDP operational status : down,
Responder IP            : -
Tunnel source IP        : -

output definitions

<table>
<thead>
<tr>
<th>zero-conf mode</th>
<th>Displays the zero configuration mode configured.</th>
</tr>
</thead>
<tbody>
<tr>
<td>zero-conf tunnel type</td>
<td>Displays if the tunnel type is Aruba or Standard. This is displayed if the mode type is tunnel.</td>
</tr>
<tr>
<td>MDNS admin status</td>
<td>Displays the administrative status of the mDNS.</td>
</tr>
<tr>
<td>SSDP admin status</td>
<td>Displays the administrative status of the SSDP.</td>
</tr>
<tr>
<td>MDNS operational status</td>
<td>Displays the operational status of mDNS. The operation status will be down if the responder IP address is not configured or not reachable.</td>
</tr>
<tr>
<td>SSDP operational status</td>
<td>Displays the operational status of SSDP. The operation status will be down if the responder IP address is not configured or not reachable.</td>
</tr>
<tr>
<td>Responder IP</td>
<td>Displays the configured responder IP address. This is displayed if the mode type is tunnel.</td>
</tr>
<tr>
<td>Tunnel Source IP</td>
<td>Displays the source IP address of the tunnel. This is displayed if the mode type is tunnel or responder.</td>
</tr>
<tr>
<td>Gateway vlans list</td>
<td>Displays the configured gateway VLANs list. This is displayed if the mode type is gateway.</td>
</tr>
<tr>
<td>Access vlans list</td>
<td>Displays the configured access VLANs list. This is displayed if the mode type is tunnel and the tunnel type is standard.</td>
</tr>
</tbody>
</table>

Release History

Release 8.4.1 R02; command introduced.
Related Commands

- **zeroconf mdns admin-state**: Enables or disables mDNS tunnel relay for the switch.
- **zeroconf ssdp admin-state**: Associates a GRE tunnel interface with the mDNS relay feature.
- **zeroconf mode**: Configures the mode of the SSDP or MDNS packet processing.
- **zeroconf responder-ip**: Configures the IP address of the tunnel endpoint (zero configuration responder).
- **zeroconf gateway-vlan-list**: Adds or deletes a VLAN from the gateway VLAN list.
- **zeroconf access-vlan-list**: Adds or deletes a VLAN from the access VLAN list.

MIB Objects

alaZeroConfConfig
  - alaZeroConfMdnsAdminStatus
  - alaZeroConfSsdpAdminStatus
  - alaZeroConfMode
  - alaZeroConfTunnelMode
  - alaZeroConfResponderIpAddressType
  - alaZeroConfResponderIpAddress
  - alaZeroConfMdnsOperStatus
  - alaZeroConfSsdpOperStatus
**show zeroconf services**

Displays all the configured mDNS or SSDP service IDs.

```bash
show zeroconf [mdns | ssdp] services
```

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Learned</td>
<td>Learned</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

N/A

### Example

```bash
-> show zeroconf mdns services
Service Id                        CfgType
--------------------------------+-------------------
_ipp._tcp.local                   Configured
_printer._tcp.local               Learned

-> show zeroconf ssdp services
Service Id                        CfgType
--------------------------------+-------------------
upnp:rootdevice                   Configured
abcd:rootdevice                   Learned
```

### output definitions

<table>
<thead>
<tr>
<th>Service Id</th>
<th>Displays the name of the service ID.</th>
</tr>
</thead>
<tbody>
<tr>
<td>CfgType</td>
<td>Displays if the service is a configured service or learned service.</td>
</tr>
</tbody>
</table>

### Release History

Release 8.4.1 R02; command introduced.
Release 8.4.1 R03; ssdp parameter added.
Related Commands

`zeroconf service-list`  Configures a list of known services for mDNS or SSDP service query.
`zeroconf service-rule policy`  Defines service rules for selective sharing of services with the clients.

Release 8.4.1 R03; command introduced.

**Related Commands**

`zeroconf service-rule policy` Defines service rules for selective sharing of services with the clients.

**MIB Objects**

N/A
**show unp profile**

Displays the UNP profile configuration for the switch.

```
show unp profile [profile_name]
```

### Syntax Definitions

- **profile_name**
  - The name of the UNP to display.

### Defaults

By default, the configuration for all profiles is displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Enter a UNP profile name with this command to display information for a specific profile.
- Use the `show unp profile map` command to display the VLAN or service type (SPB, VXLAN, or static) that is mapped to the UNP profile.
- If Device Profiling is enabled for the switch, the following UNP profiles are automatically created on the switch and will be included in the display:
  - `devProfPrinter`
  - `devProfWindows`
  - `devProfIP-Phone`
  - `devProfWireless-Router`
  - `devProfSmartPhone/PDA/Tablets`

### Examples

```
-> show unp profile
Profile Name: unp2-spb
  Qos Policy = qrules1,
  Location Policy = -
  Period Policy = -
  CP Profile = -
  CP State = Dis
  Authen Flag = Dis
  Mobile Tag = Dis
  SAA Profile = -
```
show unp profile

Ingress BW = -, Egress BW = -, Ingress Depth = -, Egress Depth = -,

Release History

Release 8.3.1; command was introduced.
Release 8.4.1.R02; the built-in “defaultWLANProfile” included in the display.
Release 8.4.1.R03; “Redirect State” field deprecated.
Release 8.5R2; default UNP profiles for Device Profiling included in the display.
Release 8.6R1; “Mac-Mobility” field added.
Release 8.6R2; “Kerberos Auth” field added.

Related Commands

- `show unp classification` Displays the UNP classification rule configuration for the switch.
- `show unp global configuration` Displays the UNP global parameter values configured for the switch.
- `show unp port` Displays the UNP configuration for the port.
- `show unp user` Displays information about the devices learned on a UNP port.

show unp profile map

Displays the VLAN, service, or L2 GRE tunnel mapping configuration assigned to a UNP profile.

```
show unp profile [profile_name] map {vlan | service-type {spb | vxlan | static | l2gre}}
```

### Syntax Definitions

- **profile_name**: The name of the UNP to display.
- **vlan**: Displays the VLAN mapping configuration for a UNP profile.
- **spb**: Displays the Shortest Path Bridging (SPB) service mapping configuration for a UNP profile.
- **vxlan**: Displays the Virtual eXtensible Local Area Network (VXLAN) service mapping configuration for a UNP profile.
- **static**: Displays the existing SPB or VXLAN service IDs that are statically assigned to a UNP profile. This type of mapping is used to map the profile to a known service ID.
- **l2gre**: Displays the L2 GRE tunnel mapping configuration for a UNP profile.

### Defaults

By default, the VLAN, service, or L2 GRE tunnel mapping configuration for all profiles is displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/48C8/C32E/T24C2</th>

</tr>
</tbody>
</table>

### Usage Guidelines

- Enter a UNP profile name with this command to display the mapping information for a specific profile.
- Only one VLAN or service is mapped to a profile at any given time.

### Examples

```
-> show unp profile map vlan
Profile Name      Vlan-Id
-------------------------
unp1-vlan        300
unp2-vlan        301
unp3-vlan        500
unp4-vlan        501

Total Profile Vlan-Map Count: 4
```
-> show unp profile unp2-vlan map vlan
Profile Name                         Vlan-Id
-----------------------------------+--------
unp2-vlan                           301

Release History

Release 8.3.1; command was introduced.
Release 8.4.1.R02; **l2gre** parameter added.
Release 8.6R1; IGMP and MLD snooping related fields added to SPB service-mapped profile display; “Port-Isolation” and “Vlan Xlation” fields added to L2 GRE service-mapped profile display.
Release 8.7R1; “Mac Orchest” field added to VXLAN service-mapped profile display.
Release 8.7R2; “Remove IngTag” field added to the service-mapped profile display for SPB, VXLAN, and L2 GRE.

Related Commands

- **unp profile map vlan**
  - Configures the mapping of a standard VLAN to a UNP profile.

- **unp profile map service-type spb**
  - Configures the mapping of SPB parameters that are used to dynamically create an SPB SAP to carry profile traffic.

- **unp profile map service-type vxlan**
  - Configures the mapping of VXLAN parameters that are used to dynamically create a VXLAN SAP to carry profile traffic.

- **unp profile map service-type l2gre**
  - Configures the mapping of L2 GRE tunnel parameters that are used to dynamically create an L2 GRE tunnel SAP to carry profile traffic.

- **unp profile map service-type static**
  - Configures the mapping of an existing SPB or VXLAN service to the profile.

- **show unp profile**
  - Displays the UNP profile configuration for the switch.

- **show unp vxlan far-end-ip-list**
  - Displays the contents of a far-end IP address list that is used to map VXLAN service parameters to a profile.

- **show unp l2gre far-end-ip-list**
  - Displays the contents of a far-end IP address list that is used to map L2 GRE service parameters to a profile.

show unp vxlan far-end-ip-list

Displays the contents of an IP address list. Each address represents a VXLAN Tunnel End Point (VTEP). A far-end IP list is associated with a VXLAN service to identify all the VTEPs that will participate in that service.

show unp vxlan far-end-ip-list [ip_list_name]

Syntax Definitions

`ip_list_name`  
The name of a list that contains the IP addresses for the far-end VTEPs.

Defaults

By default, the contents of all the VXLAN far-end IP address lists is displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</tbody>
</table>
**Release History**

Release 8.5R2; command was introduced.

**Related Commands**

unp l2gre far-end-ip-list  Configures an L2 GRE far-end IP list.
show unp profile map  Displays the L2 GRE service profile mapping configuration for the switch.

**MIB Objects**

alaDaUNPL2GreFarEndIPListTable
  alaDaUNPL2GreFarEndIPListName
  alaDaUNPL2GreFarEndIPListIPAddressCount
show unp saa-profile

Displays the Service Assurance Agent (SAA) performance monitoring profile configuration for the switch. SAA profiles are assigned to UNP VLAN profiles to specify jitter and latency threshold values for SAA sessions that apply to the assigned UNP VLAN profile.

show unp saa-profile [profile_name]

Syntax Definitions

profile_name

The name of an existing SAA profile to display.

Defaults

By default, all SAA profiles are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<p>| | | | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</tbody>
</table>

Usage Guidelines

- Enter an SAA profile name with this command to display information for a specific profile.
- This command does not provide the UNP assignment for each SAA profile. Use the show unp profile command to display the assignment information.

Examples

```
-> show unp saa-profile
Profile Name | Latency Threshold | Jitter Threshold | MC Conf Status
-------------|-------------------|-----------------|---------------
unp_saa1     | 500               | 100             | Local
unp_saa2     | 0                 | 150             | Local
unp_saa3     | 250               | 0               | Local
```

output definitions

- **Profile Name**: The name of the SAA profile.
- **Latency Threshold**: The latency threshold value applied with this profile. A value of “0” indicates no threshold value is applied.
**output definitions**

<table>
<thead>
<tr>
<th>Jitter Threshold</th>
<th>The jitter threshold value applied with this profile. A value of “0” indicates no threshold value is applied.</th>

  - `alaDaSaaSProfileRowStatus`
show unp global configuration

Displays the switch configuration for the global Universal Network Profile (UNP) parameter settings.

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- UNP global parameter settings determine specific actions related to the following:
  - Dynamically creating VLANs and/or profiles.
  - Whether or not devices attempting to authenticate are assigned to a temporary profile if the authentication server is unreachable.
  - Interaction with the Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) as part of the OmniSwitch Bring Your Own Devices (BYOD) solution.
- A hyphen, “-”, indicates that a value has not been configured for the global UNP parameter.

Examples

-> show unp global configuration
  Dynamic Vlan Configuration = Disabled,
  Dynamic Profile Configuration = Disabled,
  Auth Server Down Profile1 = -,
  Auth Server Down Profile2 = -,
  Auth Server Down Profile3 = -,
  Auth Server Down Voice Profile1 = ALE_phones,
  Auth Server Down Voice Profile2 = IP_Phone,
  Auth Server Down Voice Profile3 = -,
  Auth Server Down Port Bounce = Disabled
  Auth Server Down Timeout = 60,
  Redirect Port Bounce = Enabled,
  Redirect Pause Timer = -
  Redirect http proxy-port = 8080
  Redirect Server FQDN = cppm.abc.com
Redirect Server IP = 10.135.20.50
Allowed IP = -
Force L3-Learning = Disabled
Force L3-Learning Port Bounce = Enabled
802.1x Pass Through Mode = Disabled
AP Mode = Enabled
Secure AP Mode = Disabled
System-default service-mod = 512
System-default service-base = 10000000
System-default Multicast-Mode = Headend
System-default Vlan-Xlation = Enabled
System-default Multicast-Group = 239.0.0.0
System-default far-end-ip-list = -
IPv6 Drop Packets = Disabled,
Delayed Learning Interval = 0,
Global Mac-Mobility = Disabled,
802.1x EAP Version = v3
Multiple Untag SAP = Enabled

output definitions

<table>

**Release History**

Release 7.2.1; command was introduced.
Release 7.2.1.R02; “Dynamic Profile Configuration” and “MC Conf Status” fields added.
Release 7.3.4; “VXLAN” fields added; “MC Conf Status” fields deprecated.
Release 8.3.1.R02; “Force L3-Learning Port Bounce” field added.
Release 8.4.1.R02; “802.1x Pass Through Mode” and “AP Mode fields added”.
Release 8.5R1; “Redirect Server FQDN” and all of the “System-default” fields added.
Release 8.6R1; “Global Mac-Mobility” field added.
Release 8.7R1; “802.1x EAP Version” field added.
Release 8.9R1; “Multiple Untag SAP” field added.

**Related Commands**

show unp domain

Displays the UNP domain configuration for the switch.

show unp domain

Syntax Definitions

N/A

Defaults

N/A.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Domains are used to group physical UNP ports or link aggregates into one logical domain.
- Once a port is assigned to a specific domain, classification rules associated with the same domain ID are applied only to UNP ports associated with that same domain ID.

Examples

-> show unp domain

<table>
<thead>
<tr>
<th>Domain</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Default-Domain</td>
</tr>
<tr>
<td>1</td>
<td>UNP Domain 1</td>
</tr>
<tr>
<td>2</td>
<td>UNP Domain 2</td>
</tr>
</tbody>
</table>

Release History

Release 8.3.1; command was introduced.
**Related Commands**

show unp classification

Displays the UNP classification rule configuration for the switch.

\texttt{show unp classification rule\_type}

---

\textbf{Syntax Definitions}

\begin{itemize}
  \item \textit{rule\_type} \quad The rule type to display (refer to the table in the “Usage Guidelines” section of this command page for a list of rule type parameters).
\end{itemize}

\textbf{Defaults}

N/A

\textbf{Platforms Supported}

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

\textbf{Usage Guidelines}

\begin{itemize}
  \item Specifying one of the following classification rule type parameters is required with this command:
    \begin{itemize}
      \item \texttt{mac-rule}
      \item \texttt{mac-domain-rule}
      \item \texttt{mac-oui-rule}
      \item \texttt{mac-range-rule}
      \item \texttt{mac-range-domain-rule}
      \item \texttt{ip-rule}
      \item \texttt{ip-domain-rule}
      \item \texttt{ip-range-rule}
      \item \texttt{vlan-tag-rule}
      \item \texttt{vlan-domain-rule}
      \item \texttt{port-rule}
      \item \texttt{domain}
      \item \texttt{authentication-type-rule}
      \item \texttt{lldp-rule}
    \end{itemize}
  \item Standard classification rule parameters are combined at the time a rule is created to define a binding classification rule. The parameter combinations provided with this command reflect the allowed binding rule parameter combinations.
  \item An extended classification rule defines a list of rules and allows more combinations of standard rules than the binding rule configuration (see the \texttt{show unp classification-rule} command).
\end{itemize}

Release History

Release 8.3.1; command was introduced.

Related Commands

- **show unp classification-rule**: Displays the extended classification rule configuration for the switch.
- **show zeroconf server policy-instances**: Displays the UNP configuration for the switch.
- **show unp port**: Displays the UNP configuration for the port.
- **show unp user**: Displays information about the devices learned on a UNP port.

MIB Objects

| N/A |
**show unp classification-rule**

Displays the UNP extended classification rule configuration for the switch. An extended classification rule defines a list of rule conditions, all of which a device must match to be classified into the UNP profile associated with the extended rule name. A name and precedence value is also assigned to the list of rule conditions.

`show unp classification-rule [rule-name]`

### Syntax Definitions

*rule_name*  
The name of an existing extended classification rule.

### Defaults

By default, the configuration for all extended rules is displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Enter the name of an extended classification rule to display information for a specific rule.
- An extended classification rule defines a list of rules and allows more combinations of standard rules than a binding rule configuration.
- An extended classification rule is associated with a UNP profile and applied to traffic learned on UNP ports.
- If Device Profiling is enabled for the switch, the following “built-in” extended classification rules are also displayed:
  - devProfPrinter
  - devProfWindows
  - devProfIP-Phone
  - devProfWireless-Router
  - devProfSmartPhone/PDA/Tablets

### Examples

```bash
-> show unp classification-rule
Rule Name: "ext_rule1"
  Precedence = 10,
```

---

**Usage Guidelines**

Enter a user-defined role name with this command to display information for a specific role.

---

**Examples**

```bash
-> show unp user-role
Role Name: ur1
  Qos Policy List       : qlist1
  Priority              : 1
  Conditions:
    Profile1            : unp1-vlan
    Profile2            : unp2-spb
    Profile3            : -
  Authentication-Type : Mac
  CP Status            : Enabled

Role Name: ur2
  Qos Policy List       : qlist-allow
  Priority              : 1
  Conditions:
    Profile1            : -
    Profile2            : -
    Profile3            : -
  Authentication-Type : 802.1x Fail
  CP Status            : Disabled

Total User Role Derivation Rule Count: 2
```

---
Access Guardian Commands

**Release History**

Release 8.1.1; command was introduced.
Release 8.3.1; “Edge-Profile” field replaced with “Profile1”, “Profile2”, and “Profile3” fields.

**Related Commands**

- **unp user-role**
  - Configures a user-defined role.
- **show unp user**
  - Displays information about devices learned on UNP ports.

**MIB Objects**

- alaDaUNPUserRoleTable
  - alaDaUNPUserRoleName
  - alaDaUNPUserRolePrecedenceNum
  - alaDaUNPUserRolePolicyList
  - alaDaUNPUserRoleProfile1
  - alaDaUNPUserRoleProfile2
  - alaDaUNPUserRoleProfile3
  - alaDaUNPUserRoleAuthType
  - alaDaUNPUserRolePostLoginStatus
**show unp restricted-role**

Displays the names of the explicit QoS policy lists assigned to the built-in restricted role states (Captive Portal pre-login, Unauthorized, and QMR) used by the switch.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>X48C4E/V48C8/</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>V32E/T24C2/</td>
<td>C32E/T24C2/</td>

<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>X24C2</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

An explicit QoS policy list overrides the built-in policy list associated with the restricted role state. When the explicit policy list assignment is removed, the switch reverts back to using the built-in policy list associated with the restricted role state.

**Examples**

-> show unp restricted-role

Role name  QoS Policy List Name
-------------------------------------------------------------
UNAUTHORIZED qlist-bad
QMR qlist-qmr
CP PRE-LOGIN qlist-cp

Total Restricted Role Count: 3

**output definitions**

<table>
<thead>
<tr>
<th>Role Name</th>
<th>The restricted role name.</th>
</tr>
</thead>
<tbody>
<tr>
<td>QoS Policy List</td>
<td>The name of the QoS policy list associated with the restricted role name.</td>
</tr>
</tbody>
</table>

**Release History**

Release 8.1.1; command was introduced.
Related Commands

- **unp restricted-role policy-list**: Configures a user-defined role.
- **show unp user**: Displays information about devices learned on UNP ports.

MIB Objects

- **alaDaUNPstrictedRoleTable**
  - **alaDaUNPstrictedRoleType**
  - **alaDaUNPstrictedRolePolicyList**
**show unp port**

Displays the UNP configuration for the port. Includes only ports and link aggregates on which UNP is enabled.

```plaintext
show unp {port [chassis/slot/port1[-port2]] | linkagg [agg_id[-agg_id2]]} [type {bridge | access}]
```

---

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot/port[-port2]` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `agg_id[-agg_id2]` Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).
- `bridge` Displays only UNP bridge ports.
- `access` Displays only UNP access ports.

---

**Defaults**

By default, configuration information for all UNP ports or link aggregates is displayed.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Enter a port or link aggregate ID number to display information specific to the port or link aggregate.
- Specify a UNP port type (`bridge` or `access`) to display information only for that type of UNP port.

---

**Examples**

```
$ show unp port
Port  Port  Type  802.1x  Mac  Class.  Default  802.1X  MAC  Trust-Tag
Domain Auth  Auth  Pass-Alt  Pass-Alt
--------+--------+-----------------+-----------------+----------+----------+-----------------+----------+----------+
1/16    1 Bridge  Disabled  Disabled  Enabled  unp-1001  -  -  Disabled
1/17    0 Bridge  Disabled  Disabled  unp-1001  -  -  Disabled
1/18    0 Access  Disabled  Enabled  spb1001  -  -  Enabled
1/35    0 Access  Disabled  Disabled  -  -  -  Disabled
1/36    5 Bridge  Enabled  Enabled  Disabled  DefUnp  1XProf1  MacPAS  Enabled
1/37    5 Access  Enabled  Disabled  Enabled  -  1XProf2  -  Enabled
```

802.1x Max-Req

The maximum number of times the switch will retransmit a request for authentication information. Configured through the `unp 802.1x-authentication max-req` command.

L2 Profile

The name of a Layer 2 profile that is assigned to the UNP port or link aggregate. Configured through the `unp l2-profile` command. This field applies only to UNP access ports and link aggregates.
show unp port bandwidth

Displays the bandwidth parameter values applied to a UNP port or link aggregate. These values are optionally assigned through the UNP profile to which a UNP port is associated.

show unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} bandwidth

Syntax Definitions

chassis/slot/port1[-port2] The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).

agg_id[-agg_id2] Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the port or linkagg parameter to display information for a specific port or link aggregate ID.

- Bandwidth parameter values are not applied to UNP link aggregates that are assigned to the profile. As a result, this command will always show the bandwidth parameter values as not set for link aggregates.

- The optional bandwidth parameter values are applied when a UNP port is classified into a UNP profile. The profile name is obtained through local classification or returned from the RADIUS server.

- The source from which the bandwidth parameter values was last updated is also included in the display information. The source updates are based on the following conditions:
  - The UNP profile applies the bandwidth values at the time the UNP port is classified into the profile. This overrides any existing QoS bandwidth policies configured on the physical port.
  - QoS bandwidth policies defined in a QoS policy list associated with the profile are applied after the port is classified into the profile. This overrides the profile bandwidth values initially applied.
  - User-configured QoS bandwidth policies are applied after the port is classified into the profile.
Examples

The following example shows the default display of UNP rate limit parameters when no users are learned on the UNP port:

```
-> show unp port 1/1/11 bandwidth
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Type</th>
<th>Max Ingress Bandwidth</th>
<th>Ingress BW Source</th>
<th>Ingr BW Profile</th>
<th>Max Egress Bandwidth</th>
<th>Egress BW Source</th>
<th>Egress BW Profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/1/11</td>
<td>Bridge</td>
<td>0</td>
<td></td>
<td>-</td>
<td>0</td>
<td></td>
<td>0</td>
</tr>
</tbody>
</table>

The following example shows the UNP rate limit parameters that are applied when user devices are assigned to a UNP profile that specifies bandwidth parameter values:

```
-> show unp port 1/1/11 bandwidth
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Type</th>

</tbody>
</table>

output definitions

- **Port**: The port or link aggregate on which UNP is enabled. A “0” indicates the port is a link aggregate (for example, 0/11 is link aggregate ID 11). Configured through the `unp port-type` command.

- **Port Domain**: The domain ID assigned to the UNP port or link aggregate. Configured through the `unp domain` command.

- **Type**: The type of UNP port (Bridge or Access). Configured through the `unp port-type` command.

- **Max Ingress Bandwidth**: The maximum ingress bandwidth value applied to the UNP port. Configured through the `unp profile maximum-ingress-bandwidth` command.

- **Ingress BW Source**: The source from which the maximum ingress bandwidth value was updated on the port (UNP or QoS).

- **Ingr BW Profile**: The name of the UNP profile responsible for setting the maximum ingress bandwidth value on the UNP port. This field is only applicable when UNP classification applies the bandwidth setting on the port.

- **Max Egress Bandwidth**: The maximum egress bandwidth value applied to the UNP port. Configured through the `unp profile maximum-egress-bandwidth` command.

- **Egress BW Source**: The source from which the maximum egress bandwidth value was updated on the port (UNP or QoS).

- **Egress BW Profile**: The name of the UNP profile responsible for setting the maximum egress bandwidth value on the UNP port. This field is only applicable when UNP classification applies the bandwidth setting on the port.
output definitions

Max Ingress Depth
The maximum ingress depth value that is applied to the UNP port. This value determines how much the traffic can burst over the maximum ingress bandwidth rate. Configured through the `unp profile maximum-ingress-depth` command.

Max Egress Depth
The maximum egress depth value that is applied to the UNP port. This value determines how much the traffic can burst over the maximum egress bandwidth rate. Configured through the `unp profile maximum-egress-depth` command.

Release History
Release 8.2.1; command was introduced.

show unp port 802.1x statistics

Displays 802.1X statistics for a UNP port or link aggregate on which 802.1X authentication is enabled.

show unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} 802.1x statistics

Syntax Definitions

- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[-agg_id2]**: Link aggregate ID. Use a hyphen to specify a range of link aggregates IDs (10-15).

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

Release History

Release 7.3.4; command was introduced.

Related Commands

show unp port Displays the UNP port configuration for the switch.
show unp user Displays information about the devices learned on a UNP port.

MIB Objects

N/A
show unp port configured-vlans

Displays the VLANs assigned to UNP bridge ports or link aggregates.

show unp {port [chassis/slot/port1[-port2]] | linkagg [agg_id1-agg_id2]} configured-vlans

Syntax Definitions

chassis/slot/port1[-port2] The chassis ID, slot, and port number (3/1/1) for a specific UNP bridge port. Use a hyphen to specify a range of ports (3/1/1-8).

agg_id1-agg_id2 Link aggregate ID for a specific UNP bridge link aggregate. Use a hyphen to specify a range of link aggregate IDs (10-15).

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the port or linkagg parameter to display information for a specific UNP bridge port or link aggregate ID.
- If the port or linkagg parameter is used without specifying an individual port, a range of ports, or link aggregate ID, then the configured VLAN information for all UNP ports and link aggregates is displayed.
- The “Type” field indicates if the VLAN assignment is untagged (unpUntag) or tagged (unpQtag).

Examples

- show unp port configured-vlans
  Port  Vlan   Type
  -------+--------+--------
  0/10   500    unpUntag
  0/10   501    unpUntag
  1/1/10 600    unpQtag
  1/1/11 601    unpUntag
  1/1/11 602    unpQtag
  1/1/11 603    unpQtag

- show unp port 1/1/11 configured-vlans
  Port  Vlan   Type
  -------+--------+--------
  1/1/11 601    unpUntag
1/1/11    602  unpQtag
1/1/11    603  unpQtag

-> show unp linkagg configured-vlans

| LagId | Vlan | Type    |
|-------+------+---------|
| 0/10  | 500  | unpUntag|
| 0/10  | 501  | unpQtag |
| 0/100 | 100  | unpQtag |
| 0/100 | 101  | unpUntag|
| 0/101 | 200  | unpQtag |
| 0/101 | 201  | unpQtag |

-> show unp linkagg 100 configured-vlans

| LagId | Vlan | Type    |
|-------+------+---------|
| 0/100 | 100  | unpQtag |
| 0/100 | 101  | unpUntag|

**Release History**

Release 8.2.1; command was introduced.
Release 8.5R4; “Type” field added.

**Related Commands**

1/1/5 static-spb2
1/1/10 static-vxlan1
1/1/10 static-vxlan2
1/1/20 static-l2gre

-> show unp port 1/1/5 profile
Port Profile
---------------
1/1/5 static-spb1
1/1/5 static-spb2
**Release History**

Release 8.5R4; command was introduced.

**Related Commands**

- **unp port profile**  
  Configures static profile assignments for UNP ports.

- **show unp port**  
  Displays the UNP port and link aggregate configuration for the switch.

**MIB Objects**

- **alaDaUNPPortTable**
  - **alaDaUNPPortProfile**
show unp port-template

Displays the port template configuration for the switch.

show unp port-template [template_name] [config | configured-vlans | profile]

Syntax Definitions

template_name
The name of the UNP port template to display.

config
Displays additional details about the parameter configuration for the template.

configured-vlans
Displays the VLAN IDs that the specified template assigns to a UNP port.

profile
Displays the names of UNP service profiles that the specified template assigns as static profiles to a UNP port.

Defaults

By default, displays a summary of the configuration information for all port templates.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Enter a template name with this command to display information for a specific port template.
- Use the config option with this command to display the full configuration for each template.
- Use the configured-vlans option with this command to display the VLAN IDs that a port template will statically assign to a UNP bridge port when the template is applied on the port. Configuring a static VLAN-port association (VPA) applies only to UNP bridge ports.
- Use the profile option with this command to display the names of UNP service profiles that a port template will assign as a static profile to a UNP port when the template is applied on the port.

Examples

-> show unp port-template

**show unp user**

Displays information about the MAC addresses learned on a UNP port or link aggregate.

```
show unp user [port chassis/slot/port[1-port2] | linkagg agg_id[-agg_id2]] [sap-id sap_id] [service-id service_id] [profile profile_name] [authentication-type {none | mac | 802.1x}] [mac-address mac_address] [count]
```

**Syntax Definitions**

- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). This parameter displays all UNP users learned on the specified port number.
- **agg_id[-agg_id2]**: Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15). This parameter displays all UNP users learned on the specified link aggregate ID.
- **sap_id**: A Service Access Point (SAP) ID. This parameter displays all UNP users associated with the specified SAP ID.
- **service_id**: A service ID number. This parameter displays all UNP users associated with the specified service ID.
- **profile_name**: The name of an existing UNP profile. This parameter displays all UNP users associated with the specified profile name.
- **none**: Displays all UNP users that did not undergo the authentication process.
- **mac**: Displays all UNP users that were authenticated through the MAC authentication process.
- **802.1x**: Displays all UNP users that were authenticated through the 802.1X authentication process.
- **mac_address**: A source MAC address. This parameter displays the UNP user device with the specified source MAC address.
- **count**: Displays the number of UNP users learned on the switch.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Usage Guidelines

- Use the optional parameters provided with this command to filter the output display results. In addition, some parameters can be combined to further narrow the display results. For example:
  - Combine the **port** or **linkagg** parameter with the **profile** parameter option to display users learned on the port or link aggregate that are classified into the specified profile.
  - Combine the **port** or **linkagg** parameter with the **authentication-type** parameter option to display users on the port or link aggregate that were authenticated with the specified authentication type.

- The “Username” field displays the user name that was entered to authenticate an 802.1X user device or the user name that was entered to successfully authenticate a user device through the Captive Portal process. However, if a user device first undergoes 802.1X authentication and then undergoes successful Captive Portal authentication, the user name entered during the Captive Portal process is displayed in this field.

- IPv6 is supported only for users learned into a VLAN or service which has an IP interface configured.

Examples

```bash
=> show unp user count
Total users: 6

=> show unp user

**output definitions**

- **Port**: The port or link aggregate on which the MAC address was learned. A “0” indicates the UNP port is a link aggregate (e.g., 0/10 refers to link aggregate ID 10).
- **Username**: Displays either a source MAC address or a Captive Portal user name for the learned user device.
- **MAC address**: The MAC address of the user device. This field and the **Username** field may contain the same MAC address, depending on how the user device was authenticated.
- **User IP (V4/V6)**: The IP network address of the user device (IPv4 or IPv6).
- **Vlan**: The UNP VLAN ID to which the user device was assigned. This only applies for users authenticated into VLAN profiles.
- **Profile**: The name of the UNP profile to which the user device was assigned.

</table>

**Release History**

Release 8.1.1; command was introduced.
Release 8.7R1; Support for IPv6 addresses of UNP users added; “User IP” field changed to “User IP (IPv4/IPv6).

**Related Commands**

- **show unp user status**  
  Displays information about the authentication and validation status of users learned on UNP ports.

- **show unp user details**  
  Displays detailed information about user devices learned on UNP ports.

- **unp user flush**  
  Performs a MAC address flush of Access Guardian users (devices learned on UNP ports).

- **show zeroconf server policy-instances**  
  Displays the UNP configuration for the switch.

- **show unp port**  
  Displays the UNP configuration for the port.

**MIB Objects**

- **N/A**
**show unp user status**

Displays the status of the authentication and validation process for MAC addresses learned on a UNP port or link aggregate.

```
show unp user status [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2] [sap-id sap_id] [service-id service_id] [profile profile_name] [authentication-type {none | mac | 802.1x}] [mac-address mac_address]
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[-agg_id2]**: Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).
- **sap_id**: A Service Access Point (SAP) ID. This parameter displays all UNP users associated with the specified SAP ID.
- **service_id**: A service ID number. This parameter displays all UNP users associated with the specified service ID.
- **profile_name**: The name of an existing UNP profile.
- **none**: Displays users that did not undergo the authentication process.
- **mac**: Displays users that were authenticated through MAC authentication.
- **802.1x**: Displays users that were authenticated through 802.1X authentication.
- **mac_address**: The user device MAC address.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the optional parameters provided with this command to filter the output display results. In addition, some parameters can be combined to further narrow the display results. For example:

- Combine the `port` or `linkagg` parameter with the `profile` parameter option to display users learned on the port or link aggregate that are classified into the specified profile.
• Combine the **port** or **linkagg** parameter with the **authentication-type** parameter option to display users on the port or link aggregate that were authenticated with the specified authentication type.

**Examples**

```
-> show unp user status port 1/1/1
Profile          Profile Authentication Role  Role                 Restricted
Port  Mac address       Name     Source  Type   Status  Name  Source  CP  Redirect Access
-----+-----------------+--------+-------+------+-------+-----+-------+---+--------+-------
1/1/1 00:00:00:00:00:05 Prf1     Radius  8021x  Passed  emp1  Profile  Y  -        -
Total users : 1
```

```
-> show unp user status linkagg 100

**Release History**

Release 8.1.1; command was introduced.
Related Commands

- **show unp user**
  Displays information about users learned on a UNP ports.

- **show unp user details**
  Displays detailed information about users learned on a UNP ports.

- **show zeroconf server policy-instances**
  Displays the UNP configuration for the switch.

- **show unp port**
  Displays the UNP configuration for the port.

MIB Objects

- N/A
**show unp user details**

Displays additional details about the MAC addresses learned on a UNP port or link aggregate.

```
show unp user details [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]] [sap-id sap_id] [service-id service_id] [profile profile_name] [authentication-type {none | mac | 802.1x}] [mac-address mac_address]
```

### Syntax Definitions

- **chassis**
  The chassis identifier.

- **slot/port[-port2]**
  The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). This parameter displays all UNP users learned on the specified port number.

- **agg_id[-agg_id2]**
  Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15). This parameter displays all UNP users learned on the specified link aggregate ID.

- **sap_id**
  A Service Access Point (SAP) ID. This parameter displays all UNP users associated with the specified SAP ID.

- **service_id**
  A service ID number. This parameter displays all UNP users associated with the specified service ID.

- **profile_name**
  The name of an existing UNP profile. This parameter displays all UNP users associated with the specified profile name.

- **none**
  Displays all UNP users that did not undergo the authentication process.

- **mac**
  Displays all UNP users that were authenticated through the MAC authentication process.

- **802.1x**
  Displays all UNP users that were authenticated through the 802.1X authentication process.

- **mac_address**
  A source MAC address. This parameter displays the UNP user device with the specified source MAC address.

### Defaults

Usage Guidelines

- Use the optional parameters provided with this command to filter the output display results. In addition, some parameters can be combined to further narrow the display results. For example:
  - Combine the `port` or `linkagg` parameter with the `profile` parameter option to display users learned on the port or link aggregate that are classified into the specified profile.
  - Combine the `port` or `linkagg` parameter with the `authentication-type` parameter option to display users on the port or link aggregate that were authenticated with the specified authentication type.

- The “User Name” field displays the user name that was entered to authenticate an 802.1X user device or the user name that was entered to successfully authenticate a user device through the Captive Portal process. However, if a user device first undergoes 802.1X authentication and then undergoes successful Captive Portal authentication, the user name entered during the Captive Portal process is displayed in this field.

Examples

Release History

Release 8.1.1; command was introduced.
Release 8.4.1.R02; **VPNID** field added.
Release 8.7R1; Support for IPv6 addresses of UNP users added; “IP-Address” field changed to “IP-Address (IPv4/IPv6)”.

Related Commands

- **show unp user status**: Displays information about the authentication and validation status of users learned on UNP ports.
- **unp user flush**: Performs a MAC address flush of Access Guardian users (devices learned on UNP ports).
- **show zeroconf server policy-instances**: Displays the UNP configuration for the switch.
- **show unp port**: Displays the UNP configuration for the port.

MIB Objects

N/A
show unp policy validity-period

Displays the UNP period policy configuration for the switch. This type of policy is assigned to a UNP profile and applied to devices classified into the profile.

show unp policy validity-period [policy_name]

---

Syntax Definitions

policy_name  The name of an existing UNP period policy.

---

Defaults

By default, all UNP period policies are displayed.

---

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

Usage Guidelines

Enter a UNP period policy name to display information about a specific policy.

---

Examples

-> show unp policy validity-period
Policy Days Months Hours Interval                  TZ Active
-----------------------------------------------+---------
tp1   SMTWTFS JFMAMJJASOND 08:00 - 17:00      - - -     - NO
tp2   ------- ------------ - - -     01/01/13 00:00 - 01/02/13 00:00 CST NO

Total Period Policy Count: 2

-> show unp policy validity-period tp1
Policy Days Months Hours Interval                  TZ Active
-----------------------------------------------+---------
tp1   SMTWTFS JFMAMJJASOND 08:00 - 17:00      - - -     - NO

---

Release History

Release 8.1.1; command introduced.
Related Commands

unp policy validity-period Configures a UNP period policy.
unp profile period-policy Assigns a UNP period policy to a UNP profile.

show unp policy validity-location

Displays the UNP location policy configuration for the switch. This type of policy is assigned to a UNP profile and applied to devices classified into the profile.

show unp policy validity-location [policy_name]

Syntax Definitions

policy_name

The name of an existing UNP location policy.

Defaults

By default, all UNP location policies are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

**device-profile admin-state**

Enables or disables the Device Profiling configuration on the switch.

```
device-profile admin-state {enable | disable}
```

**Syntax Definitions**

- **enable** Enables Device Profiling configuration on the switch.
- **disable** Disables Device Profiling configuration on the switch.

**Defaults**

By default Device Profiling configuration is disabled globally on the switch.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When Device Profiling is globally enabled for the switch, Device Profiling functionality is automatically enabled on all ports and link aggregates.

**Example**

```
-> device-profile admin-state enable
-> device-profile admin-state disable
```

**Release History**

Release 8.5R2; command was introduced.

**Related Commands**

- **device-profile port linkagg** Enables or disables the Device Profiling on the ports or linkagg interface.
- **show device-profile config** Displays the global configuration of the Device Profile.

**MIB Objects**

```
alaDpAdminState
```

OmniSwitch AOS Release 8 CLI Reference Guide   April 2023   page 40-405
device-profile port linkagg

Enables or disables the Device Profiling on the ports or linkagg interface.

device-profile [port chassis/slot/port1[-port2] | linkagg agg_id1[-agg_id2] admin-state {enable | disable}]

Syntax Definitions

chassis The chassis identifier.
slot/port1[-port2] The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
agg_id1[-agg_id2] The link aggregate ID number. Use a hyphen to specify a range of link aggregate ID numbers (5-10).
enable Enables the Device Profiling on the specified port or linkagg.
disable Disables the Device Profiling on the specified port or linkagg.

Defaults

By default Device Profiling is enabled on all ports or linkagg when the Device Profiling feature is enabled globally on the switch.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Release</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
| Usage Guidelines

- Use this command to disable Device Profiling on specific ports or linkagg when the Device Profiling is globally enabled on the switch.
- Device Profiling configuration is not allowed on VFL or HiGig ports.

Example

- device-profile linkagg 1 admin-state enable
- device-profile port 2/1/2-5 admin-state enable
- device-profile port 1/1/2 admin-state enable
- device-profile port 1/1/2 admin-state disable
- device-profile linkagg 1-5 admin-state disable

Release History

Release 8.5R2; command was introduced.
**Related Commands**

- `show device-profile config` Displays the global configuration of the Device Profile.
- `show device-profile catalog` Displays the details of known and unknown devices identified in the network.

**MIB Objects**

- `alaDpIfTable`
- `alaDpIfAdminStatus`
**device-profile device-type**

Adds or removes a new device type and category in the Device Profile.

```
device-profile device-type type_name device-name device_name from {mac-address mac_address | dhcp-option-55 dhcp_option}
```

```
no device-profile device-type type_name
```

### Syntax Definitions

- **type_name**: The type of the device. The device type name can be of maximum size 32 alphanumeric characters.
- **device_name**: The name of the device type. The device name can be of maximum size 32 alphanumeric characters.
- **mac_address**: The MAC address of the device. The device with that MAC address must be in the unknown cataloged devices.
- **dhcp_option**: The DHCP option 55 codes of the device.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The unknown cataloged devices can be identified or moved to trusted identity in the Device Profile using this command.
- While specifying the MAC address of the device for identity, the device must first be present in the unknown cataloged devices. Otherwise, the MAC address will not be recognized.
- Custom signatures can be created using the DHCP option 55.
- The new signatures created will not be persistent unless it is saved. Use the **device-profile update-signature** CLI command to update the flash or signature database.
- Use the **no** form of the command to remove the device and its category from the trusted device list.
Example

```plaintext
-> device-profile device-type Printer-Fax device-name Kyocera-Printer mac-address 00:aa:bb:12:43:55
-> device-profile device-type IP-Camera device-name netgear dhcp-option-55 1,3,6,15,119,252
-> no device-profile device-type Printer-Fax
```

Release History

Release 8.5R2; command was introduced.

Related Commands

- **device-profile auto-unassignment**: Enables auto assignment of UNP profile when the device gets identified and categorized into existing device types.
- **show device-profile catalog**: Displays the details of known and unknown devices identified in the network.
- **device-profile update-signature**
  - **device-profile update-signature from**: Updates the custom or user-defined device type to the flash and signature database.
  - **device-profile update-signature from**: Apply the new signature file in the system.

MIB Objects

- `alaDpDeviceTable`
  - `alaDpDeviceType`
  - `alaDpDeviceName`
  - `alaDpDeviceMacAddress`
  - `alaDpDeviceDhcpOpt55`
  - `alaDpDeviceRowStatus`
device-profile update-signature

Updates the custom or user-defined device type to the flash and signature database.

device-profile update-signature

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

If the flash or the signature database is not updated with the new device type, it will not be persistent.

Example

-> device-profile update-signature

Release History

Release 8.5R2; command was introduced.

Related Commands

- **show device-profile catalog**: Displays the details of known and unknown devices identified in the network.
- **device-profile update-signature from**: Apply the new signature file in the system.
- **show device-profile signatures**: Displays the device types in the local database and indicates the signatures which are not saved to the flash.

MIB Objects

alaDpUpdateSignature
alaDpUpdateSignature
device-profile update-signature from

Applies the new signature file in the system.

device-profile update-signature from file-name

Syntax Definitions

file_name The name of the file which contains device signatures.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

|    | 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900 V72/C32 | 6900 X48C6/T48C6/ | 9900 |
|----|------|------|------|-------|------|-------|------|------|--------------|X48C4E/V48C8/ |      |
|    | Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes          |C32E/T24C2/     | Yes |
|    |      |      |      |       |      |       |      |      |              |X24C2           |     |

Usage Guidelines

- Use this command to update the signature file in the system. Currently, only DHCP option 55 based signature is updated.
- The command also updates the custom signature into the flash.

Example

-> device-profile update-signature from /flash/dhcp_option55_list.txt

Release History

Release 8.5R2; command was introduced.

Related Commands

show device-profile catalog Displays the details of known and unknown devices identified in the network.

show device-profile signatures Displays the device types in the local database and indicates the signatures which are not saved to the flash.

show device-profile signatures from Displays the contents of the signature file.
**MIB Objects**

alaDpGlobalConfig

alaDpUpdateSignatureFileName
**device-profile auto-unp-assignment**

Configures the status of automatic assignment to a UNP profile when the device gets identified and categorized into existing device types.

- `device-profile auto-unp-assignment`
- `no device-profile auto-unp-assignment`

---

**Syntax Definitions**

N/A

**Defaults**

By default, automatic assignment to a UNP profile is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If the device profile is from a different VLAN, then it must be port bounced using the `unp redirect port-bounce` command to toggle.
- Use the `no` form of the command to disable the auto assignment of the UNP profile.
- When Device Profiling is globally enabled for the switch, the following UNP profiles and extended classification rules are automatically created on the switch:
  - `devProfPrinter`
  - `devProfWindows`
  - `devProfIP-Phone`
  - `devProfWireless-Router`
  - `devProfSmartPhone/PDA/Tablets`
- Automatically created UNP profiles are not mapped to a VLAN; manually configuring the VLAN assignment for the profile is still required.
- UNP profiles automatically created for the device types still require mapping the profiles to a VLAN.

**Example**

- `device-profile auto-unp-assignment`
- `no device-profile auto-unp-assignment`
**Release History**

Release 8.5R2; command was introduced.

**Related Commands**

- **device-profile device-type**
  Adds or removes new device type and category in Device Profile.

- **show unp user**
  Displays information about the MAC addresses learned on a UNP port or link aggregate.

- **show unp profile**
  Displays the UNP profile configuration for the switch.

- **show unp classification-rule**
  Displays the UNP extended classification rule configuration for the switch.

- **show device-profile summary**
  Displays the number of devices identified based on the device type.

**MIB Objects**

- alaDpGlobalConfig
  - alaDpAutoUnpAssignment
show device-profile config

Displays the global configuration for Device Profiling.

show device-profile config

**Syntax Definitions**

41 Application Monitoring and Enforcement Commands

Application usage patterns in the enterprise network is changing with the increase in use of the social networking, browser based file sharing, and peer to peer applications. The use of these applications result in the new traffic patterns in the network that are not straightforward to distinguish. There is also an increase in consumerization of IT with multiplication of thin clients, HTTP based, and virtual desktop clients.

OmniSwitch Application Monitoring and Enforcement (AppMon) feature addresses the key challenges of real time classification of flows at application level by providing differential QoS treatment in the form of higher priority marking and security policies at application level. AppMon feature improves the quality of user experience through application aware network optimization and control.

Note.
- AppMon is supported on a virtual chassis of OmniSwitch 6860 and OmniSwitch 6860E platforms where at least one OmniSwitch 6860E is mandatory for the feature to work.
- AppMon is supported on a virtual chassis of OmniSwitch 6860N.

MIB information for the AppMon commands is as follows:

Filename: ALCATEL-IND1-APP-MON-MIB.mib
Module: alaAppMonMIB
A summary of the available commands is listed here:

```
app-mon admin-state
app-mon port admin-state
app-mon auto-group create
app-mon app-group
app-mon app-list
app-mon apply
app-mon l3-mode
app-mon l4-mode
app-mon l4port-exclude
app-mon flow-table flush
app-mon flow-table enforcement stats
app-mon aging enforcement
app-mon logging-threshold
app-mon flow-sync enforcement interval
app-mon force-flow-sync
app-mon separate-config-file
app-mon data
app-mon enforcement-mode
show app-mon config
show app-mon port
show app-mon app-pool
show app-mon app-list
show app-mon app-group
show app-mon app-record
show app-mon ipv4-flow-table
show app-mon ipv6-flow-table
show app-mon l4port-exclude
show app-mon stats
show app-mon aging enforcement
show app-mon vc-topology
clear app-mon app-list
```
app-mon admin-state

Enable or disable the Application Monitoring and Enforcement (AppMon) feature.

app-mon admin-state {enable | disable}

Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables AppMon support on the switch.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables AppMon support on the switch.</td>
</tr>
</tbody>
</table>

Defaults

By default, AppMon is disabled on the switch.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- AppMon cannot be enabled globally when,
  - all the mirroring sessions are used by port mirroring or monitoring features.
  - mirroring session is used by policy manager.
  - This is applicable for OmniSwitch 6860 only.
- On OmniSwitch 6860, when AppMon is enabled globally, it reserves a mirroring session in the system.
- If AppMon functionality is enabled at a port level, disabling AppMon globally overrides the functionality of all AppMon ports; however, configuration on the ports remain the same.
- AppMon is supported on a virtual chassis of OmniSwitch 6860 and OmniSwitch 6860E platforms where at least one OmniSwitch 6860E is mandatory for the feature to work.
- AppMon is supported on a virtual chassis of OmniSwitch 6860N.

Examples

- `-> app-mon admin-state enable`
- `-> app-mon admin-state disable`

Release History

Release 8.2.1; command introduced.
Related Commands

app-mon port admin-state
Enable or disable AppMon on one or more switch ports.

show app-mon config
Displays global AppMon configuration.

MIB Objects

alaAppMonAdminStatus
app-mon port admin-state

Enable or disable AppMon Monitoring and Enforcement on one or more switch ports.

```
app-mon {port chassis/slot/port[-port2] | slot chassis/slot [-slot]} admin-state {enable | disable}
```

**Syntax Definitions**

- `chassis/slot/port[-port2]`: The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
- `chassis/slot`: The chassis ID and slot number (3/1) for a specific slot.
- `enable`: Enables AppMon on the port.
- `disable`: Disables AppMon on the port.

**Defaults**

By default, AppMon is disabled on all ports.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- It is mandatory to enable AppMon globally for the port level AppMon to function.
- When slot option is used, then AppMon configuration is applied on all the physical ports of that particular slot.
- AppMon configuration is not allowed on Virtual Fabric Link, ERP, or VLAN stacking ports.
- On OmniSwitch 6860, AppMon cannot be configured on a port that is part of a link aggregate or a port mirroring port. On OmniSwitch 6860N, AppMon can be configured on a port that is part of a link aggregate.
- On OmniSwitch 6860, AppMon must not be configured on user ports and uplink ports at the same time. On OmniSwitch 6860N, it is mandatory to enable AppMon on user ports and uplink ports.
- On OmniSwitch 6860N, AppMon must be enabled on both ports involving bi-direction flow traffic.

**Examples**

- `-> app-mon slot 1/1 admin-state enable`
- `-> app-mon port 1/1/2-5 admin-state enable`
- `-> app-mon slot 1/1 admin-state disable`
**Release History**

Release 8.2.1; command introduced.
Release 8.7R1; AppMon support on SPB/UNP access ports added.
Release 8.8R1; AppMon support on SPB/UNP access ports added on OmniSwitch 6860N.

**Related Commands**

- **app-mon admin-state**  
  Enable or disable the Application Monitoring feature.
- **show app-mon port**  
  Displays AppMon status per physical port or per slot for the switch.

**MIB Objects**

alaAppMonPortConfigTable

- alaAppMonPortConfigSlotPortIndex
- alaAppMonPortConfigPortStatus
app-mon auto-group create

Creates application groups automatically on the switch. The application groups are automatically created based on the ‘category’ field of each application present in the application pool.

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Modifications are allowed in auto application groups with addition or deletion of applications using the app-mon app-group command.

- Enter app-mon apply and write memory to save the auto group configuration or modification on the switch.

- The show app-mon app-pool command displays the application categories in the signature file. The application group names are derived from the category name.

Examples

-> app-mon auto-group create

Release History

Release 8.2.1; command introduced.
Related Commands

- **app-mon apply**  
  Updates the set of application signatures configured for application monitoring.

- **show app-mon app-group**  
  Displays the details of all the applications in an application group.

- **show app-mon app-pool**  
  Displays all the applications that are part of an application pool.

MIB Objects

- **alaAppMonAutoGroupCreation**
**app-mon app-group**

Creates an application group. Applications can be added or removed from the application group.

```
app-mon app-group app_group_name {add | remove} {app-name app_name | from app_name to app_name}
```

```
no app-mon app-group app_group_name
```

**Syntax Definitions**

- `app_group_name`: Name of the application group. The group name can be a maximum of 32 alphanumeric characters.
- `app_name`: The name of the application to be added to the application group. The application name can be a maximum of 32 alphanumeric characters.
- `from app_name`: The first application name when adding a range of applications to an application group.
- `to app_name`: The last application name when adding a range of applications to an application group.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to remove an application group.
- This command can be used to add or delete applications for the auto application groups as well.
- One application can belong to more than one application group.
- Only those applications that are part of an application pool are allowed to be added to an application group.
- To add a range of applications or multiple applications to an application group, use the **from** and **to** options. Range is expanded based on the list of applications in the app-pool list (application pool). Use the **show app-mon app-pool** command to view the application names.
- If an application is removed from an application group which has only one application, then the complete application group is removed.
- If any application is added to a user group (group name same name as category name), and signature toolkit update operation or 'app-mon auto-group create' is done, then added group is not deleted. Only update happens.

- If an application group contains a single application and the group is part of an application list, then this single application cannot be removed from the application group.

- An application group cannot be deleted when it is part of an application list.

- When the last application from the application group is removed, the application group is automatically deleted.

- The list of applications (added or deleted) to an application group is displayed in show configuration snapshot command after app-mon apply command is entered. A list of applications (added or deleted) are displayed with the show app-mon app-group command even without using the app-mon apply command.

**Examples**

```
-> app-mon app-group apg2 add app-name whatsapp
-> app-mon app-group apg2 remove app-name whatsapp
-> no app-mon app-group apg2
```

To add a range of applications or multiple applications to an application group, use the show app-mon app-pool command to view the application names. For example:

```
-> show app-mon app-pool
Legend: Application-name: *= Not present in recently updated kit,
AppId | Application-name | Revision | Category
-------+-----------------+----------+----------------
968 | amazon | 1.0.0 | Web
244 | facebook | 1.0.0 | Web
182 | sip | 1.0.0 | Audio/Video
183 | skype | 1.1.0 | Instant Messaging
211 | tftp | 1.0.0 | File Server
503 | twitter | 1.0.0 | Web
597 | viber | 1.0.0 | Audio/Video
890 | webex | 1.0.0 | Audio/Video
1093 | whatsapp | 1.0.0 | Instant Messaging
240 | youtube | 1.0.0 | Web
```

Number of Applications: 10

Select any two applications for the range option using the app-mon app-group command.

```
-> app-mon app-group apg1 add from sip to viber
```

This command adds the applications from sip to viber to the application group (sip, skype, tftp, twitter, and viber).

If an application is removed from an application group which has only one application, then the complete application group is removed. For example:

```
-> show app-mon app-group group1
AppGrp-Id | App-group | App-name
----------+-----------+-------------------
1093 | whatsapp | Instant Messaging
```

Now, remove the application name ‘whatsapp’ from the application group. The complete application group gets removed as shown below.
AppGrp-Id   App-group   App-name
------------+-------------------------+-------------------------

**Release History**

Release 8.2.1; command introduced.

**Related Commands**

- **app-mon apply** Updates the set of application signatures configured for application monitoring.
- **show app-mon app-group** Displays the details of all the applications in an application group.
- **show app-mon app-list** Displays a list of applications and application groups added to an application list.
- **show app-mon app-pool** Displays all the applications that are part of an application pool.

**MIB Objects**

alaAppMonAppGroupTable
  alaAppMonAppGroupName
  alaAppMonAppGroupMember
  alaAppMonAppGroupStatus
  alaAppMonAppGrpFromAppName
  alaAppMonAppGrpToAppName
  alaAppMonAddAppGrpName
  alaAppMonAppGroupBuiltIn
  alaAppMonAppGroupCategoryName
  alaAppMonAppGrpId
  alaAppMonAppGroupAppStatus
**app-mon app-list**

Add or remove applications or application groups to an application list for enforcement or monitoring.

```
app-mon app-list {enforcement | monitor} {add | remove} {app-name app_name | app-group app_group_name}
```

**Syntax Definitions**

- **add**: Adds the specified application or application group to an application list.
- **remove**: Removes the specified application or application group from an application list.
- **app_name**: Name of the application to be added to the application list. This adds the specified application to the application list.
- **app_group_name**: Name of the application group to be added to the application list. This enables the addition of multiple applications in the application group to the application list.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The application group can be user created or generated automatically (see `app-mon app-group` and `app-mon auto-group create` command).
- Separate application list is maintained for enforcement and monitoring.
- The `show configuration snapshot` command displays the applications added or removed from the application list only after the `app-mon apply` command is used. The `app-mon apply` command saves the list of applications added or removed to the application list. The saved list of applications are displayed with the `show app-mon app-list active` command.
- QoS policy rules can be configured for a given application as well as an application group where the same application also exists. QoS matches policies based on the application-name or application-group name configured in an application list. For more information on configuring enforcement for QoS policy rules, see the “QoS Policy Commands” chapter.
Examples

-> app-mon app-list enforcement add app-name whatsapp
-> app-mon app-list enforcement add app-group apg1
-> app-mon app-list monitor add app-group apg2
-> app-mon app-list enforcement remove app-name whatsapp

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon auto-group create  Enables or disables Auto-Group functionality on the switch.
app-mon app-group       Creates an application group. Applications can be added or removed from the application group.
show app-mon app-list   Displays list of applications and application groups added to an application list.
clear app-mon app-list  Removes all applications signatures from the application list.

MIB Objects

alaAppMonAppListTable
  alaAppMonAppListMemberName
  alaAppMonAppListMemberType
  alaAppMonAppListMemberStatus
  alaAppMonAppListAppId
  alaAppMonAppListAppStatus
**app-mon apply**

This activates both enforcement and monitoring application lists for flow classification.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The following operations are performed with the `app-mon apply` command:

- Saves the current application-list, application-group, and auto-groups to flash when 'write memory' command is used.

- The application list is checked for any application configured more than once in an application list (individually or as a part of application group).
  - The `app-mon apply` command will not be successful until the conflict is resolved.
  - The `show app-mon app-list` command with the `monitor conflict` or the `enforcement conflict` parameter displays the available conflicts in an application list.
  - The duplicate application names must be removed for a successful `app-mon apply` operation.

- QoS is applied to the flows learned for the activated applications based on the configured QoS policies for Enforcement application list.

**Examples**

`-> app-mon apply`

**Release History**

Release 8.2.1; command introduced.
Related Commands

- **show app-mon config**
  Displays global AppMon configuration.

- **show app-mon port**
  Displays AppMon status per physical port or per slot for the switch.

- **show app-mon app-list**
  Displays a list of applications and application groups added to an application list.

MIB Objects

`alaAppMonUpdateAppList`
**app-mon l3-mode**

Enables or disables monitoring and enforcement for IPv4 flows, IPv6 flows, or both.

```
app-mon l3-mode {ipv4 | ipv6} admin-state {enable | disable}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>IPv4</th>
<th>IPv6</th>
<th>enable</th>
<th>disable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applies monitoring and enforcement to IPv4 flows.</td>
<td>Applies monitoring and enforcement to IPv6 flows.</td>
<td>Enables the specified L3 mode on the switch.</td>
<td>Disables the specified L3 mode on the switch.</td>
</tr>
</tbody>
</table>

### Defaults

By default, monitoring and enforcement is enabled for both IPv4 and IPv6 flows.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

N/A

### Examples

```
-> app-mon l3-mode ipv4 admin-state disable
-> app-mon l3-mode ipv4 admin-state enable
-> app-mon l3-mode ipv6 admin-state disable
```

### Release History

Release 8.2.1; command introduced.
Related Commands

**show app-mon ipv4-flow-table**  Displays the flow table for IPv4 flows entries for enforcement and monitor flows.

**show app-mon ipv6-flow-table**  Displays the flow table for IPv6 flows entries for enforcement and monitor flows.

**show app-mon config**  Displays global AppMon configuration.

MIB Objects

- `alaAppMonEnforcementIpv4`
- `alaAppMonEnforcementIpv6`
**app-mon l4-mode**

Enables or disables monitoring and enforcement for TCP or UDP flows.

```
app-mon {port chassis/slot/port[-port2] | slot chassis/slot} l4-mode {tcp | udp} admin-state {enable | disable}
```

### Syntax Definitions

- `chassis/slot/port[-port2]` The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
- `chassis/slot` The chassis ID and slot number (3/1) for a specific slot.
- `tcp` Applies monitoring and enforcement to TCP flows.
- `udp` Applies monitoring and enforcement to UDP flows.
- `enable` Enables the specified L4 mode on the switch.
- `disable` Disables the specified L4 mode on the switch.

### Defaults

By default, both TCP and UDP flows are processed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

N/A

### Examples

- `-> app-mon port 1/1/2 l4-mode udp admin-state disable`
- `-> app-mon slot 1/1 l4-mode tcp admin-state enable`
- `-> app-mon port 1/1/2 l4-mode udp admin-state enable`

### Release History

Release 8.2.1; command introduced.
**Related Commands**

- `app-mon l4port-exclude`  Configures the L4 port range to exclude from the AppMon operation.
- `show app-mon ipv4-flow-table`  Displays the flow table for IPv4 flows entries for enforcement and monitor flows.
- `show app-mon ipv6-flow-table`  Displays the flow table for IPv6 flows entries for enforcement and monitor flows.
- `show app-mon config`  Displays global AppMon configuration.

**MIB Objects**

- `alaAppMonPortConfigTable`
  - `alaAppMonPortConfigSlotPortIndex`
  - `alaAppMonEnforcementPortConfigTcpStatus`
  - `alaAppMonEnforcementPortConfigUdpStatus`
app-mon l4port-exclude

Configures the L4 port range to exclude from the AppMon operation.

app-mon l4port-exclude range-id number \{tcp-service-port | udp-port\} start number end number

no app-mon l4port-exclude range-id

Syntax Definitions

range-id number The range ID number. The valid range is 1–8.
tcp-service-port Specifies TCP service ports.
udp-port Specifies UDP ports.
start number The first port associated with the range ID number. The valid port range is 1–65535.
end number The last port associated with the range ID number. The valid port range is 1–65535.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to remove an L4 exclude range ID from the switch configuration.
- For the udp-port option, the AppMon operation is not performed on the flows with a source or destination port that is in the excluded port range.
- For the tcp-service-port option, the AppMon operation is not performed on the flows with a destination TCP port of TCP-SYN packet or a source TCP port of TCP-SYN-ACK packet that is in the excluded port range.
- This configuration applies to both enforcement and monitor features.

Examples

-> app-mon l4port-exclude range-id 5 tcp-service-port start 20 end 30
-> app-mon l4port-exclude range-id 6 udp-port start 90 end 100
-> no app-mon l4port-exclude range-id 6
Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon l4port-exclude Displays the port range excluded from AppMon operation.

app-mon flow-table flush

Clears all the learned flow-table entries for both IPv4 and IPv6 flow tables.

app-mon flow-table {enforcement | monitor} flush

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enforcement</td>
<td>Flushes all the learned flow-table entries from the enforcement application.</td>
</tr>
<tr>
<td>monitor</td>
<td>Flushes all the learned flow-table entries from the monitor application.</td>
</tr>
</tbody>
</table>

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>No</td>
</tr>
<tr>
<td>6465</td>
<td>No</td>
</tr>
<tr>
<td>6560</td>
<td>No</td>
</tr>
<tr>
<td>6570M</td>
<td>No</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
</tr>
<tr>
<td>6860N</td>
<td>Yes</td>
</tr>
<tr>
<td>6865</td>
<td>No</td>
</tr>
<tr>
<td>6900</td>
<td>No</td>
</tr>
<tr>
<td>6900 V72/C32</td>
<td>No</td>
</tr>
<tr>
<td>9900</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When the *enforcement* option is used, all the active flows information are cleared; no QoS treatment is provided (if configured). The data (active, gross counters, statistics, and flow information) in the following commands are cleared: show app-mon app-list enforcement active, show app-mon app-list enforcement active stats, show app-mon ipv4-flow-table enforcement, show app-mon ipv6-flow-table enforcement, show app-mon stats.

- When the *monitor* option is used, all the learned flows information will be cleared. The data (gross counters and flow information) in the following commands are cleared: show app-mon app-list monitor active, show app-mon ipv4-flow-table monitor, show app-mon ipv6-flow-table monitor.

- When this command is used, application-record information is not cleared.

**Examples**

- `app-mon flow-table enforcement flush`
- `app-mon flow-table monitor flush`

**Release History**

Release 8.2.1; command introduced.
**Related Commands**

- `show app-mon config` Displays global AppMon configuration.
- `show app-mon app-list` Displays a list of applications and application groups added to an application list. ‘stats’ option in this command displays active or gross packets/byte counters on per application basis.
- `show app-mon ipv4-flow-table` Displays the flow table for IPv4 flows entries for enforcement and monitor flows.
- `show app-mon ipv6-flow-table` Displays the flow table for IPv6 flows entries for enforcement and monitor flows.

**MIB Objects**

- `alaAppMonFlowTableFlush`
**app-mon flow-table enforcement stats**

Enable or disable flow table statistics update for enforcement applications.

**app-mon flow-table enforcement stats admin-state {enable | disable}**

### Syntax Definitions

- **enable**: Enable flow-table statistics update.
- **disable**: Disable flow-table statistics update.

### Defaults

By default, statistics admin status is disabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command is applicable only for enforcement applications.
- The statistics collection capability is shared with Service Manager, which means that either the Service Manager feature or AppMon can use this capability at any given time. Hence, disabling the counter usage in Service Manager using the `service stats disable` command is required to view the flow table statistics update for enforcement applications. For more information about this command, see the “Service Manager Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide*.
- When update statistics is enabled, the updated statistics is displayed in the `show app-mon ipv4-flow-table enforcement verbose`, `show app-mon ipv6-flow-table enforcement verbose`, and `show app-mon app-list enforcement active stats` commands. Statistics are refreshed every 160 seconds from data path, and based on the flow sync interval between the data path and the control path.

### Examples

- `-> app-mon flow-table enforcement stats admin-state enable`
- `-> app-mon flow-table enforcement stats admin-state disable`

### Release History

Release 8.2.1; command introduced.
Related Commands

show app-mon config          Displays global AppMon configuration.

MIB Objects

alaAppMonEnforcementFlowTableStatsAdminStatus
app-mon aging enforcement

Configures aging time for dynamically learned TCP/UDP flows for each application for Enforcement applications.

app-mon aging enforcement app-name app_name [tcp | udp] interval {120m | 60m | 30m | 10m | 5m | 3m | default}

Syntax Definitions

app_name
Name of the application to configure its aging interval. The application must be part of the application pool.

interval
The aging time interval for dynamically learned flows in the flow table, in minutes.

default
Configures the default aging interval.

Defaults

By default, aging interval is set per application and TCP or UDP flow type basis.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- User can set separate TCP or UDP flows aging interval for an given application.
- When TCP option is used to configure aging interval for an application, TCP flows generated by a given application age out with configured value.
- When UDP option is used to configure aging interval for an application, UDP flows generated by a given application age out with configured value.
- Flow aging is supported for the applications that are part of the enforcement application list. Flows related with enforcement application list are made active for QoS treatment as well statistics collection.
- Flow aging is not supported for applications that are part of Monitor application list. Monitor flow tables log these flows when they are detected until logging threshold is reached.

Examples

-> app-mon aging enforcement app-name sip tcp interval 60m
-> app-mon aging enforcement app-name tftp udp interval 120m
Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon config
Displays global AppMon configuration.

show app-mon aging enforcement
Displays the aging interval for each application for enforcement feature.

MIB Objects

alaAppMonEnforcementAgingTimerTable
alaAppMonEnforcementAgingTimerValue
**app-mon logging-threshold**

Configures the threshold for the number of matched flows for enforcement and monitor applications.

```
app-mon logging-threshold {enforcement | monitor} num-of-flows {number | default}
```

**Syntax Definitions**

- **number**: Threshold value for the number of matched flows. The valid range is 1000–60000.
- **default**: Sets the threshold back to the default value of 20K.

**Defaults**

By default, 20000 flows are logged.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6</th>
<th>X48C4E/V48C8/C32E/T24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When the logging threshold value is set to ‘0’, flows are not logged to the log file.
- When used with enforcement option, it configures the threshold for the number of matched flows to be saved on the log file for enforcement applications.
- When used with monitor option, it configures the threshold for the number of matched flows to be displayed in the monitor flow table commands.

**Examples**

```
-> app-mon logging-threshold monitor num-of-flows 10000
-> app-mon logging-threshold monitor num-of-flows default
-> app-mon logging-threshold enforcement num-of-flows 10000
```

**Release History**

Release 8.2.1; command introduced.

**Related Commands**

- `show app-mon config` Displays global AppMon configuration.
MIB Objects

alaAppMonThresholdNumberOfFlows
**app-mon flow-sync enforcement interval**

Configures the interval at which the enforcement flows information is refreshed.

```
app-mon flow-sync enforcement interval {number | default}
```

**Syntax Definitions**

- **number**: Flow sync interval at which the enforcement flows information is refreshed. The valid range is 10–3600 seconds. The interval can be configured only for the enforcement feature.

- **default**: Configures the default flow-sync interval.

**Defaults**

Default flow-sync interval is 60 seconds for enforcement.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The refreshed information is shown in the following show commands: `show app-mon applist enforcement active`, `show app-mon applist enforcement active stats`, `show app-mon ipv4-flow-table enforcement`, `show app-mon stats`.

**Examples**

```
-> app-mon flow-sync enforcement interval 10
-> app-mon flow-sync enforcement interval default
```

**Release History**

Release 8.2.1; command introduced.
**Related Commands**

- `show app-mon ipv4-flow-table`  Displays the flow table for IPv4 flows entries.
- `show app-mon ipv6-flow-table`  Displays the flow table for IPv6 flows entries.

**MIB Objects**

- `alaAppMonFlowSyncEnforcementInterval`
**app-mon force-flow-sync**

Synchronizes flows learned in the data path.

`app-mon force-flow-sync {enforcement | monitor}`

---

**Syntax Definitions**

- **enforcement**: Synchronizes flows learned in the data path for the enforcement feature from the hardware.
- **monitor**: Synchronizes flows learned in the data path for the monitor feature from the hardware.

---

**Defaults**

By default, flow synchronization occurs every 5 minutes for monitor flows and 60 seconds for enforcement flows.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

Use this command to force a flow synchronization with the control path database in real time.

---

**Examples**

```
-> app-mon force-flow-sync enforcement
-> app-mon force-flow-sync monitor
```

---

**Release History**

Release 8.2.1; command introduced.

---

**Related Commands**

- `show app-mon ipv4-flow-table` Displays the flow table for IPv4 flows entries.
- `show app-mon ipv6-flow-table` Displays the flow table for IPv6 flows entries.

---

**MIB Objects**

- `alaAppMonForceFlowSyncStatus`
**app-mon separate-config-file**

Reduces the per-application level AppMon configuration display in the `show configuration snapshot` output as well as in “vcboot.cfg”.

`app-mon separate-config-file`

`no app-mon separate-config-file`

---

**Syntax Definitions**

N/A

**Defaults**

By default, the separate configuration file option is enabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

|--------------|------|------|------|-------|------|-------|------|------|--------------|                |             |        |      |------|------|
|              | No   | No   | No   | No    | Yes  | Yes   | No   | No   | No           | No             | No            | No            | No     | No   | No   |

**Usage Guidelines**

- When this command is used, per-application level AppMon configuration is moved to a separate file called “appmon_vcboot.cfg” from “vcboot.cfg” on write memory.
- Use the `no` form of this command to disable the separate configuration file feature.

**Examples**

```
-> app-mon separate-config-file
-> no app-mon separate-config-file
```

**Release History**

Release 8.7R1; command introduced.

**Related Commands**

- `show app-mon config` Displays global AppMon configuration.

**MIB Objects**

- `alaAppMonSeparateConfigFile`
**app-mon data**

Provides an option to extract pre-defined attributes of a given application for debugging and monitoring purposes. Use this command to view the interface information for an application attribute flow.

```
app-mon data app_name [filter filter_header | no-page]
```

**Syntax Definitions**

- **app_name**: Name of the application from which to extract pre-defined attributes.
- **filter_header**: Filter the data attributes based on various fields like time, interface, source MAC, destination MAC and so on.
- **no-page**: Filter with this option to display all the records.

**Default**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570/M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td>V72/C32</td>
<td>X48C6/T48C6</td>
<td>X48C4E/V48C8</td>
<td>C32E/T24C2</td>
<td>X24C2</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This is a meta CLI, and does not have corresponding SNMP MIB object.
- This command does not allow any configuration; can be used to view the attribute records for a specific application. Currently, this command can be used only for **IEC104** application.
- The data attributes can be filtered based on various fields like time, interface, source MAC, destination MAC and so on. Filter with ‘no-page’ option to display all the records.

**Examples**

```
-> app-mon data
Please wait...
Usage: app-mon data <app-name> [filter "string"] [no-page]
app-name: display attribute records of an application name
filter: to display attribute records based on given column name (s)
no-page: display all the attribute records
Filter Usage: app-mon data <app-name> filter "ColumnNmael=value1, ColumnN-
name2=value2 ..." [no-page]
Header:
Time | Interface | SrcMac | SrcIp | SrcPort | DesMac | DesIp | DesPort | CauseTx | acpi_type | acpi_utype | asdu | Total
```

OmniSwitch AOS Release 8 CLI Reference Guide    April 2023    page 41-34
Examples:

app-mon data <app-name> filter "interface=1/1/18"
app-mon data <app-name> filter "interface=1/1/18, SrcIp= 135.254.163.134"

Example 1:

```plaintext
-> app-mon data iec104
Please wait...
```

MIB Objects
N/A
**app-mon enforcement-mode**

Enables the enforcement for either IPv4 or IPv4-IPv6 flows.

```plaintext
app-mon enforcement-mode [ipv4 | ipv4-ipv6]
```

### Syntax Definitions

- **ipv4**  
  Applies enforcement to IPv4 flows.

- **ipv4-ipv6**  
  Applies enforcement to IPv4-IPv6 flows.

### Default

By default, enforcement mode is set to IPv4-IPv6.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6465</th>
<th>6560</th>
<th>6860</th>
<th>6570M</th>
<th>6860N</th>
<th>6865</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv4</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>IPv4-IPv6</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Enforcement mode can be changed only when AppMon is in disabled state.
- Enforcement mode does not apply to monitoring app-list.
- Enforcement mode is specific to enforcement app-list only. However, this configuration does not impact the flow matching or tracking of IPv4 and IPv6 flows for applications that are part of enforcement app-lists; it only affects the subsequent QoS enforcement for flows.
- If mode is IPv4, QoS enforcement is not supported for the IPv6 flows; however, flow matching and tracking will be supported for IPv6 flows.
- If mode is IPv4-IPv6, flow matching, tracking, and QoS enforcement are supported for both IPv4 and IPv6 flows.
- This configuration is to enable user to increase the number of flows supported for QoS enforcement. User can increase number of flows supported for QoS enforcement by configuring IPv4 mode. However, it will not support QoS enforcement for IPv6 flows.

### Examples

```plaintext
-> app-mon enforcement-mode ipv4
-> app-mon enforcement-mode ipv4-ipv6
```

---

**Usage Guidelines**

- The operational state is enabled if there is at least one OmniSwitch 6860E chassis in the virtual chassis (VC). If there is no OmniSwitch 6860E in the VC, the operational-state is disabled.
- Use `app-snapshot` option to view the AppMon configuration at an application level.

---

**Examples**

```shell
-> show app-mon config
Admin State                      : Enable,
Operational State                : Enable,
Separate Config File Status      : Yes,
L3-IPv4                          : Enable,
L3-IPv6                          : Enable,
Enforcement Flow-Table Stats     : Enable,
Enforcement Flow-Sync Interval   : 60 seconds,
Monitor Logging Threshold        : 7000,
Enforcement Logging Threshold    : 7000,
App-Pool Applications            : 2849,
Monitor Applied Applications     : 2849,
Enforcement Applied Applications : 2849,
Upgraded Signature File Type     : Production,
AOS Compatible Signature Kit Version : 1,
Signature Kit version            : 3.7.6

-> show app-mon config app-snapshot
! APP-MONITORING:
  app-mon app-group "Web" add app-name "01net"
```
show app-mon config

Admin State : Enable,
Operational State : Enable,
Separate Config File Status : Yes,
Enforcement Mode : IPV4-IPV6,
Enforcement Flow-Sync Interval : 60 seconds,
Monitor Logging Threshold : 7000,
Enforcement Logging Threshold : 7000,
App-Pool Applications : 2849,
Monitor Applied Applications : 2849,
Enforcement Applied Applications : 2849,
Upgraded Signature File Type : Production,
AOS Compatible Signature Kit Version : 1,
Signature Kit version : 3.7.6

show app-mon port

Displays AppMon status per physical port or per slot for the switch.

show app-mon [port chassis/slot/port | slot chassis/slot]

Syntax Definitions

chassis/slot/port[\-port2]  The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).

chassis/slot  The chassis ID and slot number (3/1) for a specific slot.

Defaults

N/A

  alaAppMonAppPoolCategory
  alaAppMonAppPoolRevision
  alaAppMonAppPoolAppStatus
**show app-mon app-list**

Displays a list of applications and application groups added to an application list.

```
show app-mon app-list {monitor | enforcement} [active [stats]|conflict]
```

### Syntax Definitions

- **monitor**: Displays information for applications added for monitoring.
- **enforcement**: Displays information for applications added for enforcement.
- **active [stats]**: Displays the list of activated applications in an application list. Use the `stats` option together with the `enforcement` option.
- **conflict**: Displays the list of applications that are present more than once in an application list.

### Defaults

By default, all applications and application groups that belong to an application list are displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **conflict** option to identify applications that are present more than once in an application list. This needs to be checked and resolved for **app-mon apply** to be successful.
- The **active** option displays active and gross number of flows detected on per application basis.
- For monitor feature, **active** option displays only the gross counters.
- The **stats** option is used only for the **enforcement** option. This displays active or gross packets/byte counters per application basis.
### Examples

-> show app-mon app-list monitor

<table>
<thead>
<tr>
<th>App-Id/ AppGrp-Id</th>
<th>Application-List Member Name</th>
<th>Application-List Member Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>244</td>
<td>facebook</td>
<td>APP</td>
</tr>
<tr>
<td>182</td>
<td>sip</td>
<td>APP-GRP</td>
</tr>
</tbody>
</table>

#### output definitions

- **App-Id/AppGrp-Id**: Identity of the application or application group.
- **Application-List Member Name**: Name of the application group or application.
- **Application-List Member Type**: Specifies the application type: individual application or whether the application belongs to any application group.

-> show app-mon app-list monitor active

Legend: Application-name: *= Not present in recently updated kit,

<table>
<thead>
<tr>
<th>App-ID</th>

<td>APP</td>
<td>0</td>
</tr>
<tr>
<td>211</td>
<td>tftp</td>
<td>APP-GRP</td>
<td>24508</td>
</tr>
</tbody>
</table>

Number of Applications: 3

#### output definitions

- **App-ID**: Identity of the application group.
- **Application Name**: Name of the application.
- **App-Grp Name**: Name of the application group.
- **Matched Gross Count**: Total number of matched active flows per application.
- **Number of Applications**: Total number of active applications in the application list.

-> show app-mon app-list monitor conflict

<table>

**show app-mon app-group**

Displays the details of all the applications in an application group.

`show app-mon app-group [group-name group_name]`

**Syntax Definitions**

`group_name` The name of an application group. This is a case sensitive string.

**Defaults**

By default, information is displayed for all application groups.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>

show app-mon app-record

Displays current-hour application-record information as well the historic application-records on the hourly or 24-hours basis for monitored applications.

show app-mon app-record [hourly | twenty-four-hours | current-hour] [verbose]

**Syntax Definitions**

- **hourly**
  Displays flows detected for an application in an hour. An Hour is defined with fixed boundary (for example, 1:30 p.m to 2:30 p.m).

- **twenty-four-hours**
  Displays aggregate of available 'hourly' records for each application, flows detected in last 24-hours since last hour boundary. 'current-hour' data will not be part of this. This information is updated every one hour when 'hourly' record is updated.

- **current-hour**
  Displays new flow detected for an application in the current hour which is not part of 'hourly' historic data. When current-hour reaches an hour boundary, this data is moved to 'hourly' records. For example, if current time is 2.40 p.m, then information between 2.30 p.m to 2.40 p.m is displayed. On 3.30 p.m, current-hour information is moved to the latest hourly record.

- **verbose**
  Select this option to view detail information for each option. Detail information include minimum, maximum and average flows detected for each application.

**Defaults**

N/A

**show app-mon ipv4-flow-table**

Displays the flow table for IPv4 flows entries for enforcement and monitor flows.

`show app-mon ipv4-flow-table {monitor | enforcement [verbose]} [{src-ipv4 | dest-ipv4} ip_address] [app-name app_name | app-group grp_name]`

---

**Syntax Definitions**

- **verbose**
  - Displays detailed information of the flows.

- **src-ipv4 ip_address**
  - Filter flow table based on the specified source IPv4 address.

- **dest-ipv4 ip_address**
  - Filter flow table based on the specified destination IPv4 address.

- **app_name**
  - Filter flow table based on application name.

- **grp_name**
  - Filter flow table based on application group.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The **verbose** option displays additional information about the flow start time, statistics counters, associated application group, policy rule, and so on. This option is supported only for enforcement feature.

- On OmniSwitch 6860N, flows will take ten minutes to age out when the flow is idle.

**Examples**

```
-> show app-mon ipv4-flow-table monitor
SrcIP        DestIP        SrcPort  DestPort  Proto  App Name  App Group

**show app-mon ipv6-flow-table**

Displays the flow table for IPv6 flows entries for enforcement and monitor flows.

```
show app-mon ipv6-flow-table {monitor | enforcement [verbose]} [{src-ipv6 | dest-ipv6} ip_address] [app-name app_name | app-group grp_name]
```

### Syntax Definitions

- **verbose**
  Displays detailed information of the flows.

- **src-ipv6 ip_address**
  Filter flow table based on the specified source IPv6 address.

- **dest-ipv6 ip_address**
  Filter flow table based on the specified destination IPv6 address.

- **app_name**
  Filter flow table based on application name.

- **grp_name**
  Filter flow table based on application group.

### Defaults

N/A

show app-mon l4port-exclude

Displays the port range excluded from AppMon operation.

show app-mon l4port-exclude range-id [number]

Syntax Definitions

number A range ID number. The valid range is 1–8.

Defaults

By default, information is displayed for all range ID numbers.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>No</td>
</tr>
<tr>
<td>6465</td>
<td>No</td>
</tr>
<tr>
<td>6560</td>
<td>No</td>
</tr>
<tr>
<td>6570M</td>
<td>No</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
</tr>
<tr>
<td>6860N</td>
<td>No</td>
</tr>
<tr>
<td>6865</td>

</tr>
</tbody>
</table>

Usage Guidelines

Enter a range ID number with this command to display information for a specific range.

Examples

-> show app-mon l4port-exclude range-id

<table>
<thead>
<tr>
<th>Range-Id</th>
<th>Start-port</th>
<th>End-port</th>
<th>Port-type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>100</td>
<td>200</td>
<td>UDP-Port</td>
</tr>
<tr>
<td>2</td>
<td>20</td>
<td>25</td>
<td>TCP-Service-Port</td>
</tr>
</tbody>
</table>

-> show app-mon l4port-exclude range-id 1

<table>
<thead>
<tr>
<th>Range-Id</th>
<th>Start-port</th>
<th>End-port</th>
<th>Port-type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>100</td>
<td>200</td>
<td>UDP-Port</td>
</tr>
</tbody>
</table>

output definitions

<table>
<thead>

```
**show app-mon stats**

Displays the number of flow statistics.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>slot</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `app-mon flow-table enforcement flush` command to clear the counters.

**Examples**

```sh
-> show app-mon stats
Chassis/ Slot       Active Enforcement Matched Flows     Active Used Flows     Total TCP Overflow Flows     Total UDP Overflow Packets
---------+-------------------+----------------+---------------+-----------------+----------------+----------
1/1      8192                  8192             1422            0
2/1      0                   3               0             0
3/1      0                   0               0             0
4/1      0                   0               0             0
Total    8192                  8195             1422            0

-> show app-mon stats
Chassis/ Slot       Active Enforcement Matched Flows     Active Used Flows     Total TCP Overflow Flows
---------+-------------------+----------------+---------------+----------------+
1/1      0                           0              0
Total    0                           0              0
```

**output definitions**

- **Chassis/Slot**: The chassis ID and slot number.
- **Active Enforcement Matched Flows**: Total number of active flows that matched to any active application signature for enforcement feature.
**output definitions (continued)**

<table>
<thead>
<tr>
<th><strong>Active Used Flows</strong></th>
<th>Total number of active flows (including unmatched and enforcement matched) on a given chassis/slot. Each IPv4 flow takes one entry count, while each IPv6 flow takes two entries for Active Used Flows count.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Total TCP Overflow Flows</strong></td>
<td>Total number of TCP flows missed to create flow entry in flow table due to hash collision.</td>
</tr>
<tr>
<td><strong>Total UDP Overflow Packets</strong></td>
<td>Cumulative number of UDP packets missed to create flow entry in flow table due to hash collision. <em>This field is displayed only on OmniSwitch 6860.</em></td>
</tr>
</tbody>
</table>

**Release History**

Release 8.2.1; command introduced.

**Related Commands**

**show app-mon aging enforcement**

Displays the aging interval for each application for enforcement feature.

**show app-mon aging enforcement [app-name app_name]**

---

**Syntax Definitions**

*app_name*  
The name of the application. This is a case sensitive string.

---

**Defaults**

By default, the aging time for all applications is displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

890  weex                    6/1
1093 whatsapp               6/1
240  youtube                6/1
```
-> show app-mon aging enforcement app-name sip

<table>
<thead>
<tr>
<th>AppId</th>
<th>Application-name</th>
<th>TCP Aging-time/UDP Aging-time (minutes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>182</td>
<td>sip</td>
<td>60/60</td>
</tr>
</tbody>
</table>

**output definitions**

- **AppId**: Identity of the application.
- **Application-name**: Name of the application.
- **TCP Aging-time/UDP Aging-time (minutes)**: Aging time configured for the application.

**Release History**

Release 8.2.1; command introduced.

**Related Commands**

- **app-mon aging enforcement**: Configures the aging time for dynamically learned flows for each application for enforcement feature.

**MIB Objects**

- `alaAppMonEnforcementAgingTimerTable`
- `alaAppMonEnforcementAgingTimerAppName`
- `alaAppMonEnforcementAgingTimerValue`
show app-mon vc-topology

Displays the AppMon virtual chassis topology.

show app-mon vc-topology

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>output</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

Displays the topology of the available OmniSwitch 6860 and OmniSwitch 6860E chassis. This also displays the connectivity between the chassis for flow classification.

Examples

-> show app-mon vc-topology

<table>
<thead>
<tr>
<th>Chassis/Slot</th>
<th>Node Type</th>
<th>Designated Chassis/Slot</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/1</td>
<td>OS6860</td>
<td>2/1</td>
</tr>
<tr>
<td>2/1</td>
<td>OS6860E</td>
<td>2/1</td>
</tr>
<tr>
<td>3/1</td>
<td>OS6860E</td>
<td>3/1</td>
</tr>
</tbody>
</table>

output definitions

- **Chassis/Slot**: The chassis ID and slot number.
- **Node Type**: Indicates the switch type.
- **Designated Chassis/Slot**: The chassis and slot of the switch.

clear app-mon app-list

Removes all applications from the enforcement or monitor application list.

clear app-mon app-list {monitor| enforcement}

Syntax Definitions

| monitor     | Removes all applications from the monitor application list. |
| enforcement | Removes all applications from the enforcement application list. |

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

This command does not clear the active application list until the app-mon apply command is used.

Examples

-> clear app-mon app-list enforcement
-> clear app-mon app-list monitor

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon app-list Add or remove applications or application groups to an application list for enforcement or monitoring.

MIB Objects

alaAppMonClearAppList
The OmniSwitch Application Fingerprinting feature attempts to detect and identify remote applications by scanning IP packets and comparing them to pre-defined bit patterns (application signatures). Once an application is identified, Application Fingerprinting collects and stores information about the application flow in a database on the local switch. Additional configurable options for this feature include the ability to apply QoS policy list rules to the identified flow and generating SNMP traps when a signature match occurs.

Using this implementation of Application Fingerprinting, an administrator can obtain more detailed information about protocols running on a specific device or make sure that certain QoS actions are automatically applied wherever an application might be running.

MIB information for the Application Fingerprinting commands is as follows:

Filename: ALCATEL-INI1-APP-FINGERPRINT-MIB.mib
Module: alcatelIN1AppFPMIB

A summary of the available commands is listed here:

- **app-fingerprint admin-state**
- **app-fingerprint port**
- **app-fingerprint signature-file**
- **app-fingerprint reload-signature-file**
- **app-fingerprint trap**
- **show app-fingerprint configuration**
- **show app-fingerprint port**
- **show app-fingerprint app-name**
- **show app-fingerprint app-group**
- **show app-fingerprint database**
- **show app-fingerprint statistics**
**app-fingerprint admin-state**

Enables or disables the Application Fingerprinting process on all Application Fingerprinting ports.

```
app-fingerprint admin-state {enable | disable}
```

**Syntax Definitions**

- **enable**
  - Enables Application Fingerprinting.
- **disable**
  - Disables Application Fingerprinting.

**Defaults**

By default, Application Fingerprinting is enabled for the switch.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When Application Fingerprinting is enabled for the switch, traffic flows on Application Fingerprinting ports are sampled and compared to REGEX application signatures defined in the “app-regex.txt” file located in the `/flash/app-signature` directory on the local switch. This is done to identify the presence of remote applications on a flow-by-flow basis.
- Disabling the administrative status of the Application Fingerprinting feature does not remove the Application Fingerprinting configuration from the switch.

**Examples**

```
-> app-fingerprint admin-state disable
-> app-fingerprint admin-state enable
```

**Release History**

Release 7.3.2; command was introduced.

**Related Commands**

- **show app-fingerprint configuration**
  - Displays the Application Fingerprinting configuration for the switch.

**MIB Objects**

- `alaAppFPGlobalMIBConfigObjects`
alaAppFPGlobalAdminState
**app-fingerprint port**

Configures a port or link aggregate as an Application Fingerprinting interface. Once the interface is configured and Application Fingerprinting is enabled for the switch, IP packets received on the interface are sampled to determine if they match pre-defined patterns in application signature files that reside on the local switch. When a match occurs, the flow is monitored and/or subject to QoS policy rules.

```plaintext
app-fingerprint {port chassis/slot/port[-port] | linkagg agg_id[-agg_id2]} {monitor-app-group group_name | policy-list-name policy_list | unp-profile}

no app-fingerprint {port chassis/slot/port[-port] | linkagg agg_id[-agg_id2]}
```

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot/port[-port]` The slot and port number (3/1). Use a hyphen to specify a range of ports.
- `agg_id[-agg_id2]` The link aggregate ID number. Use a hyphen to specify a range of ID numbers (5-10).
- `group_name` The name of an existing signature application group.
- `policy_list` The name of an existing QoS policy list.
- `unp-profile` Apply QoS policy list from UNP to which matching traffic is classified.

**Defaults**

By default, Application Fingerprinting is disabled on all switch ports.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to disable the Application Fingerprinting service on the specified port or link aggregate.
- Use the `monitor-app-group` parameter to specify a group (profile) that represents a set of application signature files. All of the signature files in the group are checked against the IP packets received on the port. When a packet match is detected, the flow is identified and monitored. No other action is taken.
- Use the `policy-list-name` parameter to associate a QoS policy list with the Application Fingerprinting port. When a packet match is detected, the policy rules in the specified policy list are applied to the matching traffic flow.
Use the `unp-profile` parameter to specify that if traffic received on an Application Fingerprinting interface is classified into a Universal Network Profile (UNP), then the QoS policy list rules associated with that profile are applied to the traffic.

The QoS policy list specified with the `policy-list-name` parameter or assigned to a UNP for Application Fingerprinting traffic, must contain policy rules with the `appfp-group` condition.

The QoS policy list specified with the `policy-list-name` parameter must be configured as an `appfp` list. However, the UNP policy list must be configured as a UNP list.

Application Fingerprinting uses the sFlow mechanism to sample packets. Do not run Application Fingerprinting and other sFlow services on the same port or link aggregate.

**Examples**

-> app-fingerprint port 2/1-5 monitor-app-group my-p2p

-> app-fingerprint linkagg 10 policy-list-name list1

-> app-fingerprint port 1/11 unp

-> no app-fingerprint port 2/1-5

-> no app-fingerprint linkagg 10

**Release History**

Release 7.3.2; command was introduced.

**Related Commands**

`show app-fingerprint port` Displays the Application Fingerprinting port configuration.

**MIB Objects**

`alaAppFPPortTable`

`alaAppFPPort`  
`alaAppFPGroupNameOrPolicyList`

`alaAppFPPortOperationMode`

`alaAppFPPortStatus`

`alaAppFPPortRowStatus`
**app-fingerprint signature-file**

Specifies the name of the Application Fingerprinting signature file. This file contains the REGEX signatures that are used to identify applications accessing the network on Application Fingerprinting ports.

**Syntax Definitions**

`filename` The name of an existing REGEX application signature file.

**Defaults**

By default, the “app-regex.txt” file is used.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command is only required to use a REGEX signature file that has a filename that is different from the default “app-regex.txt” name.
- The signature file must reside in the `/flash/app-signature` directory on the local switch.
- After specifying the signature filename to use, upload the signature file into the switch memory using the `app-fingerprint reload-signature-file` command.

**Examples**

`-> app-fingerprint signature-file app2_regex.txt`

**Release History**

Release 7.3.2; command was introduced.
Related Commands

app-fingerprint reload-signature-file  Reloads the contents of the active application signature file into the switch memory.

MIB Objects

alaAppFPGlobalMIBConfigObjects
alaAppFPGlobalSignatureFile
**app-fingerprint reload-signature-file**

Reloads the contents of the active application signature file into the switch memory. Use this command after making any changes to the current signature file.

</tbody>
</table>

**Usage Guidelines**

- This command reloads the application signature file that was previously applied to the switch. This may be the default “app-regex.txt” file or another signature file that was applied through the **app-fingerprint signature-file** command.

- A switch reboot is *not* required after the signature file is reloaded.

**Examples**

```
-> app-fingerprint reload-signature-file
```

**Release History**

Release 7.3.2; command was introduced.

**Related Commands**

- **app-fingerprint signature-file** Specifies a different signature file to use for Application Fingerprinting.

**MIB Objects**

- `alaAppFPGlobalMIBConfigObjects`
- `alaAppFPGlobalReloadSignatureFile`
**app-fingerprint trap**

Enables or disables trap generation for the Application Fingerprinting feature.

`app-fingerprint trap {enable | disable}`

---

**Syntax Definitions**

- **enable**: Enables Application Fingerprinting traps.
- **disable**: Disables Application Fingerprinting traps.

---

**Defaults**

By default, traps are disabled for this feature.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

A trap is generated when a traffic flow matches an application signature.

---

**Examples**

- `-> app-fingerprint trap enable`
- `-> app-fingerprint trap disable`

---

**Release History**

Release 7.3.2; command was introduced.

---

**Related Commands**

- `show app-fingerprint configuration`: Displays the Application Fingerprinting status and configuration for the switch.

---

**MIB Objects**

- `alaAppFPGlobalMIBConfigObjects`
- `alaAppFPGlobalTrapConfig`
show app-fingerprint configuration

Displays the Application Fingerprinting status and configuration information for the switch.

Usage Guidelines

N/A

Examples

-> show app-fingerprint configuration

Admin-state: Enabled,
SNMP Trap: Disabled,
Signature File: app-regex.txt

output definitions

| Admin-state | The administrative status of Application Fingerprinting for the switch (Enabled or Disabled). Configured through the app-fingerprint admin-state command. |
| SNMP Trap | The status of SNMP trap generation for the switch (Enabled or Disabled). Configured through the app-fingerprint trap command. |
| Signature File | The name of the text file that contains the REGEX application signatures used to identify traffic flows. This file resides in the /flash/app-signature directory on the switch. Configured through the app-fingerprint signature-file and app-fingerprint reload-signature-file commands. |
Release History

Release 7.3.2; command was introduced.

Related Commands

show app-fingerprint port  Displays the Application Fingerprinting port configuration.

MIB Objects

show app-fingerprint port

Displays the Application Fingerprinting port configuration for the switch.

show app-fingerprint [port chassis/slot/port | linkagg agg_id]

Syntax Definitions

chassis
   The chassis identifier.

slot/port|port
   The slot and port number (3/1).

agg_id
   The link aggregate ID number.

Defaults

By default, the configuration for all Application Fingerprinting ports is displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>

<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the port and linkagg parameters to display information for a specific port or link aggregate.

Examples

-> show app-fingerprint port
Legend: * = Port or App-Group is invalid

<table>
<thead>
<tr>
<th>Port</th>
<th>Operation Mode</th>
<th>App-group/Policy-list</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/2/1</td>
<td>Monitoring</td>
<td>Testing13</td>
</tr>
<tr>
<td>1/2/1</td>
<td>QoS</td>
<td>list1</td>
</tr>
<tr>
<td>1/2/1</td>
<td>QoS</td>
<td>list2</td>
</tr>
</tbody>
</table>

-> show app-fingerprint linkagg
Legend: * = Port or App-Group is invalid

<table>
<thead>
<tr>
<th>Port</th>
<th>Operation Mode</th>
<th>App-group/Policy-list</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/100</td>
<td>Monitoring</td>
<td>Testing16</td>
</tr>
<tr>
<td>0/100</td>
<td>QoS</td>
<td>list3</td>
</tr>
<tr>
<td>0/100</td>
<td>QoS</td>
<td>list4</td>
</tr>
</tbody>
</table>
**output definitions**

| Port | The slot/port or link aggregate ID of the Application Fingerprinting interface. A “0” slot number indicates that the interface is a link aggregate. |
| Operation Mode | The Application Fingerprinting mode (Monitoring, QoS, or UNP) in which the port is operating. |
| App-group/Policy-list | The name of the group of application signatures or the QoS policy list that is applied to the traffic flows on the port. |

**Release History**

Release 7.3.2; command was introduced.

**Related Commands**

- `show app-fingerprint port` Displays the Application Fingerprinting interface configuration.
- `show app-fingerprint configuration` Displays the Application Fingerprinting status and configuration for the switch.

**MIB Objects**

- `alaAppFPPortTable`
  - `alaAppFPPort`
  - `alaAppFPGroupNameOrPolicyList`
  - `alaAppFPPortOperationMode`
  - `alaAppFPPortStatus`
  - `alaAppFPPortRowStatus`
show app-fingerprint app-name

Displays the REGEX application signature configuration for the switch. When the switch samples Application Fingerprinting ports, the traffic flow patterns on these ports are compared against the REGEX signatures specified in the “app-regex.txt” file. When a match occurs, the traffic flow is classified and monitored. In addition, QoS policies can be applied to these flows based on a specific match to an application signature group.

show app-fingerprint app-name [app_name]

Syntax Definitions

app_name

The name of an existing application signature.

Defaults

By default, all application signatures are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Application signatures are defined in the “app-regex.txt” file that resides in the /flash/app-signature directory on the switch. A default version of this file is available, but the file is user-configurable and new files can also be created.

- Application signatures can also be combined into an application group. This type of group is then assigned to one or more Application Fingerprinting ports. All the application signatures that are members of the assigned group are then applied to traffic flows on that same port.

- Use the app_name parameter to display information for a specific application signature.

Examples

-> show app-fingerprint app-name
App Name: ciscovpn
  Description: VPN client software to a Cisco VPN server
  REGEX Signature: \\x01\xf4\\x01\xf4

App Name: citrix
  Description: Citrix ICA - proprietary remote desktop application
  REGEX Signature: \x32\x26\x85\x92\x58

App Name: dhcp
  Description: Dynamic Host Configuration Protocol
show app-fingerprint app-name

App Name: citrix
Description: Citrix ICA - proprietary remote desktop application
REGEX Signature: \x32\x26\x85\x92\x58

<table>
<thead>
<tr>
<th>output definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>App-name</td>
</tr>
<tr>
<td>Description</td>
</tr>
<tr>
<td>REGEX signature</td>
</tr>
</tbody>
</table>

Release History
Release 7.3.2; command was introduced.

Related Commands

  Displays the application group configuration.
- show app-fingerprint configuration
  Displays the Application Fingerprinting status and configuration.

MIB Objects
alaAppFPAppGrpNameTable
alaAppFPGrpAppName
show app-fingerprint app-group

Displays the Application Fingerprinting application group configuration for the switch. An application group contains a user-configured list of REGEX application signatures that are represented by the group name. The group name is then assigned to Application Fingerprinting ports or link aggregates.

**show app-fingerprint app-group [group_name]**

**Syntax Definitions**

*group_name* The name of an existing application group.

**Defaults**

By default, all application groups are displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Application groups are defined in the “app-regex.txt” file that is located in the `/flash/app-signature` directory on the switch. A default version of this file is available, but the file is user-configurable and new files can also be created.

- Use the *group_name* parameter to display information for a specific application group.

**Examples**

-> show app-fingerprint app-group

App Group: chatting
   App names: jabber

App Group: mail
   App names: smtp

App Group: network
   App names: bgp dhcp rtsp smb

App Group: p2p
   App names: hotline

App Group: remote_access
   App names: ciscovpn citrix rdp ssh vnc
App Group: voip
  App names: h323 sip
-> show app-fingerprint app-group network

App Group: network
  App names: bgp dhcp rtsp smb

**output definitions**

<table>
<thead>
<tr>
<th>App-Group</th>
<th>The name of the application group file.</th>
</tr>
</thead>
<tbody>
<tr>
<td>App names</td>
<td>The names of the application signature files that belong to this group.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.3.2; command was introduced.

**Related Commands**

- **show app-fingerprint app-name**
  Displays the contents of the REGEX application signatures that are stored in the “app-regex.txt” file on the switch.

- **show app-fingerprint configuration**
  Displays the Application Fingerprinting status and configuration.

**MIB Objects**

- ```alaAppFPAppGrpNameTable```
- ```alaAppFPAppGroupName```
- ```alaAppFPGrpAppName```
show app-fingerprint database

Displays Application Fingerprinting database entries. When a match occurs between an IP traffic flow and a REGEX application signature, a multi-tuple classifier and the name of the matching application group and signature are stored in a local switch database to identify and track the application associated with the flow.

```
show app-fingerprint database [port chassis/slot/port | linkagg agg_id] [detail]
```

Syntax Definitions

- `chassis`: The chassis identifier.
- `slot/port`: The slot and the port number (3/1).
- `agg_id`: The link aggregate ID number.
- `detail`: Displays additional information about the classified traffic flow.

Defaults

By default, all application flow database entries are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the `port` and `linkagg` parameters to display information for a specific port or link aggregate.
- The following multi-tuple classifier is used to identify an application traffic flow:
  - Ingress Port
  - Dest MAC
  - Src MAC
  - VLAN
  - Dest IP
  - Src IP
  - Dest Port
  - Src Port
- Each database entry is subject to a 15 minute aging period. If the database fills up, older entries are aged out before the 15 minute limit (fast aging). However, fast aging is not applied to database entries associated with QoS. In this case, the QoS is removed after the regular 15 minute aging time period expires.
When a database entry is removed due to regular aging or fast aging conditions, any corresponding QoS is also removed for that flow.

**Examples**

```
-> show app-fingerprint database
```

<table>
<thead>
<tr>
<th>Port</th>
<th>App-Group/Name</th>
<th>SRC MAC</th>
<th>VLAN</th>
<th>SRC IP/Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/1/2</td>
<td>P2P/aim</td>
<td>00:00:22:33:44:55</td>
<td>20</td>
<td>2.3.4.4/200</td>
</tr>
<tr>
<td>0/1/2</td>
<td>P2P/ares</td>
<td>00:00:22:33:44:55</td>
<td>20</td>
<td>2.3.4.4/200</td>
</tr>
<tr>
<td>0/1/2</td>
<td>Mail/smtp</td>
<td>00:00:22:33:44:55</td>
<td>20</td>
<td>2.3.4.4/100</td>
</tr>
</tbody>
</table>

```
-> show app-fingerprint database detail
```

Port 1/2/1:

- **App-Group/Name**: Testing2/App_4
  - SRC-DST MAC: 00:00:00:04:01 - 00:e0:b1:e6:f9:b5
  - VLAN: 20
  - SRC IP/PORT: 20.20.20.21/65
  - DST IP/PORT: 10.10.10.11/55

- **App-Group/Name**: Testing2/App_5
  - SRC-DST MAC: 00:00:00:04:02 - 00:e0:b1:e6:f9:b5
  - VLAN: 20
  - SRC IP/PORT: 20.20.20.21/64
  - DST IP/PORT: 10.10.10.11/54

- **App-Group/Name**: Testing2/App_6
  - SRC-DST MAC: 00:00:00:04:03 - 00:e0:b1:e6:f9:b5
  - VLAN: 20
  - SRC IP/PORT: 20.20.20.21/66
  - DST IP/PORT: 10.10.10.11/56

Port 2/3/23:

- **App-Group/Name**: Testing1/App_1
  - SRC-DST MAC: 00:00:00:03:01 - 00:e0:b1:e6:f9:b5
  - VLAN: 10
  - SRC IP/PORT: 10.10.10.11/115
  - DST IP/PORT: 20.20.20.21/137

- **App-Group/Name**: Testing1/App_2
  - SRC-DST MAC: 00:00:00:03:02 - 00:e0:b1:e6:f9:b5
  - VLAN: 10
  - SRC IP/PORT: 10.10.10.11/114
  - DST IP/PORT: 20.20.20.21/138

**output definitions**

- **Port**: The slot/port or link aggregate ID of the AFP interface on which the flow was classified. A “0” slot number indicates a link aggregate.
- **App-Group/Name**: The name of the application group and signature that matched the flow.
- **SRC MAC**: The source MAC address of the flow.
- **VLAN**: The VLAN on which the flow is learned and forwarded.
- **SRC IP/PORT**: The source IP network address and port.

**show app-fingerprint statistics**

Displays statistics for each application flow on an Application Fingerprinting ingress port.

**show app-fingerprint statistics [port chassis/slot/port | linkagg agg_id]**

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot/port**: The slot and the port number (3/1).
- **agg_id**: The link aggregate ID number.

### Defaults

By default, statistics are displayed for all application flows.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>

The OmniSwitch implementation of Fibre Channel over Ethernet (FCoE) Initiation Protocol (FIP) snooping supports the FCoE technology used to tunnel Fibre Channel (FC) frames within Ethernet MAC frames. When the FCoE and FIP snooping functionality is enabled, the OmniSwitch serves as an FCoE transit switch. In this role, the OmniSwitch implementation of Data Center Bridging (DCB) is also used to provide the lossless Ethernet network required to support FCoE.

This implementation of FIP snooping ensures the security of the FCoE network and maintains a virtual point-to-point network connection between FCoE Nodes (ENodes) and FCoE Forwarder (FCF) devices. In addition, FIP snooping is also required to support OmniSwitch FCoE/FC gateway functionality that allows the switch to provide FCoE forwarding services between an FCoE network and a native FC storage area network (SAN).

- An OmniSwitch FCoE transit switch is placed between ENodes (servers or other bridges) and an FCF or an OmniSwitch FCoE/FC gateway to extend the reach of the FCoE network without extending the physical FC connections.
- An OmniSwitch FCoE/FC gateway runs FIP snooping on the 10G Ethernet FCoE ports that connect to an FCoE network. On the same switch, FC ports connect to native FC switches or nodes. Traffic is transmitted between the FCoE network and the FC SAN through the gateway switch.

This chapter provides information about configuring FCoE and FIP global and port parameters through the Command Line Interface (CLI). See Chapter 44, “FCoE/FC Gateway Commands,” for more information about configuring OmniSwitch FCoE/FC gateway functionality.

MIB information for the FCoE and FIP snooping commands is as follows:

- **Filename:** ALCATEL-IND1-FIPS-MIB.mib
- **Module:** alcatelIND1FipsMIB

The FCoE and FIP Snooping commands are listed here:

<table>
<thead>
<tr>

**fcoe fip-snooping**

Enables or disables Fibre Channel Initiation Protocol (FIP) snooping on the switch. FIP Snooping is enabled to allow the OmniSwitch to serve as an FCoE transit switch.

`fcoe fip-snooping admin-state {enable | disable}`

---

**Syntax Definitions**

<table>
<thead>
<tr>
<th>enable</th>
<th>Enables FIP Snooping.</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables FIP Snooping.</td>
</tr>
</tbody>
</table>

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

  alaFipsConfigFIPSAdmin
fcoe address-mode

Configures the FCoE addressing mode. This mode determines whether a server-provided MAC address (SPMA) or a fabric-provided MAC address (FPMA) is assigned to virtual FCoE entities.

fcoe address-mode {spma | fpma}

Syntax Definitions

spma                     Selects the SPMA address mode.
fpma                     Selects the FPMA address mode.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>spma</td>
<td>fpma</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The FCoE Node (ENode) and the FCoE Forwarder (FCF) must use the same addressing mode to establish virtual links between the ENode and FCF. Configure the global OmniSwitch addressing mode to match the mode used by the ENode and FCF.

- When the FPMA mode is active, a MAC address is assigned by an FCF to a single ENode MAC. This MAC address is not assigned to any other ENode MAC in the same VLAN.

- When the SPMA mode is active, MAC addresses are assigned by the ENode server.

- To change the addressing mode selection, disable FIP Snooping for the switch then make the change and enable FIP Snooping again.

Examples

- fcoe address-mode spma
- fcoe address-mode fpma

Release History

Release 7.3.2; command was introduced.
Related Commands

- **fcoe fip-snooping**: Enables or disables FIP Snooping on the switch
- **show fcoe**: Displays the FCoE and FIP snooping status and configuration for the switch.

MIB Objects

- **alaFipsConfig**
  - **alaFipsConfigAddressMode**
**fcoe priority**

Configures up to two global priority values that are designated as lossless for FCoE traffic.

```
fcoe priority {priority} [priority]
```

---

**Syntax Definitions**

| priority | A priority value between 0–7. |
---|---|

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>3</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command overwrites the existing FCoE priority values used by the switch.
- If two priority values are configured but there is a need to change only one of the values, both priority values must be specified with this command. For example, if the current priority is set to 2 and 5, to change priority 2 to 3, specify both 3 and 5 as the priority values.
- Specify a priority value of 3 to set the priority back to the default value.
- The FCoE priority values are used when FCoE priority protection is enabled for the switch.
- In addition to enabling priority protection, a lossless DCB FCoE profile with the same FCoE priority values must be assigned to the FCoE interfaces.

**Examples**

```
-> fcoe priority 2 5
-> fcoe priority 3 5
-> fcoe priority 3
```

**Release History**

Release 7.3.2; command was introduced.
Related Commands

- **fcoe priority-protection**
  - Configures the status of priority protection for the switch.

- **fcoe priority-protection action**
  - Configures the action taken when traffic is not FCoE or FIP.

- **fcoe fip-snooping**
  - Enables or disables FIP Snooping on the switch

- **show fcoe**
  - Displays the FCoE and FIP snooping status and configuration for the switch.

MIB Objects

- alaFipsConfig
  - alaFipsConfigPriorityOne
  - alaFipsConfigPriorityTwo
**fcoe priority-protection**

Enables or disables priority protection.

```
fcoe priority-protection {enable | disable}
```

### Syntax Definitions

- **enable**: Enables priority protection for the switch.
- **disable**: Disables priority protection for the switch.

### Defaults

By default, priority protection is disabled for the switch.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When priority protection is enabled, only FCoE and FIP traffic that matches the FCoE lossless priority values is allowed. All other traffic is either marked or dropped, based on the priority protection action configured for the switch.
- This command applies only to the priority value that is specified using the `fcoe priority` command.
- The FCoE priority value is advertised to FCoE-enabled hosts using the Data Center Bridging Exchange (DCBx) protocol.

### Examples

```
-> fcoe priority-protection enable
-> fcoe priority-protection disable
```

### Release History

Release 7.3.2; command was introduced.
Related Commands

- `fcoe priority` Configures the lossless priority values for the switch.
- `fcoe priority-protection action` Determines whether non-FCoE and non-FIP traffic is dropped or marked with a lower priority value.
- `fcoe fip-snooping` Enables or disables FIP Snooping on the switch
- `show fcoe` Displays the FCoE and FIP snooping status and configuration for the switch.

MIB Objects

alaFipsConfig
  alaFipsConfigPrioProtection

fcoe priority-protection action

Specifies whether non-FCoE and non-FIP traffic is dropped or marked with a lower priority value. This action is only valid when FCoE priority protection is enabled for the switch.

fcoe priority-protection action {drop | remark priority}

Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>drop</td>
<td>All non-FCoE and non-FIP traffic is dropped.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the priority value to use for remarking non-FCoE and non-FIP traffic.</td>
</tr>
</tbody>
</table>

Defaults

By default, non-FCoE and non-FIP traffic is dropped when priority protection is enabled for the switch.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>No</td>
</tr>
<tr>
<td>6465</td>
<td>No</td>
</tr>
<tr>
<td>6560</td>
<td>No</td>
</tr>
<tr>
<td>6570M</td>
<td>No</td>
</tr>
<tr>
<td>6860</td>
<td>No</td>
</tr>
<tr>
<td>6860N</td>
<td>No</td>
</tr>
<tr>
<td>6865</td>
<td>No</td>
</tr>
<tr>
<td>6900</td>
<td>Yes</td>
</tr>
<tr>
<td>6900V72/C32</td>
<td>No</td>
</tr>
<tr>
<td>9900</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- When priority protection is enabled, only FCoE traffic that matches the protected priority values is allowed in the priority queues. All other traffic is either re-marked or dropped, based on the priority protection action configured for the switch.
- If the re-mark action is configured, traffic is marked with the specified priority value and forwarded on the switch.

Examples

-> fcoe priority-protection action drop
-> fcoe priority-protection action remark 0

Release History

Release 7.3.2; command was introduced.
Related Commands

- **fcoe priority**
  Configures the lossless priority values for the switch.

- **fcoe priority-protection**
  Configures the status of priority protection for the switch.

- **fcoe fip-snooping**
  Enables or disables FIP Snooping on the switch.

- **show fcoe**
  Displays the FCoE and FIP snooping status and configuration for the switch.

MIB Objects

**alaFipsConfig**

- **alaFipsConfigPriorityProtectionAction**
**fcoe filtering-resource trap-threshold**

Configures the percentage of filtering resources used as a trap threshold value. When this percentage is reached, a trap is generated by the switch.

`fcoe filtering-resource trap-threshold percentage`

**Syntax Definitions**

`percentage` The percentage of filtering resources used.

**Defaults**

By default, the filtering resource trap threshold percentage is set to 80%.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To disable the generation of filtering resource traps, set the trap threshold value to “0”.

**Examples**

`-> fcoe filtering-resource trap-threshold 50`
`-> fcoe filtering-resource trap-threshold 0`

**Release History**

Release 7.3.2; command was introduced.

**Related Commands**

- `show fcoe` Displays the FCoE and FIP snooping status and configuration for the switch.

**MIB Objects**

Notifications (Traps)

- `alaFipsResourceThresholdReached`
- `alaFipsFilterResourceUsage`
**fcoe house-keeping-time-period**

Configures the amount of time the FCoE switch waits to receive keep alive messages from the ENode and FCF for a given FCoE session. When this time expires and no keep alive messages were received for any entity of the session, the session information is removed.

**fcoe house-keeping-time-period** *seconds*

---

**Syntax Definitions**

*seconds* The keep alive wait time, in seconds.

**Defaults**

By default, the housekeeping timer is set to 300 seconds.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To disable the housekeeping timer, set the timer value to “0”

**Examples**

- `-> fcoe house-keeping-time-period 120`
- `-> fcoe house-keeping-time-period 0`

**Release History**

Release 7.3.2; command was introduced.

**Related Commands**

- `show fcoe` Displays the FCoE and FIP snooping status and configuration for the switch.

**MIB Objects**

- `alaFipsConfig`
  - `alaFipsConfigHouseKeepingTimePeriod`
**fcoe vlan**

Configures an FCoE VLAN. This type of VLAN is used to deploy the OmniSwitch implementation of FIP snooping.

```
fcoe vlan vlan_id [admin-state {enable | disable}] [name description]
no fcoe vlan vlan_id
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan_id</code></td>
<td>A numeric value that uniquely identifies an individual FCoE VLAN. The valid ID range is 2–4094.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables the FCoE VLAN administrative status.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables the FCoE VLAN administrative status.</td>
</tr>
<tr>
<td><code>description</code></td>
<td>An alphanumeric string. Optional name description for the VLAN ID. Enclose the description in double quotes if it contains more than one word with a space in between.</td>
</tr>
</tbody>
</table>

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td><code>enable</code></td>
</tr>
<tr>
<td><code>description</code></td>
<td><code>VLAN ID</code></td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>
```

### Usage Guidelines

- Use the `no` form of this command to remove a FCoE VLAN from the switch configuration. All VLAN ports are detached before the VLAN is removed.
- Specify a VLAN ID that does not exist in the switch configuration, or the ID of a dynamically created MVRP VLAN.
- Only 802.1q-tagged FCoE ports and link aggregates can be members of FCoE VLANs.
- Configuring a FCoE VLAN as a default VLAN for a port or link aggregate is not allowed. All port associations are created by tagging FCoE ports with the FCoE VLAN ID.
- Configuring default VLAN 1 as an FCoE VLAN is not allowed.
The following features are not supported on FCoE VLANs:
- IGMP Snooping
- IP interface
- HA VLANs
- SVLAN and CVLAN
- Shortest Path Bridging (SPB)
- UDP Relay, DHCP Snooping
- Universal Network Profile (UNP)

An OmniSwitch FCoE transit switch operates between an FCoE Node (ENode) and a FCoE Forwarder (FCF). Manual configuration of the FCoE VLAN is required along the transit switch path. However, the ENode and FCF may invoke FIP VLAN discovery to discover the FCoE VLANs within the transit path. If not, manual configuration of the FCoE VLANs may also be required on the appropriate ENodes and FCFs.

**Examples**

```
-> fcoe vlan 100
-> no fcoe vlan 100
-> fcoe vlan 100 admin-state enable name fcoe-vlan1
-> fcoe vlan 100 admin-state enable
```

**Release History**

Release 7.3.2; command introduced.

**Related Commands**

- **fcoe fcf mac**
  Configures a static Fibre Channel Forwarder (FCF) MAC address for the specified FCoE VLAN.

- **fcoe fip-snooping**
  Enables or disables FIP Snooping on the switch

- **show vlan**
  Displays the VLAN configuration for the switch.

**MIB Objects**

<table>
<thead>
<tr>
<th>Object</th>
</tr>
</thead>
<tbody>
<tr>
<td>alaFipsVlanTable</td>
</tr>
<tr>
<td>alaFipsVlanId</td>
</tr>
<tr>
<td>alaFipsVlanFCMap</td>
</tr>
<tr>
<td>alaFipsVlanRowStatus</td>
</tr>
</tbody>
</table>
**fcoe fcf mac**

Configures a static Fibre Channel Forwarder (FCF) MAC address for the specified FCoE VLAN. Virtual Fibre Channel (FC) links that traverse the lossless Ethernet network send FCoE frames to and from the FCF MAC address.

```
fcoe fcf mac mac_address vlan vlan_id
no fcoe fcf mac_address vlan vlan_id
```

---

**Syntax Definitions**

- **mac_address**: Enter the FCF MAC Address (for example, 00:00:39:59:f1:0c).
- **vlan_id**: An existing FCoE VLAN ID. The valid ID range is 2–4094.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Use the no form of this command to remove the FCF MAC address from the specified FCoE VLAN.
- The FCoE VLAN ID must already exist in the switch configuration.

---

**Examples**

```
-> fcoe fcf mac 30:10:94:01:00:00 vlan 100
-> no fcoe fcf 30:10:94:01:00:00
```

---

**Release History**

Release 7.3.2; command introduced.
Related Commands

- **fcoe vlan**: Configures an FCoE VLAN for the switch.
- **fcoe fip-snooping**: Enables or disables FIP Snooping on the switch.
- **show vlan**: Displays the VLAN configuration for the switch.

MIB Objects

- **alaFipsVlanTable**
  - **alaFipsVlanId**
  - **alaFipsVlanFCMap**
**fcoe fc-map**

Configures a static Fibre Channel Mapped Address Prefix (FC-MAP) for the specified FCoE VLAN. The FC-MAP is a 24-bit value used by the Fibre Channel Forwarder (FCF) to identify an individual fabric.

```
fcoe fc-map prefix vlan vlan_id
no fcoe fc-map prefix vlan vlan_id
```

### Syntax Definitions

- **prefix**
  - Enter the FC-MAP prefix value. The valid range is 0EFC00–0EFCFF.

- **vlan_id**
  - An existing FCoE VLAN ID. The valid ID range is 2–4094.

### Defaults

By default, the FC-MAP is set to 0E:FC:00.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>No</td>
</tr>
<tr>
<td>6465</td>
<td>No</td>
</tr>
<tr>
<td>6560</td>
<td>No</td>
</tr>
<tr>
<td>6570M</td>
<td>No</td>
</tr>
<tr>
<td>6860</td>
<td>No</td>
</tr>
<tr>
<td>6860N</td>
<td>No</td>
</tr>
<tr>
<td>6865</td>
<td>No</td>
</tr>
<tr>
<td>6900</td>
<td>Yes</td>
</tr>
<tr>
<td>6900V72/C32</td>
<td>No</td>
</tr>
<tr>
<td>9900</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- On an OmniSwitch 6900, use the `no` form of this command to set the FC-MAP back to the default value (0E:FC:00) for the specified FCoE VLAN.

- The FCoE VLAN ID must already exist in the switch configuration.

- The configured FC-MAP value assigned to an FCoE VLAN must match the FC-MAP value used by the FCF device. FCF advertisement packets that contain a different FC-MAP are not processed by the switch.

- When the FCoE address mode is set to Fabric-Provided MAC Address (FPMA), the FCF uses the FC-MAP value (upper 24 bits) combined with an FCID value (lower 24 bits) to generate a unique MAC address to identify an ENode VN_Port for FCoE transactions.

### Examples

```
-> fcoe fc-map 0E:FC:04 vlan 30
-> no fcoe fc-map 0E:FC:04 vlan 30
```

### Release History

Release 7.3.2; command introduced.
Related Commands

  - **alaFipsVlanFCMap**

---

OmniSwitch AOS Release 8 CLI Reference Guide  April 2023  page 43-20
**fcoe discovery-advertisement**

Configures FIP discovery advertisement message parameters for the specified FCoE VLAN. These parameter values are advertised in both unicast and multicast advertisements.

```
fcoe discovery-advertisement vlan vlan_id[-vlan_id2] [a-bit {enable | disable}] [fka-adv-period adv_seconds] [priority priority] [uds-retries retries]
```

**Syntax Definitions**

- `vlan_id[-vlan_id2]` An existing FCoE VLAN ID. Use a hyphen to specify a range of FCoE VLAN IDs (10-25).
- `enable` Enables the available-for-login bit (A-bit) in the discovery advertisement message to indicate that the switch can accept fabric logins from ENodes.
- `disable` Disables the A-bit in the discovery advertisement message to indicate that the switch cannot accept fabric logins from ENodes.
- `adv_seconds` The discovery advertisement transmission interval and the number of FIP ENode keep alive packets expected. The valid range is 1–90 seconds.
- `priority` The priority value assigned to the switch, indicated in the priority descriptor of the discovery advertisement message. The valid range is 0–255 (0 = highest priority, 255 = lowest priority).
- `retries` The number of times a unicast discovery solicitation is transmitted after a port on which an FCF MAC was learned goes down. The valid range is 0–10.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>a-bit enable</td>
<td>enable</td>
</tr>
<tr>
<td>fka-adv-period adv_seconds</td>
<td>8</td>

<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

OmniSwitch AOS Release 8 CLI Reference Guide  April 2023  page 43-21
Usage Guidelines

- When the A-bit parameter is disabled, the switch will not process any new logins for the FCoE VLAN. However, there is no impact on existing VN_Port sessions, which are allowed to continue.

- Transmitting unicast discovery solicitations helps to find out if the same FCF is reachable on some other port of the same FCoE VLAN.

Examples

-> fcoe discovery-advertisement vlan 100 priority 10
-> fcoe discovery-advertisement uds-retries 3
-> no fcoe discovery-advertisement vlan 100

Release History

Release 7.3.3; command introduced.

Related Commands

show fcoe discovery-advertisement Displays the discovery advertisement parameter values for the specified VLANs.

MIB Objects

alaFipsDiscAdvtTable
  alaFipsDiscAdvtVlanId
  alaFipsDiscAdvtAbit,
  alaFipsDiscAdvtFkaAdvPeriod,
  alaFipsDiscAdvtPriority,
  alaFipsDiscAdvtUdsRetries,
  alaFipsDiscAdvtRowStatus
**fcoe role**

Configures the specified port or link aggregate as an FCoE interface and defines the role of the interface in the FCoE network.

```plaintext
fcoe {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} role {edge | enode-only | fcf-only | mixed | trusted | ve}

no fcoe {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

**Syntax Definitions**

- `chassis` The chassis identifier when running in virtual chassis mode.
- `slot/port[-port2]` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). FCoE is only supported on 10G or faster ports.
- `agg_id[-agg_id2]` The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `edge` Port connects directly to an ENode for transmission of FCoE and FIP frames from the ENode to the FCF.
- `enode-only` Link between FCoE switches that carries traffic from ENode to FCF.
- `fcf-only` Link between FCoE switches that carries traffic from FCF to ENode.
- `mixed` Link between FCoE switches that carries traffic in both directions (from FCF to ENode or from ENode to FCF).
- `trusted` Trust the FCoE Edge port; traffic on this port is not filtered by FIP ACLs. This port role type is typically assigned to the switch FCoE port that connects to an Ethernet port on the FCF.
- `ve` Configures port as a virtual expansion port (VE_Port) that is associated with an E2E-tunnel session. A VE_Port emulates an E_Port in an FCoE network, providing connectivity between FC switches. VE_Ports discover FCFs.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

OmniSwitch AOS Release 8 CLI Reference Guide   April 2023   page 43-23
**Usage Guidelines**

- Use the `no` form of this command to revert the FCoE port back to a regular switch port. Before doing so, however, delete any associations the port may have with an FCoE VLAN.

- To change the role of an FCoE port, first remove the FCoE configuration from the port, then configure FCoE and the new role again for that same port.

- FCoE is only supported on 10G or faster ports that are associated with an FCoE lossless DCB profile. In addition, DCBX must be enabled on the port with both PFC and ETS in an active state (either forced or negotiated via DCBX). The DCB configuration is done separately using QoS port and profile commands.

- The maximum frame size for an FCoE port must be at least 2500 bytes to accommodate FCoE encapsulated frames, which are larger than the standard Ethernet frame size. In addition, make sure the FCoE port frame size is configured the same end-to-end.

- When configuring a link aggregate as an FCoE port, make sure the link aggregate ID number already exists in the switch configuration. Ports already configured as FCoE ports cannot be added to a link aggregate.

- FCoE ports must be manually assigned to a default VLAN and then tagged with the FCoE VLAN that will carry the FCoE and FIP frames on that port.

- The following features are not supported on FCoE ports:
  - Learned Port Security (LPS)
  - Port Mirroring and Remote Port Mirroring
  - Shortest Path Bridging (SPB)

- Enabling FCoE on a Universal Network Profile (UNP) port is only supported to allow UNP dynamic assignment of a default VLAN for an FCoE port. Manual tagging of the FCoE UNP port with FCoE VLAN IDs is still required.

- FCoE VLANs may be dynamically learned through the transmission of MVRP join PDU, but any port associations with that VLAN must be manually configured.

- Assigning FCoE interfaces to different FCoE VLANs provides a method for configuring multiple FC fabrics through the same FCoE switch.

**Examples**

- `fcoe port 1/1 role edge`
- `fcoe port 1/1/1 role edge`
- `fcoe port 2/1 role fcf-only`
- `no fcoe port 2/1`

**Release History**

Release 7.3.2; command introduced.
Related Commands

- **fcoe vlan**: Configures an FCoE VLAN.
- **show fcoe ports**: Displays the status and configuration of FCoE interfaces.

MIB Objects

- **alaFipsIntfTable**: Contains information about FCoE interfaces.
  - **alaFipsIntfIfIndex**: Interface index.
  - **alaFipsIntfOperStatus**: Operational status of the interface.
  - **alaFipsIntfPortRole**: Role of the port.
  - **alaFipsIntfRowStatus**: Status of the row.
**show fcoe**

Displays the global FCoE and FIP snooping status and configuration information for the switch.

```
show fcoe
```

```

FCoE Global Configurations:

```
FIP Snooping            : Disable,
Address-Mode            : FPMA,
Priority 1              : 3,
Priority 2              : -,
Priority Protection     : Enable,
Priority Protection Action: Drop,
Re-Mark Priority        : -,
Total Filter Resources  : 256,
Used Filter Resources   : 0,
Trap threshold (%)      : 80,
House Keeping Time Period : 300
```
**Output Definitions**

FIP Snooping - The administrative status of FIP snooping for the switch (Enable or Disable). Configured through the `fcoe fip-snooping` command.

Address-mode - Indicates whether a server-provided MAC address (SPMA) or a fabric-provided MAC address (FPMA) is assigned to virtual FCoE entities. Configured through the `fcoe address-mode` command.

Priority 1 - One of two global lossless priority values for FCoE traffic. Configured through `fcoe priority` command.

Priority 2 - Two of two global lossless priority values for FCoE traffic. Configured through `fcoe priority` command.

Priority Protection - The status of priority protection for the switch (Enable or Disable). Configured through the `fcoe priority-protection` command.

Priority Protection Action - The action applied to traffic that does not match the FCoE/FIP Ethertype and configured FCoE priority value (Drop or Remark). Configured through the `fcoe priority-protection action` command.

Re-mark Priority - The priority value to use for marking traffic that does not match the FCoE/FIP Ethertype and configured FCoE priority value. This value is only applied when the priority protection action is set to Remark. Configured through the `fcoe priority-protection action` command.

Total Filtering Resources - The number of ACL entries available for filtering of FCoE traffic.

Used Filtering Resources - The number of ACL entries currently in use for filtering FCoE traffic.

Trap threshold (%) - The percentage of filtering resources used for FIP. When this percentage is reached, a trap is sent indicating the available and maximum percentage of filtering resources. Configured through the `fcoe filtering-resource trap-threshold` command.

House Keeping Time Period - The amount of time the FCoE switch will wait to receive keep alive messages from the ENode and FCF. When this amount of time expires, information for the specific FCoE session is removed. Configured through the `fcoe house-keeping-time-period` command.

**Release History**

Release 7.3.2; command was introduced.

**Related Commands**

**output definitions**

- **Ports**: The slot/port or link aggregate ID of the FCoE interface. A “0” slot number indicates that the FCoE interface is a link aggregate.
- **FCoE Role**: The designated role of the FCoE interface (Edge Port, ENode Port, FCF Port, Mixed Port, or Trusted Port).
- **Status**: The operational status of the FCoE interface (ENABLE or DISABLE).

**Release History**

Release 7.3.2; command was introduced.

**Related Commands**

- **fcoe role**: Configures a port or link aggregate as an FCoE interface.
- **show fcoe**: Displays the FCoE and FIP status and configuration for the switch.

**MIB Objects**

AlaFipsIntfTable
- alaFipsIntfIfIndex
- alaFipsIntfOperStatus
- alaFipsIntfPortRole

show fcoe sessions

Displays the FIP snooping session status and configuration for the switch.

```
show fcoe sessions [[fips | npiv-proxy | r-npiv] [port chassis/slot/port] | vlan vlan_id | linkagg agg_id] |
[e-tunnel [tunnel_id]]
```

Syntax Definitions

- **fips** Displays FIP snooping sessions on FCoE ports.
- **npiv-proxy** Displays N_Port proxy (NPIV) sessions between ENode and FC switch.
- **r-npiv** Displays F_Port proxy (R-NPIV) sessions between the HBA and the gateway switch.
- **chassis** The chassis identifier.
- **slot/port** The slot and port number (3/1).
- **vlan_id** An existing FCoE VLAN ID. The valid ID range is 2–4094.
- **agg_id** The link aggregate ID number.
- **tunnel_id** Displays E2E tunnel sessions between two E_Ports on different FC switches. Optionally enter a tunnel ID to display information for a specific tunnel.

Defaults

By default, all FCoE sessions are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the `port` or `linkagg` parameter to display sessions for a specific FCoE port or link aggregate ID.
- Use the `vlan` parameter to display the sessions for a specific FCoE VLAN ID.
- The output displays for this command include FIP snooping, N_Port proxy (NPIV), F_Port proxy (reverse-NPIV), and E2E tunnel sessions. However, the N_Port proxy, F_Port proxy, and E2E tunnel sessions are only displayed on an OmniSwitch 6900 that is configured as an FCoE/FC gateway (see Chapter 44, “FCoE/FC Gateway Commands” for more information.
Examples

output definitions

**PORT**
The FCoE port or link aggregate ID for a FIP snooping session. A “0” slot number indicates that the FCoE interface is a link aggregate.
Configured through the `fcoe role` command.

**ENODE MAC**
The MAC address of the ENode for this session.

**VN_PORT MAC**
The MAC address of the virtual node (VN) port for this session.

**FCF MAC**
The MAC address of the FCoE Forwarder (FCF) for this session.
### Output Definitions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN</td>
<td>The FCoE VLAN used for this session. Configured through the <code>fcoe vlan</code> command.</td>
</tr>
<tr>
<td>STATUS</td>
<td>The operational status of this session.</td>
</tr>
<tr>
<td>IN-PORT</td>
<td>The FCoE port or link aggregate ID for an N_Port proxy (NPIV) or F_Port proxy (R-NPIV) session. Configured through the <code>fcoe role</code> command.</td>

show fcoe enode

Displays FCoE Node (ENode) information for FIP Snooping sessions associated with the switch.

show fcoe enode [mac_address]

Syntax Definitions

mac_address Enter an ENode MAC Address (for example, 00:00:39:59:f1:0c).

Defaults

By default, information is displayed for all ENodes associated with the switch.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

```
show fcoe fcf [mac_address]
```

### Syntax Definitions

- **mac_address**
  
Enter an FCF Address (for example, 00:00:39:59:f1:0c).

### Defaults

By default, information is displayed for all FCFs associated with the switch.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

Specify an FCF MAC address with this command to display more detailed information for a specific FCF.

### Examples

```
-> show fcoe fcf

<table>
<thead>
<tr>
<th>FCF-MAC</th>
<th>VLAN</th>
<th>Config</th>
<th>Sessions</th>
<th>A-bit</th>
<th>MaxFrmVer</th>
<th>Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>E8:E7:32:3F:FD:F0</td>
<td>46</td>
<td>Npiv</td>
<td>4</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>E8:E7:32:63:8B:B0</td>
<td>56</td>
<td>Dynamic</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>128</td>
</tr>
<tr>
<td>E8:E7:32:94:68:17</td>
<td>4000</td>
<td>Dynamic</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>128</td>
</tr>
<tr>
<td>E8:E7:32:94:68:E8</td>
<td>3000</td>
<td>Static</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>E8:E7:32:94:68:EE</td>
<td>4000</td>
<td>Static</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

-> show fcoe fcf E8:E7:32:3F:FD:F0

FCF : E8:E7:32:3F:FD:F0

<table>
<thead>
<tr>
<th>VLAN</th>
<th>VN-Port-MAC</th>
</tr>
</thead>
<tbody>
<tr>
<td>46</td>
<td>0E:FC:00:01:00:03</td>
</tr>
<tr>
<td>46</td>
<td>0E:FC:00:01:00:80</td>
</tr>
<tr>
<td>46</td>
<td>0E:FC:00:01:00:82</td>
</tr>
<tr>
<td>46</td>
<td>0E:FC:00:01:00:81</td>
</tr>
</tbody>
</table>
```

**output definitions**

- **FCF-MAC**
  
The MAC address of the FCoE Forwarder (FCF).

- **VLAN**
  
The FCoE VLAN ID.
**output definitions**

<table>
<thead>
<tr>
<th>Config</th>
<th>Whether the FCF MAC address was user-configured or learned through the FIP Snooping session for the given FCoE VLAN.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sessions</td>
<td>The number of sessions associated with the FCF MAC for the given FCoE VLAN.</td>
</tr>
<tr>
<td>A-bit</td>
<td>Whether or not the available-for-login bit is set for this FCF.</td>
</tr>
<tr>
<td>MaxFrmVer</td>
<td>Whether or not the maximum frame size was verified for this FCF.</td>
</tr>
<tr>
<td>VN-Port-MAC</td>
<td>The MAC address of the virtual node port (VN_Por) for this session. This address is comprised of the FCID that the FCF assigned to the port combined with the FC-MAP.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.3.2; command introduced.
Release 7.3.3; **A-bit** and **MaxFrmVer** fields added.

**Related Commands**

- **show fcoe sessions**  
  Displays FCoE FIP snooping session status and configuration for the switch.

- **show fcoe enode**  
  Displays FCoE Node (ENode) information for the switch.

**MIB Objects**

- alaFipsFcfTable
  - alaFipsFcfSessions
  - alaFipsSessionFCFMAC
  - alaFipsSessionVlanId
  - alaFipsFcfConfigType
  - alaFipsFcfAvailForLogin
  - alaFipsFcfMaxFcoeFrmSizeVerified
show fcoe fc-map

Displays the Fibre Channel Mapped Address Prefix (FC-MAP) for each FCoE VLAN.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When the FCoE address mode is set to Fabric-Provided MAC Address (FPMA), the FC-MAP value is the required upper 24 bits of a MAC address that is assigned to a Virtual N_Port (VN_Port).

**Examples**

```
-> show fcoe fc-map
    VLAN   FC-MAP
    --------+--------
        10   0E:FC:00
        100  0E:FC:22
        200  0E:FC:23
        300  0E:FC:23
```

**Release History**

Release 7.3.2; command introduced.
Related Commands

- **fcoe vlan**: Configures an FCoE VLAN for the switch.
- **fcoe fc-map**: Configures the FC-MAP for an FCoE VLAN.
- **show vlan**: Displays the VLAN configuration for the switch.

MIB Objects

- **alaFipsVlanTable**
  - **alaFipsVlanId**
  - **alaFipsVlanFCMap**
**show fcoe discovery-advertisement**

Displays the FIP discovery advertisement message parameter values for the specified FCoE VLAN.

```
show fcoe discovery-advertisement [vlan vlan_id[-vlan_id2]]
```

**Syntax Definitions**

```
vlan_id[-vlan_id2] An existing FCoE VLAN ID. Use a hyphen to specify a range of FCoE VLAN IDs (10-25).
```

**Defaults**

By default, the discovery advertisement parameters are displayed for all FCoE VLANs.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `vlan_id[-vlan_id2]` parameter to display information for a specific FCoE VLAN or for a range of FCoE VLANs.

**Examples**

```
-> show fcoe discovery-advertisement
VLAN A-Bit FKA Pd Priority UDS-Retries
----------+--------+----------+--------+--------------
 46 ENABLE 8  128      3
 56 ENABLE 8  128      3
 76 ENABLE 8  128      3
3000 ENABLE 8  128      3
4000 ENABLE 8  128      3

-> show fcoe discovery-advertisement vlan 3000
VLAN A-Bit FKA Period Priority UDS-Retries
----------+--------+----------+--------+--------------
 3000 ENABLE 8  128      3
```

**output definitions**

- **VLAN**: The FCoE VLAN ID. Configured through the `fcoe vlan` command.
- **A-Bit**: The status of the available-for-login bit (Enabled or Disabled). When enabled, indicates the switch can accept fabric logins from ENodes.
**output definitions (continued)**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FKA-PD</td>
<td>The discovery advertisement transmission interval, in seconds.</td>
</tr>
<tr>
<td>Priority</td>
<td>The priority value assigned to the switch (0 = highest priority, 255 = lowest priority).</td>
</tr>
<tr>
<td>UDS-Retries</td>
<td>The number of times a unicast discovery solicitation is transmitted after a port on which an FCF MAC was learned goes down.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.3.3; command introduced.

**Related Commands**

`fcoe discovery-advertisement` Configures FIP discovery advertisement parameter values.

**MIB Objects**

alaFipsDiscAdvtTable
- alaFipsDiscAdvtVlanId
- alaFipsDiscAdvtAbit,
- alaFipsDiscAdvtFkaAdvPeriod,
- alaFipsDiscAdvtPriority,
- alaFipsDiscAdvtUdsRetries,
- alaFipsDiscAdvtRowStatus
**show fcoe statistics**

Displays both ENode and FCF generated statistics for FCoE interfaces or specific VLANs.

```
```

**Syntax Definitions**

- **enode**: Display statistics only for ENode traffic.
- **fcf**: Display statistics only for FCF traffic.
- **interface**: Display statistics for all FCoE interfaces (ports and link aggregates).
- **vlan_id|vlan_id2**: An existing FCoE VLAN ID. Use a hyphen to specify a range of FCoE VLAN IDs (10-25).
- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[-agg_id2]**: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

**Defaults**

By default, FCF and ENode statistics are displayed for all FCoE interfaces and VLANs.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **vlan** parameter to display statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to display statistics for a specific FCoE port or link aggregate ID.
- The output displays for this command include FIP snooping, N_Port proxy (NPIV), and F_Port proxy (reverse-NPIV) statistics. However, the N_Port proxy and F_Port proxy statistics are only displayed on an OmniSwitch 6900 that is configured as an FCoE/FC gateway (see Chapter 44, “FCoE/FC Gateway Commands” for more information.)
## Examples

-> show fcoe statistics interface

Release History

Release 7.3.2; command introduced.  
Release 7.3.3; N_Port proxy and F_Port proxy statistics displayed only on an OmniSwitch 6900.

Related Commands

clear fcoe statistics  
Clears ENode and FCF statistics.

MIB Objects

alaFipsIntfEnodeStatsTable  
alaFipsIntfFcfStatsTable  
alaFipsVlanEnodeStatsTable  
alaFipsVlanFcfStatsTable
clear fcoe statistics

Clears ENode and FCF generated statistics on FCoE interfaces or specific VLANs.

clear fcoe statistics [enode | fcf] [interface | vlan [vlan_id[|vlan_id2]] | port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]]

Syntax Definitions

enode
  Clears statistics only for ENode traffic.
fcf
  Clears statistics only for FCF traffic.
interface
  Clears statistics on all FCoE interfaces (ports and link aggregates).
vlans vlan_id[|vlan_id2]
  An existing FCoE VLAN ID. The valid ID range is 2–4094. Use a
  hyphen to specify a range of VLAN IDs (100-150).
chassis
  The chassis identifier.
slot/port[-port2]
  The slot and port number (3/1). Use a hyphen to specify a range of ports
  (3/1-8).
linkagg agg_id[-agg_id2]
  The link aggregate ID number. Use a hyphen to specify a range of IDs
  (10-20).

Defaults

By default, statistics are cleared for all FCoE interfaces and VLANs.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the port or linkagg parameters to clear the statistics for a specific FCoE port or link aggregate ID.
- Use the vlan parameter to clear the statistics for a specific FCoE VLAN ID.

Examples

- clear fcoe statistics
- clear fcoe statistics interface
- clear fcoe statistics vlan
- clear fcoe statistics vlan 2
- clear fcoe statistics vlan 2-3
- clear fcoe statistics port 1/2
-> clear fcoe statistics port 1/2-3
-> clear fcoe statistics port 1/1/2
-> clear fcoe statistics linkagg 2
-> clear fcoe statistics linkagg 2-6
-> clear fcoe statistics enode interface
-> clear fcoe statistics enode vlan
-> clear fcoe statistics enode vlan 2
-> clear fcoe statistics enode vlan 2-3

-> clear fcoe statistics enode port 1/2
-> clear fcoe statistics enode port 1/2-3
-> clear fcoe statistics enode port 1/1/2
-> clear fcoe statistics enode port 1/1/2-3

-> clear fcoe statistics enode linkagg 2
-> clear fcoe statistics enode linkagg 2-6

-> clear fcoe statistics fcf interface
-> clear fcoe statistics fcf vlan
-> clear fcoe statistics fcf vlan 2
-> clear fcoe statistics fcf vlan 2-3

-> clear fcoe statistics fcf port 1/2
-> clear fcoe statistics fcf port 1/2-3
-> clear fcoe statistics fcf port 1/1/2
-> clear fcoe statistics fcf port 1/1/2-3

-> clear fcoe statistics fcf linkagg 2
-> clear fcoe statistics fcf linkagg 2-6

**Release History**

  alaFipsVlanStatsClear
The OmniSwitch implementation of FCoE/FC gateway functionality allows the switch to transparently connect FCoE and FC nodes with an FC SAN across an FCoE (lossless Ethernet) network. To provide this type of connectivity, an OmniSwitch FCoE/FC gateway supports the following three modes of operation that are used to converge FC over Ethernet and FC-to-FC over Ethernet:

- **N_Port Proxy mode**—allows ENodes in an FCoE network and FC switches in an FC SAN to communicate with each other. To an ENode the OmniSwitch gateway emulates an FCoE forwarder; to an FC switch the OmniSwitch gateway emulates an N_Port ID Virtualization (NPIV) host.

- **F_Port Proxy mode**—allows FC nodes to connect with FC switches and FCFs across an FCoE network. The OmniSwitch gateway forwards login requests from an FC node (N_Port on a server or storage with an HBA) across Ethernet via an FCoE VLAN to an NPIV node or FCF. This mode is sometimes referred to as reverse-NPIV proxy (R-NPIV).

- **E_Port Proxy mode**—allows FC switches to set up inter-switch link trunking between FC fabrics over an FCoE network. The OmniSwitch gateway provides an E_Port to E_Port (E2E) tunneling function that emulates a point-to-point FC link between E_Ports on native FC switches.

The OmniSwitch FCoE/FC gateway sits at the entry point of an FC fabric, which is required to handle the login process for ENodes and FC nodes accessing the fabric through the gateway switch.

OmniSwitch FCoE/FC gateway operations are not automatically activated for the switch; there is no single command to enable or disable gateway functionality. Instead, the configuration of the following software components enables one or more of the supported gateway operations:

- **FIP snooping**—FCoE/FC gateway functionality requires an active FIP snooping configuration. FIP Snooping ensures the security of an FCoE network.

- **Virtual Storage Area Network (VSAN)**—an FC port is assigned to a VSAN to create an NP_Port or F_Port connection to an FC switch or node in that VSAN. Not required for E2E Tunnel configuration.

- **VSAN-to-FCoE VLAN mapping**—identifies the FCoE/FC gateway fabric for the ENode or FC node login process via the FCoE VLAN. Not required for E_Port proxy (E2E Tunnel) configuration.

- **FC port mode**—the operational mode of the FC port determines the type of gateway functionality provided on that port. There are three modes supported: N_Port proxy, F_Port proxy, and E_Port proxy.

- **FCoE port role**—an FCoE port serves as an E2E tunnel endpoint in an FCoE network only when the port is configured as a virtual E_Port (VE_Port). The role of other FCoE ports is configured based on the FIP snooping configuration for the gateway switch.

This chapter and the Chapter 43, “FIP Snooping Commands,” describe the command line interface (CLI) commands used to configure these components.
MIB information for the FCoE/FC gateway commands is as follows:

Filename: ALCATEL-IND1-FIPS-MIB.mib
Module: alcatelIND1FipsMIB

fibre-channel vsan

Configures an OmniSwitch VSAN with the specified VSAN ID and an optional description. This type of VSAN is used to segment OmniSwitch Fibre Channel ports into a virtual FCoE/FC gateway fabric.

**Note.** The VSAN created with this command only applies to the local switch configuration. There is no correlation between an OmniSwitch VSAN and a VSAN created within a native FC SAN.

```
fibre-channel vsan {vsan_id[-vsan_id2]} [admin-state {enable | disable}] [name description]
```

```
no fibre-channel vsan {vsan_id[-vsan_id2]}
```

### Syntax Definitions

- **vsan_id[-vsan_id2]**: A numeric value that will uniquely identify the VSAN. Use a hyphen to specify a range of VSAN IDs (for example, 100-105). The valid range is 2–4094).
- **enable**: Enable the VSAN administrative status.
- **disable**: Disable the VSAN administrative status.
- **description**: An alphanumeric string. Optional name description for the VSAN ID.

### Defaults

By default, VSAN 1 is created on the switch and all unassigned FC ports are assigned to VSAN 1.

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
<tr>
<td>name</td>
<td>description</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **no** form of this command to delete a VSAN from the configuration.
- When a VSAN is administratively disabled, all sessions established over that VSAN are cleared and the switch stops sending periodic FIP multicast discovery advertisement messages for the corresponding FCoE VLAN.
- The description can be any alphanumeric string. Enclose the description in double quotes if it contains more than one word with space in between.
Only FC switch ports can be assigned to a VSAN.

Assigning multiple FC ports to the same VSAN is allowed, but an FC port can only belong to one VSAN.

Configuring N_Port and F_Port proxy functionality requires mapping a VSAN to an FCoE VLAN. Note that only one VSAN is mapped to one FCoE VLAN (one-to-one) at any given time. This mapping defines a single traffic path through the gateway switch.

If an FCoE VLAN is not mapped to a VSAN, then the FCoE VLAN participates only in the FIP snooping process.

Examples

-> fibre-channel vsan 200 name “Fabric A”
-> fibre-channel vsan 100-105 admin-state disable
-> no fibre-channel vsan 200

Release History

Release 7.3.3; command introduced.

MIB Objects

alaFcVsanTable
  alaFcVsanNumber
  alaFcVsanDescription,
  alaFcVsAnAdmStatus
  alaFcVsAnOperStatus
fibre-channel port mode

Configures the port type and operational mode for an eligible FC port. The port type is only set to Fibre Channel and the specified operational mode determines the type of gateway functionality provided on that port. There are three modes supported: N_Port proxy, F_Port proxy, and E_Port proxy.

```
fibre-channel port chassis/slot/port[-port2] mode {np | f | te} [bb-sc-n buffer_num]
```

```
no fibre-channel port chassis/slot/port[-port2]
```

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot/port[-port2]` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). Only ports on an OmniSwitch 6900 OS-XNI-U12E module with an SFP-FC-SR transceiver are eligible for this command.
- `np` Activates N_Port proxy functionality on the port. In this mode the port serves as a proxy node port (NP_Port) that aggregates N_Port transactions between FCoE devices and FC switches.
- `f` Activates F_Port proxy functionality on the port. In this mode the port operates as a fabric port (F_Port), which connects to an N_Port in a point-to-point link between FC devices.
- `te` Activates E_Port functionality on the port. In this mode, the port operates as a tunnel expansion port (TE_Port) that connects to an E_Port on an FC switch. TE_Ports allow E_Ports to connect across an FCoE network as part of an inter-switch link (ISL) tunnel that is used to expand the native FC fabric over Ethernet.
- `buffer_num` The buffer-to-buffer state change (BB_SC) number. FC ports exchange BB_SC primitives after 2^BB_SC_N frames. These primitives are used to recalculate buffer credits as part of a buffer-to-buffer flow control function between FC switch connections. The valid range is 0–15.

**Defaults**

By default, no operational mode is configured for the FC ports and the port type is set to Ethernet.

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>bb-sc-n buffer_num</td>
<td>0</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

- Use the `no` form of this command to remove the operational mode configuration from the FC port. The port type reverts back to Ethernet.

- To change the FC mode for the port, use the `no` form of this command to remove the current mode configuration then configure the FC mode again for the same port.

- Changing the `bb-sc-n` parameter value can be changed at any time (removing the FC mode configuration is not required to change this parameter value).

- Make sure the `bb-sc-n` parameter value is the same on both ends of the connection between the OmniSwitch FCoE/FC gateway and an FC switch. If the value is different on each end of the connection then the greater value is used. However, if this value is set to zero for one of the ports on the connection, then the buffer-to-buffer state change function is disabled.

- FC ports do not participate in Ethernet features, such as a link aggregates, a virtual fabric links (VFLs) in virtual chassis (VC) configurations, standard VLANs, or FCoE VLANs.

- To ensure end-to-end lossless connectivity through the gateway switch, assign a PAUSE-enabled DCB profile to each FC port. For more information, see Chapter 5, “Configuring an FCoE Gateway”, in the *OmniSwitch AOS Release 8 Data Center Switching Guide*.

**Examples**

```
-> fibre-channel port 2/1 mode np
-> fibre-channel port 2/3 mode f
-> fibre-channel port 2/5 mode te
-> no fibre-channel port 2/5
```

To change the FC port mode:

```
-> no fibre-channel port 2/1
-> fibre-channel port 2/1 f
```

To change the `bb-sc-n` parameter value:

```
-> fibre-channel port 2/1 bb-sc-n 3
```

**Release History**

Release 7.3.3; command introduced.

**Related Commands**

- `fibre-channel vsan members` Assigns FC ports to VSANs.
- `show fibre-channel port` Displays the FC port configuration for the switch.

  - `alaFcIntfMode`
  - `alaFcIntfBbScN`
  - `alaFcIntfBbCredit`
  - `alaFcIntfBbRxDataField`
  - `alaFcIntfClassOfService`
  - `alaFcIntfRowStatus`
**fibre-channel vsan members**

Configures the VSAN assignment for the specified FC port.

```
fibre-channel vsan vsan_id members port chassis/slot/port[-port2]
no fibre-channel vsan vsan_id members port chassis/slot/port[-port2]
```

**Syntax Definitions**

- `vsan_id` An existing VSAN ID number.
- `chassis` The chassis identifier.
- `slot/port[-port2]` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

**Defaults**

By default, all FC ports are assigned to VSAN 1.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove the association between the specified FC port and VSAN.
- When an NP_Port is removed from a VSAN, a FIP CVL is generated for all the VN_Ports that are logged in through that NP_Port and an FC LOGO is sent on the FC port. An FC LOGO is also sent for any R-NPIV sessions that exist when the CVL is generated.
- When an F_Port (used for R-NPIV) is removed from a VSAN, then FC LOGO is sent to the host and also to the FCF.
- When an FC port is moved from VSAN 1 to another VSAN, traffic loss will occur for all existing sessions. Moving FC ports between other VSANs (for example, between VSAN 2 and 3) is not allowed.
- Multiple FC ports can belong to the same VSAN, but an FC port can belong to only one VSAN. In other words, it is not possible to tag FC ports with multiple VSANs.
• When a VSAN is mapped to an FCoE VLAN and an active FC port is assigned to that VSAN, the FC mode configured for that port determines the FCoE/FC gateway functionality provided. For example, if the FC port mode is set to operate as:
  – an NP_Port, then NPIV proxy functionality is automatically enabled.
  – an F_Port, then the R-NPIV functionality is automatically enabled.
  – a TE_Port and an FCoE port is set to operate as a virtual E_Port (VE_Port), then E2E tunneling functionality is automatically enabled.

• When more than one NP_Ports is associated with the same VSAN, the OmniSwitch will load balance ENode FLOGI requests across the NP_Ports for that VSAN. By default, the NP_Ports with the lowest number of logins provided is selected. If all the NP_Ports have the same number of logins provided, then the switch will select a port using a round robin algorithm.

Examples

-> fibre-channel vsan 10 members port 2/1
-> fibre-channel vsan 10 members port 2/1-3
-> no fibre-channel vsan 10 members port 2/1-3

Release History

Release 7.3.3; command introduced.

MIB Objects

alaFcVfpaTable
   alaFcVfpaVsanNumber
   alaFcVfpaIfIndex
   alaFcVfpaRowStatus
**fcoe vsan-map**

Maps an FC VSAN to an FCoE VLAN. This mapping is required to activate the processing of specific FCoE ENode traffic traveling to and from the designated virtual FC fabric through the FCoE/FC gateway OmniSwitch.

```plaintext
fcoe vsan-map vsan vsan_id vlan vlan_id
no fcoe vsan-map vsan vsan_id vlan vlan_id
```

### Syntax Definitions

- `vsan_id`  
  An existing VSAN ID number.

- `vlan_id`  
  An existing FCoE VLAN ID number.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to remove the VSAN-to-FCoE VLAN mapping.
- When a mapping is removed, all sessions associated with the FCoE VLAN are cleared.
- Only one VSAN is mapped to one FCoE VLAN.
- The FCoE/FC gateway does not participate in FCoE discovery mechanisms for FCoE VLANs not mapped to a VSAN.
- If an FCoE VLAN is not mapped to a VSAN, then only FIP snooping functionality is applied to that VLAN.

### Examples

- `fcoe vsan-map vsan 10 vlan 100`
- `no fcoe vsan-map vsan 10 vlan 100`

### Release History

Release 7.3.3; command introduced.
Related Commands

- `fibre-channel vsan` Configures a VSAN for the switch.

- `show fcoe vsan-map` Displays the VSAN-VLAN mapping configuration.

MIB Objects

- `alaFipsVsanVlanMapTable`
  - `alaFipsVsanVlanMapVsanNumber`
  - `alaFipsVsanVlanMapVlanNumber`
  - `alaFipsVsanVlanMapRowStatus`
fibre-channel npiv-proxy load-balance

Configures the dynamic load balancing method that is applied to ENode FLOGI requests when more than one FC port is associated with the same VSAN. Load balancing is not applied to FDISC requests.

Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>default</code></td>
<td>Selects the default load balancing method.</td>
</tr>
<tr>
<td><code>dynamic-reorder</code></td>
<td>Ensures that all sessions are load balanced evenly at any given time.</td>
</tr>
<tr>
<td><code>enode-based</code></td>
<td>Selects the FC for the new session based on the ENode MAC address.</td>
</tr>
</tbody>
</table>

Defaults

By default, the FC port with the lowest number of logins provided is selected for new FLOGI requests. If all the ports have the same number of logins provided, then the switch will select a port using a round robin algorithm.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The load balancing method is globally applied to the switch, and only one method is applied at a time.
- Using the dynamic reorder load balancing method may trigger the tearing down of some sessions, so that upon re-login the ENode FLOGI is processed on a different NP_Port in the same VSAN. For example, when a new FC NP_Port is added to the VSAN, some of the sessions are torn down and logged in again on the newly added port to distribute sessions across all ports in the VSAN.
- When the ENode-based load balancing method is used, each NP_Port in the VSAN will send a multicast discovery advertisement to all ENodes in the mapped FCoE VLAN. The FCF MAC address in the discovery advertisement is the MAC address of the FC port. The ENode then decides which FCF (NP_Port) to use for the login.
- The default and ENode-based load balancing methods do not disturb existing sessions.
- The load balancing method is **not** applied to statically mapped FCoE and FC ports.

Examples

- `-> fibre-channel npiv-proxy load-balance dynamic-reorder`
- `-> fibre-channel npiv-proxy load-balance enode-based`
- `-> fibre-channel npiv-proxy load-balance default`
**Release History**

Release 7.3.3; command introduced.

**Related Commands**

`fibre-channel npiv-proxy load-balance static` Configures a static mapping between an FCoE port and an FC NP_Port. Load balancing does not apply to statically mapped ports.

`show fibre-channel` Displays the global load balancing method applied to NP_Ports.

**MIB Objects**

- `alaFcInfo`  
- `alaFcConfigNpivLoadBalance`
**fibre-channel npiv-proxy load-balance static**

Configures a static port association between an FCoE port and an FC NP_Port to ensure that FC sessions on the specified FCoE port are mapped to the specified NP_Port.

`fibre-channel npiv-proxy load-balance static {port chassis/slot/port | linkagg agg_id} fc-port chassis/slot/port`

`no fibre-channel npiv-proxy load-balance static {port chassis/slot/port | linkagg agg_id} fc-port chassis/slot/port`

**Syntax Definitions**

- `chassis` The chassis identifier.
- `port slot/port` The slot and port number (3/1) of an FCoE port.
- `agg_id` The link aggregate ID number.
- `fc-port slot/port` The slot and port number (3/1) of an FC port.

**Defaults**

By default, there are no static FCoE-to-FC port associations. The dynamic load balancing method is applied to the FC NP_ports.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove the static association between the FCoE port and the FC port. When this association is removed, the dynamic load balancing method is applied.
- Use caution when configuring static FCoE-to-FC port assignments. Static assignments exempt both the FCoE port and the FC NP_Port from dynamic load balancing of sessions when multiple FC ports belong to the same VSAN.

**Examples**

- `-> fibre-channel npiv-proxy load-balance static port 1/1 fc-port 2/1`
- `-> no fibre-channel npiv-proxy load-balance static port 1/1 fc-port 2/1`
- `-> fibre-channel npiv-proxy load-balance static linkagg 10 fc-port 2/1`
- `-> no fibre-channel npiv-proxy load-balance static linkagg 10 fc-port 2/1`
Release History

Release 7.3.3; command introduced.

Related Commands

show fibre-channel npiv-proxy load-balance  
Displays the static FCoE port/FC NP_Port mapping and FC port session counts.

MIB Objects

alaFcNpivStaticLoadBalanceTable
   alaFcNpivStaticLoadBalanceRowStatus
   alaFcNpivStaticLoadBalanceEtherIfIndex
   alaFcNpivStaticLoadBalanceFibreIfIndex
fcoe e-tunnel

Configures an E2E tunnel identifier and associates the identifier with tunnel endpoints and an FCoE VLAN. An E2E tunnel allows FC switches to set up ISLs between fabrics over an FCoE network.

fcoe e-tunnel tunnel_id {fc-port1 chassis/slot/port} {fc-port2 chassis/slot/port | vlan vlan_id}
no fcoe e-tunnel tunnel_id

Syntax Definitions

tunnel_id
chassis
slot/port
vlan_id
A unique ID number to assign to this tunnel session.
The chassis identifier.
The slot and port number (3/1) of an FC tunnel edge (TE) port.
An existing FCoE VLAN ID number.

Defaults
N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to remove the tunnel configuration.
- An OmniSwitch FC port is configured as a tunnel E_Port (TE Port) and connects to an E_Port on an FC switch. TE_Ports can carry traffic from multiple VSANs. This command is used to associate the TE port with an FCoE VLAN or with another TE port on the same switch.
- An OmniSwitch FCoE port is configured as a virtual expansion port (VE_Port) on the FCoE network side. The VE port is associated with an FCoE VLAN by tagging the VE port with the FCoE VLAN ID.
- This command does not establish a connection. Once the required tunnel components are configured, successful exchange of exchange link parameters (ELP) between a TE_Port and a VE_Port or between two TE_Ports will establish the tunnel session.
- To create a tunnel connection between two FC switches across the FCoE network requires the following steps:
  - Configure the FCoE port that will connect to the FCoE network as a virtual expansion port
To tag the VE_Port to the FCoE VLAN that will carry traffic through the tunnel.

- Configure the FC port that will connect to an E_Port on an FC as a TE_Port.
- Use this command (fcoe e-tunnel) with the fc-port1 and vlan parameters to associate the TE_Port with the FCoE VLAN to which the VE_Port is tagged.

- To create a tunnel between two FC TE_Ports on the same switch or in a virtual chassis configuration, use the fc-port1 and fc-port2 parameters to specify the slot and port number of the two TE ports.

**Examples**

- `fcoe e-tunnel 1 fc-port1 2/1 fc-port2 2/2`
- `fcoe e-tunnel 10 fc-port1 2/3 vlan 200`
- `fcoe e-tunnel 11 fc-port1 2/4 vlan 200`
- `no fcoe e-tunnel 10`

**Release History**

- `alaFipsEtunnelIfIndexTwo`
- `alaFipsEtunnelRowStatus`
show fibre-channel vsan

Displays the VSAN configuration for the switch.

`show fibre-channel vsan [vsan_id][vsan_id2]`

**Syntax Definitions**

| vsan_id[vsan_id2] | An existing VSAN ID. Use a hyphen to specify a range of VSAN IDs (10-25). |

**Defaults**

By default, a list of all VSANs is displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Specify a VSAN ID with this command to display information about a specific VSAN.

**Examples**

```
-> show fibre-channel vsan

vsan  oper  admin  name
-------+----+-----+---------
   1   Ena  Dis  test1
  1000 Dis  Dis  test2
  2000 Ena  Dis  test3

-> show fibre-channel vsan 101

vsan  oper  admin  name
-------+----+-----+---------
  1000 Dis  Dis  test2

output definitions:

<table>
<thead>
<tr>
<th>vsan</th>
<th>The numerical VSAN ID.</th>
</tr>
</thead>
<tbody>
<tr>
<td>oper</td>
<td>The operational status of the VSAN: <strong>Ena</strong> (enabled) or <strong>Dis</strong> (disabled). The operational status remains disabled until an active FC port is assigned to the VSAN. A VSAN must have an enabled administrative status before it can become operationally enabled.</td>
</tr>
</tbody>
</table>
**output definitions (continued)**

<table>
<thead>
<tr>
<th>admin</th>
<th>The administrative status of the VSAN: <strong>Ena</strong> specifies that VSAN functions are enabled; <strong>Dis</strong> specifies that VLAN functions are disabled.</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The user-defined text description for the VSAN. By default, the VSAN ID is displayed if the VLAN description is not specified.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.3.3; command introduced.

**Related Commands**

**show fibre-channel vsan members**

Displays the VSAN port assignments.

```
show fibre-channel vsan [vsan_id [-vsan_id2]] members [port chassis/slot/port[-port2]]
```

### Syntax Definitions

- **vsan_id[[-vsan_id2]]**  
  An existing VSAN ID number. Use a hyphen to specify a range of VSAN IDs (10-25).

- **chassis**  
  The chassis identifier.

- **slot/port[[-port2]]**  
  The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

### Defaults

By default, all VSAN port assignments are displayed.

### Platforms Supported

</tr>
</tbody>
</table>

### Usage Guidelines

- If the **vsan_id** is specified without a **slot/port**, then all port assignments for that VSAN are displayed.
- If both the **vsan_id** and **slot/port** are specified, then information only for that VSAN and slot/port is displayed.
- Only OmniSwitch FC ports can be assigned to a VSAN.

### Examples

```
-> show fibre-channel vsan members
vsan port status
----------
1  2/2/1 Enabled
1003  2/2/12 Enabled
1005  3/2/5 Disabled

-> show fibre-channel vsan 1003 members
port status
-------------
2/2/12  Enabled

-> show fibre-channel vsan 1005 members port 3/2/5
vsan : 1005,
port : 3/2/5,
status : disabled
```
show fibre-channel vsan members

output definitions

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vsan</td>
<td>The numerical VSAN ID. Configured through the <code>fibre-channel vsan</code> command.</td>
</tr>
<tr>
<td>port</td>
<td>The FC port number associated with the VSAN ID. Configured through the <code>fibre-channel vsan members</code> command.</td>
</tr>
<tr>
<td>status</td>
<td>The operational status of the port (enabled or disabled).</td>
</tr>
</tbody>
</table>

Release History

Release 7.3.3; command introduced.

Related Commands

show fibre-channel vsan  Displays the VSAN configuration for the switch.

MIB Objects

alaFcVfpaTable
  alaFcVfpaVsanNumber
  alaFcVfpaIfIndex
  alaFcVfpaState
  alaFcVfpaRowStatus
show fibre-channel port

Displays the FC port configuration for the switch.

show fibre-channel port [info]

**Syntax Definitions**

info Displays session details for each FC port.

**Defaults**

By default, the parameters for each FC port are displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When the *info* parameter is used with this command, the *fcid* field shows an FC port ID for NP_Ports. For all other port modes, this field is blank. Only NP_Ports perform fabric login (FLOGI) and obtain a port ID from an FC switch.
- If an FC port is configured to operate in the fabric or tunnel E_Port mode, there is no fabric login process performed. Ports running in these modes will come up immediately.
- FLOGI is triggered only after an NP_Port is assigned to a VSAN.

**Examples**

```
-> show fibre-channel port
Legend: NP=Proxy N_Port, F=Fabric Port connected to N_port, TE=Tunnel E-Port

ports oper-status mode  BB-SC-N  service class
---------------+----------+---------------+-------------+-----------+-------------+-------------+-------------+-----------+-------------+-------------+-----------
 2/1        Up      NP        3              3
 2/2        Up      F         0              3
 2/3        Up      TE        3              3/F
 2/4       Down     NP        0              3
```

**output definitions**

- **ports** The slot and port number of the FC port.
- **oper-status** The operational status of the FC port.
The operational mode for the FC port.

The buffer-to-buffer state change number configured for the FC port.

The service class for the FC port session (2, 3, F, or 3/F). This value indicates the level of delivery integrity required for an application.

Legend: NP=Proxy N_Port, F=Fabric Port connected to N_port, TE=Tunnel E_Port

<table>
<thead>
<tr>
<th>ports</th>
<th>mode</th>
<th>fcid</th>
<th>wwpn</th>
<th>state</th>
</tr>
</thead>
<tbody>
<tr>
<td>2/1</td>

**show fcoe vsan-map**

Displays the VSAN-to-FCoE VLAN mapping configuration.

```
show fcoe vsan-map
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>vsan</th>
<th>vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>10</td>
</tr>
<tr>
<td>2000</td>
<td>2000</td>
</tr>
<tr>
<td>3000</td>
<td>3000</td>
</tr>
</tbody>
</table>

#### Defaults

N/A

#### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

Mapping a VSAN to an FCoE VLAN is required to activate the processing of specific ENode traffic traveling to and from the designated virtual FC fabric through the NPIV OmniSwitch.

#### Examples

```
-> show fcoe vsan-map
vsan  vlan
------- -------
   10     10
   2000   2000
   3000   3000
```

#### Output Definitions

<table>
<thead>
<tr>
<th>vsan</th>
<th>vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>The VSAN ID. Configured through the <code>fibre-channel vsan</code> command.</td>
<td></td>
</tr>
<tr>
<td>The FCoE VLAN ID. Configured through the <code>fcoe vlan</code> command.</td>
<td></td>
</tr>
</tbody>
</table>

#### Release History

Release 7.3.3; command introduced.
Related Commands

**fcoe vsan-map**
Configures a one-to-one mapping between a VSAN and FCoE VLAN.

**show vlan**
Displays the FCoE VLAN configuration.

MIB Objects

alaFipsVsanVlanMapTable

alaFipsVsanVlanMapVsNumber

show fibre-channel sessions

Displays the sessions established on the OmniSwitch FC ports.

**show fibre-channel sessions [vsan vsan_id | e-tunnel tunnel_id] [port chassis/slot/port] [summary]**

### Syntax Definitions

- **vsan_id**: An existing VSAN ID number.
- **tunnel_id**: An existing E-Tunnel (E2E Tunnel) ID.
- **chassis**: The chassis identifier.
- **slot/port**: The slot and port number (3/1).

### Defaults

By default, all FC sessions are displayed for all FC ports.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The **port** parameter can be combined with the **vsan** or **e-tunnel** parameters to display sessions for a specific FC port within a VSAN or E2E tunnel.

### Examples

- `-> show fibre-channel sessions summary`
  
  Total FIBRE-CHANNEL Sessions: 7 ,
  Total NPIV Sessions: 4 ,
  Total R-NPIV Sessions: 1 ,
  Total E-TUNNEL Sessions: 2

- `-> show fibre-channel sessions`
  
  Total FIBRE-CHANNEL Sessions: 4
  Total NPIV Sessions: 2
  Total R-NPIV Sessions: 1
  Total E-TUNNEL Sessions: 1

</tbody>
</table>

Usage Guidelines

This command currently displays the following:

- The load-balancing method that is applied to FLOGI requests when there is more than one NPIV proxy port assigned to the same VSAN. This mode does not apply to FC ports configured to operate in the F_Portal proxy mode (R-NPIV) or as E2E tunnel ports.
- The World Wide Node Name (WWNN) for the switch. The WWNN is comprised of “10:00” combined with the next available increment of the switch based MAC address.

Examples

-> show fibre-channel
Fibre Channel Global Configurations :
----------------------------------------
NPIV Proxy Global Load Balance Method : Default
Local WWNN : 10:00:00:E0:B1:E7:09:A4

Release History

Release 7.3.3; command introduced.
Related Commands

`fibre-channel npiv-proxy load-balance` Configures the load balancing method applied to multiple FC ports that belong to the same VSAN.

show fibre-channel statistics

Displays FC port statistics.

```
show fibre-channel statistics [npiv | r-npiv] [vsan vsan_id[vsan_id2]] [port chassis/slot/port[-port2]] [e-tunnel port chassis/slot/port[-port2]]
```

### Syntax Definitions

- **npiv**: Displays statistics for N_Port proxy sessions.
- **r-npiv**: Displays statistics for F_Port proxy sessions.
- **e-tunnel [tunnel_id]**: Displays E2E tunnel (E_Port proxy) statistics. Optionally enter a tunnel ID to display information for a specific tunnel.
- **vsan_id[vsan_id2]**: An existing VSAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VSAN IDs (100-150).
- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

### Defaults

By default, all statistics are displayed

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **vsan** parameter to display statistics for a specific VSAN ID. The **vsan** parameter is not used with the **e-tunnel** parameter, because tunnel ports are not associated with a VSAN.
- Use the **port** parameter to display statistics for a specific FC port.
**Examples**

-> show fibre-channel statistics vsan 46

show fcoe statistics npiv-proxy

Displays ENode fabric login or ENode discovery statistics for FCoE interfaces or specific VLANs.

```
show fcoe statistics npiv-proxy {enode-login | enode-discovery} {interface | vlan [vlan_id|vlan_id2] | port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

**Syntax Definitions**

- `enode-login` Displays ENode login statistics.
- `enode-discovery` Displays ENode discovery statistics.
- `interface` Display statistics for all FCoE interfaces (ports and link aggregates).
- `vlan_id[vlan_id2]` An existing FCoE VLAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VLAN IDs (100-150).
- `chassis` The chassis identifier.
- `slot/port[-port2]` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `agg_id[-agg_id2]` The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

show fibre-channel npiv-proxy load-balance

Displays the NPIV proxy load balancing static mapping and session count.

show fibre-channel npiv-proxy load balance {static | session-count}

Syntax Definitions

| static | Displays the static FCoE port/FC NP_Port mapping. |
| session-count | Displays the number of sessions on each FC port. |

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- This command displays information only for FC ports operating in the NP_Prot mode.
- Use the static parameter to display only the static mapping of FCoE ports to FC NP_Ports.
- When the session-count parameter is used, the “FC Port” field includes all NP_Ports.

Examples

- show fibre-channel npiv-proxy load-balance static

  FCoE Port   FC port
  -----------+---------
  1/1        2/1
  1/2        2/1

- show fibre-channel npiv-proxy load-balance session-count

  FC Port   session_count
  -----------+---------
  2/1       2
  2/2       0
output definitions

clear fibre-channel statistics

Clears FC port statistics.

```
clear fibre-channel statistics [npiv | r-npiv] [port chassis/slot/port[-port2] [e-tunnel port chassis/slot/port[-port2]]
```

### Syntax Definitions

- **npiv**: Clears statistics for N_Prot proxy sessions.
- **r-npiv**: Clears statistics for F_Prot proxy sessions.
- **e-tunnel [tunnel_id]**: Clears E2E tunnel (E_Prot proxy) statistics. Optionally enter a tunnel ID to display information for a specific tunnel.
- **vsan_id [vsan_id2]**: An existing VSAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VSAN IDs (100-150).
- **chassis**: The chassis identifier.
- **slot/port [-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

### Defaults

By default, all statistics are cleared.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `vsan` parameter to clear statistics for a specific VSAN ID. The `vsan` parameter is not used with the `e-tunnel` parameter, because tunnel ports are not associated with a VSAN.

- Use the `port` parameter to clear statistics for a specific FC port.

### Examples

- `clear fibre-channel statistics`
- `clear fibre-channel statistics port 2/2/5`
- `clear fibre-channel statistics npiv`
- `clear fibre-channel statistics r-npiv`
- `clear fibre-channel statistics e-tunnel`
- `clear fibre-channel statistics npiv port 2/2/1`
- `clear fibre-channel statistics r-npiv port 2/2/3`
- `clear fibre-channel statistics e-tunnel port 2/2/4`
**Release History**

Release 7.3.3; command introduced.

**Related Commands**

`show fibre-channel statistics`  Display FC port statistics.

  - `alaFcIntfEtunnelStatsClear`
clear fibre-channel sessions

Clears the specified sessions on all FC ports.

`clear fibre-channel sessions {npiv-proxy | r-proxy | e-tunnel | all}`

**Syntax Definitions**

- **npiv-proxy**: Clears NP_Port proxy sessions.
- **r-proxy**: Clears reverse NP_Port proxy sessions.
- **e-tunnel**: Clears E-Tunnel (E2E Tunnel) sessions.
- **all**: Clears all NP_Port proxy, reverse proxy, and E-Tunnel sessions.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Only the sessions associated with the specified parameter are cleared. For example, if the `npiv-proxy` parameter is used, only NPIV proxy sessions are cleared. All other session types remain active.
- When sessions are cleared on FC ports, the corresponding sessions on the FCoE ports are also cleared.

**Examples**

- `-> clear fibre-channel sessions npiv-proxy`
- `-> clear fibre-channel sessions r-npiv`
- `-> clear fibre-channel sessions e-tunnel`
- `-> clear fibre-channel sessions all`

**Release History**

Release 7.3.3; command introduced.
Related Commands

show fibre-channel sessions  Displays FC sessions.

MIB Objects

alaFcInfo
   alaFcConfigSessClear
clear fcoe statistics npiv

Clears N_Port proxy (NP_Port) statistics for FCoE interfaces or specific FCoE VLANs.

```
clear fcoe statistics npiv-proxy {interface | vlan [vlan_id|vlan_id2] | port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

### Syntax Definitions

- **interface**: Clears statistics for all FCoE interfaces (ports and link aggregates).
- **vlan_id[vlan_id2]**: An existing FCoE VLAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VLAN IDs (100-150).
- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[-agg_id2]**: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

### Defaults

N/A.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `vlan` parameter to clear statistics for a specific FCoE VLAN ID.
- Use the `port` or `linkagg` parameters to clear statistics for a specific FCoE port or link aggregate ID.

### Examples

```
-> clear fcoe statistics npiv-proxy interface
-> clear fcoe statistics npiv-proxy vlan 100
-> clear fcoe statistics npiv-proxy vlan 200-205
-> clear fcoe statistics npiv-proxy port 1/1
-> clear fcoe statistics npiv-proxy port 1/5-10
-> clear fcoe statistics npiv-proxy port 1/1/1
-> clear fcoe statistics npiv-proxy linkagg 10
```
**Release History**

Release 7.3.3; command introduced.

**Related Commands**

`show fcoe statistics npiv-proxy`  Displays N_Port proxy statistics.

clear fcoe statistics r-npiv

Clears F_Port proxy (reverse-NPIV) statistics for FCoE interfaces or specific FCoE VLANs.

clear fcoe statistics r-npiv {interface | vlan [vlan_id|vlan_id2] | port chassis/slot/port[-port2] | linkagg agg_id[1-agg_id]}]

Syntax Definitions

interface
Clears statistics for all FCoE interfaces (ports and link aggregates).

vlan_id|vlan_id2
An existing FCoE VLAN ID. The valid ID range is 2-4094. Use a hyphen to specify a range of VLAN IDs (100-150).

chassis
The chassis identifier.

slot/port[-port2]
The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

agg_id[1-agg_id]
The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults
N/A

Platforms Supported
This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>

</tr>
</tbody>
</table>

Usage Guidelines

- Use the `vlan` parameter to clear statistics for a specific FCoE VLAN ID.
- Use the `port` or `linkagg` parameters to clear statistics for a specific FCoE port or link aggregate ID.

Examples

- `clear fcoe statistics r-npiv interface`
- `clear fcoe statistics r-npiv vlan 100`
- `clear fcoe statistics r-npiv vlan 200-205`
- `clear fcoe statistics r-npiv port 1/1`
- `clear fcoe statistics r-npiv port 1/5-10`
- `clear fcoe statistics r-npiv port 1/1/1`
- `clear fcoe statistics r-npiv linkagg 10`
**Release History**

Release 7.3.3; command introduced.

**Related Commands**

*show fcoe statistics r-npiv*  
Displays F_Port proxy statistics.

**MIB Objects**

alaFipsVlanTable  
   alaFipsVlanStatsFnreClear  
alaFipsIntfTable  
   alaFipsIntfStatsFnreClear
**clear fcoe statistics e-tunnel**

Clears E_Port proxy (E2E tunnel) statistics.

`clear fcoe statistics e-tunnel [ve | te] {tunnel_id|-tunnel_id}`

### Syntax Definitions

- **ve**
  - Clears VE_Port statistics.

- **te**
  - Clears TE_Port statistics.

- **tunnel_id|-tunnel_id**
  - The ID of an existing E2E tunnel. Use a hyphen to specify a range of tunnel IDs (10-15).

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **ve** parameter to clear only VE_Port statistics for the specified tunnel ID.
- Use the **te** parameter to clear only TE_Port statistics for the specified tunnel ID.

### Examples

- `-> clear fcoe statistics e-tunnel 1`
- `-> clear fcoe statistics e-tunnel ve 2`
- `-> clear fcoe statistics e-tunnel te 2`

### Release History

Release 7.3.3; command introduced.
Related Commands

show fcoe statistics e-tunnel  Displays E_Port proxy (E2E tunnel) statistics.

MIB Objects

  alaFipsEtunnelTePortStatsTunnelId
  alaFipsEtunnelTePortStatsClear
clear fcoe sessions

Clears the specified sessions on all FCoE ports.

```
clear fcoe sessions [fips | npiv-proxy | r-proxy | e-tunnel | all]
```

### Syntax Definitions

- **fips**
  - Clears FIP snooping sessions.
- **npiv-proxy**
  - Clears NP_Port proxy sessions.
- **r-proxy**
  - Clears reverse NP_Port proxy sessions.
- **e-tunnel**
  - Clears E-Tunnel (E2E Tunnel) sessions.
- **all**
  - Clears all FCoE, NP_Port proxy, reverse proxy, and E-Tunnel sessions.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When FIP snooping sessions are cleared, a clear virtual link (CVL) request is sent for all logged ENodes.
- When R-NPIV sessions are cleared, FIP FLOGO is sent to the FCF and FC FLOGO is sent to the HBA for each R-NPIV session created.
- Once sessions are cleared, NP_Ports will trigger a fabric login to the connected fabric.

### Examples

- `-> clear fcoe sessions fips`
- `-> clear fcoe sessions npiv-proxy`
- `-> clear fcoe sessions r-proxy`
- `-> clear fcoe sessions e-tunnel`
- `-> clear fcoe sessions all`

45  VXLAN Snooping Commands

The OmniSwitch Virtual eXtensible LAN (VXLAN) Snooping feature attempts to detect and identify VXLAN traffic by sampling packets to determine if they are VXLAN encapsulated packets. Once this type of traffic is identified, VXLAN Snooping collects and stores information about the flow in a database on the local switch. Additional configurable options for this feature include the ability to apply QoS policy list rules to the identified flow and SNMP trap generation.

A VXLAN segment is a Layer 2 overlay network through which devices can communicate. Traffic from such devices is encapsulated into VXLAN frames and then tunneled through the VXLAN segment. Using this implementation of VXLAN Snooping, an administrator can obtain more detailed information about the traffic flow through the overlay network.

**Note.** Throughout this chapter, the terms “VXLAN Snooping” and “VM Snooping” are interchangeable.

MIB information for the VXLAN Snooping commands is as follows:

- **Filename:** ALCATEL-IND1-VM-SNOOPING-MIB.mib
- **Module:** alaVMSnoopingMIB

A summary of the available commands is listed here:

- `vm-snooping admin-state`
- `vm-snooping policy-mode`
- `vm-snooping trap`
- `vm-snooping filtering-resource trap threshold`
- `vm-snooping sampling-rate`
- `vm-snooping aging-timer`
- `vm-snooping vxlan udp-port`
- `vm-snooping static-policy rule`
- `vm-snooping logging-threshold`
- `vm-snooping port`
- `show vm-snooping config`
- `show vm-snooping port`
- `show vm-snooping database`
- `show vm-snooping virtual-machines`
- `show vm-snooping filtering-resource`
- `show vm-snooping statistics`
- `show vm-snooping static-policy`
- `clear vm-snooping database`
- `clear vm-snooping statistics`
vm-snooping admin-state

Configures the global status of the VXLAN Snooping process for the switch.

vm-snooping admin-state {enable | disable}

Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables VXLAN Snooping for the switch.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables VXLAN Snooping for the switch.</td>
</tr>
</tbody>
</table>

Defaults

By default, VXLAN Snooping is disabled for the switch.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>No</td>
</tr>
<tr>
<td>6465</td>
<td>No</td>
</tr>
<tr>
<td>6560</td>

<td>No</td>
</tr>
<tr>
<td>9900</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Enable VXLAN Snooping first before attempting any other VXLAN Snooping command. When enabled, the switch allocates resources for this feature. When disabled, switch resources are released for other purposes.
- This command enables or disables this feature on all VXLAN Snooping ports.

Examples

-> vm-snooping admin-state enable
-> vm-snooping admin-state disable

Release History

Release 7.3.4; command was introduced.

Related Commands

show vm-snooping config Displays the VXLAN Snooping configuration for the switch.

MIB Objects

alaVMsnoopingConfig
alaVMSnoopingAdminStatus
**vm-snooping policy-mode**

Configures the allocation of hardware resources for VXLAN Snooping. Use this command to change the policy lookup mode to basic or advanced and specify the number of policies reserved for VXLAN Snooping. In addition, an optional inner header parameter is available to specify if the header of the inner Ethernet frame is tagged or untagged.

```
vm-snooping policy-mode {basic | advance} [policy-resource {extended | default}] [inner-header {tagged | untagged | default}]
```

### Syntax Definitions

- **basic**
  - Reserves resources for VNI, VXLAN UDP port, inner source MAC address, and inner IPv4 source address policy conditions.

- **advance**
  - For IPv4 packets, reserves resources for VNI, VXLAN UDP port, inner source MAC address, inner IPv4 source address, IP protocol, and Layer 4 source and destination port policy conditions.

  - For IPv6 packets, reserves resources for VNI, VXLAN UDP port, inner source IPv6 address, Layer 4 source and destination port for policy conditions.

- **policy-resource extended**
  - Doubles the amount of resources for VXLAN Snooping policies.

- **policy-resource default**
  - Reserves the minimum amount of resources for VXLAN Snooping policies.

- **inner-header tagged**
  - The header of the inner frame is tagged.

- **inner-header untagged**
  - The header of the inner frame is untagged.

- **inner-header default**
  - The header of the inner frame is either tagged or untagged (basic mode) or just tagged (advance mode).

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>[basic</td>
<td>advance]</td>
</tr>
<tr>
<td>[extended</td>
<td>default]</td>
</tr>
</tbody>
</table>

By default, the inner header option is set to the following values based on the current policy lookup mode:

- Basic mode—untagged and tagged header for the inner frame.
- Advanced mode—tagged header for the inner frame.
Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

6900 V72/C32
9900

Usage Guidelines

- To change the policy mode, globally disable VXLAN Snooping then make the changes and enable VXLAN Snooping again to apply the changes to the switch. This command is also allowed when the VXLAN Snooping feature is globally disabled.

- When the VXLAN Snooping policy mode is changed, all database and QoS entries are flushed.

- When the VXLAN policy mode is set to `basic`, any QoS policy rules with advanced mode policy conditions will not work. When the mode is set to `advance`, QoS policy rules with basic and advance policy conditions will work.

- When configuring the `inner-header` parameter for `basic` mode, specifying only tagged or only untagged may increase the number of policies allowed. In other words, specifying both tagged and untagged (the default) may reduce the number of policies allowed.

- When configuring the `inner-header` parameter for `advance` mode, specifying both tagged and untagged is not allowed. In this case, the `default` option sets the parameter to tagged.

- Other applications, such as QoS user policies, VLAN Stacking, Application Fingerprinting, DHCP Snooping, Open Flow, IP multicast, and FIP Snooping also use up system resources. Depending on which application comes first, other applications may not be able to get the required hardware resources.

- If the resources are increased by two times (policy-resource extended), then none of the above-mentioned applications can work simultaneously.

- Only one set of hardware resources are reserved for the VXLAN Snooping application when VXLAN Snooping is globally enabled.

Examples

- `-> vm-snooping admin-state disable`
- `-> vm-snooping policy-mode basic policy-resource extended inner-header tagged`
- `-> vm-snooping admin-state enable`

- `-> vm-snooping admin-state disable`
- `-> vm-snooping policy-mode advance policy-resource extended inner-header untagged`
- `-> vm-snooping admin-state enable`

- `-> vm-snooping admin-state disable`
- `-> vm-snooping policy-mode basic inner-header default`
- `-> vm-snooping policy-mode advance inner-header default`
- `-> vm-snooping admin-state enable`
**Release History**

Release 7.3.4; command was introduced.

**Related Commands**

`show vm-snooping config`  Displays the VXLAN Snooping configuration for the switch.

**MIB Objects**

**vm-snooping trap**

Enables or disables trap generation for the VXLAN Snooping feature.

```bash
vm-snooping trap {enable | disable}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables VXLAN Snooping trap generation.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables VXLAN Snooping trap generation.</td>
</tr>
</tbody>
</table>

### Defaults

By default, trap generation for this feature is disabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

A trap is generated when one of the following occurs:

- A new VXLAN database entry is learned or ages out.
- The usage of system resources allocated for VXLAN Snooping exceeds a configurable threshold value.

### Examples

```bash
-> vm-snooping trap enable
-> vm-snooping trap disable
```

### Release History

Release 7.3.4; command was introduced.
**Related Commands**

**vm-snooping filtering-resource trap threshold**
Configures the threshold value at which point the switch generates a trap to indicate that VXLAN Snooping has utilized the specified level of system resources.

**show vm-snooping config**
Displays the VXLAN Snooping status and configuration for the switch.

**MIB Objects**

alaVMSnoopingConfig
alaVMSnoopingTrapStatus
vm-snooping filtering-resource trap threshold

Configures the threshold value at which point the switch generates a trap to indicate that VXLAN Snooping has utilized the specified level of system resources.

```
vm-snooping filtering-resource trap threshold {percentage | default}
```

### Syntax Definitions
- **percentage**: The percentage of system resources used by VXLAN Snooping.
- **default**: Sets the trap threshold value back to 80 percent (the default).

### Defaults
By default, the filtering resource threshold is set to 80 percent.

### Platforms Supported
This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines
A trap is generated when the system resources used by VXLAN Snooping reach the specified threshold value.

### Examples
- `-> vm-snooping filtering-resource trap threshold 50`
- `-> vm-snooping filtering-resource trap threshold default`

### Release History
Release 7.3.4; command was introduced.
Related Commands

- **show vm-snooping config**
  Displays the VXLAN Snooping status and configuration for the switch.

**vm-snooping sampling-rate**

Configures the packets-per-second (pps) sampling rate for the VXLAN Snooping feature.

`vm-snooping sampling-rate pps`

---

**Syntax Definitions**

`pps` The number of packets-per-second to sample on all VXLAN Snooping ports. The valid range is 1–1000.

---

**Defaults**

By default, the sampling rate is set to 1000 pps.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

The sampling rate value specified with this command is applied to every VXLAN Snooping port on the switch.

---

**Examples**

- `vm-snooping sampling-rate 500`
- `vm-snooping sampling-rate 1000`

---

**Release History**

Release 7.3.4; command was introduced.

---

**Related Commands**

**MIB Objects**

- `alaVMSnoopingConfig`  
- `alaVMSnoopingSamplingRate`
vm-snooping aging-timer

Configures the aging time value for VXLAN packet flows learned in the VXLAN Snooping database on the local switch.

```
vm-snooping aging-timer seconds
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>seconds</th>
<th>The number of seconds to wait before aging out a learned VM. The valid range is 60–86400 seconds.</th>
</tr>
</thead>
</table>

**Defaults**

By default, the aging timer is set to 300 seconds.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Set this timer to zero to prevent the learned VMs from aging out.
- Note that an inactive VXLAN packet flow (no packets received for the flow) can take up to twice as long as the aging time value specified to be removed from the VXLAN Snooping database. For example, if an aging time of 300 seconds is specified, the database entry for the flow ages out any time between 300 and 600 seconds of inactivity.

**Examples**

```
-> vm-snooping aging-timer 100
-> vm-snooping aging-timer 300
-> vm-snooping aging-timer 0
```

**Release History**

Release 7.3.4; command was introduced.
Related Commands

**show vm-snooping config**  
Displays the VXLAN Snooping status and configuration for the switch.

MIB Objects

alaVMSnoopingConfig
alaVMSnoopingAgingTimer
**vm-snooping vxlan udp-port**

Configures additional UDP destination port numbers to look for when the switch inspects packets received on VXLAN Snooping ports. This value is used to identify encapsulated VXLAN packets.

```bash
vm-snooping vxlan udp-port {udp_port_num[-udp_port_num2]}
no vm-snooping vxlan udp-port {udp_port_num[-udp_port_num2]}
```

**Syntax Definitions**

`udp_port_num[-udp_port_num2]` The UDP destination port number. Use a hyphen to specify a range of port numbers. Do not specify a range that configures more than seven UDP ports.

**Defaults**

By default, the well-known UDP port number 4789 is used.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Release History</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove a UDP destination port number. Note that the default UDP port number of 4789 is not configurable, so it can not be removed with this command. Only port numbers that were added through this command can be removed.
- Avoid using the well-known UDP ports that are already reserved by IANA for other applications.
- Including the default UDP port number (4789), up to eight UDP ports are allowed. However, configuring multiple UDP ports may slow down the VXLAN Snooping process.
- Changing the UDP port number on the fly might stop the VXLAN traffic until the VXLAN Tunnel End Points (VTEPs) in the network are configured with the same destination UDP port.

**Examples**

```
-> vm-snooping vxlan udp-port 8472
-> no vm-snooping vxlan udp-port 8472
```

**Release History**

Release 7.3.4; command was introduced.
Related Commands

**show vm-snooping config**  Displays the destination UDP port value that is used to identify VXLAN traffic.

MIB Objects

alaVMSnoopingUDPPortTable
- alaVMSnoopingUDPPortIndex
- alaVMSnoopingUDPRowStatus
vm-snooping static-policy rule

Configures a static QoS policy rule. When configured, QoS resources are automatically allocated for the specified rule even if there is no VXLAN packet flow that matches the rule conditions.

**Syntax**

```plaintext
vm-snooping static-policy rule rule_name [list list_name]
no vm-snooping static-policy rule rule_name [list list_name]
```

**Syntax Definitions**

- **rule_name**: The name of the policy rule (alphanumeric string up to 32 characters).
- **list_name**: The name of the policy list (alphanumeric string up to 32 characters).

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>list_name</td>
<td>“Default”</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to remove a static VXLAN Snooping policy rule. If the rule is associated with a user-configured policy list (not the default list), then the list name must be specified as well to remove the static policy rule. If the rule is associated with the default list, then specifying a list name is not required to remove the static policy rule.

- The default policy list available in every switch has no name and is not configurable. All QoS policy rules are assigned to the default list unless the **no default-list** option of the **policy rule** command is used at the time the rule is created.

**Examples**

- `vm-snooping static-policy rule r1`
- `vm-snooping static-policy rule r2 list 12`
- `no vm-snooping static-policy rule r1`
- `no vm-snooping static-policy rule r2 list 12`

**Release History**

Release 7.3.4; command was introduced.
Related Commands

*show vm-snooping static-policy*  Displays the static policy configuration.

**MIB Objects**

alaVMSnoopingStaticPolicyListName

alaVMSnoopingStaticPolicyRowStatus
vm-snooping logging-threshold

Configures the threshold value that determines how many entries for VXLAN packet flows and statistics are logged into a .csv file on the local switch.

```
vm-snooping logging-threshold number-of-flows \{flow_num | default\}
```

**Syntax Definitions**

- `flow_num`: The number of VXLAN packet flows to log. The range is 1000–6000.
- `default`: Sets the logging threshold value back to 5000 (the default).

**Defaults**

By default, the logging threshold value is set to 5000 packet flows.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Set the logging threshold value to zero to turn off the logging function.
- When the logging function is on, setting the VXLAN Snooping aging timer to 300 seconds is recommended. If the aging timer is set to zero, no logging occurs regardless of this threshold setting.
- The packet flows and hardware statistics are logged to the `vm_snoop_db_flow_rec.csv` file and the `vm_snoop_hw_stats_rec.csv` file in the `/flash/switch/bridge/vm_snoop/` directory on the local switch to maintain a packet flow history.
- When the number of records logged to the .csv files exceeds the logging threshold value, the corresponding files are renamed to `/flash/switch/bridge/vm_snoop/vm_snoop_db_flow_old_rec.csv` and `/flash/switch/bridge/vm_snoop_hw_stats_old_rec.csv`.
- These files are accessed and used by Alcatel-Lucent Enterprise network management tools to provide management and visibility of the overlay network traffic.

**Examples**

```
-> vm-snooping logging-threshold number-of-flows 1000
-> vm-snooping logging-threshold number-of-flows 0
-> vm-snooping logging-threshold number-of-flows default
```
**Release History**

Release 7.3.4; command was introduced.

**Related Commands**

`show vm-snooping config` Displays the VXLAN Snooping status and configuration for the switch.

**MIB Objects**

alaVMSnoopingConfig

alaVMSnoopingLoggingThresholdFlows
vm-snooping port

Configures a switch port or link aggregate as a VXLAN Snooping interface. Once the interface is configured and enabled and VXLAN Snooping is enabled for the switch, IP packets received on the interface are sampled to determine if they contain the designated UDP destination port.

```
vm-snooping {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} [admin-state {enable | disable}]
```

```
no vm-snooping {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

### Syntax Definitions

- `chassis` The chassis identifier.
- `slot/port[-port2]` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `agg_id[-agg_id2]` The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `enable` Enables the VXLAN Snooping administrative status on the port or link aggregate ID.
- `disable` Disables the VXLAN Snooping administrative status on the port or link aggregate ID.

### Defaults

By default, VXLAN Snooping is disabled on all switch ports and link aggregates.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to revert the VXLAN Snooping interface back to a regular switch port or link aggregate. This will clear the VXLAN Snooping configuration from the interface.
- Disabling the administrative status of a VXLAN Snooping interface does not remove the VXLAN Snooping configuration from the interface.
- Make sure the VXLAN Snooping feature is globally enabled for the switch to ensure that VXLAN Snooping ports will process VXLAN packets.
- VXLAN Snooping uses the sFlow mechanism to sample packets.
Examples
-> vm-snooping port 1/1/1
-> vm-snooping port 1/1/5-10
-> no vm-snooping port 1/1/1
-> no vm-snooping port 1/1/5-10
-> vm-snooping port 1/1/1 admin-state enable
-> vm-snooping port 1/1/5-10 admin-state enable
-> vm-snooping port 1/1/1 admin-state disable
-> vm-snooping port 1/1/5-10 admin-state disable

-> vm-snooping linkagg 1
-> vm-snooping linkagg 5-10
-> no vm-snooping linkagg 1
-> no vm-snooping linkagg 5-10
-> vm-snooping linkagg 1 admin-state enable
-> vm-snooping linkagg 5-10 admin-state enable
-> vm-snooping linkagg 1 admin-state disable
-> vm-snooping linkagg 5-10 admin-state disable

Usage Guidelines

- Use the port and linkagg parameters to display information for a specific port or link aggregate.
- The display output also indicates whether or not the VXLAN Snooping port is a virtual machine network profile (vNP) port.

Examples

```shell
-> show vm-snooping port
Port VM-Snooping vNP
-------+------------+--------
1/2/1  Enable        Yes
1/2/2  Enable        No
1/2/2  Enable        Yes
1/2/2  Enable        Yes
0/12   Disable       No
```

  - `alaVMSnoopingPortIsVNP`
  - `alaVMSnoopingPortRowStatus`
show vm-snooping database

Displays VXLAN Snooping database entries. When a VXLAN packet is detected and the packet contains the designated UDP destination port, VXLAN Snooping creates an entry in the local switch database to identify and track the VXLAN packet flow.

```
show vm-snooping database [vxlan udp-port udp_port_num | vtep-ip ip_address | vni vxlan_id | vm-src-mac mac_address | vm-ip ip_address] [detail] [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]] [detail]
```

**Syntax Definitions**

- `udp_port_num` The UDP destination port number used to identify VXLAN traffic.
- `vtep-ip ip_address` The IP address of the VXLAN Tunnel End Point (VTEP). This is the Loopback0 interface address on the OmniSwitch.
- `vxlan_id` The VXLAN Network Identifier (VNI) for the VXLAN segment on which the VM was learned.
- `mac_address` The source MAC address of a VM.
- `vm-ip ip_address` The source IP address of a VM.
- `detail` Displays additional information about the classified traffic flow.
- `chassis` The chassis identifier.
- `slot/port[-port2]` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `agg_id[-agg_id2]` The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

**Defaults**

By default, all database entries are displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>6900 X48C4E/V48C8/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>C32E/T24C2</td>
<td>X24C2</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `port` and `linkagg` parameters to display information for a specific port or link aggregate.
- Each database entry is subject to a VXLAN Snooping aging period. If the database fills up, older entries are aged out before the limit (fast aging).
- When a database entry is removed due to regular aging or fast aging conditions, any corresponding QoS is also removed for that flow.
Examples

-> show vm-snooping database
Total number of VM Flows: 15

output definitions

Port       The slot/port or link aggregate ID of the VXLAN Snooping interface. A “0” slot number indicates a link aggregate.
VXLAN Port  The UDP port for the VXLAN segment.
VNI         The VXLAN Network ID (VNI) for the VXLAN segment on which the VM was learned.
VM SRC MAC  The source MAC address of the VM.
-> show vm-snooping database detail

**output definitions (continued)**

| VM VLAN | The VLAN ID tag for the VM packet. |
| VM SRC IP | The source IP address of the VM. |

**Port**

The slot/port or link aggregate ID of the VXLAN Snooping interface. A “0” slot number indicates a link aggregate.

**VTEP SRC IP**

The source IP network address for the VTEP.

**VTEP DST IP**

The destination IP network address for the VTEP.

**VTEP VLAN**

The VLAN ID associated with the VTEP.

**VXLAN VNI**

The VNI for the VXLAN segment on which the VM was learned.

**VXLAN Port**

The UDP port for the VXLAN segment.

**VM SRC MAC**

The source MAC address for the VM.

**VM DEST MAC**

The destination MAC address for the VM.

**VM VLAN**

The VLAN on which the VM is learned and forwarded.

clear vm-snooping database

Clears the local database entries for each virtual machine (VM) flow.

`clear vm-snooping database [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]]`

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot/port[-port2]` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `agg_id[-agg_id2]` The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

**Defaults**

By default, all database entries are cleared for all VXLAN Snooping ports and link aggregates.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No/Yes/No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `port` and `linkagg` parameters to clear database entries for a specific port or link aggregate.

**Examples**

- `-> clear vm-snooping database`
- `-> clear vm-snooping database port 3/1/1`
- `-> clear vm-snooping database linkagg 10`

**Release History**

Release 7.3.4; command introduced.
Related Commands

**show vm-snooping database**  Displays the contents of the VXLAN Snooping database.

MIB Objects

alaVMSnoopingConfig
- alaVMSnoopingClearAllData
alaVMSnoopingDBTable
- alaVMSnoopingDBClearStats
show vm-snooping virtual-machines

Displays the port, source MAC address, and VLAN associated with Virtual Machines (VMs) discovered through the VXLAN Snooping process.

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

The output display of this command shows the port, source MAC address, and VLAN associated with each VM learned through the VXLAN Snooping process.

Examples

```
-> show vm-snooping virtual-machines
Port SRC MAC VLAN
-------- ----------------- +-----+
1/1/2 00:00:00:88:00:01 -
1/1/2 00:00:00:88:00:02 -
1/1/2 00:00:00:88:00:03 -
1/1/2 00:00:00:88:00:04 -
1/1/2 00:00:00:88:00:05 -
```

output definitions

Port: The slot/port or link aggregate ID of the VXLAN Snooping interface. A “0” slot number indicates a link aggregate.

SRC MAC: The source MAC address of the VM.

VLAN: The VLAN on which the VM is learned and forwarded.

Release History

Release 7.3.4; command was introduced.
Related Commands

show vm-snooping config  Displays the VXLAN Snooping configuration for the switch.
show vm-snooping database Displays the contents of the local VXLAN Snooping database.

MIB Objects

alaVMSnoopingLearntVMTable
  alaVMSnoopingLearntVMIIfIndex,
  alaVMSnoopingLearntVMSrcMac,
  alaVMSnoopingLearntVMVlanId
**show vm-snooping filtering-resource**

Displays the amount of switch resources available for and used by QoS policies that contain VXLAN conditions.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- VXLAN Snooping uses the amount of resources used to calculate the percentage of switch resources used and then determine if that percentage exceeds the value set for the filtering trap threshold. An SNMP trap is generated when the percentage used meets or exceeds the trap threshold value.
- The output display of this command shows the percentage of switch resources used by VXLAN policies on a per-slot basis.

**Examples**

```bash
-> show vm-snooping filtering-resource
Total Filtering Resources :256,
Chassis/Slot Filtering Resources Used
-------------------------+-------------------------------
 1/SLOT-1                0
 2/SLOT-1                0
```

**Release History**

Release 7.3.4; command was introduced.
Related Commands

**vm-snooping filtering-resource**  
Configures the trap threshold value for system resources used by VXLAN Snooping.

**trap threshold**  

**show vm-snooping config**  
Displays the VXLAN Snooping status and configuration for the switch.

MIB Objects

  - alaVMSnoopingFilterResourceChassisId
  - alaVMSnoopingFilterResourceSlotNum
  - alaVMSnoopingFilterResourceMax
  - alaVMSnoopingFilterResourceUsed
**show vm-snooping statistics**

Displays statistics for each VXLAN packet flow on a VXLAN Snooping port or link aggregate.

```
show vm-snooping statistics [hardware | sampling] [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]]
```

---

**Syntax Definitions**

**hardware**
Displays the VXLAN policy rule and list and the number of packets and bytes on which the policy rule was applied.

**sampling**
Displays the number of VXLAN packets that were sampled for a specific flow.

**chassis**
The chassis identifier.

**slot/port[-port2]**
The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

**agg_id[-agg_id2]**
The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

---

**Defaults**

By default, statistics are displayed for all VXLAN Snooping ports and link aggregates.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.

---

**Examples**

```
-> show vm-snooping statistics
Total number of Hardware Statistics: 0

Policy Rule                     Policy List       Number of pkts       Number of Bytes
---------------------------------+------------------+---------------------+------------------+
Total number of Sampling Statistics: 1

                  VXLAN   VXLAN     VM   VM   Pkts
Port  UDP PORT  VNI  SRC_MAC  SRC_IP
---------------------------------+------------------+---------------------+------------------+
2/1/2   4789     43 00:00:00:88:00:01  88.0.0.1  15
```

---

- alaVMSnoopingHardwareStatsNumOfBytes
**show vm-snooping static-policy**

Displays the static QoS policy rule configuration for VXLAN Snooping.

Show vm-snooping static-policy

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When a static policy rule is configured for VXLAN Snooping, QoS resources are automatically allocated for the specified rule even if there is no VXLAN packet flow that matches the rule conditions.

- If the static policy rule was created with a user-configured policy list (not the default list), then the list name appears in the “Policy List” field. However, if the static policy rule was created without specifying a policy list name, then the “Default” list name appears in the “Policy List” field.

### Examples

```plaintext
-> show vm-snooping static-policy
Total number of Static-Policy: 5

Policy Rule    | Policy List
---------------|----------------
r0             | Default
r1             | Default
r2             | L1
r2             | L3
r2             | Default
```

### Output Definitions

- **Policy Rule**: The name of the QoS policy rule that was specified when the static policy rule was created.
- **Policy List**: The name of the QoS policy list associated with the static policy rule.
**Release History**

Release 7.3.4; command was introduced.

**Related Commands**

*vm-snooping static-policy rule*  Configures a VXLAN Snooping static policy rule.

**MIB Objects**

clear vm-snooping statistics

Clears the collected statistics for each VXLAN packet flow on a VXLAN Snooping port or link aggregate.

```
clear vm-snooping statistics [sampling [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]]] [hardware]
```

**Syntax Definitions**

- `chassis`  The chassis identifier.
- `slot/port[-port2]`  The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `agg_id[-agg_id2]`  The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

**Defaults**

By default, statistics are cleared on all VXLAN Snooping ports and link aggregates.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `port` and `linkagg` parameters to clear statistics for a specific port or link aggregate.

**Examples**

- `clear vm-snooping statistics`
- `clear vm-snooping statistics sampling port 3/1/1`
- `clear vm-snooping statistics sampling linkagg 10`
- `clear vm-snooping statistics hardware`

**Release History**

Release 7.3.4; command introduced.
Related Commands

show vm-snooping statistics  Displays VXLAN Snooping statistics.

MIB Objects

alaVMSnoopingConfig
  alaVMSnoopingClearAllData
alaVMSnoopingSamplingStatsTable
  alaVMSnoopingSamplingStatsClear
Port Mapping is a security feature that controls communication between peer users. Each session comprises of a session ID and a set of user ports and/or a set of network ports. The user ports within a session cannot communicate with each other and can only communicate through network ports. In a port mapping session with user port set A and network port set B, ports in set A can communicate with ports in set B only. If set B is empty, the ports in set A can communicate with the rest of the ports in the system.

A port mapping session can be configured in a unidirectional or bidirectional mode. In the unidirectional mode, the network ports can communicate with each other within the same session. In the bidirectional mode, the network ports cannot communicate with each other. Network ports of a unidirectional port mapping session can be shared with other unidirectional sessions, but cannot be shared with any session that is configured in bidirectional mode. Network ports of different sessions can communicate with each other.

MIB information for the Port Mapping commands is as follows:

- **Filename**: ALCATEL-IND1-PORT-MAPPING.mib
- **Module**: alcatelIND1PortMappingMIB

A summary of the available commands is listed here:

```
port-mapping user-port network-port
port-mapping (configures port mapping status and direction)
port-mapping unidirectional bidirectional
port-mapping unknown-unicast-flooding
port-mapping dynamic-proxy-arp
show port-mapping status
show port-mapping
show ip dynamic-proxy-arp
```
**port-mapping user-port network-port**

Creates a port mapping session with the user ports, network ports, or both user ports and network ports. Use the **no** form of the command to delete ports or a link aggregate group from a session.

```
port-mapping session_id [user-port {slot chassis/slot | chassis/slot/port[-port2] | linkagg agg_id}] [network-port {slot chassis/slot | chassis/slot/port[-port2] | linkagg agg_id}]
no port-mapping session_id [user-port {slot chassis/slot | chassis/slot/port[-port2] | linkagg agg_id}] [network-port {slot chassis/slot | chassis/slot/port[-port2] | linkagg agg_id}]
```

### Syntax Definitions

- **session_id**
  - The port mapping session ID.
- **user-port**
  - Specifies a user port of the mapping session.
- **network-port**
  - Specifies a network port of the mapping session.
- **chassis**
  - The chassis identifier.
- **slot**
  - The slot number to be assigned to the mapping session.
- **slot/port[-port2]**
  - The slot and port number to assign to the mapping session. Use a hyphen to specify a range of ports (1/5-10).
- **agg_id**
  - The link aggregate ID number to assign to the mapping session.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- User ports that are part of one session cannot communicate with each other. The user ports can communicate only through network ports of the session to the other elements of the system.
- User ports can be part of only one port mapping session.
- An aggregable port of a link aggregation group cannot be a mapped port and a mapped port cannot be an aggregable port of a link aggregation group.
- A mirrored port cannot be a mapped port and a mapped port cannot be a mirrored port.
**Examples**

- `port-mapping 3 user-port 2/3 network-port 6/4`
- `port-mapping 4 user-port 2/5-8`
- `port-mapping 5 user-port 2/3 network-port slot 3`
- `no port-mapping 5 user-port 2/3`
- `no port-mapping 6 network-port linkagg 7`

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `port-mapping` Enables, disables, or deletes a port mapping session.
- `port-mapping unidirectional` Configures the direction of a port mapping session.
- `port-mapping bidirectional` Enables or disables flooding of unknown unicast traffic from all ports to user ports for a particular session.
- `port-mapping unknown-unicast-flooding` Displays the configuration of one or more port mapping sessions.
- `show port-mapping` MIB Objects

<table>
<thead>
<tr>
<th>PortMappingSessionTable</th>

<tr>
<td></td>
<td>pmapPortType</td>
</tr>
</tbody>
</table>
**port-mapping**

Enables, disables, or deletes a port mapping session.

```
port-mapping session_id {enable | disable}
no port-mapping session_id
```

**Syntax Definitions**

- `session_id`: The port mapping session ID.
- `enable`: Enables a port mapping session.
- `disable`: Disables a port mapping session.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To be enabled, a session should have a minimum of two ports.

**Examples**

```
-> port-mapping 3 enable
-> port-mapping 4 disable
-> no port-mapping 5
```

**Release History**

Release 7.1.1; command introduced.
Related Commands

- `port-mapping user-port network-port`: Creates a port mapping session with or without the user ports, network ports, or both.
- `port-mapping unidirectional bidirectional`: Configures the direction of a port mapping session.

  - pmapSessionNumber
  - pmapSessionStatus
port-mapping unidirectional bidirectional

Configures the direction of a port mapping session.

```
port-mapping session_id [unidirectional | bidirectional]
```

**Syntax Definitions**

- `session_id`: The port mapping session ID.
- `unidirectional`: Specifies unidirectional port mapping.
- `bidirectional`: Specifies bidirectional port mapping.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
<tr>
<td>unidirectional</td>
<td>bidirectional</td>
</tr>
</tbody>
</table>

**Platform Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- In the bidirectional mode, the network ports of a session cannot communicate with each other. Also, the network ports of that session cannot be a part of a network port set of another session.

- In the unidirectional mode, the network ports of a session can communicate with each other. Also, the network ports of that session can be part of a network port set of another session that is in the unidirectional mode.

- To change the directional mode of an active session with network ports, delete the network ports of the session, change the direction, and recreate the network ports.

**Examples**

```
-> port-mapping 5 enable unidirectional
-> port-mapping 5 disable unidirectional
-> port-mapping 6 enable bidirectional
-> port-mapping 5 disable bidirectional
```
**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `port-mapping user-port network-port`  
  Creates a port mapping session with or without the user ports, network ports or both.
- `port-mapping`  
  Enables, disables, or deletes a port mapping session.
- `show port-mapping`  
  Displays the configuration of one or more port mapping sessions.

**MIB Objects**

- `PortMappingSessionTable`
- `PmapSessionNumber`
- `PmapSessionDirection`
**port-mapping unknown-unicast-flooding**

Enables or disables flooding of unicast traffic from all the switch ports to the user ports related to a particular session.

```
port-mapping session_id unknown-unicast-flooding {enable | disable}
```

**Syntax Definitions**

- `session_id`: The port mapping session ID.
- `enable`: Enables the flooding of unknown unicast traffic from all ports to the user ports for a particular session.
- `disable`: Disables the flooding of unknown unicast traffic from all ports to the user ports for a particular session.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platform Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Configuring unknown unicast flooding creates a new port mapping session if there is no existing session.
- When a link aggregate is configured as a user port, the unknown unicast flooding configuration is applied to all the member ports of the aggregate.

**Examples**

```
-> port-mapping 1 unknown-unicast-flooding enable
-> port-mapping 2 unknown-unicast-flooding disable
```

**Release History**

Release 7.1.1; command introduced.
**Related Commands**

- `port-mapping user-port network-port`
  Creates a port mapping session with or without the user ports, network ports or both.
- `port-mapping`
  Enables, disables, or deletes a port mapping session.
- `show port-mapping`
  Displays the configuration of one or more port mapping sessions.
- `show port-mapping status`
  Displays the status of one or more port mapping sessions.

**MIB Objects**

- `portMappingSessionTable`
  - `pmapSessionUnknownUnicastFloodStatus`
**port-mapping dynamic-proxy-arp**

Enables or disables the dynamic proxy ARP functionality for the port mapping session.

```
port-mapping session_id dynamic-proxy-arp {enable | disable}
```

**Syntax Definitions**

- **session_id**: The port mapping session for which the dynamic proxy ARP status is enabled or disabled.
- **enable**: Enables the dynamic proxy ARP status.
- **disable**: Disables the dynamic proxy ARP status.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>

<td>No</td>
</tr>
<tr>
<td>X24C2</td>
<td>No</td>
</tr>
<tr>
<td>9900</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Clients must be connected to the user-ports and the head end routers connected to the network-ports of the port mapping session for dynamic proxy ARP to function properly.
- DHCP snooping must be enabled for dynamic proxy ARP to function.
- Using dynamic proxy ARP in conjunction with DHCP snooping allows for the configuration of the MAC Forced Forwarding feature.
- When dynamic proxy ARP is enabled, port-group allocation will be triggered. The TCAM manager will respond as success if the port-group allocation is a success. If QoS is already using the port-groups, the TCAM manager will respond with a failure and an error is displayed.
- Dynamic proxy ARP can be enabled on only two port-groups. If QoS is already using the port-groups, an error message is displayed.

**Examples**

- `-> port-mapping 1 dynamic-proxy-arp enable`
- `-> port-mapping 1 dynamic-proxy-arp disable`
**Release History**

Release 8.6R1; command was introduced.

**Related Commands**

- **port-mapping user-port network-port**: Creates a port mapping session with or without the user ports, network ports or both.
- **port-mapping**: Enables, disables, or deletes a port mapping session.
- **show port-mapping**: Displays the configuration of one or more port mapping session.
- **show port-mapping status**: Displays the status of one or more port mapping session.
- **show ip dynamic-proxy-arp**: Displays the ARPs learned through dynamic proxy.

**MIB Objects**

- portMappingSessionTable
- pmapSessionDynProxyARP
**show port-mapping status**

Displays the status of one or more port mapping sessions.

```
show port-mapping [session_id] status
```

### Syntax definitions

- **session_id**
  
  The port mapping session ID.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you do not specify the port mapping session ID, then the status of all the port mapping sessions are displayed.

### Examples

```
$ -> show port-mapping status

SessionID  Direction Status Unknown Unicast DPA Status
----------+-------------------+-----------------+----------------+---------------
     1  bi       disable flood enable
     1  bi       enable drop disable
     2  bi       disable flood disable
```

### Output definitions

- **SessionID**
  
  Displays the port mapping session ID.

- **Direction**
  
  Displays the direction of a port mapping session.

- **Status**
  
  Displays status of a port mapping session.

- **Unknown Unicast**
  
  Whether unknown unicast traffic is dropped or flooded from all the switch ports to the user ports related to the port mapping session.

- **DPA Status**
  
  Displays the status of Dynamic Proxy ARP for the port mapping session. This functionality is supported only on the OmniSwitch 6465 and OmniSwitch 6865.
**Release History**

Release 7.1.1; command introduced.
Release 8.6R1; “DPA Status” field added.

**Related Commands**

- **port-mapping user-port**  
  Creates a port mapping session with or without the user ports, network ports, or both.

- **network-port**

- **port-mapping**  
  Enables, disables, or deletes a port mapping session.

MIB Objects

alaIpNetToMediaDpaIp
alaIpNetToMediaDpaPhysAddress
alaIpNetToMediaDpaChassisId
alaIpNetToMediaDpaSlot
alaIpNetToMediaDpaPort
Learned Port Security (LPS) provides a mechanism for controlling network device communication on one or more switch ports. Configurable LPS parameters allow the user to restrict source learning on a port to:

- A maximum number of learned source MAC addresses.
- A specific amount of time in which source MAC addresses are learned.
- An individual learned source MAC address.
- A range of learned source MAC addresses.

This chapter includes descriptions of the CLI commands used to define LPS parameters and display information about the current LPS configuration.

MIB information for Learned Port Security commands is as follows:

- **Filename**: ALCATEL-IND1-LPS-MIB.mib
- **Module**: alcatelIND1LearnedPortSecurityMIB

A summary of the available commands is listed here:

```
port-security
port-security learning-window
port-security convert-to-static
port-security mac
port-security maximum
port-security port max-filtering
port-security mac-range
port-security port violation
port-security learn-trap-threshold
port-security port pkt-relay
port-security pkt-relay protocol
port-security pkt-relay protocol udp
show port-security pkt-relay filter
show port-security
show port-security mac-range
show port-security brief
show port-security learning-window
```
port-security

Enables or disables Learned Port Security (LPS) on the switch port(s) or SAP. When LPS is enabled, only devices that have a source MAC address that complies with LPS restrictions are learned on the port(s).

\[ \text{port-security \{port }\text{ chassis/slot/port[-port2] | chassis} | \{ \text{sap }\text{ port | linkagg} \text{ sap_id} \} \text{ [admin-state} \{ \text{enable | disable | locked}\} \] 

\[ \text{no port-security }\{\text{port }\text{ chassis/slot/port[-port2] | sap} \text{ port | linkagg} \text{ sap_id}\} \]

**Syntax Definitions**

- **chassis**
  - The chassis identifier.

- **slot/port[-port2]**
  - The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

- **chassis**
  - Specifies all LPS ports.

- **sap_id**
  - The SAP ID number identifying the service instance. *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 6570M.*

- **enable**
  - Administratively enables LPS on the specified port(s).

- **disable**
  - Administratively disables LPS on the specified port(s). All bridged and filtered MAC addresses are cleared, but the static MAC address and LPS configuration for the port is retained. Learning is unrestricted.

- **locked**
  - Administratively disables all learning on the port. Existing MAC addresses are retained but no additional learning of addresses, except for static MAC addresses, is allowed.

**Defaults**

By default, LPS functionality is disabled on all ports.

The following default value applies if the **admin-state** parameter is *not* specified with this command:

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>admin-state</td>
<td>enable</td>

Usage Guidelines

- Use the `no` form of this command to remove the LPS configuration from the specified port and clear all MAC addresses learned on the port. Note that the `chassis` parameter is not supported when using the `no` form of this command.

- The `admin-state disable` option disables LPS on the port but does not clear the LPS configuration.

- Use the `chassis` parameter to administratively disable or enable all active LPS ports with one command. This option does not apply to ports on which LPS was not previously enabled.

- LPS is supported on Ethernet fixed, 802.1Q-tagged ports, and access ports.

- LPS is not supported on link aggregates, 802.1Q tagged (trunked) link aggregates, or link aggregate member ports.

- Note that when LPS is enabled on an active port, all MAC addresses previously learned on that port are cleared from the source learning MAC address table.

- LPS is also supported on ports that have Universal Network Profile (UNP) functionality enabled, with the following conditions:
  - When LPS is enabled or disabled on a UNP bridge port (LPS is not supported on UNP access ports), MAC addresses already learned on that port are flushed.
  - UNP authentication and classification is applied first, then LPS rules.
  - If UNP classifies a MAC address as forwarding but LPS learns the address as filtering, an untagged packet will show as filtering in the default VLAN for the port and a tagged packet MAC will show as filtering in the specific tagged VLAN.
  - When a MAC address is filtered by LPS, the `show unp user status` command will display “LPS-B” as the profile classification source for that MAC address.

- LPS allows for the configuration of the following source MAC address learning restrictions:
  - A source learning time limit window to specify the length of time learning is allowed on a port.
  - A maximum number of bridged and filtered MAC addresses allowed on a specific port
  - A list of MAC addresses (individual or range of addresses) allowed on a port.
  - How a port handles traffic that is unauthorized.

Examples

- `port-security port 4/8 admin-state enable`
- `port-security port 2/1-10 admin-state enable`
- `port-security chassis admin-state disable`
- `no port-security port 1/1-12`
- `port-security sap port 2/1/10:10`
- `port-security sap port 2/1/10:10.20`
- `port-security sap linkagg 10:10`
- `port-security sap linkagg 10:20`
- `no port-security sap port 2/1/10:10`
- `no port-security sap linkagg 10:20`

Release History

Release 7.1.1; command introduced.
Release 8.8R1; `sap` parameter added.
Related Commands

**port-security mac-range**  Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port.

**port-security maximum**  Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.

**port-security learning-window**  Configures the amount of time, in minutes, to allow source learning on all LPS ports.

**port-security port violation**  Selects the method for handling traffic that does not comply with LPS restrictions for the specified port(s).

MIB Objects

learnedPortSecurityTable  
   lpsAdminStatus

learnedPortSecuritySAPTable  
   lpsSAPAdminStatus
port-security learning-window

Configures the amount of time, in minutes, to allow source learning on all LPS ports. This LPS parameter applies to the entire switch, so when the time limit expires, source learning of new MAC addresses is stopped on all LPS ports. Only authorized MAC addresses are allowed to be associated on LPS ports after this timer expires. This command also enables or disables the conversion of dynamic MAC addresses to static MAC addresses on LPS ports.

```
port-security learning-window minutes [convert-to-static {enable | disable}] [no-aging {enable | disable}] [mac-move {enable | disable}] [learn-as-static {enable | disable}] [boot-up {enable | disable}]
```

Syntax Definitions

- `minutes` The number of minutes during which LPS allows source learning across all LPS ports. This amount of time defines the LPS learning window. The valid range is 0–2880. When this value is set to zero, the learning window time is set to infinity (no source learning time restriction on LPS ports).

- `convert-to-static enable` Enables the `convert-to-static` option for the learning window. Dynamically learned bridged (not filtered) MAC addresses are automatically converted to static addresses when the learning window closes. This option is automatically disabled when the LPS learning window is set to infinity (zero).

- `convert-to-static disable` Disables the `convert-to-static` option for the learning window. Dynamically learned bridged MAC addresses are not converted to static addresses and will start to age out when the learning window closes.

- `no-aging enable` Enables the `no-aging` option for the learning window. Dynamically learned bridged MAC addresses are learned as `pseudo-static` MACs, which do not age out but are not saved in the switch configuration. MAC movement is not allowed for pseudo-static MAC addresses unless the `mac-move` option is also enabled.

- `no-aging disable` Disables the `no-aging` option for the learning window. MAC addresses are learned as dynamic addresses that will age out.

- `mac-move enable` Enables the `mac-move` option. Allows a pseudo-static MAC address to move to a different port in the same VLAN without getting dropped. The `mac-move` option is used with the `no-aging` option to allow MAC movement for pseudo-static MAC addresses.

- `mac-move disable` Disables the `mac-move` option. If the `no-aging` option is enabled, MAC movement for pseudo-static MAC addresses is not allowed. Frames from a duplicate pseudo-static MAC address are dropped.

- `learn-as-static enable` Enables the `learn-as-static` option for the learning window. Dynamically learned bridged MAC addresses are converted to permanent static MAC addresses during the learning window time (even if the `convert-to-static` option is disabled). MAC movement is allowed for the permanent static MAC addresses. This option and the `no-aging` option are mutually exclusive.
Learned Port Security Commands

Defaults

By default, the LPS source learning time limit is not set for the switch; the learning window defaults to infinity (source learning is not limited to a specific time frame).

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to clear the learning window time (no learning window time limit is applied to the port).

- The LPS source learning time window is started and/or reset each time the port-security learning-window command is issued or when the port-security learning-window boot-up option is enabled and the switch restarts.

- Setting the LPS learning window time to 0 (zero) configures an infinite source learning time period for all LPS ports. The learning of MAC addresses on LPS ports never times out.

- When the LPS learning window time is set to zero, all options except the convert-to-static option are still valid. For example, the no-aging option setting still applies.

- After the LPS learning window time expires, MAC addresses are learned as filtered addresses until the maximum number of filtered MAC addresses allowed for the LPS port is reached. For example, if the maximum number of bridged MAC addresses allowed is set to 30 and the learning window expires when the port has only learned 15, the port is still allowed to learn an additional 15 filtered MAC addresses.
• Enabling the no-aging option triggers the following LPS learning window behavior:
  – All new bridged MAC addresses are learned as pseudo-static MAC addresses during the learning
  window time period. Pseudo-static addresses do not age out but are not saved to the switch
  configuration.
  – MAC movement is not allowed for pseudo-static MAC addresses unless the mac-move option is
  also enabled. The mac-move status (enabled or disabled) applies only to the no-aging option.
  – Enabling the mac-move option is not allowed unless the no-aging option is also enabled. When the
  mac-move option is enabled, disabling the no-aging option is not allowed.
  – When the learning window starts, any MAC addresses that were learned prior to the learning
  window time period are retained as dynamic addresses; they are not converted to pseudo-static
  MAC addresses.

• The learn-as-static and no-aging options are mutually exclusive; if both are enabled, then the learn-
  as-static option takes precedence.

• If the convert-to-static option is enabled, then all dynamic bridged and pseudo-static MAC addresses
  are converted to static MAC addresses when the learning window closes. Static MAC addresses do not
  age out and are saved to the switch configuration.

Note. When UNP is enabled on any one LPS port, the convert-to-static, no-aging, and boot-up
parameter options are not supported on all LPS-enabled ports. This is because the learning window
configuration is global and applies to all LPS ports.

Examples
-> port-security learning-window 25
-> port-security learning-window 2 convert-to-static enable
-> port-security learning-window 60 no-aging enable mac-move enable
-> port-security learning-window 0 learn-as-static enable
-> port-security learning-window 500 boot-up disable
-> port-security learning-window 2 convert-to-static enable no-aging enable
-> port-security learning-window 2 no-aging enable convert-to-static enable boot-up
  enable learn-as-static enable mac-move enable
-> no port-security learning-window

Release History
Release 7.1.1; command introduced.
Release 7.2.1.R02; no-aging and boot-up parameters added.
Release 8.2.1; learn-as-static and mac-move parameters added.

**MIB Objects**

- `learnedPortSecurityGlobalGroup`
  - `lpsLearningWindowTime`
  - `lpsLearningWindowTimeWithStaticConversion`
  - `lpsLearningWindowNoAging`
  - `lpsLearningWindowBootupStatus`
  - `lpsLearningWindowLearnAsStatic`
  - `lpsLearningWindowPseudoMacMove`
**port-security convert-to-static**

Converts all MAC addresses dynamically learned on the LPS port(s) to static MAC addresses. This command does not apply to MAC addresses that are filtered.

```
port-security {port chassis/slot/port[-port2] | chassis} | {sap {port | linkagg} sap_id} convert-to-static
```

**Syntax Definitions**

- **chassis**
  - The chassis identifier.

- **slot/port[-port2]**
  - The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

- **chassis**
  - Specifies all the LPS ports on the chassis.

- **sap_id**
  - The SAP ID number identifying the service instance. *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 6570M.*

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Converting dynamic MAC addresses to static MAC addresses is not supported on Universal Network Profile (UNP) ports.

- You can stop the aging out of dynamic MAC addresses on the LPS port(s) by converting them to static MAC addresses.

- The number of converted static MAC addresses cannot exceed the maximum number of MAC addresses allowed on the port(s).

**Note.** The **port-security convert-to-static** command is not supported on UNP ports.

**Examples**

- `-> port-security port 4/8 convert-to-static`
- `-> port-security chassis convert-to-static`
- `-> port-security sap port 2/1/10:10 convert-to-static`
Learned Port Security Commands

**Release History**
Release 7.2.1.R02; command was introduced.
Release 8.8R1; sap parameter added.

**Related Commands**
- `port-security` Enables or disables Learned Port Security (LPS) on the switch port(s).
- `port-security maximum` Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.

**MIB Objects**
- `learnedPortSecurityGlobalGroup`
- `lpsConvertToStatic`
- `learnedPortSecuritySAPTable`
- `lpsSAPConvertToStatic`
**port-security mac**

Configures a static MAC address on the specified LPS port. This command also enables LPS on the specified port, if LPS is not already active on the port.

```
port-security {port chassis/slot/port[-port2] | sap {port | linkagg} sap_id} mac mac_address [vlan vlan_id]
```

```
no port-security {port chassis/slot/port[-port2] | sap {port | linkagg} sap_id} mac [all | mac_address] [vlan vlan_id]
```

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot/port[-port2]` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `sap_id` The SAP ID number identifying the service instance. *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 6570M.*
- `mac_address` MAC address to configure as a static MAC address on the specified LPS port (for example, 00:20:95:00:10:2A).
- `vlan` The VLAN ID to associate with the specified LPS port.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove a specific static MAC address or all of the static MAC addresses configured on the specified LPS port. Note that even when all statically configured MAC addresses are removed, LPS remains active on the port.

- A VLAN-port association (VPS) must exist between the specified VLAN and the LPS port. If no VLAN ID is specified with this command, the default VLAN for the LPS port is used.

- The following conditions will display an error or warning message:
  - A VLAN ID is specified that is not associated with the LPS port:
  - An attempt is made to configure a MAC address more than once on the same LPS port with the
Learned Port Security Commands

- A duplicate MAC address is configured on different LPS ports.

- Configuring a multicast MAC address, an all zero MAC address, or a broadcast MAC address is not allowed with this command.

- Use this command instead of the `mac-learning static mac-address` command to create a static MAC address on an LPS port.

**Examples**

```
-> port-security port 1/1/20 mac 00:20:95:00:fa:5c
-> port-security port 1/1/1-15 mac 00:da:95:00:00:10
-> no port-security port 1/1/20 mac 00:20:95:00:fa:5c
-> no port-security port 1/1/1-15 mac 00:da:95:00:00:10

-> port-security port 1/1/20 mac 00:2a:95:11:22:10 vlan 200
ERROR: Vlan 200 is not valid on this port

-> port-security port 1/1/20 mac 00:2a:95:11:22:10 vlan 200
ERROR: Mac 00:2a:95:11:22:10 ALREADY exists on Vlan 200 for port 1/1/20

```

**Release History**

Release 8.4.1; command introduced.
Release 8.8R1; `sap` parameter added.
Related Commands

  - lpsAgL2MacAddress
  - lpsAgL2VlanId
  - lpsAgL2MacAddressRowStatus

- **learnedPortSecuritySAPTable**
  - lpsSAPL2HighMacAddress
  - lpsSAPL2LowMacAddress
**port-security maximum**

Specifies the maximum number of bridged MAC addresses that an LPS port(s) is allowed to learn.

```
port-security {port chassis/slot/port[-port2] | sap {port | linkagg} sap_id} maximum number
```

**Syntax Definitions**

- **chassis**
  - The chassis identifier.

- **slot/port[-port2]**
  - The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

- **sap_id**
  - The SAP ID number identifying the service instance. *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 6570M.*

- **number**
  - The number of source MAC addresses that are allowed on this port. The valid range is 1–1000.

**Defaults**

By default, the number of MAC addresses allowed is set to 1.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Any additional source MAC addresses received that exceed the maximum number of bridged addresses allowed are filtered on the port, regardless of the LPS learning window time limit. Once the number of filtered MAC addresses reaches the maximum number of filtered addresses allowed, the port violation mode is applied.

- Note that source learning of configured authorized MAC addresses is still allowed after the LPS time limit has expired; however, all learning is stopped if the number of MAC addresses learned meets or exceeds the maximum number of addresses allowed, even if the LPS time limit has not expired.

**Examples**

```
-> port-security port 2/14 maximum 25
-> port-security port 4/10-15 maximum 100
-> port-security sap port 2/1/10:10.20 maximum 50
-> port-security sap linkagg 10:10 maximum 500
```
**Release History**

Release 7.1.1; command introduced.  
Release 8.8R1; **sap** parameter added.

**Related Commands**

- `port-security` Enables or disables Learned Port Security (LPS) on the switch port(s).
- `port-security learning-window` Configures the amount of time in minutes to allow source learning on all LPS ports.
- `port-security learn-trap-threshold` Configures the number of bridged MAC addresses to learn before sending a SNMP trap.

Learned Port Security Commands

**port-security learn-trap-threshold**

Configures the number of bridged MAC addresses to learn before sending a SNMP trap.

```
port-security {port chassis/slot/port[-port2] | sap [port | linkagg] sap_id} learn-trap-threshold number
```

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot/port[-port2]` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `sap_id` The SAP ID number identifying the service instance. *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 6570M.*
- `number` The number of bridged MAC addresses to learn before sending a trap. The valid range is 0–1000.

**Defaults**

By default, the number of bridged MAC addresses to learn before sending a trap is set to the same value as the maximum number of bridged MAC addresses allowed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When the number of bridged MAC addresses learned on the port matches the specified threshold amount, a trap is sent for every bridged MAC address learned thereafter.

- Sending a trap when this threshold is reached provides notification of newly learned bridged MAC addresses. Trap contents includes identifying information about the MAC, such as the address itself, the corresponding IP address, switch identification, and the slot and port number on which the MAC was learned.

- If this threshold value is set to zero, a trap is sent for every MAC address learned on the LPS port.

**Examples**

```
-> port-security port 1/10 learn-trap-threshold 6
-> port-security port 1/10-13 learn-trap-threshold 18
-> port-security sap port 2/1/10:10 learn-trap-threshold 1
```
**Release History**

Release 7.1.1; command introduced.
Release 8.8R1; sap parameter added.

**Related Commands**

- **port-security maximum** Configures the maximum number of source MAC addresses that an LPS port is allowed to learn.
- **show port-security pkt-relay filter** Displays Learned Port Security (LPS) configuration and table entries.

**MIB Objects**

- `learnedPortSecurityTable` `lpsLearnTrapThreshold`
- `learnedPortSecuritySAPTable` `lpsSAPlearnTrapThreshold`
**port-security port max-filtering**

Configures the maximum number of MAC addresses that can be filtered on the LPS port(s).

```
port-security {port chassis/slot/port[-port2] | sap {port | linkagg} sap_id} max-filtering number
```

**Syntax Definitions**

- `chassis`: The chassis identifier.
- `slot/port[-port2]`: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `sap_id`: The SAP ID number identifying the service instance. *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 6570M.*
- `number`: The maximum number of filtered MAC addresses that are allowed on this port. The valid range is 0–100.

**Defaults**

By default, the maximum number of MAC addresses that can be filtered on an LPS port is 5.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When the number of filtered MAC addresses learned on the port reaches the maximum, the violation mode (restrict, discard, or shutdown) configured for the port is applied.

- Any additional source MAC addresses received that exceed the maximum number of bridged addresses allowed are filtered on the port, regardless of the LPS learning window time limit. Once the number of filtered MAC addresses reaches the maximum number of filtered addresses allowed, the port violation mode is applied.

- Even after the LPS learning window time expires, MAC addresses are learned as filtered addresses until the maximum number of filtered MAC addresses allowed for the LPS port is reached. For example, if the maximum number of MAC addresses allowed is set to 30 and the learning window expires when the port has only learned 15, the port is still allowed to learn an additional 15 filtered MAC addresses.

**Examples**

```
-> port-security port 1/10 max-filtering 6
-> port-security port 1/10-13 max-filtering 18
```
Learned Port Security Commands

- port-security sap port 2/1/10:10 max-filtering 100
- port-security sap port 2/1/10:10.20 max-filtering 50
- port-security sap linkagg 10:10 max-filtering 25
- port-security sap linkagg 10:20 max-filtering 5

</tr>
</tbody>
</table>

---

**Usage Guidelines**

- By default, each LPS port is set to a range of 00:00:00:00:00:00–ff:ff:ff:ff:ff:ff, which includes all MAC addresses.

- Source MAC addresses received on an LPS port that fall within the authorized range are allowed on the port. An additional entry is made in the LPS table for each of these learned addresses.
Any additional source MAC addresses received that do not match the configured authorized addresses are not allowed (filtered) on the port, regardless of the LPS learning window time limit or the maximum number of bridged addresses allowed. Once the number of filtered MAC addresses reaches the maximum number of filtered addresses allowed, the port violation mode is applied.

Configuring more than one MAC address range per port is supported. When attempting to configure multiple MAC address ranges on the same port, consider the following:

- A maximum of eight multiple MAC address ranges can be configured per port.
- On a newly configured LPS port, the first user configured MAC range would overwrite the default MAC range.
- A MAC range cannot overlap with another MAC range configured for the port.
- Modifying a MAC range is allowed only if the lower MAC address is not changed and the defined new range does not overlap with the existing range. To modify the lower MAC address, the existing range must be deleted before adding the new range.
- When modifying a MAC range, the new range must match or accommodate any existing static MACs on the port, else an error will be thrown indicating some static MACs exist on the port that fall outside the new/resultant MAC range being configured. (Note: It is required to flush such static MACs on the port, if user needs to configure the new MAC range, which was not accommodating the static MACs).
- When the MAC range size is increased, all the dynamic filtering MACs on the port would be flushed.
- When the MAC range size is reduced, any existing dynamic forwarding MACs learned on the port would be flushed if they fall outside any MAC ranges configured on the port at that point of time.
- All the dynamic filtering MACs learned on the port would be flushed.

Use the no form of this command to delete the configured MAC range.

The default MAC range is automatically applied when all the configured MAC ranges for the port are deleted.

The default MAC range on the port cannot be deleted.

Examples

- `port-security port 1/5/11-15 mac-range low 00:da:95:00:00:10 high 00:da:95:00:00:1f`
- `port-security port 1/1/5 mac-range low 00:01:01:22:22:56 high 00:01:01:22:22:67`
- `port-security port 1/1/5 mac-range low 00:01:01:22:33:56 high 00:01:01:22:33:67`
- `port-security port 1/1/5 mac-range low 00:01:01:22:44:56 high 00:01:01:22:44:67`
- `no port-security port 1/1/5 mac-range low 00:01:01:22:33:56`

Release History

Release 7.1.1; command introduced.
Release 8.5R3; ability to configure multiple MAC ranges per port added.
Release 8.8R1; sap parameter added.
Related Commands

  - lpsHiMacRange
  - lpsRowStatus

learnedPortSecurityL2MacRangeTable
  - lpsL2LowMacAddress
  - lpsL2HighMacAddress
**port-security port violation**

Selects the method for handling traffic that does not comply with LPS restrictions for the specified port(s).

```
port-security {port chassis/slot/port|-port2} | sap {port | linkagg} sap_id} violation {shutdown | restrict | discard} | violation recovery-time {default | seconds} | violation recovery-maximum {infinite | default | max_attempts}
```

**Syntax Definitions**

- **chassis**
  The chassis identifier.

- **slot/port[-port2]**
  The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

- **sap_id**
  The SAP ID number identifying the service instance. *This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 6570M.*

- **shutdown**
  The port is administratively disabled when the port receives unauthorized traffic. No further traffic is allowed on the port.

- **restrict**
  Filters (blocks) unauthorized traffic but allows traffic that complies with LPS restrictions to forward on the port. The port remains administratively enabled.

- **discard**
  Disables learning on the port when unauthorized traffic is received or the configured maximum number of MAC addresses is reached. The port remains administratively enabled.

- **default**
  Sets the SAP recovery-time or recovery-maximum values to their default setting.

- **seconds**
  The number of seconds after which the SAP is reactivated. The valid range is 30-600 seconds.

- **infinite**
  Sets the recovery attempts to infinite for a SAP.

- **max_attempts**
  The maximum number of recovery attempts. Valid range is 0-50.

- **clear**
  Clears the violation on a SAP.

**Defaults**

By default, the security violation mode is set to restrict when LPS is enabled on the port.

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>violation</td>
<td>restrict</td>
</tr>
<tr>
<td>seconds</td>
<td>300 seconds</td>
</tr>
<tr>
<td>max_attempts</td>
<td>10</td>
</tr>
</tbody>
</table>
**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When a traffic violation occurs on an LPS port, a notice is sent to the switch log.
- If the violation mode is set to `restrict`, unauthorized source MAC addresses are not learned in the LPS table, but they are recorded in the source learning MAC address table with a filtered operational status. This allows the user to view MAC addresses attempting unauthorized access to the LPS port.
- Only violation mode `restrict` is supported on a SAP.

**Examples**

- `port-security port 2/14 violation restrict`
- `port-security port 4/10-15 violation shutdown`
- `port-security port 1/37 violation discard`
- `port-security sap port 2/1/10:10 violation recovery-maximum 4`
- `port-security sap port 2/1/10:10.20 violation recovery-time 60`
- `port-security sap linkagg 10:10 violation restrict`
- `port-security sap linkagg 10:20 violation clear`

**Release History**

Release 7.1.1; command introduced.
Release 7.2.1.R02; `discard` parameter added.
Release 8.8R1; `sap` parameter added.

**Related Commands**

- `port-security` Enables or disables Learned Port Security (LPS) on the switch port(s).
- `clear violation` Clears all port violations; allows the port to resume normal operation without a manual reset of the port or module.
- `show port-security` Displays Learned Port Security (LPS) configuration and table entries.

**MIB Objects**

- `learnedPortSecurityTable`
- `lpsViolationOption`
- `learnedPortSecuritySAPTable`
- `lpsSAPViolationRecoveryMax`
- `lpsSAPViolationRecoveryTime`
- `lpsSAPViolationRestrict`
- `lpsSAPViolationClear`
**port-security port pkt-relay**

Enables packet relay feature on a single or range of LPS ports.

```
port-security {port chassis/slot/port[-port2]} pkt-relay
no port-security {port chassis/slot/port[-port2]} pkt-relay
```

### Syntax Definitions

- **chassis**
  - The chassis identifier.

- **slot/port[-port2]**
  - The slot and port number. Use a hyphen to specify a range of ports.

### Defaults

By default, the packet relay is disabled on LPS port.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When packet relay is enabled on a non LPS port, the LPS is automatically enabled on that port.
- Packet relay feature is not supported on UNP ports.
- Use the `no` form of the command to disable packet relay on the port.

### Examples

```
-> port-security port 3/2/1 pkt-relay
-> port-security port 3/2/1-4 pkt-relay
-> no port-security port 3/2/1-4 pkt-relay
```

### Release History

Release 8.8R2; command introduced.
Related Commands

- **port-security pkt-relay**
  - **protocol**
  - **show port-security pkt-relay**
  - **filter**

  Configures the protocol filter criteria for packet relay feature.

  Displays Learned Port Security (LPS) configuration and table entries.

MIB Objects

- **lpsPacketRelay**
Learned Port Security Commands

port-security pkt-relay protocol

Configures the protocol filter criteria for packet relay feature.

port-security pkt-relay protocol {udp} {icmp} {igmp}

Syntax Definitions

udp
The packets with UDP protocol are considered for retransmission to the queue.

icmp
The packets with ICMP protocol are considered for retransmission to the queue.

igmp
The packets with IGMP protocol are considered for retransmission to the queue.

Defaults
By default, no protocol is enabled as filter for packet relay.

Platforms Supported
This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- When the protocol filter is configured, it is applied on all the ports on which packet relay is enabled.
- More than one protocol can be configured for protocol filter.

Examples

-> port-security pkt-relay protocol udp
-> port-security pkt-relay protocol icmp igmp

Release History

Release 8.8R2; command introduced.
Related Commands

```
port-security pkt-relay protocol udp
```

Configures the UDP source and destination ports as the criteria for packet relay.

MIB Objects

```
lpsPacketRelay
  lpsPacketRelayUdpStatus
  lpsPacketRelayIgmpStatus
  lpsPacketRelayIcmpStatus
```
**port-security pkt-relay protocol udp**

Configures the UDP source and destination ports as the criteria for packet relay.

`port-security pkt-relay protocol udp [src-port \[port1[-port2]\]] [dst-port \[port1[-port2]\]]`

---

**Syntax Definitions**

- **src-port**
  Specify the UDP source port for packet relay.

- **dst-port**
  Specify the UDP destination port for packet relay.

- **port1**
  Specify the port number which will be matched for retransmission to the queue.

- **port2**
  Specify the port range for sequential port.

---

**Defaults**

By default, no UDP source and destination ports are configured for packet relay.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Use this command to specify a particular or range of UDP source and destination port for packet relay.

- UDP protocol filter must be configured before configuring specific UDP source and destination ports. Use the `port-security pkt-relay protocol` CLI.

---

**Examples**

- `-> port-security pkt-relay protocol udp src-port 2`
- `-> port-security pkt-relay protocol udp src-port 2-6`
- `-> port-security pkt-relay protocol udp dst-port 4`
- `-> port-security pkt-relay protocol udp dst-port 4-6`

---

show port-security

Displays the Learned Port Security (LPS) configuration and table entries.

show port-security {port [chassis/slot/port][-port2] | slot chassis/slot] | sap {violation | {port | linkagg} sap_id}

Syntax Definitions

chassis The chassis identifier.
slot/port[-port2] The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
slot Enter the slot number for a module to specify that the command should include all ports on that module (for example, 6 specifies all ports on the module found in slot 6 of the switch chassis).
sap_id The SAP ID number identifying the service instance. This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560 and OmniSwitch 6570M.

Defaults

By default, all ports with an LPS configuration are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Displays ports that have an LPS configuration, even if LPS is disabled on the port.
- Use the port parameter with this command to display the LPS configuration for a specific port or a range of ports.
- Use the slot parameter with this command to display the LPS configuration for all the ports on a specific slot.
- MAC addresses learned on the LPS enabled port that are within the specified MAC address range appear as a separate entries in the LPS table as dynamic MAC type addresses.
- The MAC Type field is blank if an authorized MAC address range is configured for the LPS port.

Examples

-> show port-security port 1/1/20
Learned Port Security Commands

show port-security mac-range

Displays the MAC range configured on the Learned Port Security (LPS) ports.

```
show port-security [port chassis/slot/port[-port2] | sap {port | linkagg} sap_id] mac-range
```

### Syntax Definitions

- `chassis/slot/port[-port2]` The chassis, slot and port number (1/1/1). Use a hyphen to specify a range of ports (1/1/1-8).
- `sap_id` The SAP ID number identifying the service instance. This parameter is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560 or OmniSwitch 6570M.

### Defaults

By default, all the LPS ports configured with MAC range are displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Specify the chassis, slot, and port to view the MAC range configured for the specific port.

### Examples

```
-> show port-security port 1/1/4 mac-range
Port: 1/1/4:
Low MAC Range                  High MAC Range
--------------------------------+----------------------------------------
00:00:00:00:00:00:00            00:00:00:00:00:00:10
00:00:00:44:00:01               00:00:00:66:ff:ff

-> show port-security mac-range
Port: 1/1/2:
Low MAC Range                  High MAC Range
--------------------------------+----------------------------------------
00:00:00:00:00:00:01            00:00:00:00:00:00:20
00:00:00:00:55:01               00:00:00:00:55:ff
00:00:00:66:00:01               00:00:00:99:ff:ff
Port: 1/1/4:
Low MAC Range                  High MAC Range
--------------------------------+----------------------------------------
00:00:00:00:00:00:00            00:00:00:00:00:00:10
00:00:00:44:00:01               00:00:00:66:ff:ff
```

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The LPS port parameter values are displayed even if the LPS is disabled on the port.
- The operation mode displayed for the LPS port is based on a combination of the existing administrative status and the operational status of the port, the result of which is one of the following values:
  - Enabled
  - Restricted (only when the administrative status is enabled)
  - Shutdown (only when the administrative status is enabled)
  - Discard (only when the administrative status is enabled)
  - Disabled
  - Locked
  - Filtered_only

**Release History**

Release 7.2.1.R02; command was introduced.

**Related Commands**

`show port-security pkt-relay filter` Displays the LPS configuration and table entries for individual LPS ports.

**MIB Objects**

`learnedPortSecurityTable`
- `lpsMaxMacNum`
- `lpsMaxFilteredMacNum`
- `lpsMaxStaticMacNum`
- `lpsOperStatus`
- `lpsAdminStatus`
**show port-security learning-window**

Displays the source learning window configuration.

```
show port-security learning-window
```

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The source learning time limit is a switch-wide parameter that applies to all ports that have LPS enabled.
- If the learning window time is not set, then no source learning time limit is applied to LPS ports.
- Even after the LPS learning window time expires, dynamic MAC addresses are learned as filtered addresses until the maximum number of filtered MAC addresses allowed for the LPS port is reached. For example, if the maximum number of bridged MAC addresses allowed is set to 30 and the learning window expires when the port has only learned 15, the port is still allowed to learn an additional 15 filtered MAC addresses.

### Examples

```
-> show port-security learning-window
Learning-Window       = 2 min,
Convert-to-static     = DISABLE,
No Aging              = DISABLE,
Boot Up               = ENABLE,
Remaining Learning Window = 120 sec
Learn As Static       = ENABLE,
Mac Move              = DISABLE,
```
Learned Port Security Commands

**show port-security learning-window**

<table>
<thead>
<tr>
<th>output definitions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Learning-Window</strong></td>
<td>The configured amount of time during which the LPS port can learn new MAC addresses. This value of this field is set to <strong>INFINITY</strong> when the learning time window is set to zero (no source learning time restriction on LPS ports).</td>
</tr>
<tr>
<td><strong>Convert-to-static</strong></td>
<td>Indicates whether or not dynamic bridged or pseudo-static MACs are converted to static MACs (<strong>ENABLED</strong> or <strong>DISABLED</strong>). This option is always disabled when the LPS learning window is set to infinity (zero).</td>
</tr>
<tr>
<td><strong>No Aging</strong></td>
<td>Indicates whether or not bridged MAC addresses are learned as pseudo-static MAC addresses, which do not age out during the LPS learning window time period (<strong>DISABLED</strong> or <strong>ENABLED</strong>).</td>
</tr>
<tr>
<td><strong>Boot Up</strong></td>
<td>Indicates whether or not the LPS learning window automatically starts when the switch boots up (<strong>enabled</strong> or <strong>disabled</strong>).</td>

48  Port Mirroring and Monitoring Commands

The Port Mirroring and Port Monitoring features are primarily used as diagnostic tools.

The Port Mirroring feature allows you to have all the inbound and outbound traffic of an Ethernet port sent to another port on the switch. When you enable port mirroring, the active, or “mirrored,” port transmits and receives network traffic normally and the “mirroring” port receives a copy of all transmit and receive traffic to the active port. You can connect an RMON probe or network analysis device to the mirroring port to see an exact duplication of traffic on the mirrored port without disrupting network traffic to and from the mirrored port.

The Port Monitoring feature allows you to capture and examine the data traffic to and from a monitored Ethernet port.

MIB information for the Port Mirroring commands is as follows:

   Filename:   ALCATEL-IND1-PORT-MIRRORING-MONITORING-MIB.mib
   Module:     alcatelIND1PortMirrorMonitoringMIB

The following table summarizes the available commands:

| Port Mirroring Commands                  | port-mirroring source destination |
|                                        | port-mirroring                      |
|                                        | port-mirroring traffic-priority     |
|                                        | show port-mirroring status          |

| Port Monitoring Commands                | port-monitoring source             |
|                                       | port-monitoring                    |
|                                       | show port-monitoring status        |
|                                       | show port-monitoring file          |
**port-mirroring source destination**

Defines the port to mirror and the port that is to receive data from the mirrored port. Also, enables or disables remote port mirroring.

```
port-mirroring port_mirror_sessionid source {port chassis/slot/port[-port2]} destination {port chassis/slot/port[-port2] | linkagg linkagg[-linkagg2]} [rpmir-vlan vlan_id] [bidirectional | inport | outport] [loopback] [unblocked-vlan vlan_id] [tag-remove] [enable | disable]
```

```
port-mirroring port_mirror_sessionid no source {port chassis/slot/port[-port2] [chassis/slot/port[-port2]...]
```

```
port-mirroring port_mirror_sessionid no destination {port chassis/slot/port[-port2] [chassis/slot/port[-port2]...]} [linkagg linkagg[-linkagg2] [linkagg[-linkagg2]...]
```

### Syntax Definitions

- **port_mirror_sessionid**: Mirroring session identifier.
- **source**: Specifies source port, or range of ports desired to be mirrored.
- **destination**: Specifies the destination port or linkagg that receives all the mirrored packets.
- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number. Use a hyphen to specify a range of ports.
- **linkagg[-linkagg2]**: The destination link aggregate. Use a hyphen to specify a range. *This parameter is not supported on OS6360, OS6465, OS6560 and OS6570M.*
- **rpmir-vlan vlan_id**: Specifies a reserved VLAN to carry the mirroring traffic. Use this parameter to configure remote port mirroring. See “Usage Guidelines - Remote Port Mirroring” below for more information.
- **bidirectional**: Specifies bidirectional port mirroring.
- **inport**: Specifies incoming unidirectional port mirroring.
- **outport**: Specifies outgoing unidirectional port mirroring.
- **loopback**: Enables or disables loopback mechanism on the destination port for the session. *This parameter is supported only on the OmniSwitch 6465.*
- **unblocked-vlan vlan_id**: Specifies the VLAN that is to be protected from Spanning Tree changes when port mirroring is active. Ports in this VLAN remain unblocked.
- **tag-remove**: Removes the VLAN tag on mirrored traffic that egresses out of the destination mirroring ports. *This parameter is supported only on the OmniSwitch 9900.*
- **enable**: Enables port mirroring status.
- **disable**: Disables port mirroring status.

</table>

**Usage Guidelines**

- Port mirroring cannot be configured on an AppMon enabled port.
- You can configure a port mirroring and a port monitoring session on the same network interface module.
- A mirroring port cannot be assigned to a tagged VLAN port.
- When a port is configured as a mirroring port, it does not belong to any VLAN. Inbound traffic to the mirroring port is dropped since it does not belong to any VLAN.
- To mirror traffic from SAP port to destination port, explicitly create a VLAN same as the SAP VLAN.
- Spanning tree is disabled by default on a mirroring port.
- Port mirroring is not supported on logical link aggregate ports. However, it is supported on individual ports that are members of a link aggregate.
- Port mirroring destination port can be a link aggregate. This functionality is not supported on OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560 and OmniSwitch 6570M.
- Use the `port mirroring source destination` command to define the mirrored port and enable port mirroring status. Use the `port mirroring` command to enable the port mirroring session.
- Specify the `vlan_id` number of the mirroring port that is to remain unblocked when the command is executed. The unblocked VLAN becomes the default VLAN for the mirroring port. This VLAN handles the inbound traffic for the mirroring port. Spanning Tree remains disabled on the unblocked VLAN.
- A maximum of 128 source mirroring ports can be configured. In case of mirroring to LACP Link Aggregate, only the first 8 aggregable ports will be used for mirroring.
- Unblocked VLAN and RPMIR configuration cannot co-exist in the same port mirroring session.
- A port/link aggregate which is to be configured as a mirroring destination should have no prior configuration on it, for example, a MVRP enabled port/link aggregate cannot be configured as a mirroring destination. The only exception to this rule is that a port can be a untagged or a tagged member of a standard VLAN.
Port Mirroring and Monitoring Commands

- Any protocol/feature configurations on existing mirroring destinations would fail. All such configuration attempts would result in an error. The only exception to this is that if a mirroring destination is part of a mirroring session which has remote port mirroring VLAN configured (RPMIR VLAN) then such a destination can be made a tagged and/or untagged member of standard VLAN(s).

- A maximum of one mirroring session with two mirroring destinations or a maximum of two sessions each having a single mirroring destination is supported on OmniSwitch 6860, OmniSwitch 6860N, OmniSwitch 6865, and OmniSwitch 6900.

- Supports single destination mirroring port per session and seven port mirroring sessions in a system on OmniSwitch 6465, OmniSwitch 6560 and OmniSwitch 6570M platforms.

- Supports multiple destination mirroring port and link aggregates per session and seven port mirroring sessions, and 128 destination mirroring ports or link aggregates in a system. This functionality is supported on OmniSwitch 9900.

- Supports policy based multiple destination mirroring on a single port mirroring session. This functionality is supported on OmniSwitch 9900.
  - To enable this functionality, configure port mirroring session with destination port and then apply policy based configuration on the port mirroring session.
  - Use the QoS mirror session attribute to support policy based multiple destination mirroring. QoS mirroring session attribute can be specified as a part of policy action in the policy action command. Mirroring can be done on the ingress packets only. Only one session ID is supported for policy based mirroring, thus all the policies must specify the same session ID. For more information on policy based mirroring, see Chapter 37, “QoS Policy Commands.”

- Use the tag remove option to remove the VLAN tag on mirrored traffic that egresses out of destination mirroring ports. For double tagged mirrored packet, this option removes the outer VLAN tag.

- RPMIR and tag remove configuration is mutually exclusive and hence cannot co-exist in the same port mirroring session.

Usage Guidelines - Remote Port Mirroring

- Use the rpmir-vlan parameter and VLAN ID with this command to configure remote port mirroring and to assign the VLAN ID for remote port mirroring.
  - Remote port mirroring over a link aggregate is not supported on the OmniSwitch 6360, OmniSwitch 6465, OmniSwitch 6560 and OmniSwitch 6570M.
  - Remote port mirroring in loopback mode is supported only on OmniSwitch 6465.

- The VLAN ID assigned for remote port mirroring cannot be assigned to a general port mirroring port.

- There must not be any physical loop present in the remote port mirroring VLAN.

- Source learning must be disabled or overridden on the ports belonging to the remote port mirroring VLAN on intermediate and destination switches.

- The QoS redirect feature can be used to override source learning.

- The mac-learning command can also be used to disable learning on the RPMIR VLAN ID.

- VLAN 1 cannot be configured as the RPMIR VLAN.

- When mirroring configuration is removed from a mirroring destination, the port/link aggregate is made an untagged member of VLAN 1. The only exception to this is when the destination in a mirroring session with RPMIR configuration.
Port Mirroring and Monitoring Commands

- When RPMIR-loopback session is enabled, source learning on the loopback port is disabled.
- When RPMIR-loopback session is enabled, STP for the configured RPMIR-VLAN alone is disabled.
- To revert the RPMIR session from loopback to default the entire session must be removed and configured again.

Examples

-> port-mirroring 6 source port 1/2/2 destination port 1/1/3
-> port-mirroring 6 destination port 1/1/3 rpmir-vlan 7
-> port-mirroring 6 no source port 1/2/2

-> port-mirroring 7 source port 1/2/3 destination linkagg 3 unblocked-vlan 750
-> port-mirroring 7 source port 1/2/3 outport

-> port-mirroring 7 source port 1/2/3 destination linkagg 3 tag-remove

-> port-mirroring 9 source port 1/1/23 destination port 1/1/24
-> port-mirroring 9 disable

-> port mirroring 1 source port 1/1/1 destination port 1/1/3 bidirectional rpmir-vlan 100 loopback enable
-> port mirroring 1 source port 1/1/1 destination port 1/1/3 bidirectional rpmir-vlan 100 loopback disable

Release History

Release 7.1.1; command introduced.
Release 8.4.1.R03; Mirroring to a link aggregate supported on OmniSwitch 6900 and OmniSwitch 6860.
Release 8.6.R1; **tag-remove** keyword added, policy based multiple destination mirroring supported on OmniSwitch 9900.
Release 8.7 R2; **loopback** keyword added, RPMIR Loopback Session supported on OmniSwitch 6465.

Related Commands

**port-mirroring**
Enables, disables, or deletes a port mirroring session.

**show port-mirroring status**
Displays the status of mirrored ports. This value may be enabled or disabled.

**port-mirroring**

Enables, disables, or deletes a port mirroring session.

```
port-mirroring port_mirror_sessionid {enable | disable}
no port-mirroring port_mirror_sessionid
```

### Syntax Definitions

- **port_mirror_sessionid**  
  Mirroring session identifier.
- **enable**  
  Enables port mirroring.
- **disable**  
  Disables port mirroring.

### Defaults

<table>
<thead>
<tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

When the traffic priority is set to high, ingress and egress mirroring receive strict priority over other clients (regular received, not mirrored, traffic, and so on).

Examples

-> port-mirroring traffic-priority normal
-> port-mirroring traffic-priority high

Release History

Release 8.7R3; command introduced.

Related Commands

show port-mirroring status Displays the status of mirrored ports. This value may be enabled or disabled.

MIB Objects

mirrorTrafficPriority
**port-monitoring source**

Configures a port monitoring session.

```
port-monitoring port_monitor_sessionid source port chassis/slot/port[-port2] [file filename [size filesize] | no file | overwrite {on | off}] [inport | outport | bidirectional] [timeout seconds] [enable | disable] [capture-type {full | brief}]
```

```
port-monitoring port_monitor_sessionid no source port chassis/slot/port[-port2]
```

### Syntax Definitions

- **port_monitor_sessionid**: Monitoring session identifier.
- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number. Use a hyphen to specify a range of ports.
- **filename**: Specifies a file name and pathname for capturing information related to the monitoring session (for example, `/flash/port2.enc`).
- **filesize**: Specifies the size of the file in 64K byte increments. For example, a value of 3 would specify a size of (3 x 64K) bytes.
- **no file**: *This option is not supported at this time.*
- **on**: Specifies that capturing of data packets into the port monitoring file continues and old information is overwritten if the total data exceeds the specified file size.
- **off**: Specifies that capturing of data packets into the port monitoring file is stopped when the maximum file size is reached.
- **inport**: Specifies incoming unidirectional port monitoring.
- **outport**: Specifies outgoing unidirectional port monitoring.
- **seconds**: Specifies the number of seconds after which the session is disabled.
- **enable**: Enables the port monitoring status.
- **disable**: Disables the port monitoring status.
- **full**: Captures port monitoring information in detail.
- **brief**: Captures only the concise port monitoring data transmitted.

### Defaults

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Port monitoring cannot be configured on an AppMon enabled port.
- If the `ip interface 'no forward'` parameter is configured in conjunction with port-monitoring on a port which is being used for switch IP connectivity, IP connectivity may be lost. Either port-monitoring or 'no forward' must be disabled to allow IP connectivity.
- You can configure a port mirroring and a port monitoring session on the same NI.
- If the port monitoring capture-type is set to `brief`, the first 64 bytes of the traffic is captured. If the port-monitoring capture-type is set to `full`, the entire packet is captured.
- By default, a file called `pmonitor.enc` is created in the `/flash` directory when you configure and enable a port monitoring session. Use the `file` option to create a user-specified file.
- The `/flash` directory is the default and the only directory used to capture the port monitoring files.
- The format of the file created is compliant with the ENC file format (Network General Sniffer Network Analyzer Format).
- By default, the recent frames overwrite the older frames in a port monitoring file if the total data exceeds the specified file size. Use the `overwrite off` option to prevent this from occurring.

Examples

- `-> port-monitoring 6 source port 1/2/3`
- `-> port-monitoring 6 source port 1/2/3 file /flash/user_port size 2 enable`
- `-> port-monitoring 6 source port 1/2/3 file /flash/user_port capture-type full`
- `-> port-monitoring 10 source port 1/4/22-30`
- `-> port-monitoring 10 no source port 1/4/30`

  - monitorDirection
**show port-monitoring file**

Displays port monitoring data.

**show port-monitoring file** *port_monitor_sessionid*

### Syntax Definitions

**port_monitor_sessionid**

Monitoring session identifier.

### Defaults

A single line from the captured packet is displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

  - `monitorScreenLine`
sFlow is a network monitoring technology that gives visibility into the activity of the network, by providing network usage information. It provides the data required to effectively control and manage the network usage. sFlow is a sampling technology that meets the requirements for a network traffic monitoring solution.

sFlow provides a network-wide view of usage and active routes. It is used for measuring network traffic, collecting, storing, and analyzing the traffic data. As it is scalable, that doesn’t add significant network load. sFlow is an industry standard with many vendors delivering products with this support. Some of the applications of the sFlow data include:

- Detecting, diagnosing, and fixing network problems
- Real-time congestion management
- Detecting unauthorized network activity
- Usage accounting and billing
- Understanding application mix
- Route profiling and peer optimization
- Capacity planning

sFlow is a sampling technology embedded within switches/routers. It provides the ability to monitor the traffic flows. It requires an sFlow agent software process running as part of the switch software and a sFlow collector which receives and analyses the monitored data. The sFlow collector makes use of SNMP to communicate with an sFlow agent in order to configure sFlow monitoring on the device (switch).

An sFlow agent running on the switch/router combines interface counters and traffic flow (packet) samples, preferably, on all the interfaces into sFlow datagrams that are sent across the network to an sFlow collector.

Packet sampling on the switch/router is typically performed by the switching/routing ASICs, providing wire-speed performance. In this case, an sFlow agent does very little processing, by packaging data into sFlow datagrams that are immediately sent on network. This minimizes the memory and CPU utilization by the sFlow agent.

MIB information for the sFlow commands is as follows:

- **Filename:** ALCATEL-IND1-PORT-MIRRORING-MONITORING-MIB.mib
  **Module:** alcatelIND1PortMirrorMonitoringMIB

- **Filename:** SFLOW-MIB.MIB.mib
  **Module:** sFlow
A summary of the available commands is listed here:

- sflow agent
- sflow receiver
- sflow sampler
- sflow poller
- show sflow agent
- show sflow receiver
- show sflow sampler
- show sflow poller
**sflow agent**

Configures a specific sFlow agent IP address.

`sflow agent ip ip_address`

`no sflow agent ip ip_address`

---

**Syntax Definitions**

`ip_address` The sFlow agent IP address.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip-address</code></td>
<td><code>0.0.0.0</code></td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to delete the IP address.
- If no IP address is configured, 0.0.0.0 is used.
- If no IP address is configured but the Loopback0 address is configured, the Loopback0 address is used.

**Examples**

- `-> sflow agent ip 192.168.1.1`
- `-> no sflow agent ip 192.168.1.1`

**Release History**

Release 7.1.1; command was introduced.
Release 7.3.4; command deprecated. Use `ip service source-ip`. 
Related Commands

**show sflow agent** Displays the agent table.

```
sflow receiver

Sets the destination hosts where the sFlow datagrams are sent out. If there are multiple destinations, then each destination has an instance of the receiver. All these receivers are attached to the sFlow manager instance and to an associated sampler/poller.

```
vrf {name} sflow receiver receiver_index {name string | timeout {seconds | forever} | address {ip_address | ipv6_address | domain_name} | udp-port port | packet-size size version num | release}
```

## Syntax Definitions

- **name**: The name of the VRF to be configured for the sflow receiver.
- **receiver_index**: The receiver index number.
- **string**: The name.
- **seconds | forever**: Specifies the timeout value.
- **ip_address**: Specifies the 32-bit IPv4 address.
- **ipv6_address**: Specifies the 128-bit IPv6 address.
- **domain_name**: Specifies a Fully Qualified Domain Name (FQDN). The domain name can be up to 255 characters in length.
- **port**: Specifies the UDP (destination) port.
- **size**: Specifies the maximum number of data bytes (size) that can be sent.
- **num**: Specifies the version number.

</tr>
</tbody>
</table>
Usage Guidelines

- Use the `release` parameter at the end of the command to delete a receiver.

- Use the `domain_name` option to specify an FQDN instead of an IPv4 or IPv6 address. The switch will then resolve the domain name to an IP address. Make sure the specified domain name maps to a valid and reachable address. If the address is not valid or cannot be reached, then flow and counter samples may not be sent out of the sFlow agent as expected.

- After the IPv4 or IPv6 address for the specified domain name is determined, a refresh is triggered every 30 seconds. If the mapping of the domain name to an IP address changes before the next refresh, both flow and counter samples are not sent to the new address until the next refresh occurs.

- If the VRF is not configured then the default VRF is applied.

Examples

- `sflow receiver 1 name Golden Rcvr1 address 198.206.181.3`
- `vrf ipvxlan sflow receiver 1 name Golden Rcvr1 address 198.206.181.3`
- `sflow receiver 1 name Golden Rcvr1 address upam.omnivista.com`
- `sflow receiver 1 release`

Release History

Release 7.1.1; command was introduced.
Release 8.5R1; `domain_name` parameter option added.
Release 8.9R1; `vrf` parameter introduced.

**sflow sampler**

Gets the hardware sampled from Q-dispatcher and fills up the sampler part of the UDP datagram.

```
<vrf {name} sflow sampler num port chassis/slot/port[-port] {receiver receiver_index | rate value | sample-hdr-size size}>
```

```
o sflow sampler num port [chassis_id/slot/port[-port]]
```

**Syntax Definitions**

- **name**: The name of the VRF to be configured for the sflow sampler.
- **num**: Specifies the instance ID.
- **chassis**: The chassis identifier.
- **slot/port[-port]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-5).
- **receiver_index**: Specifies the receiver index.
- **value**: Specifies the rate value for packet sampling.
- **size**: Specifies the maximum number of bytes (size) that can be copied from a sampled packet.

**Defaults**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to delete a sampler.
- A sampling rate of 1 counts all packets. A sampling rate of 0 disables sampling.
- If the VRF is not configured then the default VRF is applied.
Examples

-> sflow sampler 1 port 1/2/1 receiver 1 rate 5 sample-hdr-size 64
-> vrf ipvlan sflow sampler 1 port 1/2/1 receiver 1 rate 5 sample-hdr-size 64
-> no sflow sampler 1 port 1/2/1-5

<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- It is necessary to execute the ip interface command to make a loopback0 IP address as the fixed primary address of the switch to avoid interface changes, which might need the collector software to be restarted for it to communicate using the new agent IP address. Normally, the primary IP address could change depending on the IP interface going up/down. Therefore, the sFlow agent always needs to send a fixed IP address in the datagram.

- The loopback address should be an IP interface configured on the switch.

Examples

-> ip interface loopback0 address 198.206.181.100
-> show sflow agent
Agent Version = 1.3; Alcatel; 6.1.1
Agent IP = 127.0.0.1

50  RMON Commands

Remote Network Monitoring (RMON) probes can be used to monitor, manage, and compile statistical data about network traffic from designated active ports in a LAN segment without negatively impacting network performance. This feature supports basic RMON 4 group implementation compliant with RFC 2819 (Remote Network Monitoring Management Information Base), but does not support RMON 10 group or RMON 2. This chapter includes descriptions of RMON commands used to enable or disable individual (or a group of a certain flavor type) RMON probes, show a list of (or individual) RMON probes and show a list of (or individual) RMON logged events.

MIB information for the RMON commands is as follows:

  Filename:  RMON-MIB.mib  
  Module:    rmonMibModule

The following table summarizes the available commands:

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>rmon probes</td>
</tr>
<tr>
<td>show rmon probes</td>
</tr>
<tr>
<td>show rmon events</td>
</tr>
</tbody>
</table>
rmon probes

This command enables or disables types of RMON probes.

```
rmon probes {stats | history | alarm} [entry_number] {enable | disable}
```

**Syntax Definitions**

- **stats**: Ethernet Statistics Table probe entries.
- **history**: History Control Table probe entries.
- **alarm**: Alarm Table probe entries.
- **entry_number**: The entry number in the list of probes (optional).
- **enable**: Enables the RMON probe.
- **disable**: Disables the RMON probe.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

</table>

**Usage Guidelines**

- Network activity on subnetworks attached to the RMON probe can be monitored by NMS applications.
- RMON will not monitor activities on the CMM onboard Ethernet Management port.

**Examples**

- `rmon probes stats 4012 enable`
- `rmon probes history 10240 disable`
- `rmon probes alarm 11235 enable`
- `rmon probes stats enable`
- `rmon probes history disable`
- `rmon probes alarm enable`

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- **show rmon probes**: Displays a list of RMON probes or a single RMON probe.
- **show rmon events**: Displays a list of RMON logged events or a single RMON event.

MIB Objects

- **ETHERSTATSTABLE**
  - etherStatsStatus
- **HISTORYCONTROLTABLE**
  - historyControlStatus
- **ALARMTABLE**
  - alarmStatus
show rmon probes

Displays a list of RMON probes or a single RMON probe.

```
show rmon probes [stats | history | alarm] [entry_number]
```

Syntax Definitions

- **stats**: Ethernet Statistics Table probe entries.
- **history**: History Control Table probe entries.
- **alarm**: Alarm Table probe entries.
- **entry_number**: The entry number in the list of probes *(optional)*.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- To display a list of current probes, omit the *entry-number* from the command line.
- To display statistics for a particular probe, include the probe’s *entry_number* in the command line.
- The *show rmon probes* command displays the following information: Entry number, Slot/Port, Flavor (whether the probe type is Ethernet, History or Alarm), Status (Active or Inactive), Duration (time since the last change in status, in hours/minutes) and System Resources (the amount of memory allocated to this probe).
- The *show rmon probes entry-number* command displays the following information: Probe’s Owner (probe type and location), Slot/Port, Entry number, Flavor (whether the probe type is Ethernet, History or Alarm), Status (Active or Inactive), Time since the last change in status (hours/minutes), and System Resources (the amount of memory allocated to this probe). Displayed statistics may vary, depending on whether the probe type is Ethernet, History or Alarm.

Examples

```
-> show rmon probes stats

Chassis/
Entry  Slot/Port  Flavor  Status  Duration  System Resources
--------+----------+---------+---------+-----------+-----------------+
1026 1/1/26  Ethernet  Active  71:49:41  301 bytes
```

 OmniSwitch AOS Release 8 CLI Reference Guide   April 2023   page 50-4
1025 1/1/25  Ethernet  Active      71:49:20     301 bytes
1001 1/1/1  Ethernet  Active      71:48:05     300 bytes

-> show rmon probes history

Chassis/
Entry  Slot/Port    Flavor    Status      Duration     System Resources
-------+----------+---------+-----------+------------+----------------
1     1/1/26     History   Active      71:50:08     5471 bytes
2     1/1/25     History   Active      71:49:47     5471 bytes
3     1/1/1      History   Active      71:48:32     5470 bytes
4     1/1/22     History   Active      71:48:30     5471 bytes
5     1/1/23     History   Active      71:48:30     5471 bytes

-> show rmon probes alarm

Entry Slot/Port Flavor Status Duration System Resources

<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- To display a list of logged events, omit the *entry_number* from the command line.
- To display statistics for a particular event, include the *entry_number* in the command line.
- The *show rmon events* command displays the following information for all RMON Logged Events:  
  Entry number, Time (hours/minutes/seconds) since the last change in status and Description (nature of the event).
- The *show rmon events entry_number* command displays the following information for a particular RMON Logged Event: Entry number, Time (hours/minutes/seconds) since the last change in status and Description (nature of the event).

**Examples**

```plaintext
-> show rmon events

<table>
<thead>
<tr>
<th>Entry</th>
<th>Time</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>00:08:00</td>

</thead>
<tbody>
<tr>
<td>Time</td>
<td>Time (hours, minutes, and seconds) since the last change in status.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the Alarm condition detected by the probe.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `rmon probes` Enables or disables types of RMON probes.
- `show rmon probes` Displays RMON probes or a single RMON probe.

**MIB Objects**

EVENTTABLE

- `eventIndex`
This chapter includes descriptions for Switch Logging commands. These commands are used to configure parameters for the Switch Logging utility.

MIB information for the system commands is as follows:

- **Filename:** ALCATEL-IND1-SYSTEM-MIB.mib
- **Module:** alcatelIND1SystemMIB

A summary of the available commands is listed here.

```
swlog
swlog syslog-facility-id
swlog appid
swlog output
swlog output flash-file-size
swlog advanced
swlog size-trap-threshold
swlog clear
show log swlog
show swlog
swlog console level
show log events
show log events output
```
swlog

Enables or disables switch logging. Switch logging allows you to view a history of various switch activities in a text format.

swlog {enable | disable | preamble | hash-time-limit seconds | duplicate-detect | console level num }

no swlog [preamble | duplicate-detect]

Syntax Definitions

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of the command to enable or disable the preamble and duplicate-detect setting.
- The syslog preamble includes the level, appid, and timestamp that precedes the actual log messages.
- If duplicate entries are received within the configured hash-time-limit, only a single entry will be logged along with the number of times duplicated.
• Use the `swlog console level` command to set the switch logs of different levels to be displayed on the console.

**Examples**

-> swlog enable
-> swlog hash-time-limit 30
-> no swlog preamble

**Release History**

Release 7.1.1; command was introduced.
Release 8.3.1.R02; `gmt-time` parameter added.
Release 8.4.1; `gmt-time` parameter removed.

**swlog syslog-facility-id**

Specifies a facility ID that switch logging includes in the priority (PRI) section of the event message.

```
swlog syslog-facility-id {facility_id | num}
```

### Syntax Definitions

- **facility_id**
  - A facility identification keyword. Current facility IDs are listed in the table below.
- **num**
  - A numerical equivalent value for the facility ID. The range is 0–23. Current numeric equivalent values are listed in the table below.

### Supported Facility IDs with Numerical Equivalents

<table>
<thead>
<tr>
<th>Facility ID</th>
<th>Numerical Equivalent</th>

MIB Objects

systemSwitchLogging
  systemSwitchLoggingSysLogFacilityId
swlog appid

Defines the level at which switch logging information will be filtered for the specified application. All application events of the defined level and lower are captured.

swlog appid {all | string} {library {all | string} | subapp {all | num} | exclude {all | num}} {disable | enable} level {level | num} [vrf num]

Syntax Definitions

string
An application or library identification keyword. Enter a question mark (?) on the command line to get a list of application or library IDs.

subapp num
A numerical equivalent value for the subapp ID. Enter a question mark (?) on the command line to get a list of subapp IDs.

exclude num
A numerical equivalent value for the subapp ID. Enter a question mark (?) on the command line to get a list of subapp IDs.

disable
Disables the logging of the associated application.

enable
Enables the logging of the associated application.

level level | num
The severity level filter keyword or numerical equivalent value for the application ID (see table below). All switch logging messages of the specified level and lower will be captured. The severity level is a value assigned to the relative severity of the switch logging message. A lower value indicates messages that are more severe, a higher value indicates messages that are less severe.

vrf num
The VRF ID.

<table>

</tr>
</tbody>
</table>

Usage Guidelines

- Use the `show swlog appid` command to display available registered applications.
- Specify the `event` severity level keyword to define the new event level at which switch logging information will be filtered for the specified application.

Examples

- `swlog appid all subid all enable`
- `swlog appid mvrpNi subapp 1 level 8`
- `swlog appid all supapp all level event`
- `swlog appid all library all level event`
- `swlog appid all exclude all level event`
- `show swlog appid mvrpNi`

Application Name : mvrpNi,

<table>
<thead>
<tr>
<th>SubAppl ID Sub Application Name</th>

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; exclude parameter added.
Release 8.6.R1; event severity level keyword added.

Related Commands

swlog Enables or disables switch logging.
swlog output Enables or disables switch logging output to the console, file, or data socket.
show log swlog Displays stored switch logging information from flash.
show swlog Displays switch logging information.
swlog console level Allows to set the switch logs of different levels to be displayed on the console. All application events of defined level and lower are displayed on the console.

MIB Objects

systemSwitchLogging
    systemSwitchLoggingAppName
    systemSwitchLoggingLibraryName
    systemSwitchLoggingLevel
**swlog output**

Enables or disables switch logging output to the console, file, data socket (remote session), or external syslog server.

```bash
swlog {host | ni} [slot chassis/slot] output {tty {enable | disable} | console | flash | socket {ip_address [port] | ipv6Address [port] | domain_name | console {enable | disable}} [tls] [remote command-log] [vrf-name name]}
```

```bash
no swlog output {console | flash | socket [ip_address | ipv6Address | domain_name]}
```

**Syntax Definitions**

- **tty enable**
  Enables switch logging to a connected Telnet session.

- **tty disable**
  Disables switch logging to a connected Telnet session.

- **host**
  Enable or disable host logging to remote syslog server.

- **ni**
  Enable or disable NI logging to remote syslog server.

- **slot chassis/slot**
  The chassis ID and slot ID of the NI output socket.

- **console**
  Specifies console output. When enabled, switch logging output is printed to the user console.

- **flash**
  Specifies /flash file output. When enabled, switch logging output is printed to a file in the switch’s /flash file system.

- **socket**
  Specifies data socket output. When enabled, switch logging output is printed to a remote session.

- **ip_address**
  The IPv4 address for the remote session host.

- **ipv6Address**
  The IPv6 address for the remote session host.

- **port**
  The socket port number.

- **domain_name**
  A Fully Qualified Domain Name (FQDN) for the remote session host. Specify a domain name up to 128 characters in length.

- **console enable**
  Enables uploading of the console log(s) to the remote syslog server.

- **console disable**
  Disables uploading of the console log(s) to the remote syslog server.

- **tls**
  Enables or disables syslog over TLS.

- **remote command-log**
  Enables command logging to a remote session host.

- **name**
  Specifies the VRF to be used to access the remote syslog server.

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the **no** form of this command to disable one or more configured output IP addresses.
- This command can also be used on the secondary CMM.
- Use the **socket** keyword to send output to a syslog server, followed by the IP address or FQDN of the remote host. Up to 12 servers can be configured. When an FQDN is specified, the switch will resolve the domain name to an IP address. Make sure the domain name maps to a valid and reachable IP address.
- To enable uploading of console logs to a remote syslog server, it is mandatory to have at least one remote syslog server configured (**swlog output socket <ip_address>**). If there is no UDP remote syslog server configured, an error message will be displayed.
- To enable host and NI logging to remote syslog server, it is mandatory to have at least one remote syslog server configured (**swlog output socket <ip_address>**).
- The host and NI logging to remote syslog server is supported only on OS9900.
- When all the configured remote syslog server is removed, the status of all NI and host remote logging is automatically set to disabled.
- Syslog over TLS:
  - Remote command log will not work when syslog over TLS is enabled.
  - VRF cannot be used to access the syslog server when syslog over TLS is enabled.
  - In OmniSwitch 9900 only CMM swlog is transferred to the external syslog server over TLS.
  - Dying Gasp syslog messages are not captured in syslog over TLS.
  - Use the **no** form of the command to disable syslog over TLS.
- VRF name must either be ‘default’ or a pre-defined VRF (user-defined).

Examples

- `-> swlog output console`
- `-> no swlog output flash`

swlog output flash-file-size

Configures the size of the switch logging file.

**swlog output flash-file-size kilobytes**

---

### Syntax Definitions

**kilobytes**  
The size of the switch logging file in kilobytes. The range is 125–12500.

---

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>kilobytes</td>
<td>1250</td>
</tr>
</tbody>
</table>

---

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>Yes</td>
<td>Yes</td>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

### Usage Guidelines

- Use the **show hardware-info** command to determine the amount of available flash memory.
- This command can also be used on the secondary CMM.

---

### Examples

```
-> swlog output flash-file-size 256
```

---

### Release History

Release 7.1.1; command was introduced.
Related Commands

- **swlog advanced**  
  Clears the files that store switch logging data.
- **show log swlog**  
  Displays stored switch logging information from flash.
- **show swlog**  
  Displays switch logging information.

MIB Objects

- **systemSwitchLogging**
  - **systemSwitchLoggingFileSize**
**swlog advanced**

Enable or disable switch logging in RFC5424 format.

```
swlog advanced {enable | disable}
```

---

**Syntax Definitions**

- **enable**: Enable switch logging in RFC5424 format.
- **disable**: Disable switch logging in RFC5424 format.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- By default, the switch logs the messages in BSD syslog format (RFC3164) to files and remote syslog servers.

- When switch logging RFC5424 format is enabled, the old RFC3164 syslog messages are reformatted to comply with the RFC5424 before writing to files or sending to remote syslog servers.

---

**Examples**

```
-> swlog advanced enable
-> swlog advanced disable
```

---

**Release History**

Release 8.4.1; command introduced.
**Related Commands**

**show swlog**
Displays switch logging information.

**MIB Objects**

```mib
systemSwitchLoggingSyslogProtocol
```
**swlog size-trap-threshold**

Configures the threshold limit of the storage space used for swlog record storage. When the storage reaches the configured threshold limit a notification is displayed in the swlog message.

**swlog size-trap-threshold** *threshold*

---

### Syntax Definitions

*threshold* The percentage of storage space to be set as threshold limit. The valid range is 50–90.

---

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>threshold</td>
<td>90</td>
</tr>
</tbody>
</table>

---

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

### Usage Guidelines

- Use this command to configure the threshold limit of the storage space used for swlog record storage.
- Use the **swlog clear** command to clear the files that store switch logging data.

---

### Examples

-> swlog size-trap-threshold 90

---

### Release History

Release 8.4.1; command introduced.
Related Commands

swlog clear  Clears the files that store switch logging data.
show log swlog  Displays stored switch logging information from flash.
show swlog  Displays switch logging information.

MIB Objects

systemSwitchLoggingSizeTrapThreshold
swlog clear

Clears the files that store switch logging data.

swlog clear [all]

Syntax Definitions

all

Clears all the contents of the switch log file.

Defaults

By default, the contents of the switch log file is cleared but the event logs are retained.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<td></td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use this command when the switch logging display is too long due to some of the data being old or out of date.
- This command can also be used on the secondary CMM.
- To clear all the contents including the event log use the “all” parameter with swlog clear command.

Examples

-> swlog clear
-> swlog clear all

Release History

Release 7.1.1; command was introduced.
Release 8.6R2; all parameter added.
Related Commands

- **swlog output**: Enables or disables switch logging output to the console, file, or data socket.
- **show log swlog**: Displays stored switch logging information from flash.
- **show swlog**: Displays switch logging information.

MIB Objects

- **systemSwitchLogging**
- **systemSwitchLoggingClear**
**show log swlog**

Displays stored switch logging information.

```
show log swlog
show log swlog [timestamp mm/dd/yyyy hh:mm:ss] [slot num] [reverse]
```

**Syntax Definitions**

- `mm/dd/yyyy hh:mm:ss`: Specify the starting time for the switch logging information to be displayed. Use the format `mm/dd/yyyy hh:mm:ss` where `mm` represents the month, `dd` is the day, `yyyy` is the year, `hh` is the hour, `mm` is the minutes and `ss` is the seconds. Use four digits to specify the year.

- `num`: The slot number to display the logging information for. *Currently not supported.*

- `reverse`: Display logs from the most recent to the oldest in time order of log files. `/flash/`.

**Default**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Compatibility</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When the switch logging display is too long, you may use the `swlog advanced` command to clear all of the switch logging information.

- The use of `grep` and the `timestamp` parameter can be used to filter the log files.

- When the switch is in ASA enhanced mode, both user name and password is prompted to view the SWLOG data using `show log swlog` command. Only those users who provide the valid ASA credentials are allowed to view the data. For more information on Authenticated Switch Access - Enhanced Mode mode, refer to the “Managing Switch Security” chapter in *OmniSwitch AOS Release 8 Switch Management Guide.*

**Examples**

```
-> show log swlog timestamp 09/30/2011 13:27:00
Displaying file contents for '/flash/swlog.6'
```
Switch Logging Commands

Displaying file contents for '/flash/swlog.5'
<output truncated>

Sep 30 13:27:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!

-> show log swlog | grep ChassisSupervisor
Displaying file contents for '/flash/swlog.6'
Displaying file contents for '/flash/swlog.5'
<output truncated>

Sep 28 13:25:15 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!

Sep 30 13:26:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!

Sep 30 13:27:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!

When the switch is in ASA enhanced mode, both user name and password is prompted to view the SWLOG data using show log swlog command.

-> show log swlog
Username: test
Password: ********

show log swlog | grep error and show log swlog | grep more commands are not supported in enhanced mode.

Release History

Release 7.1.1; command was introduced.

Related Commands

- **swlog**
  Enables or disables switch logging.
- **swlog appid**
  Adds or removes a filter level for a specified subsystem.
- **swlog output**
  Enables or disables switch logging output to the console, file, or data socket.
- **swlog advanced**
  Clears the files that store switch logging data.
- **show swlog**
  Displays switch logging information.

MIB Objects

| N/A |
**show swlog**

Displays switch logging information (for example, switch logging status, log devices, application IDs with non-default severity level settings).

```
show swlog [library | appid {all | string} | dying-gasp-station]
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>library</td>
<td>Displays the entire library for all application IDs.</td>
</tr>
<tr>
<td>string</td>
<td>The name of the application ID to display. Enter a question mark (?) on the command line to get a list of application IDs.</td>
</tr>
<tr>
<td>dying gasp-station</td>
<td>Displays switch logging information for Dying Gasp entries.</td>
</tr>
</tbody>
</table>

### Defaults

By default, the switch logging configuration for the switch is displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; dying-gasp-station parameter added.
Release 8.3.1.R02; GMT time logging field added.
Release 8.4.1; GMT time logging field replaced with RFC5424 Format Logging. Swlog Threshold.
Release 8.6R1; Syslog over TLS field added in show swlog output.
Release 8.8R1; Host output socket, Output Socket Console, NI output socket field added in show swlog output.

Related Commands

swlog Enables or disables switch logging.
slog syslog-facility-id Configures the value of the facility ID that switch logging includes in the priority (PRI) section of the event message.
swlog appid Defines the level at which switch logging information will be filtered for the specified application.
swlog output Enables or disables switch logging output to the console, file, or data socket.
swlog output flash-file-size Configures the size of the switch logging file.
swlog size-trap-threshold Configures the threshold limit of the storage space used for swlog record storage.
show log swlog Displays stored switch logging information from flash.
show log events Displays customer event logs on the switch.
show log events output Captures all event log to a specified file name on the switch.

**swlog console level**

Allows to set the switch logs of different levels to be displayed on the console. All application events of defined level and lower are displayed on the console.

```
swlog console level {num | alarm | alert | debug1 | debug2 | debug3 | error | info | off | warning }
```

### Syntax Definitions

- **console level num**
  The severity level filter keyword or numeric value for the application ID. *(see table for swlog appid command)*.
- **alarm**
  Sets the log level to display highest severity. *(The system is about to crash and reboot)*
- **alert**
  Sets the log level to display on console when a violation has occurred.
- **debug1**
  Sets the log level to display normal event debug message to be displayed on console.
- **debug2**
  Sets the log level to display a debug-specific message to be displayed on console.
- **debug3**
  Sets the log level to display all debug messages on the console.
- **error**
  Sets the log level to display on console when system functionality is reduced.
- **info**
  Sets the log level to display any other non-debug message on the console.
- **off**
  Sets the log level as disabled. No logs are displayed on the console.
- **warning**
  Sets the log level to display on console when an unexpected, non-critical event has occurred.

### Defaults

<table>

### Usage Guidelines

- Use the `show swlog` command to display the console display level.
**Examples**

-> swlog console level 5  
-> swlog console level info

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **swlog appid**
  Defines the level at which switch logging information will be filtered for the specified application.

- **swlog output**
  Enables or disables switch logging output to the console, file, or data socket.

- **show log swlog**
  Displays stored switch logging information from flash.

- **show swlog**
  Displays switch logging information.

- **show log events**
  Displays customer event logs on the switch.

- **show log events output**
  Captures all event log to a specified file name on the switch.

**MIB Objects**

- **systemSwitchLogging**
  - **systemSwitchLoggingConsoleLevel**
**show log events**

Displays customer event logs on the switch.

```plaintext
show log events
```

## Syntax Definitions

-> show log events
2019 Apr 28 19:17: 8.83  : CMM : ChassisSupervisor : chassisTrapsAlert - CERTIFY w/FLASH SYNCHRO process started
2019 Apr 28 19:25:25.303 : CMM : ChassisSupervisor : The switch was restarted by the user
```

## output definitions

The log output is in the following format:

```
<SWLOG TIMESTAMP> : <CMM>/<NI> : <MODULE_NAME> : <LOG_DESCRIPTION>
```
Release History

Release 8.6R1; command was introduced.

MIB Objects

| N/A |
show log events output

Captures all event log to a specified file name on the switch.

**show log events output** filename

---

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use this command to capture all event log to a filename.
- All the logs related to customer events will be appended “CUSTLOG” to the prefix to differentiate events from normal debug logs.

**Examples**

-> show log events output /flash/myevents

**Release History**

Release 8.6R1; command was introduced.
Related Commands

**show log events**  Displays customer event logs on the switch.

**swlog output**  Enables or disables switch logging output to the console, file, or data socket.

**show log swlog**  Displays stored switch logging information from flash.

**show swlog**  Displays switch logging information.

MIB Objects

| N/A |
The Health Monitoring function monitors the consumable resources of the switch (for example, bandwidth usage, CPU usage) and provides a single integrated resource for a Network Management System (NMS). This function monitors the switch, and at fixed intervals, collects the current values for each resource being monitored. Users specify resource threshold limits and traps are sent to an NMS if a value falls above or below a user-specified threshold.

The Health Monitoring commands comply with RFC1212.

MIB information for the Health Monitoring commands is as follows:

Filename: ALCATEL-IND1-HEALTH-MIB.mib
Module: alcatelIND1HealthMonitorMIB

A summary of the available commands is listed here:

- `health threshold`
- `health interval`
- `show health configuration`
- `show health`
- `show health all`
**health threshold**

Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage, CPU usage, and flash usage.

Input traffic, output/input traffic, memory usage, and CPU usage thresholds specify the maximum percentage for each resource that may be consumed before a trap is sent to the user.

```
health threshold {rx percent | txrx percent | memory percent | cpu percent | flash percent}
```

**Syntax Definitions**

- **rx** Specifies the maximum input (RX) traffic threshold.
- **txrx** Specifies the maximum output/input (TX/RX) traffic threshold.
- **memory** Specifies the maximum RAM memory usage threshold.
- **cpu** Specifies the maximum CPU usage threshold.
- **flash** Specifies the maximum flash usage threshold.
- **percent** The new threshold value, in percent, for the corresponding resource (rx, txrx, memory, cpu, flash). The valid range is 1–100.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>percentage</td>
<td>80</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When a resource falls back below the configured threshold, an additional trap is sent to the user. This indicates that the resource is no longer operating beyond its configured threshold limit.

- Changing a threshold value sets the value for all levels of the switch (the switch, module, and port). You cannot set different threshold values for each level.

- For detailed information on each threshold type, refer to page 52-5, or refer to the chapter titled “Diagnosing Switch Problems” in the OmniSwitch AOS Release 8 Network Configuration Guide.

- To view the current health threshold values, use the `show health configuration` command.
Examples

-> health threshold rx 85
-> health threshold txrx 55
-> health threshold memory 95
-> health threshold cpu 85

Release History

Release 7.1.1; command introduced.

Related Commands

show health configuration Displays the current health threshold settings.

MIB Objects

HealthThreshInfo
  healthThreshDeviceRxLimit
  healthThreshDeviceTxRxLimit
  healthThreshDeviceMemoryLimit
  healthThreshDeviceCpuLimit
  healthThreshFlashLimit
**health interval**

Configures the sampling interval between health statistics checks. The sampling interval is the time interval between polls of the consumable resources of the switch to see if it is performing within set thresholds.

**health interval seconds**

**Syntax Definitions**

`seconds` Sampling interval (in seconds). Valid entries are 10, 12, 15, 20, 30.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>10</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Decreasing the polling interval may impact switch performance.

**Examples**

-> health interval 20

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

`show health` Displays the current health sampling interval.

**MIB Objects**

HealthThreshInfo

  healthSamplingInterval
**show health configuration**

Displays current health configuration settings.

```
show health configuration
```

---

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

N/A

**Examples**

```
-> show health configuration
Rx Threshold = 80,
TxRx Threshold = 80,
CPU Threshold = 80,
Memory Threshold = 80,
Flash Threshold = 80,
Sampling Interval (Secs) = 10
```
**output definitions**

| **Rx Threshold** | The current device input (RX) threshold. This value displays the maximum percentage of total bandwidth allowed for incoming traffic on the switch. The total bandwidth is defined as the Ethernet port capacity for all NI modules currently operating in the switch, in Mbps. For example, a chassis with 48 100Base-T Ethernet ports installed has a total bandwidth of 4800 Mbps. The default value is 80 percent and can be changed using the `health threshold` command. |
| **TxRx Threshold** | The current device output/input (TX/RX) threshold. This value displays the maximum percentage of total bandwidth allowed for all incoming and outgoing traffic. As with the RX threshold described above, the total bandwidth is defined as the Ethernet port capacity for all the NI modules currently operating in the switch, in Mbps. The default value is 80 percent and can be changed using the `health threshold` command. |
| **CPU Threshold** | Displays the current CPU usage threshold. CPU usage refers to the total amount of CPU processor capacity currently used by switch applications. The default value is 80 percent and can be changed using the `health threshold` command. |
| **Memory Threshold** | Displays the current memory usage threshold. Memory usage refers to the total amount of RAM memory currently used by switch applications. The default value is 80 percent and can be changed using the `health threshold` command. |
| **Flash Threshold** | Displays the current flash usage threshold. The default value is 80 percent and can be changed using the `health threshold` command. |
| **Sampling Interval** | Displays the sampling interval time period in seconds. Sampling interval can be changed using the `health interval` command. |

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `health threshold` Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage and CPU usage.
- `health interval` Configures the sampling interval between health statistics checks.

**MIB Objects**

- HealthThreshInfo
  - `healthThreshDeviceRxLimit`
  - `healthThreshDeviceTxRxLimit`
  - `healthThreshDeviceMemoryLimit`
  - `healthThreshDeviceCpuLimit`
show health

Displays the health statistics for the switch. Statistics are displayed as percentages of total resource capacity and represent data taken from the last sampling interval.

**show health [port chassis/slot/port | slot chassis/slot[-slot2]] [statistics]**

---

**Syntax Definitions**

- **chassis**: The chassis identifier.
- **slot/port**: To view a specific port, enter the slot and port number (3/1) along with the **port** keyword (port 3/1).
- **slot[-slot2]**: To view a series of slots, enter the range of slot numbers along with the **slot** keyword (1-10).
- **statistics**: Optional command syntax. It displays the same information as the **show health** command.

---

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If no slot or port information is specified, the aggregate health statistics for all ports is displayed.

**Examples**

```bash
-> show health
CMM Resources Current 1 Min 1 Hr 1 Day
-------------------+---------+-------+------+
CPU                0       0     0     0
Memory             30      30     24    24

-> show health port 1/1/24
Port 1/1/24 Resources Limit Current 1 Min 1 Hr 1 Day
-------------------+---------+-------+------+
Receive            80      01     01    01    01
Transmit/Receive   80      01     01    01    01
```

OmniSwitch AOS Release 8 CLI Reference Guide April 2023
Output definitions

- **Receive**: Traffic received by the switch.
- **Transmit/Receive**: Traffic transmitted and received by the switch.
- **Memory**: Switch memory.
- **CPU**: Switch CPU.
- **Limit**: Currently configured device threshold levels.
- **Curr**: Current device bandwidth usage.
- **1 Min Avg**: Average device bandwidth usage over a 1-minute period.
- **1 Hr Avg**: Average device bandwidth usage over a 1-hour period.
- **1 Hr Max**: Maximum device bandwidth usage over a 1-hour period (the maximum of the 1 minute averages).

Release History

Release 7.1.1; command introduced.
Release 8.5R1; **Limit** output field included.

Related Commands

- **show health all**: Displays health statistics for a specified resource on all NIs currently operating in the chassis.

show health all

Displays health statistics for a specified resource on all *active NI modules* installed in the chassis.

```
show health all {memory | cpu | rx | txrx}
```

**Syntax Definitions**

- **memory**: Displays the RAM memory health statistics for all active NI modules in the switch.
- **cpu**: Displays the CPU health statistics for all active NI modules.
- **rx**: Displays the health statistics for traffic *received* on all active NI modules.
- **txrx**: Displays the health statistics for traffic both *transmitted and received* on all active NI modules.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

Service provider networks are large and complex with a wide user base, and they often involve different operators that must work together in order to provide end-to-end services to enterprise customers. Operations, Administration, and Maintenance (OAM) provides service assurance over a converged network that service providers are looking for in an Ethernet network. Ethernet OAM addresses areas such as availability, mean time to repair and more. Ethernet OAM focuses on two main areas that are most in need by service providers and are rapidly evolving in the standards bodies, Service OAM and Link OAM. These two OAM protocols have unique objectives but are complementary to each other. Service OAM provides monitoring and troubleshooting of end-to-end Ethernet service instances, while Link OAM allows a provider to monitor and troubleshoot an individual Ethernet link.

MIB information for the Ethernet OAM commands is as follows:

<table>

**ethoam vlan**

Creates an association between Primary VID and Non-Primary VID(s).

```
ethoam vlan vlanid_list primary-vlan vlan_id
```

```
no ethoam vlan vlanid_list
```

**Syntax Definitions**

- `vlanid_list` A list of VLAN Identifiers (e.g., ’10 30-40’ or ’10’).
- `vlan_id` VLAN Identifier (e.g., ’20’).

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Each VLAN ID specified must be created before creating any association.
- Each VLAN ID specified must be between 1 and 4094.
- Each VLAN ID specified must be static.
- A Non-Primary VID can only be associated with single Primary VID.
- Once Primary VID is associated with Non-Primary VID, then it can not be configured as Non-Primary VID. Its association must be removed before it is configured as Non-Primary VID.
- This CLI shall trigger Automip for this VLAN, if either ‘mhf’ is enabled for MA or default-MD with primary VLAN same as the primary VLAN of this VLAN.
- If the VLAN is deleted using VLAN CLI (no vlan vlan_id) and VLAN is non-primary, then the entry for this VLAN in the VLAN table will be deleted. This shall in turn delete all MEPs and MIPs associated with it. If the deleted VLAN is primary VLAN, then all its associated VLAN entries in the VLAN table shall be deleted. This shall in turn delete all MAs on this deleted VLAN.
- Use the no form of this command to dissociate Primary VID from the Non-Primary VID(s).

**Examples**

```
-> ethoam vlan 10 primary-vlan 20
```
-> ethoam vlan 11-15 primary-vlan 20
-> ethoam vlan 30 40-50 primary-vlan 20
-> no ethoam vlan 10

**Release History**

Release 7.3.1; command was introduced.

**Related Commands**

- **show ethoam vlan**
  Displays the Ethernet OAM statistics of all the Management Domains configured on the bridge.

**MIB Objects**

dotlagCfmVlanTable
  dotlagCfmVlanComponentId
  dotlagCfmVlanVid
  dotlagCfmVlanPrimaryVid
  dotlagCfmVlanRowStatus
**ethoam domain**

Creates an Ethernet domain with a specific name.

```
ethoam domain md_name format {none | dnsname | mac-address-uint | string} level num
```

```
no ethoam domain name
```

### Syntax Definitions

- **md_name**
  - Specifies the domain name.
- **none**
  - This format is supported for the inter-op with ITU-T Y.1731.
- **dnsname**
  - Domain Name like string, globally unique text string derived from a DNS name.
- **mac-address-uint**
  - MAC address + 2-octet (unsigned) integer.
- **string**
  - Character String.
- **num**
  - MD Level and it ranges from 0 to 7.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Maximum domain length is 43.
- Use format as ‘none’ for inter-op with ITU-T Y.1731.
- Domain name is unique in a system.
- Deletion of MD shall result in the deletion of all MAs, MEPs, and MIPs configured in the MD.

### Examples

- `-> ethoam domain MD format none level 3`
- `-> ethoam domain MD1 format string level 4`

### Release History

Release 7.3.1; command was introduced.
Related Commands

show ethoam
Displays the information of all the Management Domains (MD) configured on the bridge.

  dot1agCfmMdLevel
**ethoam domain mhf**

Configure the Message Handling Function (MHF) value for MD entry.

```
ethoam domain md_name mhf {none | explicit | default}
```

### Syntax Definitions

- **md_name**: Specifies the domain name used while creating the management domain for which this management association is created.
- **none**: No MHFs can be created.
- **explicit**: MHFs can be created only if a MEP is created at some lower MD Level.
- **default**: MHFs can be created.

---

**Usage Guidelines**

Domain must be created before it is modified.

---

**Examples**

```
-> ethoam domain MD id-permission chassisid
```

---

**Release History**

Release 7.3.1; command was introduced.
**Related Commands**

*show ethoam default-domain configuration*  
Displays the values of scalar Default-MD objects.

*show ethoam domain*  
Displays the information of a specific Management Domain configured on the bridge.

**MIB Objects**

dot1agCfmMdTable
  
dot1agCfmMdName
  
dot1agCfmMdIdPermission
**ethoam association**

Creates Maintenance Association (MA) entry.

```
ethoam association ma_name format {vpnid | unsignedint | string | primaryvid | icc-based} domain md_name
```

```
no ethoam association ma_name domain md_name
```

### Syntax Definitions

- **ma_name** Association name for the created Ethernet OAM Association.
- **vpnid** As specified in RFC 2685 VPN ID.
- **unsignedint** 2-octet unsigned integer.
- **string** Character String.
- **primaryvid** Primary VLAN ID (12 bits represented in a 2-octet integer).
- **icc-based** This format is supported for inter-op with ITU-T.
- **md_name** Specifies the domain name used while creating the management domain for which this management association is created.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Maximum association name is name 44 minus the length of its domain name.
- Use format as ‘icc-based’ to inter-op with ITU-T Y.1731.
- Domain must be created before the creation of MA.
- VLAN must be created before the creation of MA.
- VLAN specified must be a primary VID.
- Deletion of MA shall result in the deletion of MIPs and MEPs (on primary and non-primary VLAN) configured in it.
- Use the **no** form of the command to delete the Maintenance Association (MA) entry.
**Examples**

-> ethoam association MA format string domain MD
-> no ethoam association MA format string domain MD

**Release History**

Release 7.3.1; command was introduced.

**Related Commands**

ethoam association primary vlan

Creates a primary VLAN for the Maintenance Association (MA) entry.

```
ethoam association ma_name domain md_name primary-vlan vlan_id
no ethoam association ma_name domain md_name primary-vlan vlan_id
```

**Syntax Definitions**

- `ma_name` Association name for the created Ethernet OAM Association.
- `md_name` Specifies the domain name used while creating the management domain for which this management association is created.
- `vlan_id` Primary VLAN Identifier.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Domain must be created before the creation of MA.
- VLAN ID specified must be between 1 and 4094.
- Deletion of MA shall result in the deletion of MIPs and MEPs (on primary and non-primary VLAN) configured in it.
- Use the `no` form of the command to remove the Primary VLAN association.

**Examples**

```
-> ethoam association MA domain MD primary-vlan 100
-> no ethoam association MA domain MD primary-vlan 100
```

**Release History**

Release 7.3.1; command was introduced.
Related Commands

ethoam association id-permission

Configure id-permission value for MA Entry.

**ethoam association ma\_name domain md\_name id\_permission \{none | chassisid | defer\}**

### Syntax Definitions

- **ma\_name**: Association name for the created Ethernet OAM Association.
- **md\_name**: Specifies the domain name used while creating the management domain for which this management association is created.
- **none**: Sender ID TLV is not to be sent.
- **chassisid**: Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.
- **defer**: The contents of the Sender ID TLV are determined by the corresponding MD object ‘dot\_lag\_CfmMdIdPermission’.

### Defaults

  - `dot1agCfmMaNetName`
- `dot1agCfmMaCompTable`
  - `dot1agCfmMaCompMIdPermission`
**ethoam association ccm-interval**

Modifies the Continuity Check Message (CCM) transmission interval of an Ethernet OAM Maintenance Association.

```
ethoam association ma_name domain {md_name | mac_address} ccm-interval {interval-invalid | interval100ms | interval1s | interval10s | interval1m | interval10m}
```

### Syntax Definitions

- **ma_name**: Name of the Ethernet OAM Association.
- **md_name**: Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain command on page 53-5.
- **mac_address**: Specifies the CFM system MAC address.
- **interval-invalid**: Specifies that no CCMs are sent by a MEP.
- **interval100ms**: Specifies the CCMs are sent every 100 milliseconds.
- **interval1s**: Specifies that CCMs are sent every 1 second.
- **interval10s**: Specifies that CCMs are sent every 10 seconds.
- **interval1m**: Specifies that CCMs are sent every minute.
- **interval10m**: Specifies that CCMs are sent every 10 minutes.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval-invalid</td>
<td>interval10s</td>
</tr>
<tr>
<td>interval100ms</td>
<td>interval1s</td>
</tr>
<tr>
<td>interval10s</td>
<td>interval1m</td>
</tr>
<tr>
<td>interval10m</td>
<td></td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The **ma_name** should be unique amid all those used by or available to the service provider within a domain.
Examples
-> ethoam association MA domain MD ccm-interval interval10s

Release History
Release 7.3.1; command was introduced.

Related Commands
show ethoam domain Displays the information of a specific Management Domain configured on the bridge.

MIB Objects
dot1agCfmMaNetTable
dot1agCfmMaNetName
dot1agCfmMaCompTable
dot1agCfmMaCompMIdPermission
ethoam association endpoint-list

Modifies the MEP list of an Ethernet OAM Maintenance Association.

```
ethoam association ma_name domain {md_name | mac_address} endpoint-list mep_id[-mep_id2]
no ethoam association ma_name domain {md_name | mac_address} endpoint-list mep_id[-mep_id2]
```

## Syntax Definitions

- **ma_name**: Name of the Ethernet OAM Association.
- **md_name**: Specifies the domain name. For more information on the different formats of the domain name, refer to the [ethoam domain command](page 53-5) on page 53-5.
- **mac_address**: Specifies the CFM system MAC address.
- **mep_id[-mep_id2]**: Specifies the MEP number. Use a hyphen to specify a range of MEP numbers.

## Defaults

N/A

## Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>X48C4E/V48C8/C32E/T24C2/X24C2</td>
<td>No</td>
</tr>
</tbody>
</table>

## Usage Guidelines

- Use the **no** form of this command to remove the MEP list.
- Note that only the MEP that is associated with the MEP list of the MA can be configured locally on the bridge or monitored remotely.
- The **ma_name** should be unique within a domain.

## Examples

```
-> ethoam association MA domain MD endpoint-list 100-200
-> no ethoam association MA domain MD endpoint-list 100-200
```

## Release History

Release 7.3.1; command was introduced.

```

**Release History**

Release 7.3.1; command was introduced.

**Related Commands**

- `show ethoam default-domain configuration`: Displays the values of scalar Default-MD objects.

**MIB Objects**

- `dotlagCfmDefaultMdDefMhfCreation`
**ethoam default-domain id-permission**

Configures the effective ID permission value for all default domain entries with the ID permission value set to `defer`.

`ethoam default-domain id-permission {none | chassisid}`

`no ethoam default-domain`

**Syntax Definitions**

`none`  
Sender ID TLV is not to be sent.

`chassisid`  
Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.

**Defaults**

Default value is none.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

N/A

**Examples**

`-> ethoam default-domain id-permission chassisid`

**Release History**

Release 7.3.1; command was introduced.

**Related Commands**

`show ethoam default-domain configuration`  
Displays the default domain configuration.

**MIB Objects**

`dot1agCfmDefaultMdDefIdPermission`
ethoam default-domain primary-vlan

Configures the default domain settings for the specified primary VLAN.

```
ethoam default-domain primary-vlan {vlan_id} [level {no-level | num}] [mhf {none | default | explicit | defer}] [id-permission {none | chassisid | defer}]
```

```
no ethoam default-domain
```

### Syntax Definitions

- **vlan_id**: VLAN Identifier.
- **no-level**: MD level is inherited from the default domain level.
- **num**: MD Level. Valid range is 0 to 7.
- **none**: No MHFs can be created.
- **default**: MHFs can be created.
- **explicit**: MHFs can be created only if a MEP is created at some lower MD Level.
- **defer**: MHF defers to the default domain MHF value.
- **none**: Sender ID TLV is not to be sent.
- **chassisid**: Chassis ID Length, Chassis ID Subtype, and Chassis ID TLV are to be present.
- **defer**: ID permission defers to the default domain ID permission value.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>no-level</td>
<td>num</td>
</tr>
<tr>
<td>no-level</td>
<td>no-level</td>
</tr>
<tr>
<td>none</td>
<td>explicit</td>
</tr>
<tr>
<td>defer</td>
<td>defer</td>
</tr>
<tr>
<td>none</td>
<td>chassisid</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

On modification of MHF for any primary VID, Automip is invoked for all VLANs associated with this primary VID.
Examples

-> ethoam default-domain primary-vlan 10 id-permission chassid level 3 mhf default.
-> ethoam default-domain primary-vlan 10 id-permission chassid
-> ethoam default-domain primary-vlan 10 level 3
-> ethoam default-domain primary-vlan 10 mhf default
-> ethoam default-domain primary-vlan 10 level 3 mhf default

Release History

Release 7.3.1; command was introduced..

Related Commands

show ethoam default-domain  Displays the information of all the default MD.

MIB Objects

dotlagCfmDefaultMdTable
   dotlagCfmDefaultMdComponentId
dotlagCfmDefaultMdPrimaryVid
dotlagCfmDefaultMdLevel
**ethoam endpoint**

Creates a Maintenance End Point (MEP) and virtual MEP.

```
ethoam endpoint mep_id domain md_name association ma_name direction {up | down} {port chassis/slot/port | virtual | linkagg agg_id} [primary-vlan vlan_id | cvlan cvlan_id]
```

```
no ethoam endpoint mep_id domain md_name association ma_name
```

**Syntax Definitions**

- `mep_id`: Specifies the Maintenance Association End Point. The range is 1–8191.
- `md_name`: Specifies the domain name. For more information on the different formats of the domain name, refer to `ethoam domain`.
- `ma_name`: Association name for the created Ethernet OAM Association.
- `up`: For UP MEP.
- `down`: For DOWN MEP.
- `chassis`: The chassis identifier.
- `slot/port`: Physical slot and port number on which MEP needs to be created.
- `virtual`: Keyword for creating virtual MEP.
- `agg_id`: Linkagg Identifier on which MEP needs to be created.
- `vlan_id`: VLAN Identifier.
- `cvlan_id`: Specifies the customer VLAN of the MEP. *This parameter is supported only on the OmniSwitch 6465 and OmniSwitch 6865.*

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to delete a maintenance endpoint.
- The `mep_id` must be unique amid all those used by or available to the service provider in the specified MA.
- The direction for virtual MEP must always be up.
For creating a virtual MEP the value of port must be given the keyword “virtual”.

- The CVLAN must be part of the allowed CVLAN list.
- The direction of CVLAN based MEP must always be configured as ‘UP’.
- The CVLAN based MEP must be configured on the UNI port.
- The CVLAN ID must be associated to the SVLAN (MA VLAN) and the UNI port using Ethernet service configuration.
- The SAP profile of the SVLAN (MA VLAN), CVLAN, and UNI port must be in ‘tag preserve’ mode.
- The removal of SAP, UNI port from SAP, CVLAN from the SAP, or changing the SAP profile to ‘tag translate mode’ removes the corresponding CVLAN based MEPS automatically.

**Examples**

-> ethoam endpoint 10 domain MD association MA direction up port 1/1/1
-> ethoam endpoint 10 domain MD association MA direction down linkagg 1
-> ethoam endpoint 10 domain MD association MA direction down linkagg 1 vlan 10
-> ethoam endpoint 1 domain md1 association ma1 direction up port virtual primary-vlan 100
-> ethoam endpoint 1 domain md1 association ma1 direction up port virtual primary-vlan 20
-> no ethoam endpoint 10 domain MD association MA

**Release History**

Release 7.3.1; command was introduced.
Release 8.8R1; cvlan parameter added.

ethoam endpoint admin-state

Configures the administrative state of MEP.

```
ethoam endpoint mep_id domain {md_name | mac_address} association ma_name admin-state {enable | disable}
```

**Syntax Definitions**

- `mep_id` Specifies the Maintenance Association End Point. The range is 1–8191.
- `md_name` Specifies the domain name. For more information on the different formats of the domain name, refer to `ethoam domain`.
- `mac_address` Specifies the CFM system MAC address.
- `ma_name` Association name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
- `enable` Administratively enables MEP.
- `disable` Administratively disables MEP.

**Defaults**

The default value is disable.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

ethoam endpoint rfp

Enables or disables the Remote Fault Propagation (RFP) on MEP.

ethoam endpoint mep_id domain {md_name | mac_address} association ma_name rfp {enable | disable}

Syntax Definitions

mep_id Specifies the Maintenance Association End Point. The range is 1–8191.
md_name Specifies the domain name. For more information on the different formats of the domain name, refer to ethoam domain.
mac_address Specifies the CFM system MAC address.
ma_name Association name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
enable Administratively enables RFP on MEP.
disable Administratively disables RFP on MEP.

Defaults

The default value of RFP is disable.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The mep_id specified must already exist in the switch configuration.
- The domain and association must be created before RFP can be enabled.
- The MEP must be an UP MEP. If down MEP is specified, CLI returns with an error.
- The admin state of the MEP must be enabled in order to report faults.
- RFP cannot be enabled on virtual UP MEP since it is not associated with a physical interface.
- It is recommended that if RFP is enabled on a port, then any other violation feature (Link Monitoring or Link Fault Propagation) should not be configured.
- It is recommended that if RFP is enabled on a port, then automatic recovery is disabled for that port.
- If Link Monitoring is configured on a RFP enabled port, then the wait-to-restore timer must be less than the CCM interval.
**Examples**

`-> ethoam endpoint 1 domain md1 association ma1 rfp enable`
`-> ethoam endpoint 1 domain md1 association ma1 rfp disable`

**Release History**

Release 7.3.1; command was introduced.

ethoam endpoint ccm

Configures the MEP to generate Continuity Check Messages (CCM).

`ethoam endpoint mep_id domain {md_name | mac_address} association ma_name ccm {enable | disable}`

**Syntax Definitions**

- **mep_id**
  - Specifies the Maintenance Association End Point. The range is 1–8191.

- **md_name**
  - Specifies the domain name. For more information on the different formats of the domain name, refer to `ethoam domain`.

- **mac_address**
  - Specifies the CFM system MAC address.

- **ma_name**
  - Name of the Ethernet OAM association. Up to 48 (minus the domain name length) characters may be used.

- **enable**
  - Enables MEP to generate CCMs.

- **disable**
  - Disables MEP to generate CCMs.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

**ethoam endpoint priority**

Configures the priority values for CCMs and Linktrace Messages (LTMs) transmitted by a MEP.

```
ethoam endpoint mep_id domain {md_name | mac_address} association ma_name priority ccm_ltm_priority
```

### Syntax Definitions

- **mep_id** Specifies the Maintenance Association End Point. The valid range is 1–8191.

- **md_name** Specifies the domain name. For more information on the different formats of the domain name, refer to `ethoam domain`.

- **mac_address** Specifies the CFM system MAC address.

- **ma_name** Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.

- **ccm_ltm_priority** Priority value for CCMs and LTMs transmitted by the MEP. The valid range is 0–7.

### Defaults

**ethoam endpoint ctag-priority**

Configures the priority value to be included in the inner tag of the CFM frames originating from CVLAN MEPs.

```
ethoam endpoint mep-id domain md-name association ma-name ctag-priority \{copy-outer-to-inner | num\}
```

### Syntax Definitions

- **mep_id**
  - Specifies the Maintenance Association End Point. The valid range is 1–8191.

- **ma-name**
  - Association name for the created Ethernet OAM Association.

- **md-name**
  - Specifies the domain name used while creating the management domain for which this management association is created.

- **copy-outer-to-inner**
  - Copies the outer tag priority to the inner tag.

- **num**
  - Specify an inner tag priority value. Valid range is 0 to 7.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>copy-outer-to-inner</td>
<td>copy-outer-to-inner</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>
```

### Usage Guidelines

- If the priority value is not configured, by default, the outer tag priority value is considered as the inner-tag priority.

- The outer tag is the primary SVLAN of the MA and the inner tag is the CVLAN configured in the endpoint.

### Examples

```
-> ethoam endpoint 1 domain md1 association ma1 ctag-priority 6
-> ethoam endpoint 1 domain md1 association ma1 ctag-priority copy-outer-to-inner
```
**Release History**

Release 8.8R1; command introduced.

**Related Commands**

- **ethoam endpoint priority**
  - Configures the priority values for CCMs and Linktrace Messages (LTMs) transmitted by a MEP.

- **show ethoam domain association end-point**
  - Displays the information of a specific MEP in a Management Domain configured on the bridge.

**MIB Objects**

  - `alaCfmMepCtagSet`
ethoam linktrace

Enables the maintenance entity to initiate transmitting Link Trace Messages (LTM).

```
ethoam linktrace {target-macaddress mac_address | target-endpoint t_mepid} source-endpoint s_mepid domain {md_name | mac_address} association ma_name [flag [fdb-mpdb | fdbonly]] [hop-count hop_count]
```

**Syntax Definitions**

- `mac_address`: Target MAC address to be transmitted.
- `t_mepid`: Specifies the MEP for which the Loopback message is targeted.
- `s_mepid`: Specifies the MEP that transmits the Loopback message. The valid range is 1–8191.
- `md_name`: Specifies the domain name. For more information on the different formats of the domain name, refer to `ethoam domain`.
- `domain mac_address`: Specifies the CFM system MAC address.
- `ma_name`: Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
- `fdbonly`: Specifies that only the MAC addresses learned in a bridge's active data forwarding table will be used to decide the egress port.
- `hop_count`: Indicates the number of hops remaining in this LTM. Each bridge that handles the LTM decreases the value by 1. This decreased value is returned to the LTM. The valid range is 1–2^32.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>flag</td>
<td>fdbonly</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command allows an operator to generate a LTM for the specified MEP.
- This command signals the MEP that it should transmit a Linktrace message and detect the presence or lack of the corresponding Linktrace messages.
**Examples**

-> ethoam linktrace target-macaddress 10:aa:ac:12:12:ad source 4 domain MD association flag fdbonly hop-count 32 Transaction Id: 6943

-> ethoam linktrace target-endpoint 15 source 4 domain MD association Transaction Id: 6934

**Release History**

Release 7.3.1; command was introduced.

**Related Commands**

- dot1agCfmMepTransmitEgressIdentifier
ethoam loopback

Initiates the transmission of loopback messages from the specified source MEP to the specified target MEP or MAC address. Also triggers the source MEP to detect the presence or lack of a corresponding loopback reply from the target.

```
ethoam loopback \{target-endpoint t_mepid | target-macaddress mac_address\} source-endpoint s_mepid domain md_name association ma_name [number num] [data string] [vlan-priority vlan_priority] [drop-eligible \{true | false\}]
```

Syntax Definitions

- **t_mepid**: Specifies the MEP for which the Loopback message is targeted. The valid range is 1-8191.
- **mac_address**: Target MAC address to be transmitted.
- **s_mepid**: Specifies the MEP that transmits the Loopback message. The valid range is 1–8191.
- **md_name**: Specifies the domain name. For more information on the different formats of the domain name, refer to `ethoam domain`.
- **ma_name**: Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
- **num**: Number of loopback messages. The valid range is 1-10.
- **string**: Specifies the amount of data to be included in the Data Type Length Value (TLV), if the Data TLV is selected to be sent. The valid range is 1–255.
- **vlan_priority**: VLAN Priority. The valid range is 0-7.
- **true**: Sets the drop eligibility bit in the VLAN tag to true.
- **false**: Sets the drop eligibility bit in the VLAN tag to false.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>num</td>
<td>1</td>
</tr>
<tr>
<td>vlan_priority</td>
<td>CCM priority</td>
</tr>
<tr>
<td>drop-eligible</td>
<td>true</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>
Usage Guidelines

- Source and target MEP-ID, MD and MA must already exist before loopback is initiated.
- If data TLV is not set, then it is not sent in the loopback message.

Examples

-> ethoam loopback target-endpoint 10 source-endpoint 20 domain MD association MA number 3
Reply from 00:0E:B1:6B:43:89: bytes=64 seq=0 time=100ms
Reply form 00:0E:B1:6B:43:89: bytes=64 seq=0 time=112ms
Request timed out.
----00:E0:B1:6B:43:89 ETH-LB Statistics----
3 packets transmitted, 2 packets received, 33% packet loss
round-trip (ms) min/avg/max = 100/106/112

Release History

Release 7.3.1; command was introduced.

**ethoam fault-alarm-time**

Configures the timeout value for the Fault Notification Generation Alarm time that specifies the time interval during which one or more defects should be detected before the fault alarm is issued.

```
ethoam fault-alarm-time centiseconds endpoint mep_id domain md_name association ma_name

no ethoam fault-alarm-time endpoint mep_id domain md_name association ma_name
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>centiseconds</code></td>
<td>The Fault Notification Generation Alarm timeout value, in centiseconds. The valid range is 250–1000.</td>
</tr>
<tr>
<td><code>mep_id</code></td>
<td>Specifies the MEP of a specific MA. The valid range is 1–8191.</td>
</tr>
<tr>
<td><code>md_name</code></td>
<td>Specifies the domain name. For more information on the different formats of the domain name, refer to <code>ethoam domain</code>.</td>
</tr>
<tr>
<td><code>ma_name</code></td>
<td>Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.</td>
</tr>
</tbody>
</table>

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>centiseconds</code></td>
<td>250</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to restore the Fault Notification Generation Alarm timeout value to the default value.
- The Fault Notification Generation Alarm timeout value is configurable per MEP.

**Examples**

```
-> ethoam fault-alarm-time 500 endpoint 100 domain esd.ale.com association ale_sales
-> no ethoam fault-alarm-time endpoint 100 domain esd.ale.com association ale_sales
```
**Release History**
Release 7.3.1; command was introduced.

**Related Commands**
- `show ethoam domain association end-point` Displays the information of a specific MEP in a Management Domain configured on the bridge.

**MIB Objects**
- `Dot1agCfmMep`
  - `dot1agCfmMepFngAlarmTime`
**ethoam fault-reset-time**

Configures the timer value for the Fault Notification Generation Reset time that specifies the time interval during which the fault alarm is re-enabled to process faults. The fault alarm will only be re-enabled if no new faults are received during this time interval.

```
ethoam fault-reset-time centiseconds endpoint mep_id domain md_name association ma_name
no ethoam fault-reset-time endpoint mep_id domain md_name association ma_name
```

### Syntax Definitions

- **centiseconds**
  - The Fault Notification Generation Reset timer value, in centi seconds. The valid range is 250–1000.
- **mep_id**
  - Specifies the MEP of a specific MA. The valid range is 1–8191.
- **md_name**
  - Specifies the domain name. For more information on the different formats of the domain name, refer to `ethoam domain`.
- **ma_name**
  - Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>centiseconds</td>
<td>1000</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to restore the Fault Notification Generation Reset timeout value to the default value.
- The Fault Notification Generation Reset timer value is configurable per MEP.

### Examples

```
-> ethoam fault-reset-time 250 end-point 100 domain esd.ale.com association ale_sales
-> no ethoam fault-reset-time end-point 100 domain esd.ale.com association ale_sales
```
**Release History**

Release 7.3.1; command was introduced.

**Related Commands**

- **ethoam fault-alarm-time**
  
  Configures the timeout value for the Fault Notification Generation Alarm time.

- **show ethoam domain association end-point**
  
  Displays the information of a specific MEP in a Management Domain configured on the bridge.

**MIB Objects**

- **DotlagCfmMep**
  
  - **dotlagCfmMepFngResetTime**
**ethoam one-way-delay**

Initiates a one-way-delay measurement (1DM) to determine the one-way frame delay (latency) and delay variation (jitter) between two MEPs.

`ethoam one-way-delay {target-endpoint t_mepid | target-macaddress mac_address} source-endpoint s_mepid domain md_name association ma_name [vlan- priority vlan_priority]`

**Syntax Definitions**

- **t_mepid**: Target MEP ID. The valid range is 1-8191.
- **mac_address**: Target MAC address.
- **s_mepid**: Source MEP ID. The valid range is 1–8191.
- **md_name**: Specifies the domain name. For more information on the different formats of the domain name, refer to `ethoam domain`.
- **ma_name**: Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
- **vlan_priority**: VLAN Priority. The valid range is 0-7.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan_priority</td>
<td>7</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Source MEP-ID, MD and MA must be created before initiating 1DM.

- When `target-endpoint` is specified then entry must be present in the RMEP table, no matter if its status is RMEP_OK or RMEP_FAILED, before initiating 1DM. So `target-macaddress` can be used to bypass such a restriction.

- Although the OmniSwitch implementation of Ethernet frame delay measurement (ETH-DM) is compliant with ITU-T Y.1731, delay measurement can be performed for both ITU-T Y.1731 and IEEE 802.1ag MEPs.

- If the 1DM is initiated with a `target-macaddress` and an egress port is found for this MAC address, then the 1DM frames are transmitted from that port. Otherwise, 1DM frames are flooded in the MEP’s VLAN.
• One-way delay measurement requires NTP clock synchronization between the sending and receiving MEPs.

**Examples**

```plaintext
-> ethoam one-way-delay target-endpoint 10 source-endpoint 12 domain MD association MA vlan-priority 4
-> ethoam one-way-delay target-macaddress 00:e0:bl:6a:52:4c source-endpoint 12 domain MD association MA vlan-priority 4
```

**Release History**

Release 7.3.1; command was introduced.

**Related Commands**

- `show ethoam one-way-delay`  Displays the one-way-delay and jitter parameters for all entries or for the MAC address of a specific MEP.

**MIB Objects**

  - `alaCfmMepOWDTMacAddress`
  - `alaCfmMepOWDTMepIdentifier`
  - `alaCfmMepOWDTPriority`
**ethoam two-way-delay**

Initiate a two-way-delay measurement to determine the round-trip latency and jitter between two MEPs. The initiating MEP sends delay measurement message (DMM) frames to the receiving MEP. The receiving MEP responds with delay measurement reply (DMR) frames.

```
ethoam two-way-delay {target-endpoint t_mepid | target-macaddress mac_address} source-endpoint s_mepid domain md_name association ma_name [vlan-priority vlan_priority]
```

**Syntax Definitions**

- **t_mepid**: Target MEP ID. The valid range is 1-8191.
- **mac_address**: Target MAC address.
- **s_mepid**: Source MEP ID. The valid range is 1–8191.
- **md_name**: Specifies the domain name. For more information on the different formats of the domain name, refer to `ethoam domain`.
- **ma_name**: Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
- **vlan_priority**: VLAN Priority. The valid range is 0-7.

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan_priority</td>
<td>7</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Source MEP-ID, MD and MA must be created before initiating a two-way delay measurement.
- When `target-endpoint` is specified then entry must be present in the RMEP table, no matter if the status is RMEP_OK or RMEP_FAILED, before initiating two-way-delay. So `target-macaddress` can be used to bypass such a restriction.
- The CLI console will pause until all DMRs are received or maximum of 3 seconds to ensure that all the DMRs have been returned. If the operation fails, then the appropriate message is displayed. If the operation is successful, no message is displayed.
- If the DMM is initiated by UP MEP with a target-macaddress and the egress port is found for this MAC address, then DMM frames are transmitted from that port. Otherwise, DMM frames are flooded in the MEP’s VLAN.

- Two-way delay measurement does not require NTP clock synchronization on the sending and receiving MEPs.

- Although the OmniSwitch implementation of Ethernet frame delay measurement (ETH-DM) is compliant with ITU-T Y.1731, delay measurement can be performed for both ITU-T Y.1731 and IEEE 802.1ag MEPs.

- This command initiates an on-demand OAM performance measurement. To set up continuous two-way delay measurement, see the “Service Assurance Agent Commands” chapter for information about how to configure an SAA for continuous two-way frame delay measurement.

**Examples**

```
-> ethoam two-way-delay target-endpoint 10 source-endpoint 12 domain MD association MA vlan-priority 4
Reply from 00:0E:B1:6B:43:89 delay=2584us jitter=282us
-> ethoam two-way-delay target-macaddress 00:e0:b1:6a:52:4c source-endpoint 12
domain MD association MA vlan-priority 4
Reply from 00:E0:B1:6A:52:4C: delay=2584us jitter=282us
```

**Release History**

Release 7.3.1; command was introduced.

Usage Guidelines

- “LTM operation successful. Target is reachable.” – This message suggests that LTM has reached the target and all the expected LTRs have been received.
- “LTM operation unsuccessful. Target not reachable.” – This message suggests that LTM is successfully initiated but the target is not reachable.
- “LTM operation unsuccessful. Target is reachable.” – This message suggest that Target is reachable but at least one of the LTR from intermediate hop is not received.
- “LTM operation in progress.” – This message suggests that LTM operation is in progress. This message will appear if show CLI is fired before LTM Time-out time.
- “LTM Timed out.”- This message suggests that either LTM is not initiated properly or when none of the expected LTRs is received in LTM Time-out duration which is 5 seconds.
Examples

- `dot1agCfmVlanVid`
- `dot1agCfmVlanPrimaryVid`
**show ethoam statistics**

Displays the Ethernet OAM of all the Management Domains configured on the bridge. Also, displays the statistics of all the MAs and matching MEPs for all the MDs.

```
show ethoam statistics domain {md_name | mac_address} [association ma_name] [end-point mep_id]
```

**Syntax Definitions**

- **md_name**: Specifies the domain name.
- **mac_address**: Specifies the CFM system MAC address.
- **ma_name**: Specifies the name of Ethernet OAM Association.
- **mep_id**: Specifies a MEP for a specific MA.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

show ethoam one-way-delay

Displays the one-way ETH-DM delay (latency) and jitter parameters either for all entries or for a specified MAC address for a particular source MEP-ID.

show ethoam one-way-delay domain \textit{md\_name} association \textit{ma\_name} endpoint \textit{s\_mepid} [mac-address \textit{mac\_address}]

**Syntax Definitions**

- \textit{md\_name} Specifies the domain name. For more information on the different formats of the domain name, refer to \texttt{ethoam domain}.
- \textit{ma\_name} Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
- \textit{s\_mepid} Source MEP ID. The valid range is 1–8191.
- \textit{mac\_address} MAC Address of the remote MEP.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Dash (‘-’) in the output in Jitter column signifies that the value can not be calculated as the previous delay value is unknown. This will happen only when 1DM is received for the first time.
- Maximum entries that Delay Result table can store are 1024. After that, the oldest entry is deleted from the table whenever a new entry is required.

**Examples**

\texttt{-}\texttt{> show ethoam one-way-delay domain MD association MA endpoint 10}

Legend: Jitter: - = undefined value

<table>
<thead>
<tr>
<th>Remote Mac address</th>
<th>Delay (us)</th>
<th>Jitter (us)</th>
</tr>

show ethoam two-way-delay

Displays the two-way ETH-DM delay and jitter parameters for a specific remote MAC-Address or for all the MAC-Addresses for which two-way-delay was initiated for a particular source MEP-ID.

show ethoam two-way-delay domain md_name association ma_name endpoint s_mepid [mac-address mac_address]

Syntax Definitions

**md_name**
Specifies the domain name. For more information on the different formats of the domain name, refer to `ethoam domain`.

**ma_name**
Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.

**s_mepid**
Source MEP ID. The valid range is 1–8191.

**mac_address**
MAC Address of the remote MEP.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- If ‘0’ appears in the output in RMEP-ID column signifies that the DMM was initiated with target-macaddress. As multiple RMEPs can have same mac-address.

- If a dash (‘-‘) appears in the output in Jitter column signifies that the value can not be calculated as the previous delay value is unknown, i.e. if only one reply for DMM (DMR) is received and this was the first time DMM was initiated from the MEP, then jitter will not be calculated.

- Maximum entries that Delay Result table can store are 1024. After that, the DMM request shall be rejected if a new entry needs to be created for the MEP. If entry for the MEP already exists in the table, that entry shall be updated with the new one.
Examples

54 LINK OAM Commands

Ethernet in the First Mile (EFM), also known as LINK OAM, is a collection of protocols specified in IEEE 802.3ah, defining Ethernet in the access networks that connects subscribers to their immediate service provider. EFM, EFM-OAM and LINKOAM refers to IEEE 802.3ah standard.

LINK OAM (operation, administration, and maintenance) is a tool which monitors Layer-2 link status on the network by sending OAM protocol data units (OAMPDU$s) between the network devices. OAMPDU$s contain control and status information used to monitor, test and troubleshoot OAM-enabled links. By enabling LINK OAM on switch ports, network administrators can monitor the link-related issues on the first mile. LINK OAM provides network administrators the ability to monitor link performance, remote fault detection and remote loopback control.

**Note.** EFM (LINK OAM) does not include functions such as station management, bandwidth allocation or provisioning functions.

MIB information for the EFM (LINK OAM) commands is as follows:

<table>
<thead>
<tr>
<th>Filename</th>
<th>Module</th>
</tr>
</thead>
<tbody>
<tr>
<td>alcatel-ind1-dot3-oam-mib.mib</td>

### Remote Loopback Commands
- `efm-oam port remote-loopback`
- `efm-oam port remote-loopback start`
- `efm-oam port l1-ping`

### Show Commands
- `show efm-oam port`
- `show efm-oam port detail`
- `show efm-oam port remote detail`
- `show efm-oam port history`
- `show efm-oam port l1-ping detail`
- `show efm-oam port statistics`
- `show efm-oam configuration`

### Clear Commands
- `clear efm-oam statistics`
- `clear efm-oam log-history`
**efm-oam admin-state**

Enables or disables the LINK OAM protocol on the switch.

`efm-oam admin-state {enable | disable}`

---

**Syntax Definitions**

- **enable**
  - Enables the LINK OAM protocol.
- **disable**
  - Disables the LINK OAM protocol.

**Defaults**

By default, the LINK OAM protocol is disabled for the switch.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- LINK OAM must be enabled globally for the OAM to be functional on all the ports.
- When LINK OAM is disabled globally, all dynamically learned information on the port, including peer information, is deleted. However, the LINK OAM configuration for the port is retained.

**Examples**

- `-> efm-oam admin-state enable`
- `-> efm-oam admin-state disable`

**Release History**

Release 8.5R4; command was introduced.
**Related Commands**

- **efm-oam port admin-state** Enables or disables LINK OAM protocol on the specified port or on a range of ports.
- **efm-oam port mode** Configures the LINK OAM mode on the port or on the range of ports to active or passive.
- **show efm-oam configuration** Displays the global LINK OAM configuration.

**MIB Objects**

- **alaDot3OamStatus**
**efm-oam port admin-state**

Enables or disables LINK OAM protocol on the specified port or on a range of ports.

```plaintext
efm-oam port chassis/slot/port[-port2] admin-state {enable | disable}
```

### Syntax Definitions
- **chassis**: The chassis identifier.
- **slot/port**: The slot number of the module and the physical port number on that module.
- **-port2**: Specifies the last port in the range of ports.
- **enable**: Enables LINK OAM protocol on the specified port.
- **disable**: Disables LINK OAM protocol on the specified port.

### Defaults
By default, the LINK OAM protocol is disabled on all ports for the switch.

### Platforms Supported
This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines
- LINK OAM must be enabled globally for the OAM to be functional on all the ports.
- If LINK OAM is disabled for the port or globally disabled for the switch, any OAMPDUs received are discarded.
- When LINK OAM is disabled for the port, all dynamically learned information on the port, including peer information, is deleted. However, the LINK OAM configuration for the port is retained.
- LINK OAM is not supported on the mirroring ports.
- In link aggregates, LINK OAM is supported on an individual aggregable port only.

### Examples
- `-> efm-oam port 1/1/1 admin-state enable`
- `-> efm-oam port 1/1/1 admin-state disable`
- `-> efm-oam port 2/1/1-10 admin-state enable`
- `-> efm-oam port 2/1/1-4 admin-state disable`
**Release History**
Release 8.5R4; command was introduced.

**Related Commands**

<table>
<thead>
<tr>

<td>Displays the configuration and other related parameters for a port.</td>
</tr>
</tbody>
</table>

**MIB Objects**

- dot3OamTable
  - dot3OamAdminState
**efm-oam port mode**

Configures the LINK OAM mode on the port or on the range of ports to active or passive.

`efm-oam port chassis/slot/port[-port2] mode {active | passive}`

**Syntax Definitions**

- `chassis`: The chassis identifier.
- `slot/port`: The slot number for the module and the physical port number on that module.
- `-port2`: Specifies the last port in the range of ports.
- `active`: Configures the LINK OAM mode to active.
- `passive`: Configures the LINK OAM mode to passive.

**Defaults**

By default, LINK OAM mode is set to active on all ports.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- LINK OAM discovery process is never initiated from a port when it is in passive mode. At least one of the two peer ports should be in active mode.
- An active port will respond to Loopback-control OAMPDUs only if the peer EFM-OAM client is also in active mode.

**Examples**

- `-> efm-oam port 1/1/1 mode active`
- `-> efm-oam port 1/1/1 mode passive`
- `-> efm-oam port 2/1/1-10 mode active`
- `-> efm-oam port 2/1/1-4 mode passive`

**Release History**

Release 8.5R4; command was introduced.

</tbody>
</table>

### MIB Objects

- `dot3OamTable
  - dot3OamMode`
**efm-oam port keepalive-interval**

Configures the timeout interval for the dynamically learned neighboring devices on a port or on a range of ports. Keepalive-interval is the maximum time period for which a LINK OAM port shall wait for a hello message from its peer before resetting a discovery session.

**efm-oam port chassis/slot/port[-port2] keepalive-interval seconds**

### Syntax Definitions

- `chassis` The chassis identifier.
- `slot/port` The slot number for the module and the physical port number on that module.
- `-port2` Specifies the last port in the range of ports.
- `seconds` Specifies the keep-alive interval value in seconds. The range for this interval is 5 to 120 seconds.

### Defaults

By default, the keep-alive interval value is 5 seconds.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>9900</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Even if unsupported OAMPDU is received on the port, keep-alive timer is reset on the port.
- To set the timer to its default value, set 5 seconds as the keepalive-interval.

### Examples

- `efm-oam port 1/1/1 keepalive-interval 10`
- `efm-oam port 2/1/1-10 keepalive-interval 10`

### Release History

Release 8.5R4; command was introduced.
**Related Commands**

- `efm-oam port hello-interval`  
  Configures the time interval (in seconds) by which the information OAMPDUs are transmitted out of a LINK OAM enabled port.

- `show efm-oam port detail`  
  Displays the configuration and other related parameters for a port.

**MIB Objects**

- `alaDot3OamTable`  
  - `alaDot3OamKeepAliveInterval`
efm-oam port hello-interval

Configures the time interval (in seconds) by which the information OAMPDUs are transmitted out of an LINK OAM enabled port.

**efm-oam port chassis/slot/port[-port2] hello-interval seconds**

**Syntax Definitions**

- **chassis**
  - The chassis identifier.
- **slot/port**
  - The slot number for the module and the physical port number on that module.
- **-port2**
  - Specifies the last port in the range of ports.
- **seconds**
  - Specifies the time interval (in seconds) this port waits before sending out the next hello packet. The range for this timer is 1 to 60 seconds.

**Defaults**

By default, the hello-interval value is set to 1 second.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6/V48C8/C32E/T24C2</th>
<th>9900</th>
</tr>
</thead>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the hello-interval value of 1 second to reset the timer to its default value.
- On a given port, hello interval time period should not be more than half of keep alive timer on the peer port.

**Examples**

-> efm-oam port 1/1/1 hello-interval 5
-> efm-oam port 2/1/1-10 hello-interval 10

**Release History**

Release 8.5R4; command was introduced.
Related Commands

**efm-oam port hello-interval**
Configures the time interval (in seconds) by which the information OAMPDUs are transmitted out of a LINK OAM enabled port.

**efm-oam port keepalive-interval**
Configures the timeout interval for the dynamically learned neighboring devices on a port or on a range of ports. Keepalive-interval is the maximum time period for which a LINK OAM port shall wait for a hello message from its peer before resetting a discovery session.

**show efm-oam port detail**
Displays the configuration and other related parameters for a port.

MIB Objects

alaDot3OamTable
  alaDot3OamHelloInterval
efm-oam port remote-loopback

Specifies whether loopback requests from peers are processed or ignored on the specified port.

```
efm-oam port chassis/slot/port[-port2] remote-loopback {process | ignore}
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot/port**: The slot number for the module and the physical port number on that module.
- **-port2**: Specifies the last port in the range of ports.
- **process**: Processes incoming loopback request from peer LINK OAM port.
- **ignore**: Ignore (discard) incoming loopback requests.

### Defaults

By default, the incoming loopback requests are ignored.

### Platforms Supported

### Usage Guidelines

- When the remote-loopback is in **process** mode, the session started by peer LINK OAM client will be processed by local LINK OAM port. As a result, remote port will be in remote-loopback state and the local port will be local-loopback state.
- When the remote-loopback is in **ignore** mode, the session started by peer LINK OAM will not be processed by the local port.

### Examples

```
- efm-oam port 1/1/1 remote-loopback process
- efm-oam port 1/1/1 remote-loopback ignore
- efm-oam port 2/1/1-10 remote-loopback process
- efm-oam port 2/1/1-4 remote-loopback ignore
```

### Release History

Release 8.5R4; command was introduced.
Related Commands

**efm-oam port remote-loopback start**
Initiates the loopback control PDU towards the peer port to start or stop the loopback session on the specified port.

**show efm-oam port detail**
Displays the LINK OAM configuration and other related parameters for a port.

**show efm-oam port remote detail**
Displays the configuration and details of the related parameters of the remote port.

MIB Objects

**dot3OamLoopbackTable**

**dot3OamLoopbackIgnoreRx**
efm-oam port remote-loopback start

Initiates the loopback control PDU towards the peer port to start or stop the loopback session on the specified port.

\[
\text{efm-oam port chassis/slot/port remote-loopback \{start | stop\}}
\]

**Syntax Definitions**

- **chassis**
  - The chassis identifier.
- **slot/port**
  - The slot number for the module and the physical port number on that module.
- **start**
  - Specifies whether to start the loopback request.
- **stop**
  - Specifies whether to stop the loopback request.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Before issuing this command, the LINK OAM port has to be in active mode and discovery of peer ports has to be completed.
- When loopback is started from a port towards a peer port which is configured to ignore the loopback request, the loopback response timer will timeout and no error is displayed. In such case, verify the loopback-state of two ports by using the command **show efm-oam port remote detail**.
- The maximum number of simultaneous loopback sessions supported per network interface is 2. If a third loopback is started through CLI, an error will be displayed at the CLI prompt.

**Examples**

- `-> efm-oam port 1/1/1 remote-loopback start`
- `-> efm-oam port 1/1/1 remote-loopback stop`

**Release History**

Release 8.5R4; command was introduced.
Related Commands

**efm-oam port remote-loopback**  Specifies an action that should perform when a loopback request is received from the peer on a port or on a range of ports.

**show efm-oam port remote detail**  Displays the configuration and details of the related parameters of the remote port.

**show efm-oam configuration**  Displays the global LINK OAM configuration.

MIB Objects

dot3OamLoopbackTable
  
dot3OamLoopbackStatus
efm-oam port propagate-events

Configures whether or not the specified port or range of ports will propagate local event notifications to the remote peer.

`efm-oam port chassis/slot/port[-port2] propagate-events {critical-event | dying-gasp} {enable | disable}`

**Syntax Definitions**

- `chassis`: The chassis identifier.
- `slot/port`: The slot number for the module and the physical port number on that module.
- `-port2`: Specifies the last port in the range of ports.
- `critical-event`: Configures the notification status for critical events.
- `dying-gasp`: Configures the notification status for dying gasp events.
- `enable`: Enables the notification of critical-event or dying-gasp events to the peer.
- `disable`: Disables the notification of critical-event or dying-gasp events to the peer.

**Defaults**

By default, the notification status for both critical-event and dying-gasp events is set to enabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When the system is set for critical event or a dying-gasp event, the local OAM entity indicates the event through the OAMPDU flags to its peer OAM entity.
- In case of port admin down, the OAM IFU-PDU with dying-gasp bit set will be sent to peer as soon as a failure is detected and transmission will continue till the specific port actually goes down.
- In case of takeover or reload of the switch, the OAM IFU-PDU with dying-gasp bit set will be sent to peer as soon as a failure is detected and transmission will continue till the specific device actually goes down.
- The information PDUs with dying gasp bit set is transmitted towards peer as soon as link-down is detected at NI. However, if there is a link flap (i.e link comes again) before the expiry of link-flap.
timer, then normal information PDU transmission with dying-gasp bit reset shall resume. This will cause clearing of alarms or trap on the peer port.

**Examples**

- `-> efm-oam port 1/1/1 propagate-events critical-event enable`
- `-> efm-oam port 1/1/1 propagate-events critical-event disable`
- `-> efm-oam port 2/1/1-10 propagate-events dying-gasp enable`
- `-> efm-oam port 2/1-4 propagate-events dying-gasp disable`

**Release History**

Release 8.5R4; command was introduced.

**Related Commands**

- `show efm-oam port remote detail` Displays the configuration and details of the related parameters of the remote port.
- `show efm-oam port statistics` Displays the LINK OAM statistics on a port, or a range of ports or on all ports.

**MIB Objects**

- `dot3OamEventConfigTable`
  - `dot3OamDyingGaspEnable`
  - `dot3OamCriticalEventEnable`
**efm-oam errored-frame-period**

Configures the threshold, window frame values and the status for notification when the number of frame-errors exceed the threshold in a given period of time (specified) by window. When the number of frame errors exceeds a threshold within a given window defined by a number of frames (for example, 10 frames out of 1000 had errors), an Errored Frame Period event is generated.

```
efm-oam port chassis/slot/port[-port2] errored-frame-period [threshold threshold_symbols] [window window_frames] [notify {enable | disable}]
```

**Syntax Definitions**

- **chassis**
  The chassis identifier.

- **slot/port**
  The slot number for the module and the physical port number on that module.

- **-port2**
  The last port number in a range of ports that you want to configure on the same slot.

- **threshold_symbols**
  Specifies the frame error threshold number. The range supported is 1 to maximum 4 byte integer value (4294967295).

- **window_frames**
  Specifies the number of frames used to define a window within which the frame period errors are measured.

- **enable**
  Enables notification of the Errored Frame Period event.

- **disable**
  Disables notification of the Errored Frame Period event.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>threshold_symbols</td>
<td>1 frame error</td>
</tr>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

The default for window_frames depends on the port-types. The default, minimum and maximum supported values for various port-types are:

<table>
<thead>
<tr>
<th>port-type</th>
<th>default value</th>
<th>minimum value</th>
<th>maximum value</th>
</tr>
</thead>
<tbody>
<tr>
<td>100 mbps</td>
<td>200000</td>
<td>20000</td>
<td>120000000</td>
</tr>
<tr>
<td>1000 X</td>
<td>20000000</td>
<td>2000000</td>
<td>1200000000</td>
</tr>
<tr>
<td>1000 T</td>
<td>20000000</td>
<td>2000000</td>
<td>1200000000</td>
</tr>
<tr>
<td>10 Gig</td>
<td>200000000</td>
<td>200000000</td>
<td>12000000000</td>
</tr>
</tbody>
</table>
Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The command can be issued in any order like window, threshold, and notify. However, at least one option needs to be entered.
- To enter many ports in a single command, use a hyphen to specify a range of ports (e.g. 3/1-16).

Examples

```plaintext
-> efm-oam port 1/1/1 errored-frame-period threshold 1 window 3000000 notify enable
-> efm-oam port 1/1/1 errored-frame-period notify disable
-> efm-oam port 2/1/1-4 errored-frame-period threshold 1 window 3000000 notify enable
-> efm-oam port 2/1/1-2 errored-frame-period notify disable
```

Release History

Release 8.5R4; command was introduced.

Related Commands

- `efm-oam errored-frame`: Configures the threshold, window and notify-status for errored-frame on a port. The frame-period measures the frame-errors, within a specified window of time.
- `efm-oam errored-frame-seconds-summary`: Configures the threshold, window and notify-status for errored-frame-seconds-summary on a port. The Errored Seconds are the time in seconds in which at least one frame error has occurred.
- `show efm-oam port detail`: Displays the Errored Frame Period Event threshold, window, and notification parameter values for a port.

MIB Objects

- `dot3OamErrFramePeriodWindow`
- `dot3OamErrFramePeriodThreshold`
- `dot3OamErrFramePeriodEvNotifEnable`
**efm-oam errored-frame**

Configures an error frame threshold or window on a LINK OAM port and set notification status for errored frame events. When the number of frame errors exceeds a threshold within a given window defined by a period of time (for example, 10 frames in 1 second had errors), an Errored Frame Event is generated.

```
efm-oam port chassis/slot/port[-port2] errored-frame [threshold threshold_symbols] [window window_seconds] [notify {enable | disable}]
```

### Syntax Definitions

- `chassis` The chassis identifier.
- `slot/port` The slot number for the module and the physical port number on that module.
- `port2` The last port number in a range of ports that you want to configure on the same slot.
- `threshold_symbols` Specifies the frame error threshold number.
- `window_seconds` Specifies the window of time, in which the frame errors will be measured. The duration should be in units of 100ms.
- `enable` Enables notification of the Errored Frame event.
- `disable` Disables notification of the Errored Frame event.

### Defaults

- dot3OamErrFrameSecsEvNotifEnable
efm-oam multiple-pdu-count

Configures the value of multiple PDU count. When multiple PDU count is set to a specific number in case of any of the threshold cross events, the same event notification PDU will be transmitted that many times towards the peer.

```plaintext
efm-oam multiple-pdu-count count
```

### Syntax Definitions

`count` Specifies the number of PDUs that have to be sent in case of event-notification TLVs. The range is 1 to 10 PDUs.

### Defaults

By default, the PDU-count value is set to 3.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

**efm-oam port l1-ping**

Configures the number of frames to be sent by the current LINK OAM port to the remote port’s MAC address (l1 ping) and the delay between each consecutive sent frames and to start the ping operation.

```
efm-oam port chassis/slot/port l1-ping [num-frames number] [delay milliseconds] [start]
```

**Syntax Definitions**

- **chassis**: The chassis identifier.
- **slot/port**: Specifies the slot number for the module and the physical port number on that module.
- **number**: Specifies the number of frames that needs to be sent during ping operation. The allowed range of numbers is between 1 to 20.
- **milliseconds**: Specifies time interval between two consecutive PDUs. The allowed range of delay is between 100 to 1000 milliseconds.
- **start**: Specifies to start the ping operation.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>5 frames</td>
</tr>
<tr>
<td>milliseconds</td>
<td>1000 milliseconds</td>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The command is valid only when the LINK OAM is enabled globally, port is in active mode, discovery is done, and the port is in remote loopback mode.
- L1 ping can be started only when the port is in remote loopback mode.

**Examples**

```
-> efm-oam port 1/1/12 l1-ping num-frames 6 delay 300 start
-> efm-oam port 1/1/20 l1-ping num-frames 12 delay 500 start
-> efm-oam port 1/1/15 l1-ping num-frames 5 delay 100 start
-> efm-oam port 1/1/15 l1-ping num-frames 4 delay 200 start
-> efm-oam port 1/1/5 l1-ping num-frames 100 delay 300 start
```
**Release History**

Release 8.5R4; command was introduced.

**Related Commands**

- `show efm-oam port l1-ping detail` Displays the frames lost during a loopback session.
- `show efm-oam port statistics` Displays the LINK OAM statistics on a port, or a range of ports or on all ports.

**MIB Objects**

- `alaDot3OamLoopbackTable`  
  - `alaDot3OamPortL1PingFramesConf`  
  - `alaDot3OamPortL1PingFramesDelay`  
  - `alaDot3OamPortL1PingStatus`  
  - `alaDot3OamPortL1PingFramesSent`  
  - `alaDot3OamPortL1PingFramesReceived`  
  - `alaDot3OamPortL1PingAverageRoundTripDelay`
show efm-oam configuration

Displays the global LINK OAM configuration.

Syntax Definitions

N/A

Defaults

N/A.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>

</tbody>
</table>

Usage Guidelines

Use this command to display the global configuration of LINK OAM.

Examples

`-> show efm-oam configuration`

EFM OAM Status : enabled,
Multiple PDU Count : 5

Output fields are described here:

output definitions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFM OAM status</td>
<td>The current administrative status of LINK OAM on this switch (Enabled or Disabled).</td>
</tr>
<tr>
<td>Multiple PDU Count</td>
<td>The number of PDUs sent when LINK OAM needs to send multiple Event Notification.</td>
</tr>
</tbody>
</table>

Release History

Release 8.5R4; command was introduced.
Related Commands

**efm-oam admin-state**
Enables or disables the LINK OAM protocol on the switch.

**show efm-oam port detail**
Displays the LINK OAM configuration and other related parameters for a port.

MIB Objects

alaDot3OamStatus
alaDot3OamMultiplePduCount
show efm-oam port

Displays the status of LINK OAM on all the ports in the system, along with other relevant information such as OAM mode, operational status and loopback status of the port.

**show efm-oam port [chassis/slot/port1-port2] [enable | disable] [active | passive]**

---

**Syntax Definitions**

- **chassis**
  - The chassis identifier.

- **slot/port1**
  - The slot number for the module and the physical port number on that module.

- **-port2**
  - The last port number in a range of ports that you want to configure on the same slot (e.g. 3/1-4 specifies ports 1,2,3, and 4 on slot 3).

- **enable**
  - Specifies whether to display the LINK OAM enabled ports.

- **disable**
  - Specifies whether to display the LINK OAM disabled ports.

- **active**
  - Specifies whether to display the LINK OAM active ports.

- **passive**
  - Specifies whether to display the LINK OAM passive ports.

---

**Defaults**

By default, displays the LINK OAM status on all ports.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

</table>

**output definitions**

- **Port**: Displays the chassis/slot/port number.
- **EFM-OAM Status**: The state of the EFM-OAM. LINK OAM instance can have any of the following status.
  - **Enabled**: Specifies that the LINK OAM is disabled on the interface.
  - **Disabled**: Specifies that the LINK OAM is disabled on the interface.
**Output Definitions (continued)**

**Operational Status**

The status of the port in discovering whether the peer has LINK OAM capability or not. It has the following states:

- **activeSendLocal**: Specifies that the LINK OAM port is actively trying to discover whether the peer has LINK OAM capability but has not yet made that determination.

- **sendLocalAndRemote**: Specifies that the local LINK OAM port has discovered the peer but has not yet accepted or rejected the configuration of the peer. The local device will then decide that the peer device is acceptable or unacceptable and then accept or decline LINK OAM peering.

- **sendLocalAndRemoteOk**: Specifies the state when LINK OAM peering is allowed by the local port.

- **oamPeeringLocallyRejected**: Specifies the state when the local OAM entity rejects the peer OAM entity.

- **oamPeeringRemotelyRejected**: Specifies the state when the remote LINK OAM port rejects the peering.

- **operational**: Specifies the state when the local LINK OAM port learns that both the local LINK OAM entity and the remote LINK OAM entity have accepted the peering.

- **nonOperHalfDuplex**: Specifies the value nonOperHalfDuplex is returned whenever LINK OAM is enabled. Since LINK OAM functions are not designed to work completely over half-duplex interfaces, the value nonOperHalfDuplex is returned whenever LINK OAM is enabled but the interface is in half-duplex operation.

- **linkFault**: Specifies that the link between the host and the peer has detected a fault.

- **passiveWait**: Specifies that the LINK OAM ports are in passive mode.

**Loopback Status**

The state of remote loopback. It can be **initiatingLoopback**, **terminatingLoopback**, **localLoopback**, **remoteLoopback**, **noLoopback**, or **unknown**.

**Mode**

The state of LINK OAM mode, **active** or **passive**.

**Release History**

Release 8.5R4; command was introduced.
**Related Commands**

*efm-oam multiple-pdu-count*  
Configures the value of multiple PDU count. When multiple PDU count is set to a specific number in case of any of the threshold cross events, the same event notification PDU will be transmitted that many times towards the peer.

show efm-oam port statistics

Displays the LINK OAM statistics on a port, or a range of ports or on all ports.

show efm-oam port chassis/slot/port[-port2] statistics

show efm-oam port statistics

Syntax Definitions

chassis
  The chassis identifier.

slot/port
  Specifies the slot number for the module and the physical port number on that module.

-port2
  The last port number in a range of ports that you want to configure on the same slot.

Defaults

By default, the statistics of all ports are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

Remote MAC address : 00:30:96:fd:6b:fa,
Remote Vendor (info): 0x15a1
Remote Vendor (oui) : XYZ
Mode : active,
Max OAMPDU size : 1518,
Config Revision : 0,
Functions Supported : loopbackSupportEventSupport
```

**output definitions**

- **Remote MAC address**
  - Displays the MAC address of the remote peer.

- **Remote Vendor (info)**
  - Displays the vendor number in hexadecimal of the remote peer.

- **Remote Vendor (oui)**
  - Displays the Organizationally Unique Identifier (OUI) number of the remote peer.

- **Mode**
  - The state of LINK OAM mode on the remote port, **active** or **passive**.

- **Max OAMPDU size**
  - Displays the maximum OAMPDU size that the remote LINK OAM port can support.
### Output Definitions (continued)

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Config Revision</strong></td>
<td>Displays the configuration revision of the remote LINK OAM port.</td>
</tr>
<tr>
<td><strong>Functions Supported</strong></td>
<td>Displays the LINK OAM functions supported by the remote port.</td>
</tr>
</tbody>
</table>

### Release History

Release 8.5R4; command was introduced.

### Related Commands

**show efm-oam port history**  
Displays the log of events that have occurred on a port. This command can also be used to display specific event logs on a port.

**clear efm-oam statistics**  
Clears the LINK OAM statistics on a port.

### MIB Objects

- `dot3OamPeerTable`
  - `dot3OamPeerMacAddress`
  - `dot3OamPeerVendorOui`
  - `dot3OamPeerVendorInfo`
  - `dot3OamPeerMode`
  - `dot3OamPeerMaxOamPduSize`
  - `dot3OamPeerConfigRevision`
  - `dot3OamPeerFunctionsSupported`
**show efm-oam port history**

Displays the log of events that have occurred on a port. Use this command to display specific event logs on a port.

```
show efm-oam port chassis/slot/port history [log-type { link-fault | errored-frame | errored-frame-period | errored-frame-seconds | dying-gasp | critical}]
```

### Syntax Definitions

- **chassis**
  - The chassis identifier.

- **slot/port**
  - Specifies the slot number for the module and the physical port number on that module.

- **link-fault**
  - Displays link fault event logs. Specifies the loss of signal is detected by the receiver. This is sent once per second in the Information OAMPDU.

- **errored-frame**
  - Displays errored-frame event log. an errored frame event occurs when the number of detected error frames over a specific interval exceeds the predefined threshold.

- **errored-frame-period**
  - Displays an errored-frame-period event logs. An errored frame period event occurs if the number of frame errors in specific number of received frames exceeds the predefined threshold.

- **errored-frame-seconds**
  - Displays errored-frame-seconds event logs. When the number of error frame seconds detected on a port over a detection interval reaches the error threshold, an errored frame seconds event occurs.

- **dying-gasp**
  - Specifies an unrecoverable condition (e.g., a power failure).

- **critical**
  - Specifies a crucial event that has occurred on the port.

### Defaults

By default, all log types are displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

```
6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900

```

### Usage Guidelines

Timestamp will be in following format:

```
DAY MON Date hh:mm:ss yyyy
```
Examples

-> show efm-oam port 1/1/1 history
Legend: Location: * - Remote, # - Local
LogID  TimeStamp                Log Type          Event Total
-------+-------------------------+-------------+-------+----+
*    1     TUE JAN 06 19:44:51 2009   linkFault       1
#    2     TUE JAN 06 19:45:51 2009   erroredFrame    1

-> show efm-oam port 1/1/1 history log-type link-fault
Legend: Location: * - Remote, # - Local
LogID  TimeStamp                     Event Total
-------+---------+---------+------+-----------+
*   1      TUE JAN 06 19:46:51 2009     1
#   2      TUE JAN 06 19:46:51 2009     1

output definitions

LogID  Specifies individual events within the event log.
Timestamp  The value of actual time at the time of the logged event.
Log Type  Specifies the type of event log.
Event Total  Specifies the total number of times one or more of these occurrences have resulted in an Event Notification.

Release History

Release 8.5R4; command was introduced.

Related Commands

show efm-oam port statistics  Displays the LINK OAM statistics on a port, or a range of ports or on all ports.
clear efm-oam log-history  Clears the LINK OAM event logs history on a port.

**show efm-oam port l1-ping detail**

Displays the frames lost during a loopback session.

**show efm-oam port chassis/slot/port l1-ping detail**

### Syntax Definitions

- **chassis**
  
  The chassis identifier.

- **slot/port**
  
  Specifies the slot number for the module and the physical port number on that module.

### Defaults

N/A.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The command can also be used even on a port on which LINK OAM is not enabled.

### Examples

```bash
-> show efm-oam port 1/1/1 l1-ping detail
frames configured = 5,
frames delay (msec) = 100,
L1 ping status = Successful,
frames sent = 4,
frames received = 4,
avg delay (msec) = 5

-> show efm-oam port 1/1/4 l1-ping detail
frames configured = 5,
frames delay (msec) = 200,
L1 ping status = Successful,
frames sent = 4,
frames received = 2,
avg delay (msec) = 15
```

### Output Definitions

- **frames configured**
  
  Specifies the number of frames that are sent during L1-ping.

- **delay configured**
  
  Specifies the delay between transmission of two consecutive frames during L1-ping.
**output definitions (continued)**

| L1 ping status | The status of the L1 ping operation. The status can be **Successful**, **Unsuccessful** or **default**. |
| frames sent | Specifies the frames sent during last L1 ping. |
| frames received | Specifies the frames received during last L1 ping. |
| average delay | Specifies the average delay taken by frames during last L1 ping. |

**Release History**

Release 8.5R4; command was introduced.

**Related Commands**

**efm-oam port l1-ping**

Configures the number of frames that needs to be sent during L1-ping, the delay between each consecutive sent frames and to start the L1-ping operation.

**MIB Objects**

- alaDot3OamPortL1PingFramesReceived
- alaDot3OamPortL1PingAverageRoundTripDelay
clear efm-oam statistics

Clears the LINK OAM statistics on a port, range of ports or all ports.

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot/port**: The slot number for the module and the physical port number on that module.
- **-port2**: Specifies the last port in the range of ports.

### Defaults

By default, the statistics are cleared for all the ports if no port is specified in the command.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the port parameter with this command to clear the statistics for a specific port or range of ports.

### Examples

```plaintext
-> clear efm-oam statistics
-> clear efm-oam statistics port 2/1/1-3
```

### Release History

Release 8.5R4; command was introduced.

### Related Commands

- **show efm-oam port statistics**: Displays the LINK OAM statistics on a port, or a range of ports or on all ports.
- **clear efm-oam log-history**: Clears the LINK OAM event logs history on a port.

### MIB Objects

- alaDot3OamGlobalClearStats
- alaDot3OamStatsTable
alaDot3OamPortClearStats
clear efm-oam log-history

Clears the LINK OAM event logs history a port, range of ports or all ports.

`clear efm-oam log-history [port chassis/slot/port[-port2]]`

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot/port` The slot number for the module and the physical port number on that module.
- `-port2` Specifies the last port in the range of ports.

**Defaults**

By default, the event logs are cleared for all the ports if no port is specified in the command.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the port parameter with this command to clear the statistics for a specific port or range of ports.

**Examples**

- `-> clear efm-oam log-history`
- `-> clear efm-oam log-history port 1/1/1`
- `-> clear efm-oam log-history port 2/1/1-3`

**Release History**

Release 8.5R4; command was introduced.

**Related Commands**

- `show efm-oam port statistics` Displays the LINK OAM statistics on a port, or a range of ports or on all ports.
- `show efm-oam port history` Displays the log of events that have occurred on a port. Use this command to display specific event logs on a port.

**MIB Objects**

CPE Test Head Commands

The Customer Provider Edge (CPE) Test Head traffic generator and analyzer is a Test-OAM (Operation, Administration, and Maintenance) tool used in the Metro Ethernet Network to validate the customer Service Level Agreements (SLA). This functionality allows the operator to validate the Metro Ethernet Network between customer end points, which is critical when provisioning or troubleshooting network services.

This implementation of CPE Test Head supports unidirectional and bidirectional ingress tests. Traffic is generated at the UNI port as if the traffic was generated from a test head connected to the UNI port. This validates the actual customer SLA by subjecting the test traffic to the ingress QoS defined at the UNI port (Ethernet SAP profile or QoS policy rules for priority and bandwidth control) and the egress QoS defined at the egress NNI port and carrier network.

The CPE test is non-disruptive to traffic running on other UNI ports that are associated with the same SAP profile as the test UNI port. All UNI ports, including CPE test ports, are subject to any SAP profile or QoS configuration associated with the port. This is important to consider when analyzing test results.

The feature provides a multi-stream test capability. The CPE multi-test feature is supported on non-metro switches with metro license. The feature supports a stack containing up to eight switches.

Multi-stream test requires a free port. The port must not be used and not have any configuration. When a multi-stream test starts, the port is made out of service. The port is made operational again and the configuration is retained when the test is stopped.

MIB information for the CPE Test Head commands are:

<table>
<thead>

</tbody>
</table>
test-oam

Configures the CPE test name and an optional description. The test name is used to identify and configure a CPE test profile.

`test-oam` `string [descr description]`

`no test-oam` `string`

**Syntax Definitions**

*`string`* The name of the CPE test, an alphanumeric string between 1 and 32 characters. This name is used to identify a specific CPE test and is also referred to as the test ID.

*`description`* The description to assign to the test name, an alphanumeric string between 1 and 32 characters.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>description</code></td>
<td>DEFAULT</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove the specified CPE test configuration.
- This command creates a new CPE test profile that is identified by the test name. Make sure the name specified does not exist in the switch configuration.
- A maximum of 32 tests can be configured.
- Only one test can be active on the switch at any given time.

**Examples**

```
-> test-oam Test1
-> test-oam Test2 descr second-test
-> no test-oam Test2
```
**Release History**

Release 8.6R1; command was introduced.

**Related Commands**

- **show test-oam**
  Displays the CPE test configuration and status.

- **show test-oam statistics**
  Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.

**MIB Objects**

- **alaTestOamConfigTable**
  - **alaTestOamConfigTestName**
  - **alaTestOamConfigTestDescription**
  - **alaTestOamConfigRowStatus**
**test-oam direction**

Configures the CPE test direction.

```
test-oam string [direction {unidirectional | bidirectional}]
```

**Syntax Definitions**

- `string` The name of the CPE test, an alphanumeric string between 1 and 32 characters. This name is used to identify a specific CPE test and is also referred to as the test ID.

- `direction` The direction of the CPE test.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>unidirectional</td>
<td>unidirectional</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command assigns the direction to the CPE test.

**Examples**

- `-> test-oam Test1 direction unidirectional`
- `-> test-oam Test1 direction bidirectional`

**Release History**

Release 8.6R1; command was introduced.
Related Commands

- **show test-oam**
  Displays the CPE test configuration and status.

- **show test-oam statistics**
  Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.

MIB Objects

- **alaTestOamConfigTable**
  - **alaTestOamConfigTestName**
  - **alaTestOamConfigDirection**
**test-oam src-endpoint dst-endpoint**

Configures the source and destination endpoints for the specified test.

`test-oam string [src-endpoint src-string] [dst-endpoint dst-string]`

### Syntax Definitions

**string**

The name of an existing CPE test. The string can be of length 1 to 32 characters.

**src-string**

This represents the local or transmitting device. The management IP address or DNS host name of the switch that will transmit test traffic. In case of bidirectional test this also identifies the analyzer device. The string can be of length 1 to 32 characters.

**dst-string**

This represents the remote device. The management IP address or DNS host name of the switch that will receive test traffic. This is the switch on which traffic analysis is done. For unidirectional test this represents the analyzer device. For bidirectional test this identifies the device on which the loopback mode must be active. The string can be of length 1 to 32 characters.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The endpoint can be set as switch hostname or switch management IP address.
- Using the DNS host name of the switch is highly recommended, as this name is unique and is mapped to an IP address configured for the switch.
- This command automatically overwrites the source and destination endpoint values previously configured for the specified CPE test.
- Multicast and broadcast address must not be configured for bidirectional test.

### Examples

-> `test-oam Test1 src-endpoint SW1 dst-endpoint SW2`

-> `test-oam Test1 src-endpoint SW1`
-> test-oam Test1 dst-endpoint SW2

**Release History**

Release 8.6R1; command was introduced.

**Related Commands**

- **test-oam port**
  Configures the port on which the CPE test will run.

- **show test-oam**
  Displays the CPE test configuration and status.

**MIB Objects**

- **alaTestOamConfigTable**
  - **alaTestOamConfigTestName**
  - **alaTestOamConfigSourceEndpoint**
  - **alaTestOamConfigDestinationEndpoint**
**test-oam port**

Configures the port on which the CPE test will run. Use this command on the switch that will generate the test traffic. If the switch is going to receive test traffic, configuring a test port is not necessary.

**test-oam string port chassis/slot/port**

---

**Syntax Definitions**

- **string**: The name of an existing CPE test.
- **chassis/slot/port**: The port on which the CPE test will generate traffic.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- In an Ethernet Service environment, the UNI port is designated as the test port on the generator switch to simulate traffic coming in on the port as if it was sent from a test head device. This will subject the test traffic to the SAP profile.

- Note that the customer traffic is disrupted on ports configured as CPE test ports. Configuring a port that is not in use is recommended. In addition, if the test port is a UNI port associated with an SAP profile, only that UNI port is used for the test. Traffic on other UNI ports associated with the same profile is not disrupted by the CPE test.

- All UNI ports, including CPE test ports, are subject to any SAP profile or QoS configuration associated with the port. This must be considered when test results are analyzed.

- This command automatically overwrites the port value previously configured for the specified CPE test.

---

**Examples**

```
-> test-oam Test1 port 1/1/2
```

---

**Release History**

Release 8.6R1; command was introduced.
**Related Commands**

- **test-oam vlan test-frame**  
  Configures the source mac-address, destination mac-address, and the SVLAN for the test-frame used in the test.

- **show test-oam**  
  Displays the CPE test configuration and status.

**MIB Objects**

- **alaTestOamConfigTable**
  - **alaTestOamConfigTestName**
  - **alaTestOamConfigPort**
test-oam vlan test-frame

Configures the SVLAN and the source and destination MAC addresses for the test frame. Use this command to configure these test parameters on both the generator (local) switch and the analyzer (remote) switch for the specified CPE test.

```bash
test-oam string [vlan svlan] [[test-frame [src-mac src-address] [dst-mac dst-address]]
```

Syntax Definitions

- `string`: The name of an existing CPE test.
- `svlan`: The service VLAN ID. This is used for traffic analysis and test-frame accounting.
- `src-address`: Source mac-address of the test-frame.
- `dst-address`: Destination mac-address of the test-frame.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>src-address</td>
<td>00:00:00:00:00:00</td>
</tr>
<tr>
<td>dst-address</td>
<td>00:00:00:00:00:00</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>6900 X48C4E/V48C8/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Although the source and destination MAC addresses are optional parameters with this command, the test will not run if these addresses are set to all zeros (the default).
- Make sure that routing is disabled on the specified SVLAN.
- Avoid configuring any IEEE reserved MAC addresses as the destination MAC address for the test.
- This command automatically overwrites the SVLAN, source MAC, or destination MAC values previously configured for the specified CPE test.

Examples

```bash
-> test-oam Test1 vlan 100 test-frame src-mac 00:01:02:00:00:02 dst-mac 00:00:01:00:00:90
-> test-oam Test1 vlan 100
```
CPE Test Head Commands

test-oam vlan test-frame

-> test-oam Test1 test-frame src-mac 00:01:02:00:00:02 dst-mac 00:00:01:00:00:90
-> test-oam Test1 test-frame src-mac 00:01:02:00:00:02
-> test-oam Test test-frame dst-mac 00:00:01:00:00:90

Release History
Release 8.6R1; command was introduced.

Related Commands
- **test-oam role** Configures the switch as a generator or analyzer for the test.
- **show test-oam** Displays the CPE test configuration and status.

MIB Objects
alaTestOamConfigTable
  alaTestOamConfigTestName
  alaTestOamConfigVlan
  alaTestOamConfigFrameSrcMacAddress
  alaTestOamConfigFrameDstMacAddress
test-oam role

Configures the role the switch will perform for the specified CPE test. The type of role assigned determines whether the switch transmits (generator) or receives (analyzer) or loopback test frames.

test-oam string role {generator | analyzer | loopback}

Syntax Definitions

string The name of an existing CPE test.
generator Configures the switch as the test generator.
analyzer Configures the switch as the test analyzer.
loopback Configures the switch as loopback.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use this command on the switch that will perform the specified role.
- Configuring a generator and an analyzer switch for each test is required.
- Only one role can be assigned to the switch for a particular test.
- This command automatically overwrites the previously configured switch role for the specified CPE test.

Examples

-> test-oam Test1 role generator
-> test-oam Test2 role analyzer
-> test-oam Test2 role loopback

Release History

Release 8.6R1; command was introduced.
Related Commands

test-oam duration rate packet-size
Configures the test frame duration, rate and packet-size for the test.

show test-oam
Displays the CPE test configuration and status.

MIB Objects
alaTestOamConfigTable

  alaTestOamConfigRole
test-oam duration rate packet-size

Configures the duration, rate, and packet-size for the specified test. Use this command to configure these test parameters on the generator switch.

```
  test-oam string [duration secs] [rate rate] [packet-size bytes]
```

### Syntax Definitions

- **string**: The name of an existing CPE test.
- **secs**: The duration of the test, in seconds. This is the amount of time the generator will actively transmit test packets to the remote (analyzer) switch. The valid time range is 1–3600 seconds.
- **rate**: The rate, in Kbps or Mbps, at which test traffic is generated. The minimum value allowed is 8 Kbps to line rate. The granularity of the transmit rate is 8 Kbps for 100 Mbps port and 2 Mbps for 1Gig ports.
- **bytes**: The packet size, in bytes. The valid range is 64–9212 bytes.

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>secs</td>
<td>5 secs</td>
</tr>
<tr>
<td>rate</td>
<td>8 k</td>
</tr>
<tr>
<td>bytes</td>
<td>64 byte</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command automatically overwrites any duration, rate, and packet size parameter values previously configured for the specified CPE test.
- The status of the CPE test will change to “ended” when the test duration time expires.
- This command automatically overwrites the duration, rate, or packet size values previously configured for the specified CPE test.

### Examples

- `-> test-oam Test1 duration 10 rate 8k packet-size 64`
- `-> test-oam Test1 rate 8m`
-> test-oam Test1 duration 10
-> test-oam Test1 packet-size 64

**Release History**

Release 8.6R1; command was introduced.

**Related Commands**

- **test-oam frame**
  Configures the test frame parameter values for the CPE test.

- **show test-oam**
  Displays the CPE test configuration and status.

**MIB Objects**

  - *alaTestOamConfigTestName*
  - *alaTestOamConfigDuration*
  - *alaTestOamConfigGeneratorBandwidth*
  - *alaTestOamConfigGeneratorPacketSize*
**test-oam frame**

Configures the test frame parameter values for the specified CPE test. Use this command on the switch that will generate the test frame traffic.

```
test-oam string frame
    [vlan-tag vlan-id priority priority drop-eligible {true | false}]
    ether-type {hex-num | ipv4 {src-ip src-ipv4 dst-ip dst-ipv4 [ttl ttl] [tos tos] [protocol {udp | tcp} {src-port src-port dst-port dst-port}]]] [data-pattern pattern]
```

**Syntax Definitions**

- **string**: The name of an existing CPE test.
- **vlan-id**: The VLAN ID of the frame.
- **priority**: The priority value. The valid range is 0–7.
- **true**: Sets the drop-eligible bit to true.
- **false**: Sets the drop-eligible bit to false.
- **hex-num**: The hexadecimal ethertype value. The valid range is 0x600–0xfffe.
- **src-ipv4**: The source IP address for an IPv4 test frame.
- **dst-ipv4**: The destination IP address for an IPv4 test frame.
- **ttl**: The time-to-live value. The valid range is 0–255.
- **tos**: The type-of-service value for QoS features. The valid range is 0x0–0xff.
- **udp**: Specifies the UDP protocol.
- **tcp**: Specifies the TCP protocol.
- **src-port**: The source port of the generated test frame.
- **dst-port**: The destination port of the generated test frame.
- **pattern**: The data pattern present in the generated test frame. The valid range is 0x0000–0xffff.

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>7</td>
</tr>
<tr>
<td>drop-eligible</td>
<td>false</td>
</tr>
<tr>
<td>ttl</td>
<td>64</td>
</tr>
<tr>
<td>tos</td>
<td>0x0</td>
</tr>
<tr>
<td>pattern</td>
<td>0x0000</td>
</tr>
</tbody>
</table>
Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Specify the Ether type in hexadecimal format to configure a Layer 2 test frame.
- Specify ipv4 as the Ether type to configure a Layer 3 test frame. When this option is selected, entering a source and destination IP address is required.
- Do not specify reserved Ether type values.
- This command automatically overwrites the test packet parameter values previously configured for the specified CPE test.

Examples

If the ether-type is a hexadecimal number (Layer 2 test frame):
- `-> test-oam Test1 frame vlan-tag 1 priority 2 drop-eligible false ether-type 0x0100 data-pattern 0x0010`

If the ether-type is IPV4 (Layer 3 test frame):
- `-> test-oam Test1 frame vlan-tag 1 priority 2 drop-eligible false ether-type ipv4 src-ip 1.1.1.1 dst-ip 2.2.2.2 ttl 4 tos 0x01 protocol udp src-port 2000 dst-port 3000 data-pattern 0x0010`

Release History

Release 8.6R1; command was introduced.

Related Commands

- `test-oam l2-saa` Start or stop the CPE test.
- `show test-oam` Displays the CPE test configuration and status.

MIB Objects

- `alaTestOamIpv4ConfigTable`
**test-oam l2-saa**

Configures to run SAA tests in parallel with test streams.

```
test-oam string l2-saa [priority vlan-priority] [count num-pkts] [interval inter-pkt-delay] [continuous] [size size] [drop-eligible {true | false}]
```

```
no test-oam string l2-saa
```

---

**Syntax Definitions**

- **string**: The name of an existing CPE test.
- **vlan-priority**: Specify the internal priority of MAC ping and 802.1p value on the VLAN tag header.
- **num-pkts**: The number of packets sent in one ping iteration. Valid range is 1 to 10.
- **inter-pkt-delay**: The delay between packets sent during a ping iteration (milliseconds). Valid range is 100 to 1000, in multiples of 100.
- **continuous**: Allows the SAA session to run continuously until the test-oam session ends.
- **size**: The payload size to be used for MAC ping iteration. Must be within 1500 bytes.
- **drop-eligible**: Specify the drop precedence of the MAC ping and the Canonical Format Indicator (CFI) bit on the VLAN tag header.

---

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>vlan-priority</strong></td>
<td>0</td>
</tr>
<tr>
<td><strong>num-pkts</strong></td>
<td>5</td>
</tr>
<tr>
<td><strong>inter-pkt-delay</strong></td>
<td>1000 ms</td>
</tr>
<tr>
<td><strong>size</strong></td>
<td>36 bytes</td>
</tr>
<tr>
<td><strong>drop-eligible</strong></td>
<td>false</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Support</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Usage Guidelines

- The L2-SAA test derives the source MAC, destination MAC, and the VLAN ID from the test OAM configuration of the individual test frames.
- The default L2-SAA configuration values will be applied if no optional parameters are configured.
- To run the L2-SAA session until the test-oam session ends, use the `continuous` parameter.
- Different SAA profiles can be configured for each individual test stream.
- Use the `no` form of this command to remove the L2-SAA configuration for the test.

Examples

```
-> test-oam test1 12-saa priority 5 count 5 interval 1000 size 100 drop-eligible false
-> test-oam test1 12-saa continuous
-> no test-oam test1 12-saa
```

Release History

Release 8.6R1; command was introduced.

Related Commands

- **test-oam**
  - Configures the CPE test name and an optional description. The test name is used to identify and configure a CPE test profile.
- **show test-oam**
  - Displays the CPE test configuration and status.

MIB Objects

- `alaTestOamConfigTable`
- `alaTestOamSaaConfigDropEligible`
- `alaTestOamSaaConfigPayloadSize`
- `alaTestOamSaaConfigNumPkts`
- `alaTestOamSaaConfigInterPktDelay`
- `alaTestOamSaaContinuous`
**test-oam start stop**

Starts or stops the CPE test operation.

```
test-oam string {{vlan vlan-id} [port chassis/slot/port] [packet-size bytes] start | stop} [fetch-remote-stats]
```

### Syntax Definitions

- **string**
  - The name of an existing CPE test.

- **vlan-id**
  - The service VLAN ID. This value is required only for traffic analysis and test frame accounting and is not related to the VLAN tag specified for the actual test frame.

- **chassis/slot/port**
  - The switch port on which the test is run.

- **bytes**
  - The size of the test packet, in bytes. The valid packet size range is 64–9212 bytes.

- **start**
  - Starts the CPE test operation.

- **stop**
  - Stops the CPE test operation.

- **fetch-remote-stats**
  - Triggers the test at the remote device from the generator. The statistics are collected from the remote device and the test is stopped after receiving the test results.

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>bytes</td>
<td>64</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Ensure that routing is disabled on the specified service VLAN.

- The optional **vlan**, **port**, and **packet-size** parameters specify “active” parameter values that are applied when the specified CPE test is started. If these same parameters are defined within a CPE test profile, they are considered “configured” parameter values. Active parameter values override configured parameter values when the test is started.
• If no active parameter values are specified with this command, the test is started using the configured values defined in the CPE test profile. However, if active parameter values are not specified and the CPE test does not contain any configured values for these parameters, the test will not run.

• Specifying any of the optional parameter values does not change the configured values associated with the CPE test.

• If the specified port resides on a switch that will transmit test traffic, the port will generate the test frames. However, if the switch is an analyzer switch, specifying a port is not required.

• Start the specified test on the analyzer switch first and then on the generator switch.

• The test will stop when the test duration time expires or when the test is manually stopped using the \texttt{test-oam stop} command.

• Manually restart the test if the test is interrupted by a takeover, restart, or hot swap.

• The previous statistics related to the test will be cleared automatically once the test is started.

• Use the \texttt{fetch-remote-stats} parameter to collect the test statistics from the remote device. This parameter must be used to start the bidirectional test.

\textbf{Examples}

\begin{itemize}
\item \texttt{test-oam Test1 start}
\item \texttt{test-oam Test1 vlan 100 start}
\item \texttt{test-oam Test1 port 1/1/1 start}
\item \texttt{test-oam Test1 packet-size 100 start}
\item \texttt{test-oam Test1 vlan 100 port 1/1/1 packet-size 100 start}
\item \texttt{test-oam Test1 stop}
\item \texttt{test-oam Test1 start fetch-remote-stats}
\item \texttt{test-oam "test2" port 1/1/2 start fetch-remote-stats}
\end{itemize}

\textbf{Release History}

Release 8.6R1; command was introduced.

\textbf{Related Commands}

\begin{itemize}
\item \texttt{show test-oam statistics} \hspace{1em} Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.
\item \texttt{show test-oam} \hspace{1em} Displays the CPE test configuration and status.
\end{itemize}

\textbf{MIB Objects}

\begin{itemize}
\item \texttt{alaTestOamConfigTable}
\item \texttt{alaTestOamConfigTestName}
\item \texttt{alaTestOamConfigVlan}
\item \texttt{alaTestOamConfigPort}
\item \texttt{alaTestOamConfigGeneratorPacketSize}
\item \texttt{alaTestOamConfigTestIdState}
\item \texttt{alaTestOamConfigRemoteStatsFetch}
\end{itemize}
**test-oam remote-sys-mac**

Configures the system MAC address of the remote device to receive test OAM messages.

```
test-oam string remote-sys-mac string
```

### Syntax Definitions

- **string**
  - The name of an existing CPE test.

- **remote-sys-mac**
  - The system MAC address of the remote device.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use this command on the generator switch to set the system MAC address of the remote device to receive the test OAM messages.

- remote-sys-mac must be the primary CMM MAC address of the remote device. Use the `show cmm` command on the remote device to know the chassis MAC address of the device.

- remote-sys-mac is not applicable for analyzer or loopback.

- Configuring the Remote Sys MAC is mandatory for bidirectional test and optional for unidirectional test.

### Examples

```
-> test-oam Test1 remote-sys-mac 00:e0:b1:7c:7a:fa
```

### Release History

Release 8.6R1; command was introduced.
Related Commands

show test-oam

Displays the CPE test configuration and status.

MIB Objects

alaTestOamConfigTable
  alaTestOamConfigRemoteSysMacAddress
test-oam statistics flash-logging

Enable or disable the option to save the statistics of the test on the file in the flash directory of the switch. The test information is appended at the end of the default text file (testoamActiveStats.txt) in the flash.

test-oam statistics flash-logging {enable | disable}

---

**Syntax Definitions**

N/A

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>

output definitions
Source Endpoint
The host name for the source (generator) switch. Configured through the test-oam direction command.

Destination Endpoint
The host name for the destination (analyzer) switch. Configured through the test-oam direction command.

Test Description
Description for the test name. Configured through the test-oam command.

Direction
The direction of the test traffic. Note that only unidirectional traffic tests are supported.

Source MAC
The source MAC address for the test frame. Configured through the test-oam vlan test-frame command.

Destination MAC
The destination MAC address for the test frame. Configured through the test-oam vlan test-frame command.

Remote Sys MAC
The MAC address of the remote device configured through the test-oam remote-sys-mac command.

Duration
The amount of time the test will run. Configured through the test-oam duration rate packet-size command.

Vlan
The service VLAN (SVLAN) associated with the test. Configured through the test-oam vlan test-frame command.

Role
The role of the switch for this test (generator or analyzer). Configured through the test-oam role command

Port
The port on which the test is run. Configured through the test-oam port command.

Tx Rate
The rate at which packets are transmitted on the test port. Configured through the test-oam duration rate packet-size command.

Frame Size
The size of the test frame. Configured through the test-oam duration rate packet-size command.

State
The administrative state of the test (stop or start). Configured through the test-oam l2-saa command.

Status
The operational status of the test (running, ended, stopped, or not started).
### Output Definitions

show test-oam statistics

Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.

**show test-oam** [string] statistics

---

### Syntax Definitions

**string** The name of an existing CPE test.

---

### Defaults

By default, statistics are displayed for all CPE tests.

---

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

### Usage Guidelines

- Use the **string** parameter with this command to display statistics for a specific CPE test.
- The statistics displayed depend on the role the switch is performing for the test (generator or analyzer). For example, the analyzer switch may not show any packet count in the **TX** fields because it is the receiving switch.

---

### Examples

```
-> show test-oam Test1 statistics
Test-Id TX-Ingress TX-Egress RX-Ingress Remote-Stats Throughput (Mbps)
-----------------------------------------------
Test1 19017    19017    19017             19017        9.98

-> show test-oam statistics
Test-Id TX-Ingress TX-Egress RX-Ingress Remote-Stats Throughput (Mbps)
-----------------------------------------------
Test1 1200366 1200366 0      1200366          8
Test2 0        0       1200366 1200366          8
```

---

### output definitions

- **Test-Id** The CPE test name (ID).
- **TX-Ingress** The number of ingress test packets generated on the ingress UNI.
**output definitions**

<table>
<thead>
<tr>
<th>TX-Egress</th>
<th>The number of egress test packets transmitted on the egress NNI.</th>
</tr>
</thead>
<tbody>
<tr>
<td>RX-Ingress</td>
<td>The number of test packets received on the ingress NNI. This value is relevant on the receiving (analyzer) switch for the specific test.</td>
</tr>
<tr>
<td>Remote-Stats</td>
<td>The number of test frames received by the analyzer and fetched by the generator device.</td>
</tr>
<tr>
<td>Throughput (Mbps)</td>
<td>Displays the traffic throughput of the test.</td>
</tr>
</tbody>
</table>

**Release History**

Release 8.6R1; command was introduced.

**Related Commands**

- **test-oam statistics flash-logging** Displays the CPE test configuration and status.
- **clear test-oam statistics** Clears CPE test statistics.

**MIB Objects**

- `alaTestOamStatsTable`
  - `alaTestOamConfigTestId`
  - `alaTestOamTxIngressCounter`
  - `alaTestOamTxEgressCounter`
  - `alaTestOamRxIngressCounter`

  - `alaTestOamBandwidthThroughputStr`
**show test-oam saa statistics**

Displays the SAA test statistics for all CPE tests or for a specific test name.

```
show test-oam [string] saa statistics
```

**Syntax Definitions**

String

The name of an existing CPE test.

**Defaults**

By default, statistics are displayed for all CPE tests.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `string` parameter with this command to display SAA statistics for a specific CPE test.

**Examples**

```
-> show test-oam Test1 saa statistics
```

```
Test | Time of Last-Run | RTT Min RTT Avg RTT Max Jitter Min Jitter Avg Jitter Max Jitter Packets Sent Rcvd
-----|------------------|----------|---------|---------|--------|---------|--------|---------|--------|-----------|---------|----------|--------|---------|--------|---------|
Test1 2009-09-05 20:18:34.0 970 1067 1432 1 99 455 7 7 DEFAULT
```

```
-> show test-oam saa statistics
```

```
Test | Time of Last-Run | RTT Min RTT Avg RTT Max Jitter Min Jitter Avg Jitter Max Jitter Packets Sent Rcvd
-----|------------------|----------|---------|---------|--------|---------|--------|---------|--------|-----------|---------|----------|--------|---------|--------|---------|
Test1 2009-09-05 20:18:34.0 970 1067 1432 1 99 455 7 7 DEFAULT
Test2 2009-09-05 20:18:34.0 770 865 1432 2 99 255 7 7 DEFAULT
Test3 2009-09-05 40:38:34.0 770 967 1432 1 99 355 7 7 DEFAULT
Test4 2009-09-05 50:48:34.0 770 807 1432 1 99 255 7 7 DEFAULT
Test5 2009-09-06 60:18:34.0 640 867 1432 2 99 445 7 7 DEFAULT

clear test-oam statistics

Clears the statistics for all CPE tests or for a specific test name.

```
clear test-oam [string] statistics
```

**Syntax Definitions**

`string` The name of an existing CPE test.

**Defaults**

By default, statistics are cleared for all CPE tests.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `string` parameter with this command to clear the statistics for a specific CPE test.

**Examples**

```
-> clear test-oam Test1 statistics
-> clear test-oam statistics
```

**Release History**

Release 8.6R1; command was introduced.
Related Commands

**show test-oam statistics**  Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.

**show test-oam saa statistics**  Displays the SAA test statistics for all CPE tests or for a specific test name.

MIB Objects

alaTestOamStatsTable
  alaTestOamConfigTestId
  alaTestOamStatsClearStats
test-oam group

Configures the CPE test group name and an optional description. The group name is used to identify and configure a CPE test group.

test-oam group string [descr description]

no test-oam group string

Syntax Definitions

string
The name of the CPE test group, an alphanumeric string between 1 and 32 characters. This name is used to identify a specific CPE test-oam group.

description
The description to assign to the CPE test group, an alphanumeric string between 1 and 32 characters.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>DEFAULT</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900V72/C32</th>
<th>6900 C32E/T24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to remove the specified CPE test group.
- This command creates a CPE test group that is identified by the test-oam name. Make sure the name specified does not exist in the switch configuration.
- To configure a CPE test group, the individual test must be configured.
- A maximum of 4 testoam profiles can be configured in a group to run the tests concurrently.
- Only one CPE test group can be active on the switch at any given time.
- Usage Guidelines for OmniSwitch 6560 and OmniSwitch 6570M:
  - A maximum of 8 testoam profiles can be configured in a group to run the tests concurrently.

Examples

-> test-oam group Testgroup1
-> test-oam group Testgroup2 descr second-testgroup
-> no test-oam group Testgroup1

Release History
Release 8.6R1; command was introduced.
Release 8.9R1; CPE test head group support added for OmniSwitch 6560.

Related Commands

**show test-oam group statistics** Displays the statistics for all CPE test groups or for a specific CPE test group. Use this command on both the generator and analyzer switch to determine test results.

**show test-oam group** Displays the statistics for all CPE test groups or for a specific CPE test group.

MIB Objects
alaTestOamGroupConfigTable
alaTestOamConfigGroupId
alaTestOamConfigGroupDescription
alaTestOamGroupConfigRowStatus
**test-oam group tests**

This defines the list of CPE test group tests that need to be added in the test-oam group.

```
test-oam group string [tests string1.......string8]
test-oam group string [no tests string1.......string8]
```

### Syntax Definitions

<table>
<thead>
<tr>
<th><strong>string</strong></th>
<th>The name of the CPE test group, an alphanumeric string between 1 and 32 characters. This name is used to identify a specific CPE test group.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>string1.......string8</strong></td>
<td>The name of the configured test-oam tests.</td>
</tr>
</tbody>
</table>

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command defines the list of test-oam tests that need to run concurrently.
- The test must exist, while configuring the test-oam list.
- A maximum of four tests can be configured to run concurrently.
- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of test-oam group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.
- Use the `no` form of the command to remove the test-oam tests from the CPE test group.
- Usage Guidelines for OmniSwitch 6560 and OmniSwitch 6570M:
  - A maximum of 8 tests can be configured to run concurrently.

### Examples

```
-> test-oam test1
-> test-oam test2
-> test-oam test3
```
-> test-oam test4
-> test-oam test5
-> test-oam test6
-> test-oam test7
-> test-oam test8
-> test-oam group Testgroup1 descr first-testgroup
-> test-oam group Testgroup1 tests test1 test2 test3 test4 test5 test6 test7 test8
-> test-oam group Testgroup1 no tests test1 test2 test3

**Release History**

Release 8.6R1; command was introduced.
Release 8.9R1; CPE test head group support added for OmniSwitch 6560.

</tr>
</tbody>
</table>

**MIB Objects**

alaTestOamGroupFlowConfigTable
  alaTestOamConfigGroupId
  alaTestOamConfigTestId
  alaTestOamGroupFlowConfigRowStatus
test-oam feeder

This configures the feeder port globally in the system for CPE test group to feed the test traffic to generator port.

**test-oam feeder-port chassis/lot/port**

**no test-oam feeder-port**

### Syntax Definitions

**chassis/lot/port**

The port to be used to feed the test traffic only to generator port.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command configures the feeder port globally in the system.
- The feeder port cannot be the generator port and the generator port cannot be the feeder port.
- When a CPE test group is running, the modification to the feeder port shall not be allowed.
- Use the **no** form of the command to remove the feeder port from the system for CPE test group.

### Examples

```
-> test-oam feeder-port 1/1/4
-> no test-oam feeder-port
```

### Release History

Release 8.6R1; command was introduced.
Related Commands

- **test-oam group port**: Configures the port on which the CPE test group will run.
- **show test-oam group**: Displays the configuration and status of the CPE test groups.

MIB Objects

- `alaTestOamGlobalFeederPort`
test-oam group src-endpoint dst-endpoint

Configures the source and destination endpoints for the CPE test group.

```
<command>

Syntax Definitions

string | src_string | dst_string

string The name of an existing CPE test group.
src_string The management IP address or DNS host name of the switch that will transmit test traffic.
dst_string The management IP address or DNS host name of the switch that will receive test traffic. This is the switch on which traffic analysis is done.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>src-endpoint</td>
<td>DEFAULT</td>
</tr>
<tr>
<td>dst-endpoint</td>
<td>DEFAULT</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>

<td>Y</td>
<td>Y</td>
<td>N</td>
<td>N</td>
<td>N</td>
<td>N</td>
<td>N</td>
<td>N</td>
<td>N</td>
<td>N</td>
<td>N</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Using the DNS host name of the switch is highly recommended, as this name is unique and is mapped to an IP address configured for the switch.
- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of test-oam group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

Examples

```
-> test-oam group Testgroup1 src-endpoint SW1 dst-endpoint SW2
-> test-oam group Testgroup1 src-endpoint SW1
-> test-oam group Testgroup1 dst-endpoint SW2
```
**Release History**

test-oam group role

Configures the role the switch will perform for the specified CPE test group. The type of role assigned determines whether the switch transmits (generator) or receives (analyzer) test frames.

test-oam group name role {generator | analyzer | loopback}

Syntax Definitions

name
   The name of an existing CPE test group.
generator
   Configures the switch as the test generator.
analyzer
   Configures the switch as the test analyzer.
loopback
   Configures the switch as loopback.

Defaults

N/A

Usage Guidelines

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

Examples

-> test-oam group Testgroup1 role generator
-> test-oam group Testgroup2 role analyzer
-> test-oam group Testgroup2 role loopback

Release History

Release 8.6R1; command was introduced.
Related Commands

- **test-oam group duration rate**  Configures the duration and rate for the specified CPE test group.
- **show test-oam group**  Displays the configuration and status of the CPE test groups.

MIB Objects

- alaTestOamGroupConfigTable
  - alaTestOamConfigGroupId
  - alaTestOamGroupConfigRole
**test-oam group port**

Configures the port on which the CPE test group will run. Use this command on the switch that will generate the test traffic.

**Syntax Definitions**

```
string                  The name of an existing CPE test group.
chassis/slot/port       The port on which the CPE test will generate traffic.
```

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Configuring a port that is not in use is recommended. In addition, if the test port is a UNI port associated with an SAP profile, only that UNI port is used for the test. Traffic on other UNI ports associated with the same profile is *not* disrupted by the CPE test.
- This command automatically overwrites the port value previously configured for the specified CPE test group.
- The feeder port cannot be the generator port and the generator port cannot be the feeder port.
- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

**Examples**

```
-> test-oam group Testgroup1 port 1/1/2
```

**Release History**

Release 8.6R1; command was introduced.
Related Commands

**test-oam group start stop**  
Starts the traffic test for the CPE test group on the configured port or the given port.

**test-oam group remote-sys-mac**  
Stops the traffic test for the CPE test group on the configured port or the given port.

**show test-oam group**  
Displays the configuration and status of the CPE test groups.

MIB Objects

alaTestOamGroupConfigTable
  alaTestOamConfigGroupId
  alaTestOamGroupConfigPort
**test-oam group direction**

Configures the test direction of the test-oam group.

```
test-oam group string [direction {unidirectional | bidirectional}]
```

### Syntax Definitions

- `string` The name of an existing CPE test group.
- `direction` The direction of the CPE test group.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>direction</td>
<td>unidirectional</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

### Examples

- `-> test-oam group Testgroup1 direction unidirectional`
- `-> test-oam group Testgroup2 direction bidirectional`

### Release History

Release 8.6R1; command was introduced.
**Related Commands**

- **test-oam group duration rate**  Configures the duration and rate for the specified CPE test group.
- **show test-oam group**  Displays the configuration and status of the CPE test groups.

**MIB Objects**

- `alaTestOamGroupConfigTable`
  - `alaTestOamConfigGroupId`
  - `alaTestOamGroupConfigDirection`
**test-oam group duration rate**

Configures the duration and rate for the specified test-oam group. Use this command to configure these test parameters on the generator switch.

**Syntax**

```
(test-oam group string [duration secs] [rate rate])
```

**Syntax Definitions**

- **string**
  - The name of an existing CPE test group.

- **secs**
  - The duration of the test, in seconds. This is the amount of time the generator will actively transmit test packets to the remote (analyzer) switch. The valid time range is 5–3600 seconds.

- **rate**
  - The rate, in Kbps or Mbps, at which test traffic is generated. The minimum value allowed is 8 Kbps to line rate. The granularity of the transmit rate is 8 Kbps for 100 Mbps port and 2 Mbps for 1Gig ports.

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>secs</td>
<td>5 secs</td>
</tr>
<tr>
<td>rate</td>
<td>8 k</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command automatically overwrites any duration and rate parameter values previously configured for the specified CPE test group.

- The status of the CPE test group will change to “ended” when the test duration time expires.

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.

- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.

- When a CPE test group is running, the modification of a feeder port shall not be allowed.

**Examples**

```
-> test-oam group Testgroup1 duration 10
```
CPE Test Head Commands

test-oam group duration rate

-> test-oam group Testgroup1 rate 8m
-> test-oam group Testgroup1 duration 10 rate 8m

test-oam group start stop

Starts or stops the traffic test for the test-oam group on the configured port or the given port.

test-oam group string \{\{port chassis/slot/port\} start | stop\} [fetch-remote-stats]

Syntax Definitions

string The name of an existing CPE test group.
chassis/slot/port The port on which the CPE test group will generate traffic.
start Enables the test.
stop Disables the test.
fetch-remote-stats Triggers the group test at the remote device from the generator. The statistics are collected during the test and the test is stopped after receiving the test results.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

• When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.

• When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.

• When a CPE test group is running, the modification of a feeder port shall not be allowed.

• Use the fetch-remote-stats parameter to collect the test statistics from the remote device.

Examples

- test-oam group Testgroup1 port 1/1/2 start
- test-oam group Testgroup2 start
- test-oam group Testgroup1 start fetch-remote-stats
- test-oam group testgroup2 port 1/1/2 start fetch-remote-stats
- test-oam group Testgroup1 stop
- test-oam group Testgroup2 stop
**Release History**

Release 8.6R1; command was introduced.

**Related Commands**

- `show test-oam group` Displays the configuration and status of the CPE test groups.

**MIB Objects**

- `alaTestOamGroupConfigTable`  
  - `alaTestOamConfigGroupId`  
  - `alaTestOamGroupConfigPort`  
  - `alaTestOamGroupConfigState`  
  - `alaTestOamGroupConfigRemoteStatsFetchState`
test-oam group remote-sys-mac

Configures the system MAC address of the remote device to receive test OAM messages.

```
test-oam group string remote-sys-mac string
```

**Syntax Definitions**

- **string**: The name of an existing CPE test group.
- **remote-sys-mac**: The system MAC address of the remote device.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Support</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use this command on the switch to set the system MAC address of the remote device to receive the test OAM messages.
- The remote-sys-mac must be the primary CMM MAC address of the remote device.
- The remote-sys-mac is not applicable for analyzer or loopback.

**Examples**

```
-> test-oam group Testgroup1 remote-sys-mac 00:e0:b1:7c:7a:fa
```

**Release History**

Release 8.6R1; command was introduced.

**Related Commands**

- `show test-oam group` Displays the configuration and status of the CPE test groups.

**MIB Objects**

- `alaTestOamGroupConfigTable`
- `alaTestOamGroupConfigRemoteSysMacAddress`
clear test-oam group statistics

This clears the statistics of the CPE test group.

clear test-oam group string statistics

**Syntax Definitions**

string

The name of an existing CPE test group.

statistics

Clears the statistics for the give CPE test group.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

**Examples**

-> clear test-oam group Testgroup1 statistics (Clears the statistics for the specified test-oam group)

-> clear test-oam group statistics (Clears the statistics for all the test-oam groups)

**Release History**

Release 8.6R1; command was introduced.
Related Commands

**show test-oam group statistics**  Displays the statistics for all test-oam groups or for a specific CPE test group.

**show test-oam group**  Displays the configuration and status of the CPE test groups.

MIB Objects

</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Use the **tests** parameter to display information for all CPE test groups configured on the switch.

- Use the **string** parameter to display detailed information for a specific CPE test group.

---

**Examples**

```plaintext
-> show test-oam group tests
Total Test-Groups: 2
Feeder Port : none
Test-Group Port Duration Rate Nb of Flows Direction Status Remote-Sys-Mac
----------+-----+----------+---------+-----+---------------+------------+---------------------
Testgroup1 none 5          -     2 unidirectional not-started 00:00:00:00:00:00:00
Testgroup2 none 5          -     3 unidirectional not-started 00:00:00:00:00:00:00
```

---

**output definitions**

- **Test-Groups**
  - The CPE test group. Configured through the `test-oam group` command.

- **Port**
  - The port on which the test is run.

- **Duration**
  - The amount of time the test will run.

- **Rate**
  - The rate at which packets are transmitted on the test port. Configured through the `test-oam group duration rate` command.

- **Nb of Flows**
  - Number of test flows configured for the respective CPE test group.

show test-oam group saa statistics

Displays the SAA test statistics for all CPE test groups or for a specific test name.

show test-oam group [string] saa statistics

Syntax Definitions

string

The name of an existing CPE test group.

Defaults

By default, statistics are displayed for all CPE test group.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

### show test-oam group statistics

Displays the statistics for all CPE test groups or for a specific CPE test group. Use this command on both the generator and analyzer switch to determine test results.

**show test-oam group [string] statistics**

---

**Syntax Definitions**

*string* 

The name of an existing CPE test group.

**Defaults**

By default, statistics are displayed for all CPE test groups.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Use the *string* parameter with this command to display statistics for a specific CPE test group.
- The statistics displayed depend on the role the switch is performing for the test (generator or analyzer). For example, the analyzer switch may not show any packet count in the **TX** fields because it is the receiving switch.

**Examples**

```bash
-> show test-oam group TestGroup4 statistics
Test-Group Flow TX-Ingress TX-Egress RX-Ingress Remote-Stats Throughput(Mbps)
-----------------------------------------------+----------------+---------------+------------+-------------+----------------+
TestGroup4 flow1 19017 19017 0 19017
TestGroup4 flow2 19017 19017 0 19017

-> show test-oam group statistics
Test-Group Flow TX-Ingress TX-Egress RX-Ingress Remote-Stats Throughput(Mbps)
-----------------------------------------------+----------------+---------------+------------+-------------+----------------+
Testgroup1 test1 20163463 17205475 0 17205475 172.05
Testgroup1 test2 20720137 17680541 0 17680541 176.81
Testgroup1 test3 20709603 17668483 0 17668483 176.68
Testgroup1 test4 20698156 17656987 0 17656987 176.57
Testgroup2 test1 20163463 17205475 0 17205475 172.05
Testgroup2 test2 20720137 17680541 0 17680541 176.81
Testgroup2 test3 20709603 17668483 0 17668483 176.68
Testgroup2 test4 20698156 17656987 0 17656987 176.57
```
**Output Definitions**

56  PPPoE Intermediate Agent

Point-to-Point Protocol over Ethernet (PPPoE) provides the ability to connect a network of hosts to a Remote Access Concentrator. For example, Broadband Network Gateway over a simple bridging access device. In PPPoE model, each host utilizes its own Point-to-Point Protocol (PPP) stack and the user is presented with a familiar user interface. By using PPPoE, Access control, billing, and type of service can be configured on a per-user, rather than a per-site, basis.

PPPoE Intermediate Agent (PPPoE-IA) solution is designed for the PPPoE access method and is based on the Access Node implementing a PPPoE-IA function to insert access loop identification in PPPoE discovery packets (PADI/PADR/PADT) received from the user side.

MIB information for the PPPoE-IA commands is as follows:

   *Filename*: alcatel-ind1-pppoe-ia-mib.mib
   *Module*: ALCATEL-IND1-PPPOEIA-MIB

A summary of the available commands is listed here.

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>pppoe-ia</td>
</tr>
<tr>
<td>pppoe-ia {port</td>
</tr>
<tr>
<td>pppoe-ia {trust</td>
</tr>
<tr>
<td>pppoe-ia access-node-id</td>
</tr>
<tr>
<td>pppoe-ia circuit-id</td>
</tr>
<tr>
<td>pppoe-ia remote-id</td>
</tr>
<tr>
<td>clear pppoe-ia statistics</td>
</tr>
<tr>
<td>show pppoe-ia configuration</td>
</tr>
<tr>
<td>show pppoe-ia {port</td>
</tr>
<tr>
<td>show pppoe-ia statistics</td>
</tr>
</tbody>
</table>

Configuration procedures for PPPoE-IA are explained in the “Configuring PPPoE Intermediate Agent” chapter of the *OmniSwitch AOS Release 8 Network Configuration Guide*. 
pppoe-ia

Enable or disable PPPoE-IA globally on the switch.

pppoe-ia {enable | disable}

Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enable PPPoE-IA.</td>
</tr>
<tr>
<td>disable</td>
<td>Disable PPPoE-IA.</td>
</tr>
</tbody>
</table>

Defaults

By default, PPPoE-IA is disabled globally on the switch.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

All PPPoE-IA parameters are configurable irrespective of the global status of PPPoE-IA.

Examples

-> pppoe-ia enable
-> pppoe-ia disable

Release History

Release 8.6R1; command introduced.

### MIB Objects

- alaPPPoEIAGlobalStatus
**pppoe-ia {port | linkagg}**

Enable or disable PPPoE-IA on a port or a link aggregate port. Link aggregate can be either static or dynamic.

**pppoe-ia {port chassis/slot/port[-port2] | linkagg agg_num} {enable | disable}**

### Syntax Definitions

- **chassis**
  - The chassis identifier.

- **slot**
  - The slot number for the module.

- **port**
  - Port number of the interface to be configured.

- **port2**
  - Last port number in a range of ports to be configured.

- **linkagg agg_num**
  - The link aggregate identification number.

- **enable**
  - Enable PPPoE-IA on a port.

- **disable**
  - Disable PPPoE-IA on a port.

### Defaults

By default, PPPoE-IA is disabled on all ports.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>6900 X48C4E/V48C8/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- All PPPoE-IA parameters are configurable irrespective of the per-port PPPoE-IA status (enabled or disabled).

- PPPoE-IA must be enabled globally as well as on a port.

- PPPoE-IA is not supported on port mirroring destination ports. However, the configurations are accepted.

- PPPoE-IA is not supported on aggregable ports.

### Examples

- -> pppoe-ia port 1/1/1 enable
- -> pppoe-ia port 1/1/4 disable
- -> pppoe-ia linkagg 1 enable
Release History

Release 8.6R1; command introduced.

Related Commands

- **pppoe-ia**
  Enable or disable PPPoE-IA globally on the switch.

- **show pppoe-ia configuration**
  Displays the global configuration for PPPoE-IA.

- **show pppoe-ia {port | linkagg}**
  Displays the PPPoE-IA configuration for a physical port, physical port range, link aggregate port, or all the physical or link-aggregate ports.

- **show pppoe-ia statistics**
  Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

MIB Objects

- **alaPPPoEIAPortConfigTable**
- **alaPPPoEIAPortConfigStatus**
**pppoe-ia {trust | client}**

Configures a port or a link aggregate port as trusted or client port for PPPoE-IA.

A trust port is a port that is connected to the Broadband Network Gateway whereas a client port is connected to the host.

```
pppoe-ia {port chassis/slot/port[-port2] | linkagg agg_num} {trust | client}
```

### Syntax Definitions

- **chassis**
  - The chassis identifier.
- **slot**
  - The slot number for the module.
- **port**
  - Port number of the interface to be configured.
- **port2**
  - Last port number in a range of ports to be configured.
- **linkagg agg_num**
  - Specifies the link aggregate identification number.
- **trust**
  - Specifies the mode of the port as trust.
- **client**
  - Specifies the mode of the port as client.

### Defaults

By default, all ports are client ports.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Support</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- All PPPoE-IA parameters are configurable irrespective of per-port PPPoE-IA status (enabled or disabled).
- PPPoE-IA must be enabled globally as well as on a port.
- For PPPoE-IA to work, it must be enabled on a client port as well as a trusted port.
- PPPoE-IA is not supported on aggregable ports.
- PPPoE-IA is not supported on port mirroring destination ports; however, the configurations are accepted.

### Examples

```
-> pppoe-ia port 1/1 /1
```
PPPoE Intermediate Agent

ppoe-ia {trust | client}

-> pppoe-ia port 1/1/2-4 client
-> pppoe-ia linkagg 7 trust
-> pppoe-ia linkagg 0 client

Release History
Release 8.6R1; command introduced.

Related Commands

ppoe-ia
Enable or disable PPPoE-IA globally on the switch.

ppoe-ia {port | linkagg}
Enable or disable PPPoE-IA on a port or a link aggregate port.

ppoe-ia {trust | client}
Configures a port or a link aggregate port as trust or client port for PPPoE-IA.

show pppoe-ia configuration
Displays the global configuration for PPPoE-IA.

show pppoe-ia {port | linkagg}
Displays the PPPoE-IA configuration for a physical port, physical port range, link aggregate port, or all the physical or link-aggregate ports.

show pppoe-ia statistics
Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

MIB Objects
alaPPPoEIAPortConfigTable
alaPPPoEIAPortConfigTrustMode
**pppoe-ia access-node-id**

Globally configures a format to form an identifier that uniquely identifies an access node.

```plaintext
pppoe-ia access-node-id {base-mac | system-name | mgnt-address | user-string string}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base-mac</td>
<td>The base MAC address of the switch.</td>
</tr>
<tr>
<td>system-name</td>
<td>The configured name of the switch.</td>
</tr>
<tr>
<td>mgnt-address</td>
<td>The IP address of the management interface of the switch.</td>
</tr>
<tr>
<td>string</td>
<td>The value of user configured string.</td>
</tr>
</tbody>
</table>

### Defaults

By default, PPPoE-IA uses the base MAC address of the switch as the Access-Node-Identifier.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Support Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>No</td>
</tr>
<tr>
<td>6465</td>
<td>Yes</td>
</tr>
<tr>
<td>6560</td>
<td>Yes</td>
</tr>
<tr>
<td>6570M</td>
<td>Yes</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
</tr>
<tr>
<td>6860N</td>
<td>No</td>
</tr>
<tr>
<td>6865</td>
<td>Yes</td>
</tr>
<tr>
<td>6900</td>
<td>No</td>
</tr>
<tr>
<td>6900 V72/C32</td>
<td>Yes</td>
</tr>
<tr>
<td>6900 X48C6/T48C6/</td>
<td>No</td>
</tr>

<tr>
<td>9900 X48C2/T24C2/</td>
<td>Yes</td>
</tr>
<tr>
<td>9900 X24C2</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The access-node-identifier can have a maximum of 32 characters. The access-node-identifier longer than 32 characters is truncated to 32 characters.
- The access-node-identifier when configured as user-string must not contain spaces.
- The value of user string must not be NULL.
- In case of management address format, IP address of the Loopback0 interface (if configured and active) or the first active IP interface address is used as the management address. If none of them are available, IP address ‘0.0.0.0’ is used as management address.
- If the access-node-identifier is configured as any other format other than user-string format, then the string value configuration is not allowed through SNMP or Web View application.
- It is mandatory to provide the string value through SNMP using Multi-varbind for the user-string format.

### Examples

```plaintext
-> pppoe-ia access-node-id base-mac
-> pppoe-ia access-node-id user-string accessnode1
```
**Release History**

Release 8.6R1; command introduced.

**Related Commands**

- `pppoe-ia`  
  Enable or disable PPPoE-IA globally on the switch.

- `pppoe-ia {port | linkagg}`  
  Enables or disables PPPoE-IA on a port or a link aggregate port.

- `pppoe-ia {trust | client}`  
  Configures a port or a link aggregate port as trust or client port for PPPoE-IA.

- `clear pppoe-ia statistics`  
  Clears the statistics for all the physical or link-aggregate ports, a single port or a link aggregate port, or a range of physical ports for PPPoE-IA.

- `show pppoe-ia configuration`  
  Displays the global configuration for PPPoE-IA.

- `show pppoe-ia {port | linkagg}`  
  Displays the PPPoE-IA configuration for a physical port, physical port range, link aggregate port, or all the physical or link-aggregate ports.

- `show pppoe-ia statistics`  
  Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

**MIB Objects**

- `alaPPPoEIAGlobalAccessNodeIDFormatType`
- `alaPPPoEIAGlobalAccessNodeIDStringValue`
**pppoe-ia circuit-id**

Globally configures a Circuit-ID format that forms an identifier that uniquely identifies an access node and an access loop that receives the PPPoE Active Discovery Initiation (PADI) or PPPoE Active Discovery Request (PADR) or PPPoE Active Discovery Terminate (PADT) from the user end.

`pppoe-ia circuit-id {default [atm] ascii [base-mac | system-name | interface | vlan | cvlan | interface-alias | user-string string | delimiter char}]`

**Syntax Definitions**

- **default**
  The default value of the Circuit-ID used for the Ethernet parameter.

- **atm**
  When the PPPoE-IA Circuit-ID format is configured as “default atm” the Circuit-ID encoding happens for “ATM” (Asynchronous Transfer Mode) parameter.

- **ascii**
  Circuit-ID format used to configure Circuit-ID string using the five parameters and delimiter. Maximum five parameters can be selected from the given seven options: base-mac, system-name, interface, vlan, cvlan, interface-alias, and user-string.

- **base-mac**
  The base MAC address of the switch.

- **system-name**
  Name configured for the switch.

- **interface**
  The interface on which the PPPoE message is received.

- **vlan**
  VLAN interface on which the PPPoE message is received.

- **cvlan**
  Inner-VLAN or customer VLAN of the PPPoE message.

- **interface-alias**
  Configured alias of the interface on which the PPPoE message is received.

- **string**
  The value of user configured string.

- **delimiter**
  A user configurable delimiter used to separate the fields of an ASCII string forming the Circuit-ID.

- **char**
  The value (a character) of the user configurable delimiter.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>char</td>
<td>:</td>
</tr>
</tbody>
</table>

By default, “:” (colon) is used as the delimiter.
Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platforms Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
</tr>
<tr>
<td>6465</td>
</tr>
<tr>
<td>6560</td>
</tr>
<tr>
<td>6570M</td>
</tr>
<tr>
<td>6860</td>
</tr>
<tr>
<td>6860N</td>
</tr>
<tr>
<td>6865</td>
</tr>
<tr>
<td>6900</td>
</tr>
<tr>
<td>6900 V72/C32</td>
</tr>
<tr>
<td>6900 X48C6/T48C6</td>
</tr>
<tr>
<td>6900 X48C6/V48C8</td>
</tr>
<tr>
<td>9900 C32E/T24C2</td>
</tr>
<tr>
<td>9900 X24C2</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Circuit-ID identification is configurable only globally and cannot be configured on a per-port or per-VLAN basis.
- To configure ethernet default parameter, use “default” in the CLI command.
- To configure default parameter as “atm”, use “default ATM” in the CLI command.
- When the PPPoE-IA Circuit-ID format is configured as “default atm” the Circuit-ID encoding happens for “ATM” (Asynchronous Transfer Mode) parameter.
- By default, the value of the Circuit-ID is "access-node-id eth slot/port[:vlan-id]". For example, if the value of access-node-id is "vxTarget", the default value of Circuit-ID is "vxTarget eth 1/1:10", if the packet is received on the interface 1/1 in vlan 10.
- By default, the delimiter used is “:”. The available delimiters are: “:” (colon), “|” (pipe), “/” (forward slash), “\” (backward slash), “_” (hyphen), “_” (underscore), “ “ (space), “#” (hash), “.” (full stop), “,” (comma), “;” (semicolon).
- The Circuit-ID can have a maximum of 63 characters. The Circuit-ID longer than 63 characters is truncated to 63 characters.
- At most, five fields out of the available seven is encoded for the Circuit-ID in the order specified by the user.
- If the access-node-identifier is configured as any other format other than user-string format, then the string value configuration is not allowed through SNMP or Web View application.
- It is mandatory to provide the string value through SNMP using Multi-varbind for the user-string format.
- The value of user string must not be NULL.
- You can configure the same Circuit-ID format multiple times (for example, base MAC address of the switch can be configured multiple times in ASCII format of Circuit-ID).
- If the Circuit-ID format is default, irrespective of the ASCII fields (if configured), the Circuit-ID configuration is not visible in `show pppoe-ia configuration` output.

Examples

```
-> pppoe-ia circuit-id default
-> pppoe-ia circuit-id default atm
-> pppoe-ia circuit-id ascii base-mac vlan
-> pppoe-ia circuit-id ascii system-name interface user-string cid1
-> pppoe-ia circuit-id ascii system-name delimiter #
```
Release History

Release 8.6R1; command introduced.

**pppoe-ia remote-id**

Globally configures a format to form an identifier that uniquely identifies the user attached to the access loop.

`pppoe-ia remote-id {base-mac | system-name | mgnt-address | user-string string}`

**Syntax Definitions**

- **base-mac**: The base MAC address of the switch.
- **system-name**: The name configured for the switch.
- **mgnt-address**: The management IP address of the switch.
- **string**: The value configured for user string.

**Defaults**

By default, the base MAC address of the switch is used as the format for Remote-ID.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>

Release History

Release 8.6R1; command introduced.
**Related Commands**

- **pppoe-ia**
  Enable or disable PPPoE-IA globally on the switch.

- **pppoe-ia access-node-id**
  Globally configures a format to form an identifier that uniquely identifies an access node.

- **pppoe-ia circuit-id**
  Globally configures a Circuit-ID format that forms an identifier that uniquely identifies an access node and an access loop on which the PADI/PADR/PADT is received from the user side.

- **pppoe-ia remote-id**
  Globally configures a format to form an identifier that uniquely identifies the user attached to the access loop.

- **show pppoe-ia statistics**
  Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

show pppoe-ia {port | linkagg}

Displays the following:

- PPPoE-IA configuration for a physical or link-aggregate port, physical port range, or all the physical or link-aggregate ports.
- Port or port range configuration for ports with PPPoE-IA enabled or disabled
- Ports that are configured as trust or client port for PPPoE-IA.

```shell
class show pppoe-ia {port {chassis/lot/port[-port2] | linkagg agg_num} [enabled | disabled | trusted | client]
```

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot` The slot number for the module.
- `port` Port number of the interface to be configured.
- `port2` Last port number in a range of ports to be configured.
- `linkagg agg_num` Specifies the link aggregate identification number.
- `enabled` PPPoE-IA enabled port.
- `disable` PPPoE-IA disabled port.
- `trust` Port configured as trust.
- `client` Port configured as client.

Service Assurance Agent (SAA) enables customers to assure new business-critical applications, as well as services that utilize data, voice, and video. Use SAAs to verify service guarantees, increase network reliability by validating network performance, proactively identify network issues, and increase return on investment (ROI) by easing the deployment of new services. The SAA feature uses active monitoring to generate traffic in a continuous, reliable, and predictable manner, thus enabling the measurement of network performance and health.

IP SAAs enhance the service level monitoring to become IP application-aware by measuring both end-to-end and at the IP layer. IP SAA would allow performance measurement against any IP addresses in the network (switch, server, pc). Use ETH-LB/DMM to measure delay and jitter by sending out frames with DM information to the peer MEP and receiving frames with DM information from the peer MEP.

MIB information for the SAA commands is as follows:

- **Filename:** Alcatel-IND1-ETHERNET-OAM-MIB.mib
  **Module:** alcatelIND1EoamMIB

- **Filename:** IEEE8021-CFM-MIB.mib
  **Module:** ieee8021CfmMib

- **Filename:** ALCATEL-IND1-SAA-MIB.mib
  **Module:** alcatelIND1SaaMIB

**saa**

Configures a Service Assurance Agent (SAA).

```
[vrf vrf_name] saa string [descr description] [interval interval] [jitter-threshold jitter_thresh] [rtt-threshold rtt_thresh]
```

```
[vrf vrf_name] no saa string
```

---

**Syntax Definitions**

- **vrf_name**
  The name of an existing VRF instance.

- **string**
  SAA ID string up to 32 characters. Use quotes around string if SAA ID contains multiple words with spaces between them (for example “SAA 10”).

- **description**
  Text string up to 32 characters. Use quotes around string if description contains multiple words with spaces between them (for example, “ALE Marketing SAA”).

- **interval**
  The amount of time, in minutes, between two iterations of the SAA test. Valid range is from 1, 2, 5, 10 to 1500.

- **jitter_thresh**
  The jitter threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.

- **rtt_thresh**
  The round-trip time threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.

---

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Use the **no** form of this command to remove an SAA from the switch configuration. Note that the SAA must be stopped before it can be deleted.
The desc and interval parameters are optional. If these values are specified, the SAA is created with those values. If these values are not specified, the SAA is created with the default values.

If the desc and/or interval parameters are specified for an existing SAA, then the values of the existing parameters are updated with those specified.

If the session time interval is changed for an SAA that is already running and active, the interval value is immediately updated in the database but is not applied to the SAA until after the next iteration.

If none of the optional parameters are specified and the given SAA exists, the CLI will return an error message, as duplicate entries are not allowed.

Any number of SAAs can be configured (MAX 127). It is recommended not to start many aggressive SAAs (having session interval <= 10). To achieve proper scheduling of all the started SAA (aggressive and relaxed) it is recommended not to start more than 50 SAAs.

Ensure the interval value is greater than the execution time (number of packets * inter packet delay).

When SAA processes an iteration of a session, it will compare the results against the following criteria to see if an SNMP trap should be sent. A trap with the session name is sent if:

- At least one packet is lost.
- Warning: Average RTT/Jitter crosses 90% of threshold.
- Critical: Average RTT/Jitter at or above threshold.

**Examples**

-> saa saa1 descr "saa for ip-ping"
-> saa saa1 jitter-threshold 100 rtt-threshold 500
-> saa saa2 descr "Monitoring Default VRF-interface" interval 160
-> saa saa2 interval 120
-> no saa saa1

**Release History**

Release 7.3.1; command was introduced.
Release 7.3.2; jitter-threshold and rtt-threshold parameters added.

saa type ip-ping

Configure SAA for IP including the number of packets and inter-packet delay parameters.

```
[vrf vrf_name] saa string type ip-ping destination-ip ip_address source-ip ip_address type-of-service tos [num-pkts count] [inter-pkt-delay delay] [payload-size size]
```

### Syntax Definitions

- **vrf_name**
  The name of an existing VRF instance.

- **string**
  SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, “SAA 10”).

- **destination-ip ip_address**
  The IPv4 address of the destination to ping.

- **source-ip ip_address**
  The IPv4 address of the source.

- **tos ip_address**
  The type of service. Valid range is 0 – 255.

- **count**
  The number of packets to send in one ping iteration. The valid range is 1–100.

- **delay**
  The delay between packets sent during a ping iteration, in milliseconds. Valid range is from 100 ms to 1000 ms in multiples of 100 ms.

- **size**
  The size of the ICMP payload to be used for the ping iteration. Valid range is 24–1472 bytes.

### Defaults

<table>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The **num-pkts**, **inter-pkt-delay**, and **payload-size** are optional parameters. If these values are specified, the SAA is created with the values entered. If none of them are specified, the SAA is created with the default values. The **num-pkts** and **inter-pkt-delay** can be modified, but **payload-size** cannot be modified later.
• Total execution time, that is, the product of num-pkts and inter-pkt-delay (number of packets * inter-packet delay) for a SAA iteration must be less than the sum of interval and inter-packet delay.

• The SAA must not be in a ‘started’ state at the time the num-pkts or inter-pkt-delay parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.

• The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return an error.

• Do not specify a broadcast or multicast address for the source or destination IP. In addition, do not use 0.0.0.0 as the destination IP address.

• The timeout for each ping request packet is 1 sec. This value is not configurable.

• If a VRF is specified, the SAA for IP is configured in the specified VRF. By default, the SAA is configured in the ‘default’ VRF.

Examples

-> saa saa1 type ip-ping destination-ip 123.32.45.76 source-ip 123.35.42.124 type-of-service 4
-> saa saa2 type ip-ping destination-ip 123.32.45.77 source-ip 123.35.42.124 type-of-service 5
-> saa saa3 type ip-ping destination-ip 123.32.55.27 source-ip 123.35.42.125 type-of-service 8 inter-pkt-delay 1000
-> saa saa4 type ip-ping destination-ip 123.46.45.77 source-ip 123.35.42.125 type-of-service 2 num-pkts 5
-> saa saa5 type ip-ping destination-ip 12.53.45.77 source-ip 123.35.42.125 type-of-service 35 payload-size 1000
-> saa saa6 type ip-ping destination-ip 123.22.45.66 source-ip 123.35.42.125 type-of-service 5 inter-pkt-delay 1000 num-pkts 8 pkt-size 1000
-> vrf vrf3 saa saa7 type ip-ping destination-ip 123.22.45.66 source-ip 123.35.42.125 type-of-service 5 inter-pkt-delay 1000 num-pkts 8 pkt-size 1000

saa type mac-ping

Configure SAA for a MAC address including the VLAN, VLAN ID, number of packets and inter-packet delay parameters.

`saa string type mac-ping destination-mac mac_address vlan vlan_id [vlan-priority vlan_priority] [drop-eligible {true | false}] [data data] [num-pkts count] [inter-pkt-delay delay] [payload-size size] [isid-check isid]`

**Syntax Definitions**

- **string**: SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, “SAA 10”).
- **mac_address**: The destination MAC address to ping.
- **vlan_id**: The VLAN on which the L2 SAA Packets will be sent out. Valid range is 1-4094.
- **vlan_priority**: Specifies both the internal priority of the MAC ping and the 802.1p value on the VLAN tag header. Valid range is 0-7.
- **true**: Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to true.
- **false**: Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to false.
- **data**: User specified string to be included in the packet (Data TLV). Maximum string length for data is 255.
- **count**: The number of packets to send in one ping iteration. The valid range is 1–100.
- **delay**: The delay between packets sent during a ping iteration, in milliseconds. Valid range is from 100 ms to 1000 ms in multiples of 100 ms.
- **size**: The size of the ICMP payload to be used for the ping iteration. Valid range is 36–1500 bytes.
- **isid**: A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network.

Usage Guidelines

- The num-pkts, inter-pkt-delay, and payload-size are optional parameters. If these values are specified, the SAA is created with the values entered. If none of them are specified, the SAA is created with the default values. The num-pkts and inter-pkt-delay can be modified, but payload-size cannot be modified later.

- Total execution time, that is, the product of num-pkts and inter-pkt-delay (number of packets * inter-packet delay) for a SAA iteration must be less than the sum of interval and inter-packet delay.

- The SAA must not be in a ‘started’ state at the time the num-pkts or inter-pkt-delay parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.

- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return an error.

- The timeout for each ping request packet is 1 sec. This value is not configurable.

- If data-TLV is specified and payload size is not specified, then payload size will be increased internally to accommodate the data TLV.

- If data TLV and payload size both are specified and payload size is less than [dataTLV + 36] bytes (for time-stamping and other packet info), then the CLI will be rejected.

- Destination-MAC cannot be broadcast/multicast address.

- Timeout for each ping request packet is 1 sec. This value is non-configurable.

- For SAA mac-ping over linkagg, it is recommended to have 5 (default) or more packets per session to ensure that accurate RTT and jitter values are obtained. Session iteration may see packet loss over linkagg if request and reply packets are not received on the same member port. This will not be seen in the subsequent iterations of the session.

Examples

- `saa saa1 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10`
- `saa saa4 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 inter-pkt-delay 100`
- `saa saa5 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 num-pkts 10`
- `saa saa6 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 payload-size 400`
- `saa saa8 type mac-ping destination-mac 00:11:11:11:11:11 vlan 1001 isid-check 1002`

**saa spb**

Configures session parameters for the Shortest Path Bridging (SPB) SAA. The SPB feature dynamically discovers SPB-enabled switches. Each discovered switch is identified by the pairing of a SPB VLAN (BVLAN) and the backbone MAC address (BMAC) for the switch. SPB advertises these BVLAN-BMAC pairs to the SAA feature, which in turn creates and starts MAC ping sessions based on the parameters configured with this command.

```
saa spb [auto-create] [auto-start] [interval interval] [vlan-priority vlan_priority] [drop-eligible {true | false}] ] [data data] [num-pkts count] [inter-pkt-delay delay] [payload-size size] [jitter-threshold jitter_thresh] [rtt-thresh rtt_thresh] [keep]
```

**Syntax Definitions**

- **auto-create**  
  Automatically creates an SPB SAA session for each discovered BVLAN-BMAC pair.

- **auto-start**  
  Automatically starts each SPB SAA session.

- **interval**  
  The amount of time, in minutes, between two iterations of the SAA test. Valid range is from 1, 2, 5, 10–1500.

- **vlan_priority**  
  Specifies both the internal priority of the MAC ping and the 802.1p value on the VLAN tag header. Valid range is 0-7.

- **true**  
  Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to true.

- **false**  
  Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to false.

- **data**  
  User specified string to be included in the packet (Data TLV). Maximum string length for data is 255.

- **count**  
  The number of packets to send in one ping iteration of the test. Valid range is 1–100.

- **delay**  
  The delay between packets sent during a ping iteration, in milliseconds. Valid range is 100–1000 ms in multiples of 100 ms.

- **size**  
  The size of the ICMP payload to be used for the ping iteration. Valid range is 32–1500 bytes.

- **jitter_thresh**  
  The jitter threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.

- **rtt_thresh**  
  The round-trip time threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.

- **keep**  
  Retains SPB SAA session information even when SPB signals that a BMAC or BVLAN no longer exists.

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The **auto-create** and **auto-start** parameters enable the SPB SAA functionality required to automatically create and start this type of SAA session.

- Ensure the interval value is greater than the execution time (number of packets * inter-packet delay).

- Total execution time, that is, the product of **num-pkts** and **inter-pkt-delay** (number of packets * inter-packet delay) for an SAA iteration must be less than the sum of interval and inter-packet delay.

- SPB SAA sessions cannot be modified but are automatically configured with “SPB” as the owner of the session so they can be easily identified within the applicable SAA **show** command displays.

- The SAA ID for an SPB SAA is the prefix SPB- combined with the BVLAN and BMAC pairing used to generate the session. For example, SPB-bvlan-bmac (SPB-4000-e8-e7-32-07-98-cd).

- For SAA mac-ping over linkagg, it is recommended to have 5 (default) or more packets per session to ensure that accurate RTT and jitter values are obtained. Session iteration may see packet loss over linkagg if request and reply packets are not received on the same member port. This will not be seen in the subsequent iterations of the session.
Examples

-> saa spb auto-create auto-start interval 160 num-pkts 50 inter-pkt-delay 100 keep
-> saa spb auto-create auto-start jitter-threshold 100 rtt-threshold 500
-> saa spb keep

OmniSwitch AOS Release 8 CLI Reference Guide   April 2023   page 57-15
Usage Guidelines

- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return error.
- Source MEP-ID, MD and MA must be created before initiating loopback.
- If the source MEP-Id/MA/MD does not exist, the configuration will be accepted and no error will be returned.
- When target-endpoint is specified then it must be learned before initiating loopback.
- When target-endpoint is specified and learned, Ethernet Loopback will be transmitted irrespective of whether the RMEP state is OK or failed.
- The data, num-pkts, and inter-pkt-delay are optional parameters. If these values are specified, the entry will be created with these values. If none of them are specified, the SAA will be created with default values. The num-pkts and inter-pkt-delay can be modified later.
- Total execution time, that is, the product of num-pkts and inter-pkt-delay (number of packets * inter-packet delay) for a SAA iteration must be less than the sum of interval and inter-packet delay.
- The SAA must not be in a ‘started’ state at the time the num-pkts or inter-pkt-delay parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- The Target MEP/MAC, source MEP, domain, and association parameters are mandatory. If they are not specified, the CLI will return an error.
- The data parameter is optional. If this parameter is not specified, then it is not sent in the loopback message.
- The timeout value for each LB packet is one second. This value is not configurable.
- For SAA Ethernet OAM over linkagg, it is recommended to have 5 (default) or more packets per session to ensure that accurate RTT and jitter values are obtained.

Examples

- `saa saa1 type ethoam-loopback target-endpoint 10 source endpoint 1 domain md1 association ma1`
- `saa saa2 type ethoam-loopback target-endpoint 10 source endpoint 2 domain md1 association ma1 data "monitor association ma1" num-pkts 6 inter-pkt-delay 500`
- `saa saa3 type ethoam-loopback target-endpoint 15 source endpoint 1 domain md1 association ma1 data "monitor association ma1" num-pkts 6`
- `saa saa4 type ethoam-loopback target-endpoint 10 source endpoint 2 domain md1 association ma1 inter-pkt-delay 500`

**saa type ethoam-two-way-delay**

Configuration SAA for ETH-DMM, including the number of packets and inter-packet delay parameters.

```
saa string type {ethoam-two-way-delay} {target-endpoint t_mepid | target-mac address mac_address}
source-endpoint s_mepid domain md_name association ma_name vlan-priority vlan_priority [num-pkts num] [inter-pkt-delay delay]
```

**Syntax Definitions**

- **string**  
  SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, “SAA 10”).

- **t_mepid**  
  The ID of the destination MEP.

- **mac_address**  
  The MAC address of the destination.

- **s_mepid**  
  The ID of the source MEP.

- **md_name**  
  The domain to which the source MEP belongs.

- **ma_name**  
  The association to which the source MEP belongs.

- **vlan_priority**  
  The VLAN priority to be used for the outgoing packet. The valid range is 0-7.

- **num**  
  The number of packets to send during loopback. Valid range is 1–100.

- **delay**  
  The delay between packets sent during a ping iteration, in milliseconds. Valid range is 100–1000 ms in multiples of 100 ms.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>num</td>

**Usage Guidelines**

- The SAA should exist before issuing the CLI. If the SAA does not exist, the CLI will return error.
- The source MEP-ID, MD, and MA must be created before initiating DMM.
• If the source MEP-Id/MA/MD does not exist, the configuration will be accepted and no error will be returned.

• When the target-endpoint parameter is specified, then it must be learned before initiating DMM.

• When the target-endpoint parameter is specified and learned, ETH-DMM will be transmitted irrespective of whether the RMEP state is OK or failed.

• The num-pkts and inter-pkt-delay parameters are optional. If these values are specified, the entry will be created with those values. If none of them are specified, the SAA will be created with default values. The num-pkts and inter-pkt-delay values can be modified, but the pkt-size value cannot be modified later.

• Total execution time, that is, the product of num-pkts and inter-pkt-delay (number of packets * inter-packet delay) for a SAA iteration must be less than the sum of interval and inter-packet delay.

• The SAA must not be in a ‘started’ state at the time the num-pkts or inter-pkt-delay parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.

• Target MEP/MAC, source MEP, domain, and association parameters are mandatory. If they are not specified, the CLI will return an error.

• The timeout for each DMM packet is 1 sec. This value is not configurable.

• For SAA Ethernet OAM over linkagg, it is recommended to have 5 (default) or more packets per session to ensure that accurate RTT and jitter values are obtained.

Examples

-> saa saa1 type ethoam-two-way-delay target-endpoint 10 source endpoint 1 domain md1 association ma1
-> saa saa2 type ethoam-two-way-delay target-endpoint 10 source endpoint 2 domain md1 association ma1 num-pkts 6 inter-pkt-delay 500
-> saa saa3 type ethoam-two-way-delay target-endpoint 15 source endpoint 1 domain md1 association ma1 num-pkts 6
-> saa saa4 type ethoam-two-way-delay target-endpoint 10 source endpoint 2 domain md1 association ma1 inter-pkt-delay 500

  - alaSaaEthoamCtrlAssociationName
  - alaSaaEthoamCtrlNumPkts
  - alaSaaEthoamCtrlInterPktDelay
  - alaSaaEthoamCtrlVlanPriority
saa start

Starts the SAA test.

[vrf vrf_name] saa string start [at yyyy-mm-dd,hh:mm:ss]

Syntax Definitions

vrf_name The name of an existing VRF instance.
string An existing SAA ID string.
yyyy-mm-dd,hh:mm:ss The date and time to start the SAA.

Defaults

By default, the SAA test is started immediately.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- An existing SAA with the SAA type configured must be specified with this command.
- Use the saa stop command to stop an SAA test that is already running.
- Use the at option to specify a date and time for the test to start.
- If an SAA is scheduled to start at a specified time and another saa start command with a different value is given before the specified time, the subsequent command will over-ride the previous command.
- If the saa start command is given after an SAA is started, then the CLI will return error.
- If the SAA type is configured with a source IP that does not exist or is not active, then the packet will not be transmitted and no error will be returned. Swlogs will be updated.
- ICMP must be enabled on the switch. If ICMP is disabled and an SAA of type 'ip-ping’ is started, then the iteration will timeout and will be treated as failed iteration.
- Immediately after a CMM restart (reboot or takeover), the command to start SAA will be accepted, but the actual execution of the iteration will start 5 minutes after the CMM restart.
- If the SAA type is configured with a source MEP that does not exist or is not active (admin down), then the packet will not be transmitted and no error will be returned on the CLI console. Swlogs will be updated.
• It is recommended that all the SAAs be rescheduled if the system time is being changed.

Examples

-> saa saa2 start at 2009-09-12,09:00:00
-> saa saa4 start

Release History

Release 7.3.1; command was introduced.

Related Commands

show saa
  Displays SAA configuration information.

show saa statistics
  Displays SAA statistics.

MIB Objects

alaSaaCtrlTable
  alaSaaCtrlTestIndex
  alaSaaCtrlStartAt
**saa stop**

Stops the SAA test.

```
[vrf vrf_name] saa string stop [never | at yyyy-mm-dd,hh:mm:ss]
```

### Syntax Definitions

- **vrf_name**
  - The name of an existing VRF instance.

- **string**
  - An existing SAA ID string.

- **never**
  - Specifies that the SAA test will not be stopped unless the **saa stop** command is used with the **at** option.

- **yyyy-mm-dd,hh:mm:ss**
  - The date and time to start the SAA.

### Defaults

By default, the test is stopped immediately.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- An existing SAA with the SAA type configured must be specified with this command.
- The SAA must be in a ‘started’ state before giving the command unless the start and stop times are scheduled. If the SAA is not in a ‘started’ state, the CLI will return an error.
- Use the **at** option to specify a date and time for the test to stop.
- If the **never** option is specified, the SAA test will keep on running until the **saa stop** command is entered again with the **at** option.
- If SAA test is stopped while it is running an iteration, the current iteration is pre-empted. The statistics and history are updated for the partial iteration run.
- If an SAA is scheduled to stop at a specified time and another **saa stop** command with a different value is given before the specified time, the subsequent command will over-ride the previous command.

### Examples

```
-> saa saa1 stop
-> saa saa2 stop never
```
**Release History**

Release 7.3.1; command was introduced.

- `show saa statistics` Displays SAA statistics.

**MIB Objects**

- `alaSaaCtrlTable`
  - `alaSaaCtrlTestIndex`
  - `alaSaaCtrlStopAt`
saa jitter-calculation enhanced

Calculates jitter values on each SAA probe. Each and every jitter that is calculated will be implemented as per the formula specified in RFC 1889.

Syntax Definitions

N/A

Defaults

By default, the inter-arrival jitter calculation is based on the round-trip-time difference between two successive packets.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- When the jitter calculation mode is set to enhanced, then jitter calculation will be made as per RFC 1889 defined formula.

  Formula:
  
  Jitter = Jitter + (abs (ElapsedTime - OldElapsedTime ) - Jitter) / 16

  Where
  
  ‘Jitter’ - Jitter value calculated from successive packets RTT.
  Elapsed - RTT value involved in the packet.

- The jitter calculation is applicable for IP SAA, ETH SAA, MAC SAA, and SAA SPB.

- The enhanced jitter calculation will only affect the jitter calculation for the overall iteration. The calculation of jitter for individual packets will not change with enhanced mode.

- Use the no form of this command to set the jitter calculation to default.

Examples

- saa jitter-calculation enhanced

- no saa jitter-calculation enhanced
**Release History**

Release 8.8R1; command introduced.

**Related Commands**

*show saa* Displays the mode which is set for jitter calculation.

**MIB Objects**

alaSaaJitterCalculationConfigGroup
alaSaaJitterCalculationEnhanced
**saa xml**

Configures SAA XML parameters that determine when and where an SAA XML history file is created.

```
saa xml [file-name xml_filename] [interval interval] [admin-state {enable | disable}]
```

**Syntax Definitions**

- `xml_filename` The name of the file where SAA history entries are stored. This file must reside in the `/flash/network` directory on the local switch.
- `interval` The amount of time, in minutes, between each generation of the XML history file. Valid range is from 1–15000.
- `enable` Enables XML history file generation.
- `disable` Disables XML history file generation.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>xml_filename</code></td>
<td>saa.xml</td>
</tr>
<tr>
<td><code>interval</code></td>
<td>20 minutes</td>
</tr>
<tr>
<td><code>admin-state</code></td>
<td>Disabled</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

- When this function is enabled, SAA will periodically generate an XML file containing the following entries:
  - SAA name and ID
  - VRF name
  - Iteration number (1-5)
  - Last run time
  - Reason
  - Packets sent/received
  - InterPktDelay
  - EgressPort
  - RTT min/avg/max (value is ‘-1’ in case of failed test)
  - Jitter min/avg/max (value is ‘-1’ in case of failed test)
  - Subports

**Examples**

-> saa xml interval 60 admin-state enable
-> saa xml file-name switch1_saa.xml interval 120 admin-status enable

**Release History**

Release 7.3.2; command was introduced.

**Related Commands**

*show saa xml* Displays the SAA XML file generation parameters.

**MIB Objects**

alaSaaXmlFeature
alaSaaXmlStatus
alaSaaXmlFilename
alaSaaXmlInterval
show saa

Displays SAA session information.

[vrf vrf_name] show saa [string | {descr description}] | [owner saa_owner]

**Syntax Definitions**

- **vrf_name**: The name of an existing VRF instance.
- **string**: An existing SAA ID.
- **description**: An existing SAA description string.
- **saa_owner**: The owner name associated with the SAA session.

**Defaults**

By default, information is displayed for all SAA sessions.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **string** or **descr description** parameter to display information for a specific SAA.
- Use the **owner saa_owner** parameter to display only those sessions initiated by a specific owner. The owner of an SAA session is not user configurable, but identifies the entity that created the session.
- When an SAA is created, an owner name is assigned to the agent. This name is based on the Alcatel-Lucent Enterprise application that generated the SAA and is not configurable. For example:
  - CLI SAA owner name = “USER”
  - OmniVista owner name = “OV”
  - Shortest Path Bridging owner name = “SPB” (SAA ID is SPB-bvlan-bmac)

**Examples**

```
-> show saa
Legend: eth-lb = ethoam-loopback
       eth-dmm = ethoam-two-way-delay
       jitter-calculation = Default

SAA                      Owner Type Status Interval Time of Last Run Last Run Description

</tbody>
</table>

output definitions

- **SAA**: SAA name.
- **Owner Type**: The owner name assigned to the agent.
- **Type**: The SAA type.
- **Status**: The status of the SAA test: started or stopped.
- **Interval (min)**: The amount of time between two iterations of the SAA test.
- **Time of Last Run**: The time the SAA was last run.
- **Last Run Result**: Result of last iteration.
- **Description**: Configured description for the SAA.

Release History

- Release 7.3.1; command was introduced.
- Release 7.3.2; owner parameter and field added.
- Release 8.8R1; Jitter-calculation field added.

Related Commands

- **saa**: Configures an SAA.

show saa type config

Displays the SAA configuration for the specified SAA type.

```
[vrf vrf_name] show saa [string] type {mac-ping | ip-ping | ethoam-loopback | ethoam-two-way-delay} config
```

Syntax Definitions

- **vrf_name**: The name of an existing VRF instance.
- **string**: An existing SAA ID.
- **mac-ping**: Displays MAC Ping SAAs.
- **ip-ping**: Displays IP Ping SAAs.
- **ethoam-loopback**: Displays ETH-LB SAAs.
- **ethoam-two-way-delay**: Displays ETH-DMM SAAs.

Defaults

By default, all SAAs with the specified type are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the `string` parameter to display information for a specific SAA.
- If the SAA ID string specified does not match the specified SAA type, the CLI will return an error.
- If a specific VRF is specified, the IP ping sessions for that VRF is displayed.

Examples

```
-> show saa type ip-ping config
SAA : saa20
  SAA-type : ip-ping,
  Status    : started,

**show saa statistics**

Display SAA statistics.

```
[vrf vrf_name] show saa [string] statistics [aggregate | history]
```

---

**Syntax Definitions**

- **vrf_name**: The name of an existing VRF instance.
- **string**: An existing SAA ID string.
- **aggregate**: Displays aggregate results for the specified SAA.
- **history**: Displays a results history for the specified SAA.

---

**Defaults**

By default, statistics are displayed for all SAAs and only for the most recent SAA test run.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>V72/C32</th>
<th>X48C6/T48C6</th>
<th>X48C4E/V48C8</th>

<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- If the **aggregate** parameter is specified, then only the aggregate results are displayed.
- If the **history** parameter is specified, then only the history results are displayed.
- Since results are only kept for the last five iterations, using the **history** option displays only the last five iterations of each SAA test.
- Specify the SAA ID to display statistics for a specific SAA.
- Statistics and history do not persist across a switch reboot or takeover.

---

**Examples**

```
-> show saa statistics
Legend: eth-lb  = ethoam-loopback
        eth-dmm = ethoam-two-way-delay
        - = Delay or jitter value not available

show saa vrf

Display SAA statistics for the IP ping sessions.

show saa {vrf vrf_name | all} [statistics [aggregate | history]]

Syntax Definitions

vrf_name
   Displays the results for the specified SAA IP pings from a specific VRF.

all
   Displays the results for the SAA IP pings from all VRF across the system.

statistics
   Displays the statistics for the most recent SAA IP ping test run.

aggregate
   Displays aggregate results for the specified SAA IP ping.

history
   Displays a results history for the specified SAA IP ping.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- If the aggregate parameter is specified, then only the aggregate results are displayed.
- If the history parameter is specified, then only the history results are displayed.
- Since results are only kept for the last five iterations, using the history option displays only the last five iterations of each SAA test and in each SAA history, iteration information of first 20 received packets are stored.
- Statistics and history do not persist across a switch reboot or takeover.
- The show output will be filtered based on the corresponding VRF. Any VRF name that auto-completes to “all” will be taken as the keyword “all”, and all the IP ping sessions across the VRFs is displayed.

Examples

--> show saa vrf all
SAA Owner  Type   Status  Interval Time of Last Run Last Run Result Description  VRF Name
(min)                          ===================================================
ip100 USER ip-ping started 2 2020-01-26,22:45:46.0 success DEFAULT VRF1
ip200 USER ip-ping started 2 2020-01-26,22:45:35.0 success DEFAULT VRF2
Service Assurance Agent Commands

```

The Chassis Management Module (CMM) CLI commands permit you to manage switch software files on the CMM.

MIB information for the CMM commands is as follows:

- **Filename**: ALCATEL-IND1-CHASSIS-MIB.mib
  - **Module**: alcatelIND1ChassisMIB

- **Filename**: ALCATEL-IND1-CONFIG-MGR-MIB DEFINITIONS.mib
  - **Module**: alcatelIND1ConfigMgrMIB

A summary of available commands is listed here:

```
reload secondary
reload slot
reload all
reload from
issu from
issu slot
write memory
reload chassis-id
copy certified
copy running certified
modify running-directory
copy flash-synchro
takeover
show running-directory
show reload
show microcode
show issu status
usb
usb backup admin-state
usb auto-copy
mount
umount
show usb statistics
auto-config-abort
image integrity check
image integrity get-key
```
reload secondary

Reloads the secondary CMM from the **certified** directory.

```
reload [chassis-id \textit{chassis}] secondary \textit{in [hours:] minutes | at hour:minute [month day | day month]}
```

```
reload secondary cancel
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **in \textit{[hours:] minutes}**: Optional syntax. Schedules a reload of the software to take effect in the time. The time can be specified in minutes or hours and minutes within the next 24 hours.
- **at \textit{hour:minute}**: Optional syntax. Schedules a reload of the software to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
- **month day | day month**: The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. See examples below for further explanation.
- **cancel**: Cancels a pending time delayed reboot.

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- Can be issued from both primary or secondary CMM.
- Reloads the secondary CMM only, the Primary CMM remains operational.

### Examples

```
-> reload secondary
-> reload secondary in 15:25
-> reload secondary at 15:25 august 10
-> reload secondary at 15:25 10 august
```

### Release History

Release 7.1.1; command introduced.
Related Commands

reload from

Reloads both CMMs from the specified directory.

MIB Objects

  chasControlDelayedRebootTimer
**reload all**

Reloads both Chassis Management Modules (CMMs) from the *certified* directory.

```
reload [chassis-id chassis] all [in [hours:] minutes | at hour:minute [month day | day month]]
```

**reload all cancel**

**Syntax Definitions**

- `chassis` The chassis identifier.
- `in [hours:] minutes` Optional syntax. Schedules a reload of all modules to take effect in the specified minutes or hours and minutes within the next 24 hours.
- `at hour:minute` Optional syntax. Schedules a reload of all modules to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
- `month day | day month` The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. It is unimportant if the month or day is first. See examples below for further explanation.
- `cancel` Cancels a pending time delayed reload.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Can be issued from the Primary CMM only.

**Examples**

- `-> reload all`
- `-> reload all in 1:30`
- `-> reload all at 12:00 july 25`
**Release History**

Release 7.1.1; command introduced.

**Related Commands**

*reload slot*  
Reloads a specific NI module.

**MIB Objects**

chasEntPhysicalTable
  chasEntPhysAdminStatus
chasGlobalControl
  chasGlobalControlDelayedResetAll
reload from

Reloads both CMMs from the specified directory. There is no CMM failover during this reboot, causing a loss of switch functionality during the reboot. All the NIs and the secondary CMM will reload.

```
reload [chassis-id chassis] from image_dir {rollback-timeout minutes | no rollback-timeout [in [hours:] minutes | at hour:minute] [redundancy-time minutes]}
```

### Syntax Definitions

- **chassis**
  The chassis identifier when running in virtual chassis mode.
- **image_dir**
  The directory that contains the image files to be loaded onto the switch.
- **rollback-timeout minutes**
  Sets a timeout period, in minutes. The switch immediately reboots from the specified directory. At the end of this time period, the switch automatically reboots again from the **certified** directory. The valid range of rollback timeout minutes is 1–15.
- **no rollback-timeout**
  Specifies no timeout to rollback. If the command is issued with this keyword, then the switch continues to run from the specified directory until manually rebooted.
- **in [hours:] minutes**
  Optional syntax. Schedules a reload of the to take effect in the specified minutes or hours and minutes within the next 24 hours.
- **at hour:minute**
  Optional syntax. Schedules a reload to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
- **redundancy-time minutes**
  Specifies the time period in minutes that the switch must run without failure. If a failure occurs within this time period, the switch will reboot from the **certified** directory.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Can be issued from Primary CMM only.
- This command is used to reload the switch from the specified directory.

- A file verification will be performed before rebooting to ensure all necessary files are present and valid. An error message will be displayed describing any issues found.

- The image directory reload takes place immediately unless a time frame is set using the `in` or `at` keywords.

- If a rollback-timeout is set, the switch reboots again after the set number of minutes, from the `certified` directory. The reboot can be halted by issuing a cancel order as described in the `reload all` command.

- If the `redundancy-time` parameter is entered, any reboot of the Primary CMM prior to the redundancy timer expiring will cause the switch to reboot. If the Primary CMM reboots after the redundancy timer expires, the secondary CMM will take over without a reboot.

**Examples**

- `reload from working rollback-timeout 5`
- `reload from working no rollback-timeout`
- `reload from working no rollback-timeout in 50`
- `reload from working rollback-timeout 10 at 12:50`

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `reload all` Reboots both CMMs from the `certified` directory.

**MIB Objects**

- `chasControlModuleTable`
  - `chasControl`
  - `chasControlVersionMngt`
  - `chasControlActivateTimeout`
  - `chasControlRedundancyTime`
  - `chasControlDelayedActivateTimer`
  - `chasControlWorkingVersion`
  - `chasControlNextRunningVersion`
**reload slot**

Reloads the NI in the specified slot using the current running image.

```
reload slot chassis/slot
```

---

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot**: The slot number to be reloaded.

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

Can be issued from Primary CMM only.

### Examples

```
-> reload slot 1/2
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

- **reload from**: Reloads both CMMs from the specified directory.

### MIB Objects

- `chasEntPhysicalTable`
  - `chasEntPhysAdminStatus`

---
**reload chassis-id**

Reloads the specified chassis id when running in virtual chassis mode.

```
reload chassis-id chassis [all] [in [hours:] minutes | at hour:minute [month day | day month]]
```

```
reload chassis-id cancel
```

---

**Syntax Definitions**

- `chassis` The chassis identifier.
- `in [hours:] minutes` Optional syntax. Schedules a reload of the software to take effect in the time. The time can be specified in minutes or hours and minutes within the next 24 hours.
- `at hour:minute` Optional syntax. Schedules a reload of the software to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
- `month day | day month` The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. See examples below for further explanation.
- `cancel` Cancels a pending time delayed reboot.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Can be issued from both primary or secondary CMM.
- Reloads the secondary CMM only, the Primary CMM remains operational.

---

**Examples**

```
-> reload chassis-id 1
-> reload chassis-id 1 in 15:25
-> reload chassis-id 1 at 15:25 august 10
```
- reload chassis-id 1 at 15:25 10 august
- reload chassis-id 1 cancel

**Release History**
Release 7.3.1; command introduced.

**Related Commands**
- **reload from**
  Reloads both CMMs from the specified directory.

**MIB Objects**
- `chasEntPhysicalTable`
- `csEntPhysicalIndex`
- `chasEntPhysAdminStatus`
- `chasControlRedundantTable`
- `chasControlDelayedRebootTimer`
copy certified

Copies the contents of the certified directory to the specified directory.

```
copy certified image_dir [make-running-directory]
```

**Syntax Definitions**

- `image_dir` - The directory that the contents of the certified directory will be copied to.
- `make-running-directory` - Makes the destination directory the new RUNNING DIRECTORY after the configuration is copied.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Using the `make-running-directory` parameter changes the RUNNING DIRECTORY allowing changes to be saved using the `write memory` command.
- This command does not delete any extra files in the target directory.
- This command does not affect the synchronization status of the running configuration.
- To synchronize the running and saved configuration, use the `write memory` command.

**Examples**

```
-> copy certified mydir
-> copy certified mydir make-running-directory
```

**Release History**

Release 7.1.1; command introduced.
Related Commands

**copy flash-synchro**  
Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

MIB Objects

chasControlModuleTable
- chasControlVersionMngt
- chasControlWorkingVersion
### issu from

Upgrades the system with the images stored in the specified directory with minimal disruption to traffic.

`issu from image_dir [redundancy-time minutes]`

<table>
<thead>
<tr>
<th>Syntax Definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>image_dir</code></td>
</tr>
<tr>
<td><code>redundancy-time minutes</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Defaults</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The new code must support ISSU with the current running version of code.
- A text file named ‘`issu_version`’ is used to determine ISSU compatibility between code versions. It can be downloaded from the Service and Support website and must be included in the directory along with the new image files.

**Examples**

`-> issu from myissu`

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `issu slot` Causes a power-cycle of the NI in the specified slot after an ISSU upgrade.

**MIB Objects**

- `chasEntModuleTable`
chasControlWorkingVersion
chasControlRedundancyTime
**issu slot**

Causes a reset of the NI in the specified slot after an ISSU upgrade.

```
issu slot num
```

**Syntax Definitions**

`num` Specifies the slot number.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Will return an error if ISSU is not in progress or if the slot has already been reset after the ISSU.

**Examples**

```
-> issu slot 2
```

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

`issu from` Upgrades the system with the images stored in the specified directory without disruption to traffic.

**MIB Objects**

chasEntPhysicalTable

entPhysicalIndex
**write memory**

Copies the current configuration (RAM) to the RUNNING DIRECTORY on the primary CMM.

`write memory [flash-synchro]`

---

**Syntax Definitions**

`flash-synchro`  
Synchronizes the primary and secondary CMM.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>Yes</td>
</tr>
<tr>
<td>6465</td>
<td>Yes</td>
</tr>
<tr>
<td>6560</td>
<td>Yes</td>
</tr>
<tr>
<td>6570M</td>
<td>Yes</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
</tr>
<tr>
<td>6860N</td>
<td>Yes</td>
</tr>
<tr>
<td>6865</td>
<td>Yes</td>

<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- This command is used to copy the changes performed using the CLI commands from the running configuration (RAM) to the RUNNING DIRECTORY.

- The `flash-synchro` keyword synchronizes the files between the primary and secondary CMMs by overwriting the contents of the secondary CMM **certified** directory with the contents of the primary CMM certified directory.

- This command is only valid if the switch isn’t running from the **certified** directory. Use the `show running-directory` command to check where the switch is running from.

- During flash synchronization configuration changes may time out causing error messages to be displayed. Once the synchronization is complete configuration changes can resume.

---

**Examples**

- `-> write memory`
- `-> write memory flash-synchro`

---

**Release History**

Release 7.1.1; command introduced.
Related Commands

**copy flash-synchro**

Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

MIB Objects

```plaintext
configManager
  configWriteMemory
```
copy running certified

Copies the current RUNNING DIRECTORY configuration to the certified directory on both CMMs.

`copy running certified [flash-synchro]`

---

**Syntax Definitions**

| flash-synchro | Synchronizes the primary and secondary CMM. |

---

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900
| Yes | Yes | Yes | Yes | Yes | Yes | Yes | Yes | Yes |

**Usage Guidelines**

- This command is used to overwrite the contents of the certified directory with the configuration from the RUNNING DIRECTORY. This should only be done if the running configuration has been verified.
- This command only synchronizes the image and configuration files in the RUNNING DIRECTORY, no other directories, such as the switch or network directories, are synchronized.
- The flash-synchro keyword synchronizes the files between the primary and secondary CMMs by overwriting the contents of the secondary CMM certified directory with the contents of the primary CMM certified directory. Beginning in 7.3.1 the flash-synchro functionality is done automatically; entering the flash-synchro parameter is no longer required.
- In 7.3.3 the flash-synchro parameter will display an error on the OS6900 if there is no secondary CMM.
- If there is not enough free space, the copy attempt fails and an error message is generated.
- This command does not work if the switch is running from the certified directory. To view where the switch is running from, see the show running-directory command.
- This command may take up to two minutes to complete.

**Examples**

`-> copy running certified`
Release History

Release 7.1.1; command introduced.
Release 7.3.1; flash-synchro parameter no affect; the functionality is performed automatically.

Related Commands

copy flash-synchro
Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

MIB Objects

chasControlModuleTable
chasControlVersionMngt
chasControlWorkingVersion
modify running-directory

Changes the RUNNING DIRECTORY to the specified directory.

modify running-directory image_dir

Syntax Definitions

image_dir The directory name to become the new RUNNING DIRECTORY.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use this command to change the RUNNING DIRECTORY and allow configuration changes to be saved to the new RUNNING DIRECTORY.

Examples

-> modify running-directory user-config1
-> write memory

Release History

Release 7.1.1; command introduced.

Related Commands

write memory Copies the running primary RAM version of the CMM software to the RUNNING DIRECTORY.

MIB Objects

chasControlModuleTable
   CurrentRunningVersion
copy flash-synchro

Copies the certified directory version of the primary CMM software to the certified directory of the secondary CMM.

copy flash-synchro

Syntax Definitions
N/A

Defaults
N/A

Platforms Supported
Not supported in this release.

Usage Guidelines

- This command is used to synchronize the certified directories of the primary and secondary CMMs. The two CMMs must be synchronized if a fail over occurs, otherwise switch performance is affected.

- This command is a shorter version of the ‘copy running certified flash-synchro’ command. Beginning in 7.3.1 the flash-synchro functionality is done automatically; this command is no longer required.

Examples
-> copy flash-synchro
-> configure copy flash-synchro

Release History
Release 7.1.1; command introduced.

Related Commands

copy running certified

Copies the RUNNING DIRECTORY configuration to the certified directory on the primary CMM.

MIB Objects
chasControlModuleTable
chasControlVersionMngt
**takeover**

Forces the current secondary CMM to assume the role of the primary CMM.

```
takeover [chassis]
```

---

**Syntax Definitions**

- `chassis`: The chassis identifier.

---

**Defaults**

N/A

---

**Platforms Supported**

Not supported in this release.

---

**Usage Guidelines**

- This command causes the secondary CMM to take over the functions of the primary CMM. After this command, the old primary CMM is the new secondary CMM.

- Be sure that the secondary CMM has all software (i.e., image and configuration files) required to continue CMM operations, before issuing the `takeover` command.

- For information on synchronizing the primary and secondary CMM software before issuing the `takeover` command, see the `copy flash-synchro` command.

---

**Examples**

```
-> takeover
```

---

**Release History**

Release 7.1.1; command introduced.

---

**Related Command**

- `reload all`: Reboots the switch.

---

**MIB Objects**

- `chasEntPhysicalTable`
  - `chasEntPhysAdminStatus`
show running-directory

Shows the current state of version and configuration management for a CMM.

show running-directory

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Once a switch boots up and is running, it runs either from the *working*, *certified*, or a *user-defined* directory. If the switch is running from the *certified* directory, changes made to the RUNNING CONFIGURATION using CLI commands, cannot be saved.

- Depending on the switch configuration there may be a small delay before the information is displayed.

Examples

-> show running-directory

CONFIGURATION STATUS
  Running CMM : PRIMARY,
  CMM Mode : MONO CMM,
  Current CMM Slot : A,
  Running configuration : CERTIFIED,
  Certify/Restore Status : CERTIFIED,

SYNCHRONIZATION STATUS
  Flash Between CMMs : SYNCHRONIZED
  Running Configuration : SYNCHRONIZED

BOOT STATUS
  Machine State : SHUTDOWN

output definitions

Running CMM The CMM currently controlling the switch, either PRIMARY or SECONDARY.

CMM Mode Whether there are one or two CMMs installed or Virtual Chassis mode.
**output definitions (continued)**

<table>

  - `chasEntPhysOperStatus`
  - `entPhysicalIndex`
- `chasControlReloadTable`
  - `chasControlReloadStatus`
show reload

Shows the status of any time delayed reboot(s) that are pending on the switch.

show reload [[chassis-id chassis] [status | all status]]

Syntax Definitions

chassis
The chassis identifier.

status
Displays whether or not either of the CMMs are scheduled for a reload.

all status
Displays whether or all the modules are scheduled for a reload.

Defaults
N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>V72/C32</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

• It is possible to preset a reboot on a CMM by using the reload command. If this is done, use the show reload command to see when the next scheduled reboot is going to occur.

• If the reload from command is used, and a rollback timeout is set, the rollback occurs and is shown using the show reload command.

Examples

-> show reload status
Primary Control Module Reload Status: No Reboot Scheduled,
Secondary Control Module Reload Status: No Reboot Scheduled

Release History

Release 7.1.1; command introduced.
Related Commands

reload secondary  Reboots the primary or secondary CMM to its startup software configuration.
reload from  Immediate primary CMM reboot to the specified software configuration without secondary CMM takeover.

MIB Objects

chasControlModuleTable
   chasControlDelayedActivateTimer
chasGlobalControl
   chasGlobalControlDelayedResetAll
**show microcode**

Displays microcode versions installed on the switch.

```
show microcode [working | certified | loaded | issu | image_dir]
```

### Syntax Definitions
- **working**: Specifies the `working` directory.
- **certified**: The chassis identifier when running in virtual chassis mode.
- **loaded**: Specifies the loaded (i.e., currently-active) microcode versions.
- **issu**: Specifies the `issu` directory.
- **image_dir**: Specifies the user-defined directory.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>microcode</td>
<td>loaded</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- If no additional parameters are entered the command defaults to the `loaded` parameter and the currently active microcode information is displayed.

- If a different version of code than the currently active version is copied to the RUNNING directory the image will be marked as ‘Stale’.

### Examples

```
-> show microcode
Package           Release       Size     Description
-----------------+---------------+--------+-----------------------------------
Ros.img           7.1.1.403.R01    1828255 Alcatel-Lucent OS
Renl.img      7.1.1.403.R01    1359435 Alcatel-Lucent NI
```
**output definitions**

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>Release</td>
<td>Version number.</td>
</tr>
<tr>
<td>Size</td>
<td>File size.</td>
</tr>
<tr>
<td>Description</td>
<td>File description.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

*usb*  
Displays the archive history for microcode versions installed on the switch.

**MIB Objects**

* N/A
usb

Enables access to the device connected to the USB port.

*usb {enable | disable}*

**Syntax Definitions**

N/A

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If an Alcatel-Lucent Enterprise certified USB device is connected after enabling the USB interface, the device will be automatically mounted as `/uflash`.
- Once mounted, common file and directory commands can be used for file management.

**Examples**

- `usb enable`
- `cp /flash/working/boot.cfg /uflash/boot.cfg`
- `ls /uflash`

**Release History**

Release 7.1.1; command was introduced.
Related Commands

**usb auto-copy**
Allows backup image files from the USB device to be automatically copied to the /flash/working directory on the switch immediately after the USB device is connected.

**usb backup admin-state**
Enables or disables USB backup on the switch.

MIB Objects

```plaintext
systemServices
  systemServicesUsbEnable
```
usb backup admin-state

Enables or disables USB backup on the switch.

```
usb backup admin-state {enable | disable} {[key string] | hash-key string [bootable]}
```

**Syntax Definitions**

- **enable**
  Enables Administrative control to USB backup on the switch.

- **disable**
  Disables Administrative control to USB backup on the switch.

- **key**
  Keyword which will be used for encryption. *This parameter is only supported on the OmniSwitch 6465.*

- **hash-key**
  Keyword which will be decrypted and then used for encryption. *This parameter is only supported on the OmniSwitch 6465.*

- **bootable**
  Keyword which will enable the advanced backup. *This parameter is only supported on the OmniSwitch 6465 and OmniSwitch 6865.*

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When this command is enabled, the images and configuration from certified and running directories are copied into /uflash/6860/certified and /uflash/6860/running directories.

- When `write memory` is executed and backup is enabled, the configuration files from /flash/running-directory are copied to /uflash/6860/running-directory name.

- When `usb backup admin-state` is enabled and `copy running certified` and `write memory flash-synchr` commands are executed, the configuration and images from /flash/certified will be copied to /uflash/6860/certified.

- If the image files are manually deleted from /uflash after a backup subsequent `write memory flash-synchr` commands will not copy the image files /uflash again. Use the `usb backup` command to disable and re-enable usb backup and copy the image files to /uflash again.
• Encryption is supported only on the OmniSwitch 6465.
  – When a key or hash key is specified, all of the configuration files and images will be encrypted and copied to the USB device.
  – If a key or hash key is not specified, all of the configuration files and images will be copied as is to the USB device.
  – Maximum length of key should be 32 characters. Minimum key length should be 8 characters.
  – If the user has gone through one back up cycle of encryption and wants to disable encryption, then the user must disable the USB back up and enable it again with no password.
• On the OmniSwitch 6465, when power supply configurations are added by the powersupply enable command, the power supply configurations are backed up in /uflash/6465/system folder when backup is enabled.
• Back-up cannot be enabled if auto-copy is enabled and auto-copy cannot be enabled if back-up is enabled. So only one of these features can be enabled at any given time.
• The bootable option is used to indicate advanced backup. The advanced backup is supported only on OmniSwitch 6465 and OmniSwitch 6865 platforms.
• When bootable option is enabled:-
  – The images from certified and running directories are copied into /uflash/6465/certified and /uflash/6465/running directories as the existing USB backup.
  – Compress the files (along with directory path) and use it for switch operation located in /flash to a tar file, then encrypt it with input key / hash-key as “configuration.tar.enc” and copy the output file to /uflash/6465 directory.

Examples

-> usb backup admin-state enable
-> usb backup admin-state disable
-> usb backup admin-state enable key “abc12345”
-> usb backup admin-state enable hash-key “a05234d”
-> usb backup admin-state enable key “abc12345” bootable
-> usb backup admin-state enable hash-key “a05234d” bootable

Release History

Release 8.5R1; command was introduced.
Release 8.5R2; key and hash-key parameter added.
Release 8.8R1; bootable parameter added.

Related Commands

usb auto-copy
  Allows backup image files from the USB device to be automatically copied to the /flash/working directory on the switch immediately after the USB device is connected

usb
  Enables access to the device connected to the USB interface.

show usb statistics
  Displays the status USB setting and features.

MIB Objects

systemServices
  systemServicesUsbBackupAdminState
systemServicesUsbBackupKey
systemServicesUsbBackupHashkey
systemServicesUsbBackupBootable
**usb auto-copy**

Allows the image files from the USB device to be automatically copied to the switch immediately after the USB device is connected.

```
usb auto-copy {enable | disable} copy-config {enable| disable} [key string | hash-key string ]
```

**Syntax Definitions**

- `enable`: Enables Administrative control to USB auto copy on the switch
- `disable`: Disables Administrative control to USB auto copy on the switch
- `key`: Keyword which will be used for encryption. *This parameter is only supported on the OmniSwitch 6465.*
- `hash-key`: Keyword which will be decrypted and then used for encryption. *This parameter is only supported on the OmniSwitch 6465.*

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If the automatic copy is successful the switch will automatically reboot.
- The USB device must contain the proper file structure and image files mentioned below and the USB root directory must contain a signature file named `aossignature`. The `aossignature` file can be a blank text file transferred to the switch.
- This operation will enable all of the image files from the `/uflash/6465/working` or `/uflash/6860/working` directory to be copied to the `/flash/working` directory.
- If the auto-copy is successful, the auto-copy feature will be disabled before rebooting the switch and must be re-enabled by the administrator for the next auto-copy process to execute. This will prevent running the same auto-copy multiple times.
- If `copy-config` is enabled, configuration files will also be copied in addition to image files to the `/flash/working` directory from `/uflash/6860/working` directory.
Encryption is supported only on the OmniSwitch 6465.
- When a key or hash key is specified, all of the configuration files and images will be decrypted and copied to the AOS flash.
- If a key or hash key is not specified, all of the configuration files and images will be copied as is to the AOS flash.
- Maximum length of key should be 32 characters. Minimum key length should be 8 characters.

On the OmniSwitch 6465, when power supply configurations are added by the `powersupply enable` command, the power supply configurations are backed up in `/uflash/6465/system` folder when backup is enabled.

Back-up cannot be enabled if auto-copy is enabled and auto-copy cannot be enabled if back-up is enabled. So only one of these features can be enabled at any given time.

**Examples**

```
-> usb auto-copy enable copy-config enable
-> usb auto-copy enable copy-config disable
-> usb auto-copy enable copy-config enable key "abc12345"
-> usb auto-copy enable copy-config enable hash-key "a05234d"
```

**Release History**

Release 7.1.1; command was introduced.
Release 8.5R1; `copy-config` parameter added.
Release 8.5R2; `key` and `hash-key` parameter added.

**Related Commands**

- `usb backup admin-state` Enables or disables USB backup on the switch.

**MIB Objects**

- `systemServices` Enables access to the device connected to the USB interface.
  - `systemServicesUsbCopyConfig`
  - `systemServicesUsbBackupKey`
  - `systemServicesUsbBackupHashkey`
mount

Mounts a USB device on /uflash.

`mount [/uflash]`

---

**Syntax Definitions**

- `/uflash` The name of the file-system to mount.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>

MIB Objects

N/A
image integrity check

Verifies whether the SHA256 hash key of an image file located in the specified directory matches the SHA256 hash key in the specified key file.

image integrity check image_dir key-file filename

Syntax Definitions

image_dir
The directory on the switch that contains the image file to verify. Enter the name of the directory in “/flash” or include the full path (for example, “working” or “/flash/working”).

filename
The name of the file that contains the key for the image file in the specified directory. Enter the name of the key file or include the full path (for example, “hash.txt” or “/flash/hash.txt”).

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- If the name of the key file is specified without the directory path, the switch will look for the key file in the same directory specified for the image file.

- The following format is used to store the hash key values in the key file:
  Uos.img:f0ff173eff38e43e0598663da2185a363fcba5bd407201d7537d0a6b9f58670e

Example

-> image integrity check /flash/working key-file /flash/hash.txt
This operation may take several minutes...

Success: Key matched.

Release History

Release 8.3.1; command introduced.
Related Commands

**image integrity get-key**

Calculates and displays the SHA256 key for image files.

MIB Objects

- **systemServicesAction**
- **systemServicesArg1**
- **systemServicesArg2**
image integrity get-key

Displays the SHA256 hash key of the image present in the specified location.

image integrity get-key image_dir

Syntax Definitions

image_dir

The directory on the switch that contains the image file. Enter the name of the directory in “/flash” or include the full path (for example, “working” or “/flash/working”).

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- When this command is entered, the SHA256 hash of the image files in the specified directory is calculated and displayed. It can be manually verified against the hash provided in the file.

- To store the hash key value in a text file that can be used with the image file integrity check command, use the following format:
  Uos.img:f0ff173eff38e43e0598663da2185a363fcba5bd407201d7537d0a6b9f58670e

Example

-> image integrity get-key /working
This operation may take several minutes...

<table>
<thead>
<tr>
<th>Image Name</th>
<th>SHA256 Key</th>
</tr>
</thead>
<tbody>
<tr>
<td>Uos.img</td>
<td>c64d6b23312a6f9c4b99642b31ed087e600bce58d6fdd089d09e1f8077bd208</td>
</tr>
</tbody>
</table>

-> image integrity get-key /flash/certified
This operation may take several minutes...

<table>
<thead>
<tr>
<th>Image Name</th>
<th>SHA256 Key</th>
</tr>
</thead>
<tbody>
<tr>
<td>Uos.img</td>
<td>3d4d488a73eb798325bac85793ef0d67bdf377527278a6732270d3a4801bb44b</td>
</tr>
</tbody>
</table>
**Release History**

Release 8.3.1; command introduced.

**Related Commands**

- **image integrity check**
  Verifies the SHA256 hash key for the image file matches the key specified in a text file.

**MIB Objects**

- systemServicesAction
- systemServicesArg1
- systemServicesArg2
Chassis Management and Monitoring commands allow you to configure and view hardware-related operations on the switch. Topics include basic system information, as well as Network Interface (NI) module and chassis management.

**Additional Information.** Refer to your separate *Hardware Users Guide* for detailed information on chassis components, as well as managing and monitoring hardware-related functions.

MIB information for the Chassis Management and Monitoring commands is as follows:

- **Filename:** ALCATEL-IND1-CHASSIS-MIB.mib  
  **Module:** alcatelIND1ChassisMIB

- **Filename:** ALCATEL-IND1-SYSTEM-MIB.mib  
  **Module:** alcatelIND1SystemMIB

- **Filename:** ALCATEL-IND1-CAPMAN-MIB.mib  
  **Module:** alcatelIND1CapManMIB

**system contact**

Specifies the administrative contact for the switch. An administrative contact is the person or department in charge of the switch. If a contact is specified, users can easily find the appropriate network administrator if they have questions or comments about the switch.

**system contact** *text_string*

---

**Syntax Definitions**

*text_string*  
The administrative contact being specified for the switch. The system contact can range from 1 to 254 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, “Jean Smith Ext. 477 jsmith@company.com”.

---

**Defaults**  
N/A

---

**Platforms Supported**  
This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**  
N/A

---

**Examples**

-> system contact "Jean Smith Ext. 477 jsmith@company.com"
-> system contact engineering-test@company.com

---

**Release History**  
Release 7.1.1; command introduced.
Related Commands

- **system name**: Modifies the current system name of the switch.
- **system location**: Specifies the current physical location of the switch.
- **capability trap-threshold**: Displays the basic system information for the switch.

MIB Objects

- **system**
  - **systemContact**
**system name**

Modifies the current system name of the switch. The system name can be any simple, user-defined text description for the switch.

```
system name text_string
```

---

**Syntax Definitions**

`text_string`  
The new system name. The system name can range from 1 to 32 characters in length. No spaces are allowed in the system name.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Spaces are not allowed in the system name.
- The OmniSwitch can be configured with a DHCP client interface that allows the switch to dynamically obtain the system name (DHCP Option-12) from the DHCP server. The user-defined system name configuration (through CLI, WebView, SNMP) always gets priority over the DHCP server values. For more information on DHCP client options, refer to the “Configuring DHCP” chapter of the *OmniSwitch AOS Release 8 Network Configuration Guide*, and “IP Commands” chapter of the *OmniSwitch AOS Release 8 CLI Reference Guide*.

**Examples**

- `-> system name OmniSwitch6900`
- `-> system name OS6900`

**Release History**

Release 7.1.1; command introduced.
Related Commands

- **system contact**: Specifies the administrative contact of the switch (for example, an individual or a department).
- **system location**: Specifies the current physical location of the switch.
- **capability trap-threshold**: Displays the basic system information for the switch.

MIB Objects

- **system**
  - **systemName**
**system location**

Specifies the current physical location of the switch. If you need to determine the location of the switch from a remote site, entering a system location can be very useful.

```
system location text_string
```

**Syntax Definitions**

`text_string`  
The physical location of the switch. For example, TestLab. The system location can range from 1 to 254 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, “NMS Test Lab”.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>6900 X48C4E/V48C8/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

N/A

**Examples**

```
-> system location "NMS Test Lab"
-> system location TestLab
```

**Release History**

Release 7.1.1; command introduced.
Related Commands

- **system contact**: Specifies the administrative contact of the switch (for example, an individual or a department).
- **system name**: Modifies the current system name of the switch.
- **capability trap-threshold**: Displays the basic system information for the switch.

MIB Objects

- **system**
  - **systemLocation**
system date

Displays or modifies the current system date on the switch.

system date [mm/dd/yyyy]

Syntax Definitions

`mm/dd/yyyy` The new date being specified for the system. Enter the date in the following format: `mm/dd/yyyy`, where `mm` is the month, `dd` is the day, and `yyyy` is the year. For example, `08/08/2010`.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- If you do not specify a new system date in the command line, the current system date is displayed.
- For more information on setting time zone parameters (for example, Daylight Savings Time), refer to the `system timezone` command on page 59-14.

Examples

-> system date 08/08/2010
-> system date
08/08/2010

Release History

Release 7.1.1; command introduced.
Related Commands

- **system time**  Displays or modifies the current system time on the switch.
- **system timezone**  Displays or modifies the time zone for the switch.

MIB Objects

- **systemServices**
  - **systemServicesDate**
system time

Displays or modifies the switch current system time.

**system time [hh:mm:ss]**

---

**Syntax Definitions**

`hh:mm:ss` The new time specified for the system. To set this value, enter the current time in 24-hour format, where `hh` is the hour, `mm` is the minutes, and `ss` is the seconds. For example, **14:30:00**.

---

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If a new system time is not specified in the command line, the current system time is displayed.
- Setting the year to 1970 is not supported. The system interprets 1970 as meaning the internal clock has never been set and will reset to the year 2014.
- The OmniSwitch 6360 does not contain a real-time clock.
  - It is recommended to use NTP to ensure time synchronization on an OmniSwitch 6360.
  - When the switch is reset, the switch will boot up from an approximation of the last known good time.
  - When the switch is powered off, it cannot detect the time left in the powered off state. When it boots up, it will have the same time as when the switch was last powered off.

**Examples**

```
-> system time 14:30:00
-> system time
14:30:08
```

**Release History**

Release 7.1.1; command introduced.
Related Commands

- **system date**
  Displays or modifies the current system date on the switch.

- **system timezone**
  Displays or modifies the time zone for the switch.

MIB Objects

- **systemServices**
  - **systemServicesTime**
**system timezone**

Displays or modifies the time zone for the switch.

```plaintext
system timezone [timezone_abbrev]
```

### Syntax Definitions

**timezone_abbrev**

Specifies a time zone for the switch and sets the system clock to run on UTC. If a time zone abbreviation is specified, the hours offset from UTC is automatically calculated by the switch.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The configuration must be saved after changing the timezone.
- To display the current time zone for the switch, enter the syntax `system timezone`.
- If the configured timezone supports DST, it is automatically enabled and cannot be disabled.
- If the configured timezone does not support DST, it is automatically disabled and cannot be enabled.
- The OmniSwitch can be configured with a DHCP client interface that allows the switch to dynamically obtain the time zone (DHCP Option-2) from the DHCP server. The user-defined time zone configuration (through CLI, WebView, SNMP) always gets priority over the DHCP server values. For more information on DHCP client options, refer to the “Configuring DHCP” chapter of the *OmniSwitch AOS Release 8 Network Configuration Guide*, and “IP Commands” chapter of the *OmniSwitch AOS Release 8 CLI Reference Guide*.
- Refer to the *OmniSwitch AOS Release 8 Switch Management Guide* for a list of time zone abbreviations.

### Examples

```
-> system timezone mst
```

### Release History

Release 7.1.1; command introduced.
Related Commands

- **system date**
  Displays or modifies the current system date on the switch.

- **system time**
  Displays or modifies the current system time on the switch.

MIB Objects

- **systemServices**
  - systemServicesTimezone
  - systemServicesTimezoneStartWeek
  - systemServicesTimezoneStartDay
  - systemServicesTimezoneStartMonth
  - systemServicesTimezoneStartTime
  - systemServicesTimezoneOffset
  - systemServicesTimezoneEndWeek
  - systemServicesTimezoneEndDay
  - systemServicesTimezoneEndMonth
  - systemServicesTimezoneEndTime
  - systemServicesEnableDST
**system daylight-savings-time**

Displays the Daylight Savings Time (DST) setting for the configured timezone.

```
系统 daylight-savings-time [enable | disable]
```

---

**Syntax Definitions**

```
enable | disable
```

Enables or disables DST.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timezone supports DST</td>
<td>enabled</td>
</tr>
<tr>
<td>Timezone does not support DST</td>
<td>disabled</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- If the configured timezone supports DST it is automatically enabled.
- If the configured timezone does not support DST it is automatically disabled.

---

**Examples**

```
-> system daylight-savings-time
Daylight Savings Time (DST) is ENABLED.
```

---

**Release History**

Release 7.1.1; command introduced.
Related Commands

- **system time** Displays or modifies the current system time on the switch.
- **system timezone** Displays or modifies the timezone for the switch.
- **system date** Displays or modifies the current system date on the switch.

MIB Objects

- **systemServices**
  - systemServicesTimezone
  - systemServicesEnableDST
update uboot

Updates the uboot versions of the CMM or NIs. Refer to the Release Notes and/or any available Upgrade Instructions for the new release before performing this type of update on the switch.

update uboot {cmm slot | ni {all | slot} file filename}

Syntax Definitions

- **cmm**: Specifies that the update is performed for the Chassis Management Module (CMM).
- **all**: Specifies that the update is performed for all slots within a chassis.
- **slot**: Specifies the slot number of the module within a chassis.
- **filename**: Specifies the path and name of the upgrade file.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

Note that when performing an update, it is important that the correct update file is used. Specifying the wrong file may impact the operation of the switch.

Examples

- > update uboot ni all file 9999.tar.gz
- > update uboot cmm 1 file /flash/temp/9999.tar.gz

Release History

Release 7.1.1; command introduced.

Related Commands

- **reload slot**: Reloads the specified NI module.

MIB Objects

- **systemServices**:
  - systemServicesArg1
systemServicesAction
update fpga-cpld

Updates the FPGA/CPLD versions of the CMM or NIs. Refer to the Release Notes and/or any available Upgrade Instructions for the new release before performing this type of update on the switch.

update fpga-cpld \{cmm \{chassis/cmm |all\} | ni \{chassis/ni | daughter num\} file filename\}

**Syntax Definitions**

- **cmm**
  Specifies that the update is performed for the Chassis Management Module (CMM).

- **daughter**
  Specifies the number of the daughter board on the NI module.

- **ni**
  Specifies the slot number of the module within a chassis.

- **filename**
  Specifies the path and name of the upgrade file.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>

<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Note that when performing an update, it is important that the correct update file is used. Specifying the wrong file may impact the operation of the switch.

- When updating CMMs with the **all** option an “fpga_kit” file must be used. If upgrading a CMM using the **chassis/cmm** option, a “vme” file must be used.

- A *.updater file can be used for upgrading ONIE-based devices.

- Refer to the appropriate release notes for release specific file information.

**Examples**

-> update fpga-cpld ni 4 file 9999.vme
-> update fpga-cpld cmm 1/1 file /flash/OS6865_U28X_CPLD_V11.vme
-> update fpga-cpld cmm all file fpga_kit_4960
-> update fpga-cpld cmm 1/1 file os6860n_p24m_p24z_maincpld_20220309.updater
**Release History**

Release 7.1.1; command introduced.
Release 7.3.4; **fpga** parameter changed to **fpga-cpld**.

**Related Commands**

- **reload slot**
  Reloads the specified NI module.

**MIB Objects**

- **systemServices**
  - **systemServicesArg1**
  - **systemServicesAction**
reload slot

Reloads or reboots a specified Network Interface (NI) module.

**reload slot slot**

---

**Syntax Definitions**

*slot* Specifies the slot number.

---

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

**Usage Guidelines**

The `reload slot` command reboots only the specified NI. Other modules installed on the chassis, including primary and secondary CMMs, are not affected.

**Examples**

```
-> reload slot 2
```

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- **reload slot**: Reloads the specified NI module.
- **power slot**: Turns the power on or off for a specified NI module.
- **show slot**: Shows the hardware information and the current status for NI modules currently running in the chassis.

**MIB Objects**

- `chasEntPhysicalTable`
- `chasEntPhysAdminStatus`
- `reset`
power slot

Turns the power on or off for a specified Network Interface (NI) module.

`power slot chassis.slot`

`no power slot chassis.slot`

---

**Syntax Definitions**

`chassis`  
The chassis identifier.

`slot`  
The chassis slot number containing the NI module being powered on or off.

---

**Defaults**

N/A

---

**Platforms Supported**

Not supported in this release.

---

**Usage Guidelines**

Use the `no` form of this command to power off an NI module.

---

**Examples**

`-> power slot 1`
`-> power slot 7`

---

**Release History**

Release 7.1.1; command introduced.

---

**Related Commands**

`reload slot`  
Reloads the specified NI module.

`show slot`  
Shows the hardware information and current status for NI modules currently running in the chassis.

---

**MIB Objects**

`chasEntPhysicalTable`
`chasEntPhysAdminStatus`
`powerOn`
`powerOff`
powersupply enable

Enables the power supply unit identified by the PSU-ID.

powersupply enable [slot]

no powersupply enable [slot]

Syntax Definitions

slot Slot number of power supply.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

N/A

Release History

Release 7.1.1; command introduced.

Related Commands

power slot Turns the power on or off for a specified Network Interface (NI) module.

MIB Objects

N/A
powersupply powersave

Enables the power saving functionality on the switch.

`powersupply powersave {enable | disable}`

**Syntax Definitions**

| enable | disable | Enables or disables the power saving functionality. |

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

Not supported in this release.

**Usage Guidelines**

- When enabled unneeded power-supplies are shut down to conserve energy, only the power supplies required to provide N+1 redundancy remain on.

- If enabled and power is lost to all active power supplies simultaneously, the switch will lose power since N+1 redundancy applies only to the active power supplies.

- If the power-save mode is disabled, all available power supplies are switched on at all times.

**Examples**

```
-> powersupply powersave disable
-> powersupply powersave enable
```

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

show powersupply Displays the hardware information and current status for chassis power supplies.

**MIB Objects**

chasEntPhysicalTable
chasEntPhysAdminStatus
**powersupply type**

Configures the type of power supply that is connected to the chassis.

`powersupply num name string type {ALE {xl-ac | lo-ac | hi-ac} | phoenix-contact {48VDC | 24VDC} | third-party wattage num} [chassis-id chassis_id]`

---

**Syntax Definitions**

- `num` (power supply connector ID)
- `string` (the descriptive name of the power supply)
- `xl-ac | lo-ac | hi-ac` (the type of ALE power supply)
- `phoenix-contact 48VDC | 24VDC` (the type of Phoenix Contact power supply)
- `third-party wattage num` (the wattage value of the attached third-party power supply)

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td></td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- The OmniSwitch 6465 cannot auto-detect the type of power supply connected. This command is used to configure the type of power supply that is connected.

- Refer to the OmniSwitch 6465 Hardware User Guide for chassis power requirements when using third-party power supplies.

- Refer to the OmniSwitch 6465 Hardware Users Guide for power supply specifications using the power supply part number mapping below. A power supply may be associated with multiple part numbers depending on ALE branding, ordering part number or manufacturer part number.
  - lo-ac (OS6465-BPN, PS-175AC, SDR-75-48)
  - hi-ac (O6465-BPN-H, PS-1185AC-P, SDR-240-55)
  - xl-ac (OS6465-BPN-X, PS-1275AC-P, SDR-480-48)

---

**Examples**

```
-> powersupply 1 name ALE-75W-ps1 type ale lo-ac
```
-> powersupply 2 name ALE-75W-ps2 type ale lo-ac
-> powersupply 1 name third-party-ps type third-party wattage 75

**Release History**

Release 8.5 R1; command introduced.

**Related Commands**

**show powersupply**

Displays the hardware information and current status for chassis power supplies.

**MIB Objects**

N/A
**hash-control**

Configures the hash control method on the switch. Depending upon this configuration, hashing algorithm used by various applications for packet forwarding is affected.

```
hash-control {brief | extended [udp-tcp-port] | load-balance non-ucast {enable | disable}}
hash-control extended no udp-tcp-port
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>brief</td>
<td>Sets hashing to brief mode.</td>
</tr>
<tr>
<td>extended</td>
<td>Sets hashing to extended mode.</td>
</tr>
<tr>
<td>udp-tcp-port</td>
<td>Sets extending hashing to use UDP/TCP ports.</td>
</tr>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>hash-control</td>
<td>brief (OS6465, OS6900) extended (OS6560, OS6570M, OS6860, OS6865, OS9900)</td>
</tr>
<tr>
<td>udp-tcp-port</td>
<td>disabled</td>
</tr>
<tr>
<td>non-ucast</td>
<td>disabled</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Disabling TCP-UDP port hashing is recommended when Server Load Balancing (SLB) is configured, because SLB dynamically assigns ports.
- The hash control setting also impacts the fabric load balancing for Chassis based products. It is recommended not to set brief hashing mode on Chassis based products.
- Changing the hash control mode affects the hashing algorithm for Link Aggregation, Server Load Balancing and ECMP.
- The hashing mode must be set to extended to enable UDP/TCP port hashing.
• Enabling or disabling the **load-balance non-ucast** option applies to all link aggregates. When this option is disabled (the default), link aggregation load balances only unicast packets; all non-unicast packets are sent through the primary port of the link aggregate.

• When the **load-balance non-ucast** option is enabled, all non-unicast traffic (broadcast, L2 multicast, L3 multicast, and unknown unicast) is load balanced over the link aggregate.

**Examples**

-> hash-control brief  
-> hash-control extended  
-> hash-control extended udp-tcp-port  
-> hash-control extended no udp-tcp-port  
-> hash-control load-balance non-ucast enable  
-> hash-control load-balance non-ucast disable

**Release History**

Release 7.2.1; command introduced.

**Related Commands**

`show hash-control` Displays the current hash control setting for the switch.

**MIB Objects**

alaChasHashMode  
alaChasUdpTcpPortMode  
alachasNonUCHashControl
**bluetooth**

Enables or disables USB adapter with Bluetooth technology connectivity and configures the power level.

`bluetooth {admin-state [enable | disable] | transmit-power [low | high]}`

**Syntax Definitions**

<table>
<thead>
<tr>
<th>enable</th>
<th>disable</th>
<th>Enables or disables USB adapter with Bluetooth technology connectivity.</th>
</tr>
</thead>
<tbody>
<tr>
<td>low</td>
<td>high</td>
<td>Configures the power level to low or high.</td>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command will configure all USB adapters with Bluetooth technology in a virtual chassis.

**Examples**

- `-> bluetooth admin-state enable`
- `-> bluetooth transmit-power high`

**Release History**

Release 8.1.1; command was introduced.
Related Commands

- **show bluetooth status**  
  Displays the current USB adapter with Bluetooth technology settings.

- **show me**  
  Executes an LED blink pattern for 10 seconds that is used by the USB adapter with Bluetooth technology to identify the connected switch.

MIB Objects

- **systemServices**
  - **systemServicesUsbEnable**
  - **systemServicesBluetoothTxPower**
**capability profile**

Configures the mode of the switch to be either *switch* or *router*.

```
capability profile {switch | router}
```

**Syntax Definitions**

- `switch | router`: Configures the *switch* or *router* profile.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>switch</td>
<td>router</td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use this command to change the mode of a switch between *switch* and a *router*. This will adjust the L2 and L3 table entries based on the network requirements.

- The *switch* profile provides more L2 entries. The *router* profile provides more LPM entries. Refer to the Specifications Guide for details on the L2 and L3 entries.

- The switch must be rebooted for the configured profile to take effect.

**Examples**

```
-> capability profile router
```

**Release History**

Release 8.5R2; command was introduced.
**Related Commands**

- `show capability profile` Displays the active and configured profile settings.

**MIB Objects**

<table>
<thead>
<tr>
<th>MIB Object</th>

</thead>
<tbody>
<tr>
<td>alaCapManProfile</td>
</tr>
<tr>
<td>alaCapManProfileMode</td>
</tr>
</tbody>
</table>
**capability profile tcam mode**

Configures the TCAM (Ternary Content Addressable Memory) mode of the switch to support source IPv6 filtering.

`capability profile tcam mode {source-ipv6 | dest-ipv6}`

**Syntax Definitions**

- `source-ipv6` Selects the source IPv6 (enhanced) mode.
- `dest-ipv6` Selects the destination IPv6 mode.

**Defaults**

By default, the TCAM mode supports destination IPv6 filtering only; source IPv6 filtering is not allowed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Setting the TCAM mode to source IPv6 filtering is required to support DHCPv6 Snooping IPv6 source filtering on an OmniSwitch 6560 and OmniSwitch 6570M.
- When the TCAM mode is changed, a warning message is displayed (see command examples below).
- After the TCAM mode is changed and the configuration is saved with the `write memory` command, reboot the switch to activate the specified mode.
- When the TCAM mode is set to source IPv6 filtering, the TCAM will operate in an enhanced mode to support the use of source IPv6 conditions in QoS policy rules.
- The following functionality is not supported when the source IPv6 filtering mode is active:
  - Destination IPv6 source filtering.
  - ISSU
  - QoS anti-spoofing
  - Fewer QoS policy rules supported.

**Examples**

```
-> capability profile tcam mode source-ipv6
WARNING: Source ipv6 tcam mode would not support : QoS policy with destination ipv6 address / destination network group / ipv6 Tcpflags. Reboot is needed for the capability profile tcam mode to use source-ipv6
```
capability profile tcam mode dest-ipv6
WARNING: Destination ipv6 tcam mode would not support : QoS policy with source ipv6 address / source network group.
Reboot is needed for the capability profile tcam mode to use dest-ipv6

Release History
Release 8.6R1; command was introduced.

Related Commands

`dhcppv6-snooping ipv6-source-filter`  
Confirms the IPv6 source filtering capability for a port, link aggregate, or VLAN using the DHCPv6 Snooping binding table.

`show tcam utilization detail`  
Displays additional TCAM usage information, such as application usage.

`show capability profile`  
Displays the active and configured profile settings.

MIB Objects

alaCapManProfile

alaCapManProfileTcamMode
capability trap-threshold

Configures the MAC and ARP table utilization high and low values for generating the associated traps.

```
capability trap-threshold {MAC | ARP} {HIGH num | LOW num}
```

**Syntax Definitions**

- **MAC**: Configures the MAC table threshold.
- **ARP**: Configures the ARP table threshold.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>HIGH num</td>
<td>95</td>
</tr>
<tr>
<td>LOW num</td>
<td>90</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If the table utilization reaches the configured HIGH value a trap will be sent indicating the usage has reached the HIGH value. The trap will continue to be periodically sent until the usage drops below the configured HIGH value.
- Once the usage drops to the configured LOW value, a trap will be sent indicating the usage has dropped below the configured LOW value.
- The minimum LOW value is 5% and the maximum HIGH value is 95%. It is recommended to have a difference of at least 5% between LOW and HIGH values.

**Examples**

- `-> capability trap-threshold ARP HIGH 90 LOW 80`
- `-> capability trap-threshold MAC HIGH 88 LOW 80`

**Release History**

Release 8.6R1; command was introduced.
Related Commands

show capability trap-threshold  Displays the capability trap-threshold configured values.

MIB Objects

   alaCapManTrapThresholdMacHigh
   alaCapManTrapThresholdArpLow
   alaCapManTrapThresholdArpHigh
capability shared-vlan-learning

Enables or disables shared VLAN learning. When enabled (the default), this functionality provides system resources for a Private VLAN (PVLAN) configuration.

capability shared-vlan-learning {enable | disable}

Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Shared VLAN learning is enabled to support PVLAN configuration.</td>
</tr>
<tr>
<td>disable</td>
<td>Shared VLAN learning is disabled to free up system resources. PVLAN configuration is not available.</td>
</tr>
</tbody>
</table>

Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>enable</td>
</tr>
</tbody>
</table>

Platforms Supported

Not supported in this release.

Usage Guidelines

A switch reboot is required whenever shared VLAN learning is enabled or disabled.

Examples

- `-> capability shared-vlan-learning disable`
- `-> capability shared-vlan-learning enable`

Release History

Release 8.7R2; command introduced.

Related Commands

- `show pvlan` Displays a list of PVLANs configured on the switch.

MIB Objects

alaCapManSharedVlanLearningConfig
alaCapManSharedVlanLearning
**uboot access**

Enables or disables the U-boot access.

`uboot access {enable | disable}`

---

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enable the U-boot access.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disable the U-boot access.</td>
</tr>
</tbody>
</table>

**Defaults**

By default, U-boot access is enabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>Yes</td>
</tr>
<tr>
<td>6465</td>
<td>Yes</td>
</tr>
<tr>
<td>6560</td>
<td>Yes</td>
</tr>
<tr>
<td>6570M</td>
<td>Yes</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
</tr>
<tr>
<td>6860N</td>
<td>No</td>
</tr>
<tr>
<td>6865</td>
<td>Yes</td>
</tr>
<tr>
<td>6900</td>
<td>No</td>
</tr>
<tr>
<td>6900 V72/C32</td>
<td>No</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Only the admin user can enable or disable the U-boot access.
- When the U-boot access is enabled, U-boot shell can be accessed with any key-press at AOS boot.
- When the U-boot access is disabled, any key-press at AOS boot does not allow access to U-boot shell. AOS images are booted with the pre-set parameters. If the AOS images are not valid or corrupted, switch goes to no response state, where only watch-dog reboots are possible. U-boot cannot start AOS and recover options cannot be used, as these options need U-boot access. In this case, the switch must be returned to the factory for repair as it cannot be recovered by the admin user.
- In case of VC, U-boot access configuration shall be synched to all the units of VC. The U-boot access configuration shall not be synched to any new unit (slave) joining the VC later. The U-boot access configuration must be applied before the new slave joins the VC or reapplied on the VC master after the new slave joins the VC.
- U-boot authentication feature does not have any effect, when U-boot access is disabled. When U-boot access enabled, it takes the latest authentication status.

**Examples**

```
-> uboot access enable
-> uboot access disable
```
Release History
Release 8.7R3; command introduced.

Related Commands
- `uboot authentication`  Enables or disables the U-boot authentication.
- `show uboot config`     Displays the U-boot authentication status.

MIB Objects
- `alaAaaU-bootAccess`
**uboot authentication**

Enables or disables the U-boot authentication.

`uboot authentication {enable password password | disable}`

---

### Syntax Definitions

- **enable**
  - Enable the U-boot authentication.

- **disable**
  - Disable the U-boot authentication.

- **password**
  - The U-boot password. The password can be between 8 to 30 characters.

---

### Defaults

By default, U-boot authentication is disabled.

---

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

### Usage Guidelines

- When the authentication option is enabled, password input must be given. The U-boot shell is allowed to access only after authenticating with the password.

- Maximum of five retirees are allowed for the U-boot password. If the user enters the wrong password for five times, U-boot will proceed with the normal AOS boot.

- U-boot does not prompt for the password if AOS has not enabled the U-boot authentication with a password.

- The U-boot password cannot be modified at the U-boot prompt. Only the admin user can modify or set the password using the U-boot authentication command. If the user forgets the password, user can continue to normal AOS boot. The admin user can then modify or reset the U-boot password.

- In case of VC, the U-boot authentication password must be applied before the new slave joins the VC or reapplied on the VC master after the new slave joins the VC.

---

### Examples

- `-> uboot authentication enable password abcd1234`
- `-> uboot authentication disable`

---

### Release History

Release 8.7R3; command introduced.
Related Commands

- **uboot access**  Enables or disables the U-boot access.
- **show uboot config**  Displays the U-boot authentication status.

MIB Objects

- alaAaaUbootAuthenticationPassword
license apply file

Activates the license for licensed protocols on the switch.

```
license apply {file file_name | key license_key} [order-id order_id]
```

**Syntax Definitions**

- `file_name`: The name of the license file containing the license keys.
- `license_key`: Enter the individual license key. The license key can contain special characters; it is required to encase using single quote character ("'). The `key` input is needed only for applying MACsec license.
- `order_id`: The order ID for the MACsec license.

**Defaults**

By default, licensed protocols are not activated on the switch.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>V72/C32</td>
<td>T48C6/T48C6</td>
<td>X48C4E/X48C8</td>
<td>C32E/T24C2</td>
<td>X24C2</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The license file can have any name.
- The license file is only used to activate the licensed features and does not need to remain on the switch.
- Using `key` option, the license key can be directly entered in the command. The license key can contain special characters; it is required to encase the key using single quote character ("'). The `key` input is needed only for applying MACsec license.
- Performance software license (OS6560-SW-PERF) is optional allowing ports 25/26 (OS6560-24X4/P24X4) and ports 49/50 (OS6560-48X4/P48X4) to operate at 10G speed. Ports support 1G by default. There is no reboot required after applying this license, but the ports should be administratively disabled and re-enabled.
- Performance software license (OS6360-SW-PERF) is optional allowing the two RJ45/SFP+ combo ports (25/26) of the OS6360-PH24 model to operate at 10G speed. Ports support 1G by default. There is no reboot required after applying this license, but the ports should be administratively disabled and re-enabled.
- The module type will continue to display as ‘U16L’ even after upgrading a ‘U16’ to a ‘U16E’.
- The `order-id` parameter is mandatory for MACsec license but it is not applicable for other licenses.
- The MACsec license is a site license and does not use the serial number and the MAC address of the switch. However, `order-id` is required for the license generator to generate MACsec license. The order ID value entered in this command is validated against the order ID in the license file. If this value does not match with the value stored in license file, MACsec license will not be installed.

- The order ID is a seven digit number and the license generation process appends the digit 0 at the beginning implicitly. Hence, it is required to provide eight digits (0 + 7 digits of the order ID) to install the license successfully.

- The Metro license is created based on the generic Metro type (feature ID), this is based on MAC address and the serial number of the unit.

- Following features are part of Metro license: CPE Test Head, PPPoE-IA, Ethernet OAM, SAA, Link OAM, VLAN Stacking, Dynamic Proxy ARP, Hardware Loopback. Metro license is required to configure these features on the switch.

- The Metro license is applicable for all OmniSwitch 6560 and OmniSwitch 6570M, which support Metro feature. The Metro configuration will be rejected if the Metro license is not installed prior to configuration. On other platforms, Metro features does not require a license.

- The switch must be rebooted to reflect the licensed feature set. For MACsSec, 10G license, and Metro license, a reboot is not required.

**Examples**

```
-> license apply file /flash/swlicense.txt
The switch will reboot after the license is applied.
Are you sure you want to proceed(Y/N)?Y
```

```
-> license apply file \flash\swlicense.dat order-id "07766551"
```

```
-> license apply key 'hasJ-i{v!-[qVW-YPr-t@YK' order-id "01234567"
```

**Release History**

Release 7.2.1; command was introduced.
Release 7.3.1; `key` and `deactivate` parameters deprecated.
Release 8.6R1; MACsec site-wide license and OmniSwitch 6560 10-Gigabit port license support added.
Release 8.6R2; `key` parameter added.
Release 8.9R1; Metro license support added for OmniSwitch 6560.

**Related Commands**

`show license-info` Displays all the licensed applications installed on the switch.

**MIB Objects**

- `alaCapManVcSwLicensingAction`
- `alaCapManVcSwLicensingActionArg`
- `alaCapManVcSwLicensingOrderId`
show system

Displays basic system information for the switch. Information includes a user-defined system description, name, administrative contact, location, object ID, up time, and system services.

show system

output definitions

System Description The description for the current system. This description shows the current software version and the system date.

System Object ID The SNMP object identifier for the switch.
### System Up Time
The amount of time the switch has been running since the last system reboot.

### System Contact
An user-defined administrative contact for the switch. This field is modified using the `system contact` command.

### System Name
A user-defined text description for the switch. This field is modified using the `system name` command.

### System Location
The user-defined physical location of the switch. This field is modified using the `system location` command.

### System Services
The number of current system services.

### System Date & Time
The current system date and time. This field is modified using the `system date` and `system time` commands.

### Flash Space: Primary CMM:
#### Available (bytes)
The available flash memory space available on the primary management module of the switch.

### Flash Space: Primary CMM:
#### Comments
Comments regarding the available flash memory space available on the primary management module of the switch, if applicable.

### Release History
Release 7.1.1; command introduced.

### Related Commands
- **system contact**: Specifies the administrative contact for the switch (for example, an individual or a department).
- **system name**: Modifies the current system name of the switch.
- **system location**: Modifies the current physical location of the switch.

### MIB Objects
```
system
  systemContact
  systemName
  systemLocation
```
**show hardware-info**

Displays the current system hardware information. Includes CPU, flash, RAM, NVRAM battery, jumper positions, BootROM, and miniboost and FPGA information.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The fields displayed may differ slightly based on the switch model. The example given is for an OS9900.

**Examples**

```
-> show hardware-info
Chassis 1
CPU Manufacturer : GenuineIntel
CPU Model         : Intel(R) Atom(TM) CPU C2518 @ 1.74GHz
Compact Flash Manufacturer : MICRON
Compact Flash size   : 1997967360 bytes
RAM Manufacturer    : Micron
RAM size            : 16322816kB
Control FPGA version : 2.0.0
Power FPGA version   : 0.8
Coreboot Version     : 8.3.1.103.R01
CPMs Present         : 1,-
Power Supplies Present: 1,2,-
Fan Trays Present    : 1,2,3
NIs Present          : 1,-,3,4,-,-,-
```

**output definitions**

- **CPU Manufacturer**: The manufacturer of the CPU used on the CMM.
- **CPU Model**: The model of the CPU on the CMM.
- **Compact Flash Manufacturer**: The manufacturer of the flash memory used on the CMM.

Release History
Release 7.1.1; command introduced.

Related Commands

- **show hardware-info**
  Displays the current system hardware information.

- **show powersupply**
  Displays the hardware information and current status for chassis power supplies.

- **show fan**
  Displays the current operating status of chassis fans.

MIB Objects

- **chasChassisTable**
- **chasFreeSlots**
- **chasPowerLeft**
**show cmm**

Displays basic hardware and status information for the CMM modules in a standalone switch.

`show cmm [slot]`

---

**Syntax Definitions**

| `slot` | Specifies the CMM by slot number or letter. |

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

On chassis-based switches, a CMM installed in the left CMM slot position is defined as CMM-A. A CMM installed in the right position is CMM-B.

**Examples**

```
-> show cmm
Chassis ID 1 Module in slot CMM-A
    Model Name:    OS99-CMM,
    Module Type:   0x7100101,
    Description:   MGMT MODULE,
    Part Number:   903754-90,
    Hardware Revision: C06,
    Serial Number: U1820028,
    Manufacture Date: May 10 2016,
    FPGA - Control: 2.0.0,
    FPGA - Power:   0.8,
    Admin Status:   POWER ON,
    Operational Status: UP,
    Max Power:       64,
    CPU Model Type:  Intel Atom C2518,
    MAC Address:    2c:fa:a2:13:e4:02,
    Coreboot Version: 8.3.1.103.R01
```

### Release History
Release 7.1.1; command introduced.

### Related Commands

- **show module**
  - Displays the basic information for either a specified module or all modules installed in the chassis.

- **show module status**
  - Displays the basic status information for either a specified module or all modules installed in the chassis.

### MIB Objects

- **N/A**
show module status

Displays the basic status information for either a specified module or all modules installed in a standalone switch chassis.

show module status [slot]

Syntax Definitions

slot

The slot number or CMM letter for a specific module installed in the chassis. If no slot number is specified, information for all modules is displayed.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

When this command is entered from the secondary CMM, the Operational and Admin Status for NIs will display as ‘UNKNOWN’.

Examples

-> show module status

<table>
<thead>
<tr>
<th>Slot</th>
<th>Operational Status</th>
<th>Admin-Status</th>
<th>Rev</th>
<th>MAC</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMM-A</td>
<td>UP</td>
<td>POWER ON</td>
<td>N/A</td>
<td>00:d0:95:a3:e5:09</td>
</tr>
<tr>
<td>SLOT-1</td>
<td>UP</td>
<td>POWER ON</td>
<td>N/A</td>
<td>00:d0:95:a3:e5:0b</td>
</tr>
</tbody>
</table>

output definitions

Slot

The chassis slot position of the module. For detailed slot numbering information, refer to the “Chassis and Power Supplies” chapter of the Hardware User Guide. Refer to page 59-51 for additional information on CMM callouts.

Operational Status

The operational status of the module. Options include UP or DOWN. For NI and secondary CMM modules, the operational status can be DOWN while the power status is on, indicating a possible software issue.
### Output Definitions (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Admin-Status</strong></td>
<td>The current power status of the module. Options include POWER ON or POWER OFF.</td>
</tr>
<tr>
<td><strong>Firmware Rev</strong></td>
<td>The firmware version for module ASICs.</td>
</tr>
<tr>
<td><strong>MAC</strong></td>
<td>For the CMM, the base chassis MAC address is displayed. For NI modules, the MAC address for the corresponding NI is displayed.</td>
</tr>
</tbody>
</table>

### Release History

Release 7.1.1; command introduced.

### Related Commands

- **show module**
  - Displays the basic information for either a specified module or all the modules installed in the chassis.

- **show module long**
  - Displays the detailed information for either a specified module or all the modules installed in the chassis.

### MIB Objects

| N/A |
**show powersupply**

Displays the hardware information and current status for chassis power supplies.

`show powersupply [slot]`

### Syntax Definitions

- **slot**
  - The slot number for a specific power supply installed in the chassis. If no power supply number is specified, information for all power supplies is displayed.

- **powersave status**
  - Displays the status of the power saving functionality.

### Defaults

The OmniSwitch 6465 and 6570 cannot auto-detect the type of power supply connected and will not display a power supply that is not powered up. Use the `powersupply type` command on the OS6465 to manually configure a power supply.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

N/A

### Examples

```
-> show powersupply
+---+-----+-------+--------+---------+--------+--------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----------+----- <tr>
<td>Airflow</td>
<td>-</td>
</tr>
</tbody>
</table>

---

**Release History**

Release 7.1.1; command introduced.
Related Commands

**show fan**

Displays the current operating status of chassis fantrays.

MIB Objects

N/A
**show fantray**

Displays the current operating status of chassis fantrays.

**show fantray [slot]**

---

### Syntax Definitions

| slot | Specifies the slot number of the fantray. |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guideline

N/A

### Examples

```
-> show fantray
 | Working | Fan |
Tray | Status | Fans | Load % |
-----|--------|------|--------|
1     ON      4        50
```

### output definitions

| Chassis/Tray | The chassis/Tray ID. |
| Status       | The current operational status of the fantray. |
| Working Fans | The number of working fans. |
| Fan Load %   | The load of the fantray. |

### Release History

Release 7.1.1; command introduced.
Related Commands

**show fantray**
Displays the current operating status of chassis fantrays.

MIB Objects

N/A
show temperature

Displays the internal operating temperature of the chassis, as well as current temperature threshold settings.

Syntax Definitions

index Specifies the index number.
cmm_letter Specifies the CMM letter.
chassis The ID number of the chassis.

Defaults
N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- This command displays the internal operating temperature, not the ambient temperature, of the current operating chassis as well as current temperature threshold settings.
- Refer to the appropriate Hardware Users Guide for detailed information about temperature thresholds for a specific OmniSwitch model.

Examples

-> show temperature
Chassis/Device | Current | Range | Danger | Thresh | Status
-----------------------------------------------
1/CMMA        | 48     | -45 to 93 | 98    | 93    | UNDER THRESHOLD

output definitions

Chassis/Device The device being measured (CMM, Fabric, or NI)
Current The current CPU temperature in Celsius.
Range The supported threshold range.
Danger The danger threshold value. This value is based on the switch model and is not configurable.
output definitions (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thresh</td>
<td>The warning temperature threshold, in degrees Celsius. If the switch reaches or exceeds this temperature, the primary switch or CMM TEMP LED displays amber and a warning is sent to the user.</td>
</tr>
<tr>
<td>Status</td>
<td>Whether the current temperature has reached the threshold.</td>
</tr>
</tbody>
</table>

Release History

Release 7.1.1; command introduced.

Related Commands

show fan

Displays the hardware information and current status for the chassis fans.

MIB Objects

chasChassisTable
  - chasHardwareBoardTemp
  - chasHardwareCpuTemp
  - chasTempRange
  - chasTempThreshold
  - chasDangerTempThreshold
show hash-control

Displays the current hash control settings for the switch.

show hash-control [non-ucast]

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

N/A

Examples

-> show hash-control
Hash Mode   = brief,
Udp-Tcp-Port = disabled

-> show hash-control non-ucast
Hash Status = Enabled,
Hash Mode   : Normal

output definitions

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Hash Mode</td>
<td>The current Hash Mode.</td>
</tr>
<tr>
<td>Udp-Tcp-Port</td>
<td>Status of UDP/TCP hashing.</td>
</tr>
<tr>
<td>Non-ucast Hash Status</td>
<td>Status of Non-ucast Hash status.</td>
</tr>
</tbody>
</table>

Release History

Release 7.2.1; command introduced.
Related Commands

powersupply type

Configures the hash mode of the switch.

MIB Objects

alaChasHashMode
alaChasUdpTcpPortMode
alaChasNonUCHashControl
show license-info

Displays all the licensed applications installed on the switch.

show license-info

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use this command to verify which licenses are installed on the switch.
- The number of days remaining is only applicable for demo licenses.
- The module type will continue to display as ‘U16L’ even after upgrading a ‘U16’ to a ‘U16E’.

**Examples**

-> show license-info

<table>
<thead>
<tr>
<th>VID</th>
<th>device</th>
<th>license</th>
<th>type</th>
<th>Time (Days)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0</td>
<td>AV</td>

<td>0</td>
<td>MACSE</td>
<td>permanent</td>
<td>NA</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>METRO</td>
<td>permanent</td>
<td>NA</td>
</tr>
</tbody>
</table>

**output definitions**

- **VID**: Virtual chassis identifier.
- **Device**: Slot number of NI.
- **License**: Displays the feature license installed on the switch.
- **Type**: The type of license.
**Release History**

Release 7.2.1; command was introduced.
Release 8.6R1; **Upgrade Status** and **Expiration Date** fields added.
Release 8.9R1; **Upgrade Status** and **Expiration Date** fields removed.

**Related Commands**

- **license apply file**
  Activates the license for licensed protocols on the switch.

**MIB Objects**

- alaVcCapManSwLicensingInfoTable
  - alaVcLicensedvcSlot
  - alaVcLicensedMask
  - alaVcLicenseType
  - alaVcTimeRemain

**output definitions**

<table>
<thead>
<tr>
<th>VID</th>
<th>Virtual chassis identifier.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device</td>
<td>Slot number of NI.</td>
</tr>
<tr>
<td>License</td>
<td>Displays the feature license installed on the switch.</td>
</tr>
<tr>
<td>Time (Days) Remaining</td>
<td>Time of days remaining for a demo license. Display as ‘NA’ for permanent licenses.</td>
</tr>
</tbody>
</table>
**show bluetooth status**

Displays the current USB adapter with Bluetooth technology configuration.

**show bluetooth status**

---

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/V48C8/C32E/T24C2</th>
<th>9900</th>

<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guideline**

N/A

**Examples**

```bash
-> show bluetooth status
Admin Status   : disabled,
Transmit Power : low,

Chassis Operational Status
---------------------------
1               Not Present
```

**output definitions**

- **Admin Status**: Whether the USB adapter with Bluetooth technology is enabled or disabled.
- **Transmit Power**: Whether transmit power is high or low.
- **Chassis**: The chassis identifier.
- **Operational Status**:
  - `notPresent`—No USB adapter with Bluetooth technology present.
  - `connectionInactive`—USB adapter with Bluetooth technology present but inactive.
  - `connectionActive`—USB adapter with Bluetooth technology present and active.
**Release History**

Release 8.1.1; command introduced.

**Related Commands**

- **bluetooth**

  Enables or disables a USB adapter with Bluetooth technology and configures the power level.

**MIB Objects**

| N/A |
**show me**

Executes an LED blink pattern for 10 seconds that is used by the USB adapter with Bluetooth technology to identify the connected switch.

**show me**

---

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guideline**

Use this command in a virtual chassis to identify which switch currently has USB adapter with Bluetooth technology connectivity.

**Examples**

```
-> show me
The Chassis ID LED will blink for 10 seconds.
```

**Release History**

Release 8.1.1; command introduced.

**Related Commands**

- **bluetooth**: Enables or disables a USB adapter with Bluetooth technology and configures the power level.

**MIB Objects**

N/A
**show tcam utilization**

Displays runtime information about the Ternary Content Addressable Memory (TCAM) utilization for each stage of each TCAM on each slot of the switch.

```
show tcam utilization [chassis/slot] [chassis/slot/tcam]
```

**Syntax Definitions**

- `chassis/slot`: A chassis ID and slot number. Use this parameter to display TCAM utilization for a specific slot.
- `chassis/slot/tcam`: A chassis ID, slot, and TCAM number. Use this parameter to display utilization for a specific TCAM.

**Defaults**

By default, TCAM utilization is displayed for the entire switch.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The utilization is represented in terms of the minimum-sized entry supported by the TCAM.
- On an OmniSwitch 6860N, utilization statistics for the EM stage will display if the resource is configured. If the resource is not configured, all statistics for EM will show as zero. On the other OmniSwitch platforms, EM statistics will always show as zero.
- This command replaces the `show qos slice` command on the supported OmniSwitch platforms listed above; the `show qos slice` command, however, is still available on the other OmniSwitch platforms.

**Examples**

```
-> show tcam utilization
```

Legend:

- `C/S/T` = Chassis/Slot/TCAM
- `PI` = Pre-Ingress
- `I` = Ingress
- `E` = Egress
- `EM` = ExactMatch

- `alaTcamTotalEntries`
- `alaTcamPercentUsed`
show tcam utilization detail

Displays the Ternary Content Addressable Memory (TCAM) utilization of each application (or application group) for each stage of each TCAM on each slot of the switch.

show tcam utilization [chassis/slot] [chassis/slot/tcam] detail

Syntax Definitions

chassis/slot
A chassis ID and slot number. Use this parameter to display TCAM utilization for a specific slot.

chassis/slot/tcam
A chassis ID, slot, and TCAM number. Use this parameter to display utilization for a specific TCAM.

Defaults

By default, the detailed TCAM utilization is displayed for the entire switch.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

show capability profile

Displays the active and configured profile settings.

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>X72</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The switch must be rebooted for the configured profile to take effect.
- On the OmniSwitch 6900-V72/C32, and OmniSwitch 6900-X72, this command displays the configured and active mode to indicate if the switch is operating in the router or switch mode. The configured mode is changed using the `capability profile` command.
- On the OmniSwitch 6560 and OmniSwitch 6570M, this command displays the configured and active TCAM mode (source or destination IPv6 filtering). The configured TCAM mode is changed using the `capability profile tcam mode` command.

Examples

Sample output on the OmniSwitch 6900-V72/C32, and OmniSwitch 6900-X72:

```
-> show capability profile
Configured Profile : Router
Active Profile     : Switch
```

Sample output on the OmniSwitch 6560:

```
-> show capability profile
Configured TCAM Mode : dest-ipv6
Active TCAM mode     : dest-ipv6
```

Release History

Release 8.5R2; command introduced.
Release 8.6R1; TCAM mode display added.
Related Commands

- **capability profile** Configures the mode of the switch to be either switch or router.
- **capability profile tcam mode** Configures the source IPv6 filtering or destination IPv6 filtering TCAM mode for the switch.

alaCapManTrapThresholdArpHigh
show tech-support

Creates a log or tar file gathering important switch information that can be used by technical support.

show tech-support [layer2 | layer3 | eng [complete]]

Syntax Definitions

layer2 Gathers layer 2 switch configuration information.
layer3 Gathers layer 3 switch configuration information.
eng [complete] Gathers all relevant switch information from flash such as log files, configuration files, directories and creates an archive file with all the information.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>6900 X48C4E/V48C8/</th>
<th>9900</th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Running the command with no parameters creates a tech_support.log file.
- The layer2 parameter creates a tech_support_layer2.log file.
- The layer3 parameter creates a tech_support_layer3.log file.
- The eng parameter creates a tech_support_eng.log file. The complete parameter creates a tech_support_complete.tar file with information from all switches in a VC along with the log files.
- Files with the prefix "smemcap" may be generated when the switch is operating at high memory usage. Ten files are generated before the switch reboots due to being out of memory. These files are cleared when the show tech-support eng complete command is run.

Examples

- show tech-support
- show tech-support layer2
- show tech-support layer3
- show tech-support eng
- show tech-support eng complete
Release History

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The Chassis MAC Server (CMS) manages MAC addresses on the switch. The MAC addresses managed via the CMS are used as identifiers for the following functions:
  - Base chassis MAC address
  - Ethernet Management Port (EMP)
  - VLAN router ports
- Similar to IP addresses, MAC addresses are assigned by the Internet Assigned Numbers Authority (IANA) and distributed to users in sequential blocks. A sequential block of MAC addresses is referred to as a MAC address range.
- The MAC address range is stored on the switch’s EEPROM. The switch supports one MAC address range only. By default, this MAC address range contains thirty-two (32) factory-installed, contiguous MAC addresses.
- Because the switch currently supports one MAC address range only, index position 1 displays.

Examples

-> show mac range

<table>
<thead>
<tr>
<th>Mac Range</th>
<th>Row Status</th>
<th>Local/Global</th>
<th>Start Mac Addr</th>
<th>End Mac Addr</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>ACTIVE</td>
<td>GLOBAL</td>
<td>00:d0:95:6a:79:6e</td>
<td>00:d0:95:6a:79:8d</td>
</tr>
</tbody>
</table>
output definitions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mac Range</td>
<td>The MAC range index number (1). Because the switch currently supports one MAC address range only, index position 1 displays.</td>
</tr>
<tr>
<td>Row Status</td>
<td>The current status of the MAC range. The status <strong>ACTIVE</strong> refers to MAC addresses that are available for allocation to VLAN router ports and other applications.</td>
</tr>
<tr>
<td>Local/Global</td>
<td>The Local/Global status for MAC addresses in the range. Local MAC addresses have the local bit set in the first byte of the address. Global MAC addresses (also referred to as <strong>EEPROM</strong> MAC addresses) have the global bit set in the first byte of the address and are stored on the switch’s EEPROM. Because the switch’s default MAC range is stored on EEPROM, the status <strong>GLOBAL</strong> displays.</td>
</tr>
<tr>
<td>Start Mac Addr</td>
<td>The first MAC address in the MAC address range.</td>
</tr>
<tr>
<td>End Mac Addr</td>
<td>The last MAC address in the MAC address range.</td>
</tr>
</tbody>
</table>

**show mac-range alloc**

Displays all allocated addresses from the MAC range table.

```
show mac-range [index] alloc
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>index</th>
<th>Identifies the MAC range by referring to its position in the MAC range table. Currently, index position 1 only is supported.</th>
</tr>
</thead>
</table>

**Defaults**

N/A

**Platforms Supported**

Not supported in this release.

**Usage Guidelines**

N/A

**Examples**

```
-> show mac-range alloc
             Range    Mac Address         Application     Id
-----------------+-----------------+--------------------+---
01    00:d0:95:6b:09:40 CHASSIS              0
01    00:d0:95:6b:09:41 802.1X               0
01    00:d0:95:6b:09:5f CHASSIS              1
```

**output definitions**

<table>
<thead>
<tr>
<th>Range</th>
<th>The MAC range’s index number. The index number refers to the position of the range in the MAC range table. Values may range from 1–20. MAC ranges are divided by index number into four distinct categories. Refer to page 59-92 for more information.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mac Address</td>
<td>Current MAC address allocated for a specific application.</td>
</tr>
<tr>
<td>Application</td>
<td>The application for which the allocated MAC address is being used. Current options include VLAN, 802.1X, and CHASSIS. VLAN refers to MAC addresses allocated to VLAN router ports in multiple MAC router mode. CHASSIS refers to MAC addresses used for the base chassis MAC address and the Ethernet Management Port (EMP).</td>
</tr>
</tbody>
</table>
An ID number used to identify an allocated MAC address. ID numbers are used for the base chassis MAC address and Ethernet Management Port (EMP), as well as VLAN router ports. The ID value 0 is reserved for the switch's base chassis MAC address. The ID value 1 is reserved for the EMP MAC address. Router ports assigned to VLANs 2 through 4094 are given corresponding MAC IDs. For example, a router port configured on VLAN 44 receives an allocated MAC ID of 44. Because default VLAN 1 router ports use the base chassis MAC address by default, any router port configured on VLAN 1 is assigned the ID value 0.

Release History

```

### Release History

Release 8.4.1 R03; command introduced.
Release 8.7R1; **gen-random-key-256** keyword added.

### Related Commands

- **security key**: This command creates an authentication key into the system.

### MIB Objects

- N/A
security key

Creates an authentication key into the system.

security key key_id algorithm {simple | sha512 | sha384 | sha256 | sha224 | sha1 | md5} {encrypt-key encrypt_key | key simple_key} start-time mm/dd/yyyy [hh:mm] [lifetime days [hh:mm]]} {aes-gcm-256 | aes-gcm-128} {hex-key hex_key | encrypt-key {hex | num}} | {aes-cmac-256 | aes-cmac-128} {hex-key hex_key | encrypt-key {hex | num}}] keyed-name hex-kn}

no security key key_id [-key_id2]

Syntax Definitions

key_id The key ID. This can be in the range 1-256.
simple Specifies that the simple authentication algorithm is used as authentication key. This parameter is currently not supported.
sha512 Specifies that the SHA512 authentication algorithm is used as the authentication key. This parameter is currently not supported.
sha384 Specifies that the SHA384 authentication algorithm is used as the authentication key. This parameter is currently not supported.
sha256 Specifies that the SHA256 authentication algorithm is used as the authentication key.
sha224 Specifies that the SHA224 authentication algorithm is used as the authentication key. This parameter is currently not supported.
sha1 Specifies that the SHA1 authentication algorithm is used as the authentication key. This parameter is currently not supported.
md5 Specifies that the MD5 authentication algorithm is used as the authentication key. This parameter is currently not supported.
encrypt_key The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form. The key can range from 16 to 512 characters in length.
simple_key Key will be plain text ASCII up to 118 characters. Use quotes (""") around the string if the key contains multiple words with spaces between them. Plain text key can range from 16 to 118 characters in length.
mm/dd/yyyy Key activation time. Granularity is up to minutes. Enter the start time in the format mm/dd/yyyy hh:mm where mm is the month, dd is the day, yyyy is the year, hh is the hour, mm is the minutes. For example, 08/08/2005 14:30
days Validity duration of the key in terms of days and time. Lifetime can be in the range 1 - 9125 days.
aes-gcm-256 Specifies that the AES-GCM-256 authentication algorithm is used as authentication key. This parameter is currently not supported.
aes-gcm-128 Specifies that the AES-GCM-128 authentication algorithm is used as authentication key.
aes-cmac-256 Specifies that the AES-CMAC-256 authentication algorithm is used as authentication key. This parameter is only supported on the OmniSwitch 6860N and OmniSwitch 6900-X48C4E.

aes-cmac-128 Specifies that the AES-CMAC-128 authentication algorithm is used as authentication key.

hex-key hex_key The key value in hexadecimal format (0xhex). Configuration snapshot displays the authentication key in the encrypted form. The key can range from 1 to 32 characters in length (16 byte) for AES-GCM-128 or AES-CMAC-128 algorithm, and 1 to 64 characters in length (32 byte) for AES-GCM-256 or AES-CMAC-256 algorithm.

encrpt-key hex The key in hexadecimal format. The key can range from 1 to 32 characters in length (16 byte) for AES-GCM-128 or AES-CMAC-128 algorithm, and 1 to 64 characters in length (32 byte) for AES-GCM-256 or AES-CMAC-256 algorithm.

encrpt-key num The key in numerical format. The key can range from 1 to 32 characters in length (16 byte) for AES-GCM-128 or AES-CMAC-128 algorithm, and 1 to 64 characters in length (32 byte) for AES-GCM-256 or AES-CMAC-256 algorithm.

hex-kn The Connectivity Association Key Name (CKN) value in hexadecimal format (0xhex). The key can range from 1 to 64 characters in length (32 byte) for AES-CMAC-128 algorithm, and 1 to 128 characters in length (64 byte) for AES-CMAC-256 algorithm.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>lifetime days</td>
<td>180 days</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The switch can have a maximum of 256 keys.
- Current active key is determined based on the lowest numerical key ID. When the current active key expires, if the keychain has multiple active keys, the switch will switchover to active key having lowest key ID.
- When the current active key expires, if the keychain does not have any other active key, the switch will bring down all the adjacencies formed using that keychain.
Parameters of a key can be modified if the key is not in use. Once the key is attached to any of the keychains, no more modification is allowed.

Use the `no` form of this command to delete a key.

To delete a key, first disassociate the keychain from a user application, and detach the key from the keychain.

The show commands will always display the key-string in an encrypted format.

Use the command `security key-chain gen-random-key` to generate a the hex-key to be configured for the AES-GCM-128 and AES-GCM-256 or AES-CMAC-128 and AES-CMAC-256 algorithm.

A keychain must have all keys of either 128-bit type or 256-bit type.

A keychain using the AES-GCM-128 authentication algorithm must be attached only to MACsec interface for its static-SAK configured under MACsec mode ‘static’. A keychain using the AES-CMAC-128 or AES-CMAC-256 authentication algorithm can be attached only to MACsec interface for its Static Connectivity Association Key (static-CAK) using Pre-Shared key configured under MACsec mode ‘dynamic’.

For more information on MACsec configuration, refer to the “Ethernet Port Commands” chapter in this guide.

**Examples**

```bash
-> security key 5 algorithm sha256 key "passwordstring123" start-time 1/31/2017 00:00 life-time 180 10:30
-> security key 5 algorithm sha256 key "passwordstring123" start-time 5/2/2017 life-time 150
-> security key 1 algorithm aes-gcm-128 hex-key 0x0102030405060708090A0B0C0D0E0F
-> security key 1 algorithm aes-cmac-128 hex-key 0x0102030405060708090A0B0C0D0E0F
  keyed-name 0x0102030405060708090A0B0C0D0FFF

-> no security key 5
```

**Release History**

Release 8.4.1; command introduced.
Release 8.4.1 R03; `aes-gcm-128` keyword added.
Release 8.5R2; `aes-cmac-128` keyword added.
Release 8.7R1; `aes-gcm-256` and `aes-cmac-256` keyword added.

**Related Commands**

- `show security key`  
  This command displays the configured keys in the system.

**MIB Objects**

- `alaSecKeyId`  
- `alaSecKeyAlgorithm`  
- `alaSecKeyType`  
- `alaSecKeyAuthKey`  
- `alaSecKeyStartTime`  
- `alaSecKeyLifeTime`  
- `alaSecKeyRowStatus`
security key-chain

This command creates a system level security keychain.

```
security key-chain key_chain_id [name key_chain_name]
```

```
no security key-chain key_chain_id1 [-key_chain_id2]
```

## Syntax Definitions

- `key_chain_id`: The keychain ID. This can be in the range 1-32.
- `key_chain_name`: The keychain name. The keychain name can range from 1 to 16 characters in length.

## Defaults

N/A

## Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

## Usage Guidelines

- There can be a maximum of 32 keychains in the device, and each of them can hold multiple keys of the same algorithm type.
- Use the `no` form of this command to delete a keychain.
- To delete a keychain, first disassociate the keychain from the user application.
- Deleting a keychain will not delete the keys associated with the keychain. Keys will subsequently remain configured, but will not be associated to any keychain, until reassociation.
- The keychain ID is associated to user applications such as ISIS, OSPF. The authentication information is carried in the Hello packet. If the authentication succeeds, then adjacency is formed. The two remote machines should have same current key ID, key and same authentication type.
- Changing the switch system clock impacts the status of the keys.

## Examples

```
-> security key-chain 1 globalKeyChain
-> no security key-chain 1-3
-> no security key-chain 4
```
Release History

Release 8.4.1; command introduced.

Related Commands

show security key-chain  This command displays the configured keychains in the system.

MIB Objects

alaSecKeyChainId
alasecKeyChainName
security key-chain key

This command associates a key into the specified keychain.

```
security key-chain key_chain_id key key_id [-key_id2]
no security key-chain key_chain_id1 [-key_chain_id1]
```

**Syntax Definitions**

- `key_chain_id` The keychain ID.
- `key_id` The key ID.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

security key-chain key
This command associates a key into the specified keychain.

MIB Objects

alaSecKeyChainId
alasecKeychainName
alarm in

Configures an alarm input. For an alarm input, action can be configured to either send an SNMP trap, log a SWLog message locally, or set alarm output.

alarm in alr_in_name [chassis-in chassis_id_in] action {swlog | trap | alarm-out} [admin-state {enable | disable}]

no alarm alr_in_name

Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alr_in_name</td>
<td>Name of the alarm input (1 to 32 characters).</td>
</tr>
<tr>
<td>chassis_id_in</td>
<td>Chassis identifier where alarm input is connected.</td>
</tr>
<tr>
<td>swlog</td>
<td>trap</td>
</tr>
<tr>
<td>enable</td>
<td>Enable the alarm input.</td>
</tr>
<tr>
<td>disable</td>
<td>Disable the alarm input.</td>
</tr>
</tbody>
</table>

Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>disabled</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- By default, alarm is disabled for all actions.
- If the chassis ID is not configured, by default, local chassis is considered for the alarm input.
- Use the no form of this command to remove the alarm input.
- OmniSwitch 6465 switch has a single alarm input.
- The alarm status and alarm output will be updated to reflect a change in the alarm input.
- On reload of the switch, the alarm status and output alarm is set based on the current alarm input.

Examples

- `-> alarm in "temperature-sensor" action alarm-out`
-> alarm in "door-sensor" chassis-in 1 action alarm-out admin-state enable
-> alarm in "smoke-sensor" chassis-in 2 action trap swlog alarm-out admin-state enable

-> no alarm temperature-sensor

**Release History**

Release 8.5 R1; command introduced.

**Related Commands**

- **alarm clear status**
  
  Clears the status of the specified alarm.

- **show alarm input config**
  
  Displays the alarm input configuration.

- **show alarm status**
  
  Displays all the traps, system events, or alarm input for which the alarm output is raised.

**MIB Objects**

alaAlarmInputConfigTable
  
  - alaAlarmInputConfigName
  - alaAlarmInputConfigChassis
  - alaAlarmConfigInputTrapActionEnable
  - alaAlarmConfigInputSwlogActionEnable
  - alaAlarmConfigInputAlarmOutputActionEnable
  - alaAlarmConfigAdminStatus
  - alaAlarmInputConfigRowStatus
alarm event

Configures the listed system events or any trap for alarm output.

```
alarm event alr_event_name {event {vc-status-change | temperature | system-health | power-supply | port-violation network-port userport [-userport2] | port-health | link-down network-port userport [-userport2] | authentication-failure} | trapid id} [chassis-in chassis_id_in] [admin-state {enable | disable}]
```

no alarm alr_event_name

---

**Syntax Definitions**

- `alr_event_name`: Name of the alarm event or trap (1 to 32 characters).
- `userport`: Network port of the switch.
- `id`: Trap ID.
- `chassis_id_in`: Chassis identifier where alarm input is connected.
- `enable`: Enable the alarm event.
- `disable`: Disable the alarm event.

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td><code>disable</code></td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- By default, alarm output action is disabled for all the alarm events.
- System events corresponds to critical failures of the switch. Alarm event can be configured for any of these supported system events.
- Trap ID corresponds to the SNMP traps supported in the switch. Use `show snmp-trap config` command to view the supported traps. Alarm event can be configured for any of these supported traps.
- Both event as well as trap cannot be configured for the same alarm event. If configured, the later is ignored with an error message.
Alarm event of the single chassis can be mapped to multiple alarm outputs on different chassis for redundancy.

Alarm events from multiple chassis can be mapped to alarm output on the single chassis.

Same network port can be configured for both link down as well as port violation event but with a different event name.

A network port that falls in the network port range, which is already configured to an event cannot be configured to another event.

If the chassis ID is not configured, by default, local chassis is considered for the alarm event.

Use the `no` form of this command to remove the alarm event.

**Examples**

```plaintext
-> alarm event system-fail event system-health
-> alarm event link-failure-critical event link-Down network-port 10-15 chassis-in
l admin-state enable

-> no alarm system-fail
```

**Release History**

Release 8.5 R1; command introduced.

**Related Commands**

- `alaAlarmEventConfigRowStatus`
alarm out

Configures the alarm output relay of a chassis.

```
alarm out alr_out_name [chassis-out chassis_id_out] [admin-state {enable | disable}]
no alarm out alr_out_name
```

**Syntax Definitions**

- `alr_out_name`: Name of the alarm output (1 to 32 characters).
- `chassis_id_out`: Chassis identifier where alarm output is connected.
- `enable`: Enable the alarm output.
- `disable`: Disable the alarm output.

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If the chassis ID is not configured, by default, local chassis is considered for the alarm output.
- Use the `no` form of this command to remove the alarm output.
- OmniSwitch 6465 switch has single alarm output.

**Examples**

```
-> alarm out "critical-fault-detector"
-> alarm out "minor-fault-detector" chassis-out 2 action admin-state enable
-> alarm out "critical-fault-detector"
```

**Release History**

Release 8.5 R1; command introduced.
**Related Commands**

</tbody>
</table>

---

**Usage Guidelines**

- Alarm input or event of the single chassis can be mapped to multiple alarm outputs on different chassis for redundancy.
- Alarm input or event from multiple chassis can be mapped to alarm output on the single chassis.
- Use the **no** form to unmap the alarm input from alarm output.

---

**Examples**

- `--> alarm map "temperature-sensor" out "critical-fault-detector"
- `--> no alarm map "temperature-sensor"

---

**Release History**

Release 8.5 R1; command introduced.
Related Commands

- **alarm in**: Configures an alarm input.
- **alarm event**: Configures the listed system events or any trap for alarm output.
- **alarm out**: Configures the alarm output relay of a chassis.
- **show alarm status**: Displays all the traps, system events, or alarm input for which the alarm output is raised.

MIB Objects

- **alaAlarmMappingConfigTable**
  - **alaAlarmInputConfigName**
  - **alaAlarmOutputConfigName**
  - **alaAlarmMappingConfigRowStatus**
alarm duration

Configure the duration of an alarm.

```
alarm duration [[hour] [min] | [default]]
```

**Syntax Definitions**

- **hour**: Duration of the alarm in hours.
- **min**: Duration of the alarm in minutes.
- **default**: Sets the alarm duration to 24 hours 0 minutes.

**Defaults**

By default, the alarm duration is set to 24 hours 0 minutes.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- In a virtual chassis (VC) setup, alarm duration configuration applies to all the chassis of the VC.
- A minimum alarm duration of five minutes and a maximum alarm duration of 48 hours can be configured.
- An alarm is switched off for an input or event after the configured duration. If there are multiple events or input, alarm is switched off after the elapsed duration of all the events and input.
- Use `alarm clear status` command to force stop the alarm before the set alarm duration for any alarm event or input.
- Modification or updated duration is applied only to those alarms raised after the configuration change. Alarms which are in progress are not impacted.
- Use `default` option to reset the alarm duration to 24 hours 0 minutes.

**Examples**

- `-> alarm duration 2`
- `-> alarm duration default`

**Release History**

Release 8.5 R1; command introduced.
Related Commands

**alarm clear status**
Clears the status of the specified alarm.

**show alarm status**
Displays all the traps, system events, or alarm input for which the alarm output is raised.

MIB Objects

  - alarmDurationConfigHour
  - alarmDurationConfigMin
alarm clear status

Clears the status of the specified alarm.

`alarm clear status [alarm_name]`

**Syntax Definitions**

- `alarm_name`: Name of the alarm input or alarm event.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The command does not disable or remove the alarm.
- The command can be used to forcibly stop the alarm and clear the status.
- If the output alarm is ON for multiple events or input, all the alarms have to be cleared to switch off the alarm output.
- If the alarm name is not specified, all the configured alarms are cleared.

**Examples**

- `-> alarm clear status temperature-sensor`
- `-> alarm clear status`

**Release History**

Release 8.5 R1; command introduced.
Related Commands

show alarm status Displays all the traps, system events, or alarm input for which the alarm output is raised.

MIB Objects

alarmStatusTable
   alarmStatusInputName
   alarmStatusOutputName
   alarmStatusInputChassis
   alarmStatusOutputChassis

   alarmStatusTrapid
**show alarm input config**

Displays the alarm input configuration.

`show alarm input config chassis chassis_id`

---

**Syntax Definitions**

- `chassis_id`: Chassis identifier.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The command displays configuration of all the chassis if chassis ID is not specified.

**Examples**

`-> show alarm input config`

```
Alarm Duration 5 hrs 30 Mins
```

<table>
<thead>
<tr>
<th>Alarm-Name</th>
<th>Chassis-in</th>
<th>Action</th>
<th>Alarm-Output-Name</th>
<th>Chassis-out</th>

  alaAlarmOutputConfigName
  alaAlarmOutputConfigChassis
  alaAlarmOutputConfigRowStatus

alaAlarmMappingConfigTable
  alaAlarmInputConfigName
  alaAlarmOutputConfigName
  alaAlarmMappingConfigRowStatus
```
show alarm status

Displays all the traps, system events, or alarm input for which the alarm output is raised. For a VC, the alarm status for each chassis is displayed.

show alarm status chassis chassis-id

Syntax Definitions

chassis_id

Chassis identifier.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Network port displays the status on the port range or a specific port.
- If the same failure (input or event or trap) is repeated, the data structure is updated with the latest failure.

Examples

-> show alarm status chassis-id 2

<table>
<thead>
<tr>
<th>Alarm-Name</th>
<th>Chassis-In</th>
<th>Time-Stamp</th>
<th>Network-Port</th>
<th>Trap-ID</th>
<th>Event-Name</th>
<th>Alarm-Output</th>
<th>Chassis-Out</th>
</tr>
</thead>
<tbody>
<tr>
<td>login-failure</td>
<td>2</td>
<td>09/31/2017 : 14:30:00</td>
<td>N/A</td>
<td>5</td>
<td>N/A</td>
<td>minor-fault-detector</td>
<td>2</td>
</tr>
</tbody>
</table>

output definitions

- **Alarm-Name**: Name of the alarm.
- **Chassis-in**: Chassis identifier where alarm input is connected.
- **Time-Stamp**: The system time of the switch where the alarm occurred.
- **Network-Port**: Network port of the chassis.
- **Trap-ID**: Trap ID.
- **Event-Name**: Name of the system event.
- **Alarm-Output**: Name of the alarm output.
- **Chassis-out**: Chassis identifier where alarm output is connected.
Release History
Release 8.5 R1; command introduced.

Related Commands

- **show alarm input config** Displays the alarm input configuration.

Copies the current configuration (RAM) to the RUNNING DIRECTORY on the primary CMM.

MIB Objects

N/A
appmgr commit

Saves the configuration across reboots.

appmgr commit

---

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

Not supported in this release.

**Usage Guidelines**

Enter `appmgr` without any parameters to see the command syntax.

**Examples**

`-> appmgr commit`

**Release History**

Release 8.6R2; command introduced.
Release 8.7R2; command deprecated. Use `write memory`.

**Related Commands**

appmgr

Use this command to start the tasks for AOS Micro Services (AMS).

**MIB Objects**

N/A
pkgmgr

Installs Debian packages for non-AOS software applications.

```
pkgmgr {[install | verify] package_file_name | remove package_name}
```

### Syntax Definitions

- **install**: Extracts and installs the contents of the package to system memory.
- **remove**: Removes all the files of this package from system memory.
- **verify**: Verifies the ALE signature and the checksums for the Debian package.

**package_file_name**: Name of the Debian package file

**package_name**: Name of the package displayed in output of `show pkgmgr` command.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The package manager and app manager commands can be run by administrators only with write privileges to the SYSTEM partition management family.

- The Debian package must be downloaded from the service and support website (`businessportal2.alcatel-lucent.com`).

- The Debian package file must be copied to the `pkg` in the running directory. For example, if working is the running directory, then copy to `/flash/working/pkg` directory of the switch.

- Use the `pkgmgr verify` command to verify the contents of the package. It also provides the version compatibility information for the release.

- Compatible release in the `pkgmgr verify` output displays the release which is compatible with the package. The "&gt;=" sign means the package is compatible for AOS release version greater than or equal to the version displayed in "Compatible release". If the sign is not displayed then it is compatible only for that release version only.

- Use the `pkgmgr install` command to install the package.
After the package is installed successfully, use the **write memory** command to save the installation permanently.

If the switch restricts installation of the package due to memory threshold, use the **health threshold memory** command to increase the RAM memory threshold of the switch.

Use the **pkgmgr remove** command to remove the package.

**Note.** In a Virtual Chassis environment, if this **pkgmgr** command is successful on Master unit, it will be automatically executed on all units of the Virtual Chassis.

**Examples**

```
-> pkgmgr verify uos-ams-apps-v1.deb
uos-ams-apps-v1.deb
Verifying MD5 checksum.. OK
Compatible release: >=8.7.3-0

-> pkgmgr install uosn-ams-apps-v1.deb
Verifying MD5 checksum.. OK

Saves all ‘installed’ packages so that they can be restored after reboot.

pkgmgr commit

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

Not supported in this release.

**Usage Guidelines**

This command was deprecated in 8.7R2. Use the write memory command.

**Examples**

-> pkgmgr commit

**Release History**

Release 8.6R2; command introduced.
Release 8.7R2; command deprecated.

**Related Commands**

- **pkgmgr**
  
  Use this command to install the required non-AOS software applications (developed by ALE and/or ALE-approved partners) Debian package.

- **show pkgmgr**
  
  Displays the packages currently installed/committed.

**MIB Objects**

N/A
The Network Time Protocol (NTP) is used to synchronize the time of a computer client or server to another server or reference time source, such as a radio or satellite receiver. It provides client time accuracies within a millisecond on LANs, and up to a few tens of millisecond on WANs. Typical NTP configurations utilize multiple redundant servers and diverse network paths in order to achieve high accuracy and reliability.

It is important for networks to maintain accurate time synchronization between network nodes. The standard timescale used by most nations of the world is based on a combination of Universal Coordinated Time (UTC) (representing the Earth’s rotation about its axis) and the Gregorian Calendar (representing the Earth’s rotation about the Sun). UTC time is disseminated by various means, including radio and satellite navigation systems, telephone modems, and portable clocks.

The MIB information for NTP is as follows:

- **Filename:** ALCATEL-IND1-NTP-MIB.mib
- **Module:** alcatelIND1NTPMIB
A summary of available commands is listed here:

- ntp server
- ntp server synchronized
- ntp server unsynchronized
- ntp client
- ntp src-ip preferred
- ntp broadcast
- ntp broadcast-client
- ntp broadcast-delay
- ntp key
- ntp key load
- ntp authenticate
- ntp master
- ntp interface
- ntp max-associations
- ntp broadcast
- ntp peer
- ntp vrf-name
- show ntp status
- show ntp client
- show ntp client server-list
- show ntp server client-list
- show ntp server status
- show ntp keys
- show ntp peers
- show ntp server disabled-interfaces
**ntp server**

Specifies an NTP server from which the switch will receive updates.

```
ntp server {ip_address | server_name} [key key_id | | minpoll poll | maxpoll poll | version version | prefer | burst | iburst | preempt]
no ntp server ip_address
```

### Syntax Definitions

- **ip_address**
  The IP address of the NTP server to be added or deleted to the client’s server list. The IP address can be IPv4 or IPv6 address.

- **server_name**
  Fully qualified NTP server domain name.

- **key_id**
  The key identification number that corresponds to the specified NTP server. The value ranges from 0 to 65534. 0 can be used to unconfigure the key ID.

- **minpoll poll**
  It specifies the minimum polling interval for NTP messages, in seconds. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the minimum poll time would be 16 seconds ($2^4 = 16$). The minimum poll interval defaults to 6 (64 s), but can be decreased by the minpoll option to a lower limit of 3 (8 s) and an upper limit of 17 (36.4h).

- **maxpoll poll**
  It specifies the maximum polling interval for NTP messages, in seconds. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the maximum poll time would be 16 seconds ($2^4 = 16$). The maximum poll interval defaults to 10 (1,024 s), but can be increased by the maxpoll option to an upper limit of 17 (36.4h) and a lower limit of 3 (8 s). The maxpoll must not be less than the minpoll value.

- **version**
  The version of NTP being used. This will be 1, 2, 3, or 4.

- **prefer**
  Marks this server as the preferred server. A preferred server’s timestamp will be used before another server.

- **burst**
  Enables burst mode. The burst mode allows the exchange of eight NTP messages (instead of one) when the server is reachable and at each poll interval to achieve faster synchronization. The spacing between the first and the second packet is 16 seconds to allow a modem call to complete, while the spacing between the remaining packets is 2 seconds.

- **iburst**
  Enables initial burst (iburst) mode. The iburst mode allows immediate exchange of eight NTP messages (instead of one) when the server is unreachable and at each poll interval, to achieve faster initial synchronization acquisition. The spacing between the packets is 16 seconds to allow a modem call to complete. Once the server is reachable, the spacing between the packets is 2 seconds.

- **preempt**
  Enables the preemption mode for the server rather than the default persistent.

Usage Guidelines

- Use the no form of this command to clear an NTP server from the list of configured servers.
- To configure NTP in the client mode you must first define the NTP servers. Up to 12 NTP servers may be defined.
- Either an IP address or domain name for the specified server can be entered.
- The NTP key identification is an integer. It corresponds to an MD5 authentication key contained in an authentication file (.txt) located on the server. This file must be on both the server and the local switch, and match, for authentication to work. Enter the key identification using the key keyword if the server is set to MD5 authentication.
- An authentication key is composed of a 32-bit integer and 32-byte string of characters. The integer format is hexadecimal. For an NTP message to be authenticated the NTP client authentication key must match the key configured at the NTP server. This means the authentication keys must be distributed in advance of configuring the NTP client. If authentication is disabled but authentication key is present, the association will still be unauthenticated.
- Use the version keyword to set the correct version of NTP.
- Use the minpoll keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the minimum poll time would be 16 seconds ($2^4 = 16$). The client will poll the server for a time update when the minpoll time is exceeded.
- Use the maxpoll keyword to specify the maximum polling interval for NTP messages. This number is determined by raising 2 to the power of the number entered. The maximum poll interval defaults to 10 (1,024 s), but can be increased by the maxpoll option to an upper limit of 17 (36.4 h) and a lower limit of 3 (8 s). The maxpoll must not be less than the minpoll value.
• NTP authentication must be disabled before adding or removing an NTP server.

• Burst mode of operation improves timekeeping quality with the server command and iburst mode of operation is designed to speed the initial synchronization acquisition with the server command.

• When preempt is enabled, the specified server is marked unavailable for selection if any error (authentication failure) is detected on a connection between the local device and reference clock. The server is marked available for selection if no other connections are available and no error is detected on the connection between the local device and reference clock.

Examples

-> ntp server 1.1.1.1
-> ntp server 4100:1000::124
-> ntp server 0.pool.ntp.org
-> ntp server 1.1.1.1 key 1
-> ntp server 1.1.1.1 version 4
-> ntp server 0.pool.ntp.org minpoll 5
-> ntp server 0.pool.ntp.org maxpoll 6
-> ntp server 1.1.1.1 burst
-> ntp server 1.1.1.1 iburst
-> ntp server 1.1.1.1 preempt
-> no ntp server 1.1.1.1

Release History

Release 7.1.1; command was introduced.
Release 8.5R4: server name, maxpoll, burst, iburst, preempt keywords added.
Release 8.7R3; NTP support for IPv6 added.

Related Commands

ntp client
  Enables or disables NTP operation on the switch.

show ntp client server-list
  Displays a list of the servers with which the NTP client synchronizes.

show ntp server status
  Displays the basic server information for a specific NTP server or a list of NTP servers.

**ntp server synchronized**

Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.

**Syntax Definitions**

N/A

**Defaults**

By default, NTP synchronization is enabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The NTP protocol discards the NTP servers that are unsynchronized. However, the unsynchronized NTP servers are used as network time sources.

**Examples**

```
-> ntp server synchronized
```

**Release History**

Release 7.1.1; command was introduced.
Release 8.5R4; command deprecated.

**Related Commands**

- **ntp server unsynchronized** Disables an NTP client from invoking tests for NTP server synchronization. This allows the NTP client to synchronize with unsynchronized NTP servers in the network.

**MIB Objects**

alaNtpConfig
alaNtpPeerTests
ntp server unsynchronized

Disables an NTP client from invoking tests for NTP server synchronization. This allows the NTP client to synchronize with unsynchronized NTP servers in the network.

ntp server unsynchronized

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

When NTP peer synchronization tests are disabled, the NTP client is able to synchronize with either an NTP peer that is not synchronized with an atomic clock or a network of NTP servers that will finally synchronize with an atomic clock.

Examples

- ntp server unsynchronized

Release History

Release 7.1.1; command was introduced.
Release 8.5R4; command deprecated.

Related Commands

ntp server synchronized Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.

MIB Objects

alaNtpConfig
alaNtpPeerTests
**ntp client**

Enables or disables NTP time synchronization discipline.

```plaintext
ntp client admin-state {enable | disable}
```

### Syntax Definitions

- **enable**: Enables NTP.
- **disable**: Disables NTP.

### Defaults

NTP protocol is disabled by default.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6</th>
<th>6900 X48C4E/V48C8/C32E/T24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use this command to enable or disable NTP. Before NTP can be enabled, an NTP server must be specified using the `ntp server` command. Up to 12 NTP servers may be defined.

- It is not necessary to specify an NTP server if the NTP client will only receive time updates from NTP broadcast servers.

- NTP client will not synchronize with an unsynchronized NTP server (Stratum 16).

### Examples

```
-> ntp client enable
-> ntp client disable
```

### Release History

Release 7.1.1; command was introduced.
**Related Commands**

**ntp server**

Specifies an NTP server from which the switch will receive updates.

**MIB Objects**

alaNtpEnable
**ntp src-ip preferred**

Configures a source IP address to use as the source for NTP packets.

```
ntp src-ip preferred {default | no-loopback0 | ip_address}
no ntp src-ip preferred
```

**Syntax Definitions**

- **default**
  
  The Loopback0 address, if configured, will be used for the source IP address field. If no Loopback0 is configured, the EMP-VC IP address will be used. If no EMP-VC IP address is configured, the preferred IP address will be used. If no preferred IP address is configured the first available IP address on the switch will be used.

- **no-loopback0**
  
  The Loopback0 address will not be used for the source IP address field and either the preferred IP address (if configured) or the first available IP address on the switch will be used.

- **ip_address**
  
  The IP address to be used in the source IP field.

**Defaults**

By default, the NTP source IP preferred setting is set to the `default` parameter.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- By default The Loopback0 address, if configured, will be used for the source IP address.
- If no Loopback0 is configured, the VC-EMP IP address will be used for the source IP address.
- If no VC-EMP IP address is configured, the preferred IP address will be used for the source IP address.
- If no preferred IP address is configured the first available IP address on the switch will be used as the source IP address.
- When configuring a preferred IP address, that address must already exist on the switch.
- If the configured preferred IP address is the same as the IP address that would have been automatically chosen by the switch, then the ‘ntp src-ip preferred’ command will not be included in the output of the ‘configuration snapshot’ command since only non-default settings are included in the output.
• Use the **no** form of this command to clear a specific IP address and change the behavior back to default.

**Examples**

-> ntp src-ip preferred 192.168.10.1  
-> ntp src-ip preferred no-loopback0  
-> ntp src-ip preferred default

**Release History**

Release 7.1.1; command was introduced.  
Release 7.3.4; command deprecated.

**Related Commands**

**show ntp status** Display the NTP configuration and status.

**MIB Objects**

N/A
**ntp broadcast-client**

Enables or disables the NTP client to receive time updates from NTP broadcast servers.

```
ntp broadcast-client {enable | disable}
```

### Syntax Definitions

- **enable**
  - Enables the client broadcast mode.

- **disable**
  - Disables the client broadcast mode.

### Defaults

Broadcast mode is disabled by default.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Broadcast mode is intended for operation on networks with numerous workstations and where the highest accuracy is not required. In a typical scenario, one or more time servers on the network broadcast NTP messages that are received by NTP hosts. Correct time is determined from this NTP message based on a pre-configured latency or broadcast delay in the order of a few milliseconds.

- In order to configure NTP in broadcast client mode, it is required to define the network server to client broadcast delay.

### Examples

```
-> ntp broadcast-client enable
-> ntp broadcast-client disable
```

### Release History

Release 7.1.1; command was introduced.
**Related Commands**

**ntp broadcast-delay** Sets the broadcast delay time in microseconds.

**MIB Objects**

alaNtpBroadcastEnable
**ntp broadcast-delay**

Sets the broadcast delay time in microseconds of received NTP broadcast messages.

**Syntax Definitions**

*milliseconds* The number of microseconds for the broadcast delay.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>milliseconds</td>
<td>4000</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When running in the NTP client broadcast mode, a broadcast delay must be set. The broadcast delay is the number of microseconds added to the timestamp received from a broadcast NTP server.

**Examples**

- `ntp broadcast-delay 1000`
- `ntp broadcast-delay 10000`

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **ntp broadcast** Enables or disables the client’s broadcast mode.

**MIB Objects**

- `alaNtpBroadcastDelay`
ntp key

Labels the specified authentication key identification as trusted or untrusted.

ntp key key [trusted | untrusted]

Syntax Definitions

key
The key number matching an NTP server.

trusted
Signifies that the specified key is trusted and can be used for authentication.

untrusted
Signifies that the specified key is not trusted and cannot be used for authentication. Synchronization will not occur with an untrusted authentication key.

Defaults

By default, all authentication key are untrusted.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Authentication keys are stored in a key file and loaded into memory when the switch boots. The keys loaded into memory are not trusted until this command is used. The location of the file containing set of generated authentication keys is /flash/network/ntp.keys.

- Once the keys are loaded into software (on boot up of the switch), they must be activated by being labeled as trusted. A trusted key will authenticate with a server that requires authentication as long as the key matches the server key.

- New keys must be added manually to the key file. A newly added key will not be loaded into the switch software until the `ntp key load` command is issued, or the switch is rebooted.

- An authentication key is composed of a 32-bit integer and 32-byte string of characters. The integer format is hexadecimal. For an NTP message to be authenticated the NTP client authentication key must match the key configured at the NTP server. This means the authentication keys must be distributed in advance of configuring the NTP client. If authentication is disabled but authentication key is present, the association will still be unauthenticated.

- By default all keys read from the ntp.conf key file are untrusted therefore keys must be set to ‘trusted’ status to allow NTP to use the key for authentication.
Examples

-> ntp key 5 trusted
-> ntp key 2 untrusted

Release History

Release 7.1.1; command was introduced.

Related Commands

- **ntp key**: Sets the public key the switch uses when authenticating with the specified NTP server.
- **ntp client**: Enables or disables NTP operation on the switch.

MIB Objects

- **alaNtpAccessKeyIdTable**
  - **alaNtpAccessKeyIdKeyId**
  - **alaNtpAccessKeyIdKeyId**
  - **alaNtpAccessKeyIdTrust**
**ntp key load**

Loads the current key file into memory.

**ntp key load**

---

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command reloads the key file into the switch memory. This allows for new keys in the key file to be added to the list of keys the switch can use for authentication.
- Newly added keys must be labeled as trusted with the `ntp key` command before being used for authentication.
- By default, all authentication keys are untrusted therefore reloading a key file will change any current trusted keys to untrusted status.
- The file ntp.keys is used during the establishment of a set of authentication keys that are used by the NTP protocol. The location of this file is fixed in directory /flash/network.

**Examples**

-> ntp key load

**Release History**

Release 7.1.1; command was introduced.
Related Commands

**ntp key**  
Labels the specified authentication key identification as trusted or untrusted.

**ntp server**  
Specifies an NTP server from which this switch will receive updates.

MIB Objects

`alaNtpAccessRereadkeyFile`
**ntp authenticate**

Enables or disables the authentication on a configured NTP server.

```
ntp authenticate {enable | disable}
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables authentication for NTP server.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables authentication for NTP server.</td>
</tr>
</tbody>
</table>

**Defaults**

By default, NTP authentication is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6</th>
<th>X48C4E/V48C8/C32E/T24C2</th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use this command to enable or disable authentication for NTP server.
- Before NTP authentication is enabled, NTP operation should be enabled by using `ntp client` command.
- Before enabling the NTP operation, NTP server must be specified using the `ntp server` command.
- NTP authentication must be disabled before adding or removing an NTP server.

**Examples**

```
-> ntp authenticate enable
-> ntp authenticate disable
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- **show ntp status**
  Displays the information about the current NTP status.

MIB Objects

- **alaNtpAuthenticate**
**ntp master**

Specifies the stratum value for unsynchronized switch to act as an authoritative NTP source.

**ntp master stratum_number**

---

### Syntax Definitions

**stratum_number**

Integer value ranging from 2 to 16.

---

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>stratum_number</td>
<td>16</td>
</tr>
</tbody>
</table>

---

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Release</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

### Usage Guidelines

- Use this command to synchronize improved clocks with lower strata value if any of the trustworthy NTP sources comes up.
- Use default value of 16 if switch is not synchronized with itself.
- When the switch is synchronized, the stratum number should correspond to peer/server.

---

### Examples

```
-> ntp master 4
```

---

### Release History

Release 7.1.1; command was introduced.
Release 8.5R4; command deprecated.
**Related Commands**

`show ntp status`  
Displays current NTP status.

**MIB Objects**

`alaNtpConfig`

`alaNtpSysStratum`
ntp interface

Enables or Disables NTP server functionality for an interface.

**ntp interface** {interface_ip} {enable | disable}

### Syntax Definitions

- **interface_ip**
  - IP address of an interface on which NTP server functionality is to be disabled. The IP address can be an IPv4 or IPv6 address.
- **enable**
  - Enables NTP server functionality on an interface.
- **disable**
  - Disables NTP server functionality on an interface.

### Defaults

By default, NTP server functionality is enabled on all the interfaces.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use this command to enable or disable the incoming NTP request.
- Disabling the NTP server functionality drops the NTP request on an interface and synchronization information is not sent out.

### Examples

- `-> ntp interface 10.10.10.1 disable`
- `-> ntp interface 10.10.10.1 enable`
- `-> ntp interface 4100:1000::125 enable`
- `-> ntp interface 4100:1000::125 disable`

### Release History

Release 7.1.1; command was introduced.
Release 8.7R3; NTP support for IPv6 added.
Related Commands

show ntp status  Displays current NTP status.

MIB Objects

**ntp max-associations**

Configures the maximum number of associations on the switch.

`ntp max-associations number`

**Syntax Definitions**

`number`  
Maximum no of client/server and peer associations. Integer value ranging from 0 to 512.

**Defaults**

By default, 128 associations are allowed on the switch.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Released</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use this command to restrict the number of client/server and peer association.
- The command can be used to change the default value of 128 to any value between 0 to 512.
- The command protects the switch from overwhelming with the NTP requests. When the limit is reached, trap is sent to indicate the switch.

**Examples**

```
-> ntp max-associations 20
```

**Release History**

Release 7.1.1; command was introduced.
Release 8.6R2; max value increased to 512.
**Related Commands**

*show ntp status*  
Displays current NTP status.

**MIB Objects**

alaNtpConfig

alaNtpMaxAssociation
**ntp broadcast**

Enables NTP to broadcast synchronized information to all the clients in the subnet in the configured interval.

```
ntp broadcast {broadcast_addr} [version version] [minpoll poll_interval]
no ntp broadcast {broadcast_addr}
```

### Syntax Definitions

- `broadcast_addr`: Subnet for which broadcast updates are regularly sent.
- `version`: NTP version on which the broadcast updates are sent out on the subnet for the clients. Value is 3 or 4.
- `poll_interval`: Polling interval for NTP broadcast message. This value is measured in seconds.

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>version</code></td>
<td>4</td>
</tr>
<tr>
<td><code>poll_interval</code></td>
<td>6</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
```

### Usage Guidelines

- Use this command to configure NTP to act in broadcast server mode.
- Use the `no` form of this command to remove the configured broadcast servers. This also disables NTP synchronization information being sent for that broadcast subset.
- The NTP broadcast address needs to defined to enable NTP broadcast mode. A maximum of 3 broadcast addresses can be configured.
- Use the `version` keyword to set the correct version of NTP.
- Use the `minpoll` keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered.
**Examples**

```
-> ntp broadcast 10.145.59.255 version 4 minpoll 5
-> no ntp broadcast 10.145.59.255
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **ntp broadcast** Enables or disables the client’s broadcast mode.
- **ntp broadcast-delay** Sets the broadcast delay time in microseconds

**MIB Objects**

- `alaNtpPeerTable`
  - `alaNtpPeerType`
  - `alaNtpPeerVersion`
  - `alaNtpPeerMinpoll`
**ntp peer**

Configures NTP to operate in the symmetric active peering mode. This also enables the establishment of an active symmetric association with the specified remote peer.

```
ntp peer {ip_address} [key key_id] [version version] [minpoll poll_interval]
no ntp peer {ip_address}
```

**Syntax Definitions**

- `ip_address` IP address of the remote peer. The IP address can be IPv4 or IPv6 address.
- `key_id` Authentication key for the remote peer.
- `version` NTP packet version to be used for the peer association.
- `poll_interval` Polling interval for NTP broadcast message. Poll interval which when expires, packets will be sent to the peer.

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>4</td>
</tr>
<tr>
<td>poll_interval</td>
<td>6</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use `no` form of this command to remove the peers that are configured to act in symmetric active mode. This command deletes the symmetric active association with the remote peer.
- Use the `version` keyword to set the correct version of NTP.
- Use the `minpoll` keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered.
- The command should not be used for `b(Broadcast), m(Multicast) or r(Reference clock address 127.127.x.x)`.
- `ip-address` is the mandatory parameter to be entered in the command while `key id` is the optional parameter. If `key id` is not specified, then peering will not be authenticated.
Examples

-> ntp peer 172.18.16.112
-> ntp peer 4100:1000::124
-> no ntp peer 172.18.16.112

</tr>
</tbody>
</table>

Usage Guidelines

- This command displays the information about the status of NTP, which is configured along with other global configuration. See the Examples section for more information.

- If the source IP Configuration is done in default or no-loopback0 then the source ip-address will not be displayed in the output of the show ntp status command.

Example

-> show ntp status
Current time:                   Mon, Jan 21 2019  7:31:04.685 (UTC),
Last NTP update:                Mon, Jan 21 2019  7:30:10.160 (UTC),
Server reference:               10.10.10.10,
Client mode:                    enabled,
Broadcast client mode:          disabled,
Broadcast delay (microseconds): 4000,
Stratum:                        4,
Maximum Associations Allowed:   32,
Authentication:                 enabled,
VRF Name:                       default

Current time
The current time for the NTP client.

Last NTP update
The time of the last synchronization with an NTP server.

Server reference
The source of the time signal, which is the address of the NTP server that provided the currently-used time update.

Client mode
Whether the NTP client software is enabled or disabled.
**Network Time Protocol Commands**

- **Broadcast client mode** - What NTP mode the client is running in, either client or broadcast.
- **Broadcast delay** - The number of microseconds in the advertised broadcast delay time. This field is absent if the client broadcast mode is disabled.
- **Stratum** - The stratum of the server. The stratum number is the number of hops from a UTC time source.
- **Max-Association** - Maximum association on the switch that restricts the number of client/server and peer association.
- **Authentication** - Whether Authentication is enabled or disabled.
- **VRF Name** - Name of the VRF.

**Release History**

Release 7.1.1; command introduced.
Release 7.3.1; vrf parameter added.

**Related Command**

- **ntp client** - Enables or disables NTP operation on the switch.
- **ntp server** - Specifies an NTP server from which the switch will receive updates.
- **ntp server synchronized** - Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.
- **ntp max-associations** - Configures the maximum number of associations on the switch.
- **ntp master** - Specifies the stratum value for unsynchronized switch.
- **ntp broadcast** - Enables or disables the client’s broadcast mode.
- **show ntp client** - Displays information about the current client NTP configuration.
- **show ntp client server-list** - Displays a list of the servers with which the NTP client synchronizes.
- **show ntp server client-list** - Displays the basic server information for a specific NTP server or a list of NTP servers.

**MIB Objects**

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

This command displays the current configuration parameters for the NTP client. The display is slightly different depending on what has been configured on the client. See the Examples section for more information.

Examples

-> show ntp client

Current time: Mon, Jan 21 2019 7:31:12.505 (UTC),
Last NTP update: Mon, Jan 21 2019 7:30:10.160 (UTC),
Server reference: 10.10.10.10,
Client mode: enabled,
Broadcast client mode: disabled,
Broadcast delay (microseconds): 4000,
VRF Name: default

output definitions

Current time The current time for the NTP client.
Last NTP update The time of the last synchronization with an NTP server.
Server reference The source of the time signal, which is the address of the NTP server that provided the currently-used time update.
Client mode Whether the NTP client software is enabled or disabled.
Broadcast client mode What NTP mode the client is running in, either client or broadcast.
### Output Definitions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Broadcast delay</td>
<td>The number of microseconds in the advertised broadcast delay time. This field is absent if the client broadcast mode is disabled.</td>
</tr>
<tr>
<td>VRF Name</td>
<td>Name of the VRF.</td>
</tr>
</tbody>
</table>

### Release History

Release 7.1.1; command was introduced.

### Related Command

**ntp client**

Enables or disables NTP operation on the switch.

### MIB Objects

<td>1024</td>
<td>377</td>
<td>0.000</td>
<td>0.000</td>
<td>0.000</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to display tabular information on the current NTP client to server association status.

**Examples**

```
-> show ntp client server-list
Legends: + active peer, - passive peer, = client, * current system peer, ^ broadcast server, ' broadcast client
```

```
Mode | IP Address       | Ver | Key | St | when | poll | reach | Delay | Offset | Disp
---|------------------|-----|-----|----|------|------|-------|-------|--------|------
*    | 198.206.181.170  | 4   | 0   | 2  | 895  | 1024 | 377   | 0.167 | 0.323  | 0.016 |
-    | 198.206.181.123  | 4   | 0   | 16 | 591  | 1024 | 377   | 0.000 | 0.000  | 0.000 |
```

**output definitions**

- **Mode**
  - "+" indicates an active peer
  - "." indicates a passive peer
  - "+" indicates a client
  - "+" indicates current system peer
  - "^" indicates a broadcast server
  - "^" indicates a broadcast client

- **IP Address**
  - The server IP address.

- **Ver**
  - The version of NTP the server is using. Versions 3 and 4 are valid.

- **Key**
  - The NTP server’s public key. This must be accurate and the same as the NTP server, or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
output definitions

MIB Objects

alaNtpPeerListTable
  alaNtpPeerShowStatus
show ntp keys

Displays information about all authentication keys.

show ntp keys

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command displays the information on the current set of trusted authentication keys.

**Examples**

```
-> show ntp keys
Key  Status
======+============
1     untrusted
2     untrusted
3     trusted
4     trusted
5     untrusted
6     untrusted
7     trusted
8     trusted
```

**output definitions**

| Key | Status | The key number corresponding to a key in the key file. Whether the key is trusted or untrusted.
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command was introduced.
Related Command

ntp key
Labels the specified authentication key identification as trusted or untrusted.

ntp key load
Loads the current key file into memory.

MIB Objects
alaNtpAccessKeyIdTable
show ntp peers

Displays the information about the current status on the NTP peer association.

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use this command to display the tabular information on the current NTP peer association status.

Examples

```
-> show ntp peers
IP Address     Ver   Key   St   When   Poll   Reach   Delay    Offset    Disp
-------------+-----+-----+----+------+------+-------+--------+--------+-------
172.23.0.202    4    0     3    895    1024   377     0.300    0.404    0.0024
10.255.24.120   4    0     3    591    1024   377     0.016    0.250    0.0017
```

output definitions

- **IP Address**: Peer IP Address
- **Ver**: The version of NTP the server is using. Versions 3 and 4 are valid.
- **Key**: The NTP server’s public key. This must be accurate and the same as the NTP server or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
- **St**: The stratum of the server.
- **When**: Number of seconds passed since last response from remote host.
- **Poll**: Polling interval to the remote host in seconds.
output definitions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reach</td>
<td>This is a shift register used to determine the reachability status of this peer. This register is displayed to the user in octal values instead of binary, decimal or even hex. The maximum value of an eight-bit binary number is 11111111, which is 377 in octal.</td>
</tr>
<tr>
<td>Delay</td>
<td>The delay received from the server in its timestamp.</td>
</tr>
<tr>
<td>Offset</td>
<td>The offset received from the server in its timestamp.</td>
</tr>
<tr>
<td>Disp</td>
<td>The dispersion value received from the server in its timestamp.</td>
</tr>
</tbody>
</table>

Release History

Release 7.1.1; command was introduced.
Release 8.5R4; When, Poll, Reach fields added.

Related Command

- **ntp client** Enables or disables NTP operation on the switch.
- **show ntp status** Displays the information about the current NTP status.
- **show ntp server status** Displays the basic server information for a specific NTP server or a list of NTP servers.

show ntp server disabled-interfaces

Displays the IP addresses of the interfaces on which NTP server is not enabled.

show ntp server disabled-interfaces

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

This command displays ip interfaces on which currently NTP server functionality is disabled.

Examples

-> show ntp server disabled-interfaces
IP Address
----------
172.23.0.202
10.255.24.120

output definitions

<table>
<thead>
<tr>
<th>IP Address</th>
<th>Peer IP Address</th>
</tr>
</thead>
</table>

Release History

Release 7.1.1; command was introduced.
Related Command

- `alaNtpPeerListAddress`
Session Management Commands

Session Management commands are used to monitor and configure operator sessions including FTP, Telnet, HTTP (WebView), console, Secure Shell, and Secure Shell FTP on the switch. (See the SNMP Commands chapter for SNMP session commands.) Maximum number of concurrent sessions allowed:

<table>
<thead>
<tr>
<th></th>
<th>OmniSwitch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Telnet(v4)</td>
<td>6</td>
</tr>
<tr>
<td>FTP(v4)</td>
<td>4</td>
</tr>
<tr>
<td>SSH + SFTP(v4)</td>
<td>8</td>
</tr>
<tr>
<td>HTTP</td>
<td>4</td>
</tr>
</tbody>
</table>

MIB information for commands in this chapter are as follows:

Filename: ALCATEL-IND1-SESSION-MGR-MIB.mib
Module: alcatelIND1SessionMgrMIB

Filename: ALCATEL-IND1-SYSTEM-MIB.mib
Module: alcatelIND1SystemMIB

Filename: ALCATEL-IND1-IP-MIB.mib

A summary of the available commands is listed here:

```
  session login-attempt
  session login-timeout
  session banner
  session timeout
  session session-limit
  session prompt
  session reauthentication
  session xon-xoff
  session cli-auto-complete-space
  show prefix
  user profile save
  user profile reset
  history
  command-log
  kill
  exit
  who
  whoami
  show session config
  show session xon-xoff
  more
  telnet
  ssh
  ssh login-grace-time
  ssh enforce-pubkey-auth
  ssh strong-ciphers
  ssh strong-hmacs
  installsshkey
  revokesshkey
  show command-log status
  show telnet
  show ssh
```
session login-attempt

Sets or resets the number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

`session login-attempt integer`

**Syntax Definitions**

`integer` The number of times the user can attempt to log in to the switch before the TCP connection is closed. Valid range is 1 to 10.

**Defaults**

Default is 3 login attempts.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

N/A

**Examples**

`-> session login-attempt 5`

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- `show session config` Displays Session Manager information such as banner file name, session timeout value, and default prompt value.
- `session login-timeout` Sets or resets the amount of time the user can take to accomplish a successful login to the switch.
- `session timeout` Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

**MIB Objects**

- `sessionMgr`  
  - `sessionLoginAttempt`

**session login-timeout**

Sets or resets the amount of time the user can take to accomplish a successful login to the switch. If the timeout period is exceeded, the TCP connection is closed by the switch.

**session login-timeout seconds**

---

**Syntax Definitions**

seconds  
The number of seconds the switch allows for the user to accomplish a successful login. Valid range is from 5 to 600 seconds.

**Defaults**

Login timeout default is 55 seconds.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

N/A

**Examples**

`-> session login-timeout 30`

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

**show session config**
Displays Session Manager information such as banner file name, session timeout value, default prompt value, login timer, and login attempt number.

**session login-attempt**
Sets or resets the number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

**session timeout**
Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

**MIB Objects**

**sessionMgr**

**sessionLoginTimeout**
### session banner

Sets or resets the file name of the user–defined banner. The banner is a welcome banner that appears after the user successfully logs onto the switch.

```
session {cli | ftp | http} banner file_name

no session {cli | ftp | http} banner
```

#### Syntax Definitions

- **cli**
  - Creates/modifies the CLI banner file name.
- **ftp**
  - Creates/modifies the FTP banner file name.
- **http**
  - Creates/modifies the HTTP banner file name.
- **file_name**
  - Banner file name including the path from the switch’s /flash directory. The maximum length of the filename and path is 255 characters.

#### Defaults

- A default banner is included in one of the switch’s image files. It is automatically displayed at login so no configuration is needed.
- The user has the option of defining a custom supplementary banner or of using the default banner.

#### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

- The **no session banner** command is used to disable a user defined session banner file from displaying when you log onto the switch.
- The **session banner** command is used to configure or modify the banner file name. You must use a text editor to edit the file containing the banner text.
- The banner file must be manually copied to each unit in a VC.

#### Examples

```
-> session cli banner /switch/banner.txt
```

#### Release History

Release 7.1.1; command was introduced.
**Related Commands**

*show session config*  
Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

**MIB Objects**

SessionConfigTable  
  SessionType  
  SessionBannerFileName
**session timeout**

Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

```
session {cli | http | ftp} timeout minutes
```

### Syntax Definitions

- `cli`: Sets the inactivity timeout for CLI sessions.
- `http`: Sets the inactivity timeout for HTTP sessions.
- `ftp`: Sets the inactivity timeout for FTP sessions.
- `minutes`: Inactivity timeout value (in minutes). Valid range 1 to 59623.

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>minutes</td>
<td>4</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

```
+-----------+---------+---------+---------+---------+---------+---------+---------+---------+---------+---------+---------+
| 6360      | 6465    | 6560    | 6570M   | 6860    | 6860N   | 6865    | 6900    | 6900    | 9900    | 6900    | 9900    |
| Yes       | Yes     | Yes     | Yes     | Yes     | Yes     | Yes     | Yes     | Yes     | Yes     | Yes     | Yes     |
+-----------+---------+---------+---------+---------+---------+---------+---------+---------+---------+---------+---------+
```

### Usage Guidelines

- The inactivity timer value may be different for each type of interface, such as CLI (Console, Telnet), HTTP (including WebView), and FTP.
- If you change the timer, the new value does not affect current sessions; the new timer is applied to new sessions only.

### Examples

```
-> session cli timeout 5
```

### Release History

Release 7.1.1; command was introduced.
Related Commands

**show session config**  Displays Session Manager information, such as banner file name, session timeout value, and default prompt value.

MIB Objects

`SessionConfigTable`
  `SessionType`
  `SessionInactivityTimerValue`
**session session-limit**

Configures the concurrent session limit for FTP, SSH, Telnet and HTTP or HTTPS.

```
session {ftp | ssh | telnet | http} session-limit num
```

### Syntax Definitions

- **ftp**
  - Sets the number of concurrent session for FTP sessions. Valid range 1 to 4.

- **ssh**
  - Sets the number of concurrent session for ssh sessions. Valid range 1 to 8.

- **telnet**
  - Sets the number of concurrent session for telnet sessions. Valid range 1 to 6.

- **http**
  - Sets the number of concurrent session for http or https sessions. Valid range 1 to 32.

- **num**
  - The concurrent session limit.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>ftp</td>
<td>4</td>
</tr>
<tr>
<td>ssh</td>
<td>8</td>
</tr>
<tr>
<td>telnet</td>
<td>6</td>
</tr>
<tr>
<td>http</td>
<td>32</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
```

### Usage Guidelines

The access is denied when the number of sessions exceed the configured session-limit.

### Examples

- `-> session ftp session-limit 2`
- `-> session ssh session-limit 4`
- `-> session telnet session-limit 3`
- `-> session http session-limit 20`
**Release History**

Release 8.9R2; command was introduced.

**Related Commands**

`show session config` Displays Session Manager information, such as banner file name, session timeout value, and default prompt value.

**MIB Objects**

SessionConfigTable

- sessionFtpLimitNum
- sessionSshLimitNum
- sessionTelnetLimitNum
- sessionHttpLimitNum
**session prompt**

Configures the default CLI prompt for console and Telnet sessions. The prompt is the symbol and/or text that appears on the screen in front of the cursor.

```
session prompt default [string]
```

---

**Syntax Definitions**

*string* Prompt string. Maximum length 31 characters.

---

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>-&gt;</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

The new prompt will not take effect until you log off and back onto the switch.

---

**Examples**

```
-> session prompt default -->
```

---

**Release History**

Release 7.1.1; command was introduced.

---

**Related Commands**

- `show session config` Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

---

**MIB Objects**

- `SessionConfigTable`  
  - `SessionType`  
  - `sessionDefaultPromptString`
session reauthentication

Configures the timeout interval to reauthenticate for TACACS+ session.

    session reauthentication [minutes]

Syntax Definitions

minutes    The number of minutes the switch waits before retrying the TACACS+
            authentication request. The valid range is from 1 to 1200 minutes.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>minutes</td>
<td>5</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- By default, the TACACS+ reauthentication timer is enabled. The default interval is 5 minutes.
- The reauthentication is disabled when the interval is configured as 0.
- The reauthentication is enabled when the interval is configured from 1 to 1200.
- The session reauthentication CLI is applicable only for TACACS+ authentication.

Examples

    -> session reauthentication 6
    -> session reauthentication 0

Release History

Release 8.8R1; command was introduced.
Related Commands

**show session config**
Displays Session Manager information such as banner file name, session timeout value, default prompt value and TACACS+ reauthentication interval.

MIB Objects

SessionConfigTable
  SessionType
  sessionReauthenticationInterval
**session xon-xoff**

Enable or disable the XON-XOFF protocol on the console port.

```
session xon-xoff {enable | disable}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables XON-XOFF on the console port.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables XON-XOFF on the console port.</td>
</tr>
</tbody>
</table>

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>6465</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>6560</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>6570M</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>

</tr>
<tr>
<td>6900X48C8/C32E/T24C2/</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The switch may interpret noise from an RS232 line as Control-S (XOFF). If the `session console xon-xoff` command is enabled, traffic to the console port may be stopped.

### Examples

```
-> session xon-xoff enable
-> session xon-xoff disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- `show session xon-xoff` Displays whether the console port is enabled or disabled for XON-XOFF.

### MIB Objects

- `sessionXonXoffEnable`
**session cli-auto-complete-space**

Enable or disable the CLI auto completion using space key.

```
  session cli-auto-complete-space {enable | disable}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables CLI auto completion on the switch.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables CLI auto completion on the switch.</td>
</tr>
</tbody>
</table>

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Auto completion of CLI command can be enabled or disabled using this command.
- With CLI auto-complete feature enabled, the space key can be used for auto completion of the CLI command similar to the TAB key.

### Examples

```
  -> session cli-auto-complete-space enable
  -> session cli-auto-complete-space disable
```

### Release History

Release 8.9R2; command introduced.
**Related Commands**

*show session config*  
Displays session manager configuration information (for example, default prompt, banner file name, inactivity timer, login timer, login attempts, and CLI console shell status).

**MIB Objects**

*sessionCliAutoCompleteSpace*
show prefix

Shows the command prefix (if any) currently stored by the CLI. Prefixes are stored for command families that support the prefix recognition feature.

show prefix

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Prefixes are stored for command families that support the prefix recognition feature. These command families include AAA, Interface, Link Aggregation, QoS, Spanning Tree, and VLAN Management. Other command families do not store a prefix.

### Examples

```
-> show prefix
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show prefix**

This command defines the format of the CLI prompt. The prompt can be defined to include the command prefix.

### MIB Objects

N/A
**user profile save**

Saves the user account settings for prompts and the more mode screen setting. These settings will be automatically loaded when the user account logs on.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use this command to save prompt definitions and more mode screen settings for use in future login sessions for the current user account.
- Use the `user profile reset` command to set values to their factory defaults.

**Examples**

-> user profile save

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **show prefix**
  Defines substitute command text for the switch’s CLI command keywords.

- **user profile reset**
  Resets the alias, prompt and more values to their factory defaults.

**MIB Objects**

N/A
user profile reset

Resets the alias, prompt, and more values to their factory defaults.

user profile reset

Syntax Definitions

N/A

Defaults

N/A

---

**Release History**

Release 7.1.1; command was introduced.
Related Commands

Recalls commands listed in the history buffer and displays them at the CLI prompt.

MIB Objects

N/A
Recalls commands listed in the history buffer and displays them at the CLI prompt.

\[ \text{!} \{ \text{!} | n \} \]

**Syntax Definitions**

\[ ! \]
Recalls the last command listed in the history buffer and displays that command at the CLI prompt.

\[ n \]
Identifies a single command in the history buffer by number and displays that command at the CLI prompt.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- You can use the **history** command to list all commands in the history buffer, then use the **!n** syntax to issue a single command from the list.

- When you use **!n** or **!!** to recall a command in the history buffer list, you must press the Enter key to execute the command.

**Examples**

```
-> history
1* show ip interface
2 show vlan
3 show arp
4 clear arp
->!2
show vlan
  vlan  type  admin  oper  ip   mtu   name
  ------------------------+---------+---------+
  1   std    Ena    Ena   Dis  1500   VLAN 1
  10  std    Ena    Ena   Ena  1500   VLAN 10

  14  std    Ena    Ena   Ena  1500   VLAN 14
  30  vip    Ena    Ena   Ena  1500   VIP VLAN 30
  40  vip    Ena    Ena   Ena  1500   VIP VLAN 40
```
4094  mcm    Ena  Ena  Dis  9198  MCM IPC

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

`history`  
Sets the number of commands that will be stored in the CLI history buffer.

**MIB Objects**

N/A
**command-log**

Enables or disables command logging on the switch. When command logging is enabled, a `command.log` is automatically created; this file stores a comprehensive CLI command history for all active sessions since the function was *first* enabled.

```
command-log {enable | disable}
```

**Syntax Definitions**

- **enable**: Creates a file called `command.log` in the switch’s `/flash` directory. Any configuration commands entered on the command line will be recorded to this file until command logging is disabled.

- **disable**: Disables logging of current session commands to the `command.log` file.

**Defaults**

```
<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>
```

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

</table>

**Usage Guidelines**

The maximum log file size is 66,402 bytes; the file may hold up to 100 commands.

**Examples**

```
-> command-log enable
-> command-log disable
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

show command-log
Displays the contents of the command.log file.

show command-log status
Shows the current status of the command logging function (i.e., enabled or disabled).

MIB Objects

sessionCliCommandLogEnable
**kill**

Kills an active session. The command takes effect immediately.

`kill session_number`

---

**Syntax Definitions**

`session_number` Number of the session you want to kill.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Use the `who` command to obtain the session number variable.
- You cannot kill your own session.
- You cannot kill a connected session where the user has not yet completed the login process. These sessions appear with username “(at login)” when displayed with the `who` command.

---

**Examples**

`-> kill 3`

---

**Release History**

Release 7.1.1; command was introduced.
Related Commands

**who**
Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP)

MIB Objects

SessionMgr
- sessionIndex
- sessionRowStatus
exit

Ends the current CLI session. If the CLI session to the switch was via Telnet, the connection is closed.

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the who command to display all sessions on the switch.

Examples

-> whoami
Session number = 5
   User name    = admin,
   Access type  = telnet,
   Access port  = NI,
   IP address   = 121.251.17.76,
   Read-only domains = None,
   Read-only families = ,
   Read-Write domains = All ,
   Read-Write families = ,

Output definitions

| Session Number | The session number assigned to the user. |
| User name      | User name.                                |
| Access type    | Type of access protocol used to connect to the switch. |
| Access port    | Switch port used for access during this session. |
| Ip Address     | User IP address.                          |
| Read-only domains | The command domains available with the user’s read-only access. |
| Read-only families | The command families available with the user’s read-only access. |

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- You can identify your current login session by using the IP address.
- This command applies to the following session types: Console, Telnet, SSH, FTP, SFTP, HTTP, HTTPS, SNMP.

**Examples**

```
-> who
Session number = 0
  User name   = (at login),
  Access type = console,
  Access port = Local,
  IP address  = 0.0.0.0,
  Read-only domains   = None,
  Read-only families  = ,
  Read-Write domains  = None,
  Read-Write families = ,

Session number = 5
  User name   = admin,
  Access type = telnet,
  Access port = NI,
  IP address  = 128.251.17.176,
  Read-only domains   = None,
  Read-only families  = ,
  Read-Write domains  = All ,
  Read-Write families = ,
```
output definitions

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the configuration commands detailed in this section to modify any of the values displayed.

**Examples**

```plaintext
-> show session config

Cla Default Prompt   = ->
Cla Banner File Name = ,
Cla Inactivity Timer in minutes = 60,
Ftp Banner File Name = ,
Ftp Inactivity Timer in minutes = 60,
Http Inactivity Timer in minutes = 60,
Login Timer in seconds = 60,
Maximum number of Login Attempts = 2,
Session reauthentication interval in minutes = 1,
Cla auto-complete space = Enable
Ftp session limit = 2,
Ssh session limit = 6,
Telnet session limit = 4,
Http session limit = 8
```

**output definitions**

- **Cla Default Prompt**
  Default prompt displayed for CLI sessions.

- **Cla Banner File Name**
  Name of the file that contains the banner information that will appear during a CLI session.
output definitions (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cli Inactivity Timer in minutes</td>
<td>Inactivity timer value (in minutes) for CLI sessions. The user is logged off when this value is exceeded.</td>
</tr>
<tr>
<td>Ftp Banner File Name</td>
<td>Name of the file that contains the banner information that will appear during an FTP session.</td>
</tr>
<tr>
<td>Ftp Inactivity Timer in minutes</td>
<td>Inactivity timer value (in minutes) for FTP sessions. The user is logged off when this value is exceeded.</td>
</tr>
<tr>
<td>Http Inactivity Timer in minutes</td>
<td>Inactivity timer value (in minutes) for HTTP (including WebView) sessions. The user is logged off when this value is exceeded.</td>
</tr>
<tr>
<td>Login Timer in seconds</td>
<td>The amount of time the user can take to accomplish a successful login to the switch. If the timeout period is exceeded, the TCP connection is closed by the switch.</td>
</tr>
<tr>
<td>Maximum number of Login Attempts</td>
<td>The number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.</td>
</tr>
<tr>
<td>Session reauthentication interval in minutes</td>
<td>The number of minutes the switch waits for before retrying the TACACS+ authentication request.</td>

</tbody>
</table>

Release History

Release 7.1.1; command was introduced.
Release 8.8R1; **Session reauthentication interval in minutes** field added.
Release 8.9R2; **Cli auto-complete space, Ftp session limit, Ssh session limit, Telnet session limit, and Http session limit** field added.
**Related Commands**

- `session session-limit` Configures the default CLI prompt for console and Telnet sessions.
- `session banner` Sets the file name of the user–defined banner.
- `session timeout` Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface.
- `session login-attempt` Sets the number of times a user can attempt to log into the switch unsuccessfully before the TCP connection is closed.
- `session login-timeout` Sets the amount of time the user can take to accomplish a successful login to the switch.
- `session reauthentication` Configures the timeout interval to reauthenticate for TACACS+ session.
- `session cli-auto-complete-space` Enable or disable the CLI auto completion using space key.

**MIB Objects**

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

The switch may interpret noise from an RS232 line as Control-S (XOFF). If the console port is enabled for XON-XOFF (through the session reauthentication command), traffic to the console port may be stopped.

Examples

-> show session xon-xoff
XON-XOFF Enabled

Release History

Release 7.1.1; command was introduced.

Related Commands

session reauthentication Enables/disables the XON-XOFF protocol on the console port.

MIB Objects

sessionXonXoffEnable
more

Enables the more mode for your console screen display.

more filename

Syntax Definitions

filename The file to display.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>

</tr>
</tbody>
</table>

Usage Guidelines

- This parameter can also be used to pipe output from the CLI.
- This command is case sensitive.

Examples

- more textfile.txt
- write terminal | more

Release History

Release 7.1.1; command was introduced.

Related Commands

MIB Objects

SystemServices
  systemServicesArg1
  systemServicesAction
**telnet**

Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

```
[vrf name] telnet {port [default | service_port] | admin-state [enable | disable] | ip_address}
```

### Syntax Definitions

- **name**
  - Name of the VRF.
- **default**
  - Sets the port back to the default of 23.
- **service_port**
  - The TCP service port number. Must be 23 or between 20000-20999.
- **enable | disable**
  - Enables or disables telnet access.
- **ip_address**
  - Specifies the IPv4 or IPv6 address for the Telnet session.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>

Release 7.1.1; command was introduced.
**Related Commands**

**telnet**
Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

**ssh enforce-pubkey-auth**
Invokes Secure Shellv6 on the switch. Secure Shellv6 is used to make a secured connection to an SSHv6 server.

**show command-log**
Displays the status of Secure Shell, SCP/SFTP on the switch.

**show ssh**
Displays the current configuration specifying the ports SSH daemons are listening on.

**MIB Objects**

alaIpSshConfig
alaIpSshAdminStatus
alaIpSshPort
ssh login-grace-time

Configures the duration in which the user has to enter a login password and authenticate for an SSH session.

**ssh login-grace-time seconds**

**Syntax Definitions**

seconds The number of seconds for the grace time period. The range is 30–600.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, the login grace time period is set to 120 seconds.

**Examples**

-> ssh login-grace-time 300
-> ssh login-grace-time 600

**Release History**

Release 8.3.1.R02; command was introduced.

**Related Commands**

`show ssh` Displays the current SSH configuration for the switch.

**MIB Objects**

alaIpSshConfig
alaIpSshLoginGraceTime
ssh enforce-pubkey-auth

Enables or disables Secure Shell public key and password authentication. When enabled, password authentication is not allowed.

ssh enforce-pubkey-auth {enable | disable}

Syntax Definitions

| enable   | Enforces only SSH public key authentication. |
| disable  | Enforces both SSH public key and password authentication. |

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

N/A

Examples

-> ssh enforce-pubkey-auth enable

Release History

Release 7.1.1; command was introduced.

Related Commands

telnet

Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

MIB Objects

alaIpSshConfig

alaIpSshPubKeyEnforceAdminStatus
**ssh strong-ciphers**

Enables or disables the enforcement of a Secure Shell (SSH) cipher configuration across a switch reboot.

`ssh strong-ciphers {enable | disable}`

---

### Syntax Definitions

**enable**

Enables the enforcement of an SSH cipher configuration.

**disable**

Disables the enforcement of an SSH cipher configuration.

---

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

---

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

### Usage Guidelines

N/A

---

### Examples

- `ssh strong-ciphers enable`
- `ssh strong-ciphers disable`

---

### Release History

Release 8.3.1; command was introduced.

---

### Related Commands

- `show ssh`
  Displays the current SSH configuration for the switch.

---

### MIB Objects

- `alaIpSshConfig`
- `alaIpSshStrongCiphersAdminStatus`
**ssh strong-hmacs**

Enables or disables the enforcement of a Secure Shell (SSH) HMAC configuration across a switch reboot.

`ssh strong-hmacs {enable | disable}`

---

**Syntax Definitions**

| enable   | Enables the enforcement of an HMAC configuration. |
| disable  | Disables the enforcement of an HMAC configuration. |

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- SSH HMAC refers to message authentication codes that use cryptographic hash functions.
- Enable strong-hmacs will enforce the use of “hmac-sha2-256, hmac-sha2-512” in ssh server.
- Disable will select default hmcas in the configuration.

**Examples**

- `-> ssh strong-hmacs enable`
- `-> ssh strong-hmacs disable`

**Release History**

Release 8.3.1; command was introduced.
Release 8.7R2; hmac-sha1 removed.
Related Commands

**show ssh**

Displays the current SSH configuration for the switch.

MIB Objects

alaIpSshConfig

alaIpSshStrongHmacsAdminStatus
installsshkey

Used to install the public key used for SSH onto the switch.

installsshkey user path

Syntax Definitions

user
The user that the key will be associated with.

path
The location of the key file.

Defaults
N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Be sure the associated private key is stored on the client device.
- Verify that the user that will use SSH is a valid user name on the OmniSwitch.
- Refer to the Switch Management Guide for information on generating the public/private keys.

Examples

```bash
$ -> installsshkey new_ssh_user /flash/system/new_ssh_user_rsa.pub
```

Release History

Release 8.3.1; command was introduced.

Related Commands

- **revokesshkey**
  Used to revoke a key from an SSH user.
- **show ssh**
  Displays the current SSH configuration for the switch.

MIB Objects

N/A
revokesshkey

Used to revoke a key from an SSH user.

`revokesshkey user remote-user`

**Syntax Definitions**

- `user`: The local user name.
- `remote-user`: The user on the remote client device.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

N/A

**Examples**

```
-> revokesshkey new_ssh_user remote_ssh_user@192.168.10.1
```

**Release History**

Release 8.3.1; command was introduced.

**Related Commands**

- `installsshkey`: Used to install the public key used for SSH onto the switch.
- `show ssh`: Displays the current SSH configuration for the switch.

**MIB Objects**

N/A
show command-log

Displays the contents of the `command.log` file. This file contains a record of all CLI commands executed on the switch since the command logging function was enabled. For more information on enabling and disabling command logging, refer to page 61-26.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The most recent commands are listed first.
- The command history is archived to the `command.log` file. If this file is removed, the command history will no longer be available. In addition, the `command.log` file has a 66,402 byte capacity. This capacity allows up to 100 commands; if the maximum capacity is reached, only the 100 most recent commands display.

**Examples**

```
-> show command-log
Command : ip interface Marketing address 17.11.5.2 vlan 255
  UserName : admin
  Date     : FRI JAN 09 00:20:01
  Ip Addr  : 128.251.19.240
  Result   : SUCCESS
Command : ip interface "Distribution" 11.255.14.102 vlan 500 local-proxy-arp
  UserName : admin
  Date     : FRI JAN 09 00:19:44
  Ip Addr  : 128.251.19.240
  Result   : ERROR: Ip Address must not belong to IP VLAN 44 subnet
Command : command-log enable
  UserName : admin
  Date     : FRI JAN 09 00:18:49
  Ip Addr  : 128.251.19.240
  Result   : SUCCESS
```
**Output Definitions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command</strong></td>
<td>The exact syntax of the command, as entered by the user.</td>
</tr>
<tr>
<td><strong>UserName</strong></td>
<td>The name of the user session that entered the command. For more information on different user session names, refer to the user command on page 39-60, or the “Managing Switch User Accounts” chapter in the OmniSwitch AOS Release 8 Switch Management Guide.</td>
</tr>
<tr>
<td><strong>Date</strong></td>
<td>The date and time, down to the second, when the command was entered.</td>
</tr>
<tr>
<td><strong>IpAddr</strong></td>
<td>The IP address of the terminal from which the command was entered.</td>
</tr>
<tr>
<td><strong>Result</strong></td>
<td>The outcome of the command entry. Options include SUCCESS and ERROR. For erroneous command entries, the same error details presented by the switch at the time the command was entered are also displayed in the log file.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **command-log** Enables or disables command logging on the switch.
- **show command-log status** Shows the current status of the command logging function (i.e., enabled or disabled).

**MIB Objects**

- `sessionCliCommandLogEnable`
**show command-log status**

Shows the current status of the command logging function (for example, enabled or disabled).

```
show command-log status
```

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

N/A

**Examples**

```
-> show command-log status
CLI command logging : Enable
```

**output definitions**

<table>
<thead>
<tr>
<th>CLI command logging</th>
<th>The current status of command logging on the switch. Options include Disable and Enable.</th>
</tr>
</thead>
</table>

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **command-log** Enables or disables command logging on the switch.

**MIB Objects**

- `sessionCliCommandLogStatus`
**show telnet**

Displays the current configuration specifying the ports the telnet daemons are listening on.

```plaintext
[vrf name] show telnet
```

---

**Syntax Definitions**

```plaintext
name
```

Name of the VRF.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If VRF is specified, the current status of the telnet daemon for the specified VRF is displayed.

**Examples**

```plaintext
vrf1::-> show telnet
Telnet Admin-State = Enabled
Telnet Port = 23
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `command-log` Enables or disables command logging on the switch.

**MIB Objects**

- `alaIpTelnetAdminStatus`
- `alaIpTelnetPort`
show ssh

Displays the current configuration specifying the ports on which the SSH daemons are listening.

[vrf name] show ssh

Syntax Definitions

name

Name of the VRF.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

If VRF is specified, the current status of the SSH daemon for the specified VRF is displayed.

Examples

vrf1:---> show ssh
Ssh Admin-State = Enabled
Ssh Port = 22
Ssh Enforce-Pubkey-Auth = Disabled
Ssh Strong-Ciphers = Disabled
Ssh Strong-Hmacs = Disabled
Ssh login-grace-time = 600 seconds

Release History

Release 7.1.1; command was introduced.
Release 8.3.1; Ssh Strong-Ciphers and Ssh Strong-Hmacs fields added.
Release 8.3.1.R02; Ssh login-grace-time field added.
Related Commands

**command-log**

Enables or disables command logging on the switch.

MIB Objects

alaIpSshConfig

This chapter includes descriptions for CLI commands used to manage files on the switch. Several of these commands are used to create, move, and delete both files and directories in the OmniSwitch flash directory. Other commands allow you to change command privileges and to monitor the memory usage on the switch.

MIB information for the system commands is listed here:

**Filename:** ALCATEL-IND1-SYSTEM-MIB.mib  
**Module:** alcatelIND1SystemMIB

**Filename:** ALCATEL-IND1-CHASSIS-MIB.mib  
**Module:** alcatelIND1ChassisMIB

A summary of the available commands is listed here:

<table>
<thead>
<tr>
<th>File System</th>
<th>cd</th>
<th>pwd</th>
<th>mkdir</th>
<th>rmdir</th>
<th>ls</th>
<th>rm</th>
<th>cp</th>
<th>scp</th>
<th>mv</th>
<th>chmod</th>
<th>fsck</th>
<th>freespace</th>
<th>fsck</th>
<th>newfs</th>
</tr>

<tbody>
<tr>
<td>System Services</td>
<td>vi</td>
<td>tty</td>
<td>show tty</td>
<td>tftp</td>
<td>sftp</td>
<td>ftp</td>
<td>show ftp</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

---
cd

Changes the current working directory of the switch.

cd [path]

---

**Syntax Definitions**

*path* Specifies the path to the working directory. If no path is specified, the current directory of the switch is changed to the higher directory level.

---

**Defaults**

The default working directory of the switch is `/flash`.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

Separate the multiple directory names that are part of the path with a slash (/).

---

**Examples**

- `-> cd`
- `-> cd /flash/certified`

---

**Release History**

Release 7.1.1; command introduced.
Related Commands

**pwd**
Displays the current working directory of the switch.

**mkdir**
Creates a new directory.

**rmdir**
Deletes an existing directory.

**ls**
Displays the contents of a specified directory or the current working directory.

**rm**
Displays the contents of a specified directory or the current working directory.

MIB Objects

- `systemServices`
  - `systemServicesWorkingDirectory`
**pwd**

Displays the current working directory of the switch.

**pwd**

---

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `pwd` command can also be used on the secondary CMM.

**Examples**

```
-> pwd
/flash
```

**Release History**

Release 7.1.1; command introduced.
Related Commands

- **cd**
  Changes the current working directory of the switch.

- **mkdir**
  Creates a new directory.

- **rmdir**
  Deletes an existing directory.

- **ls**
  Displays the contents of a specified directory or the current working directory.

- **rm**
  Displays the contents of a specified directory or the current working directory.

MIB Objects

- **systemServices**
  - systemServicesWorkingDirectory
**mkdir**

Creates a new directory.

```
mkdir [options] [path] /dirname
```

---

**Syntax Definitions**

- **options**
  - Use the ‘?’ on the command line for a list of options.
- **path**
  - The path or location in which the new directory is to be created. If no path name is specified, the new directory is created in the current directory.
- **dirname**
  - A user-defined name for the new directory.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Separate the directory names that are part of the path with a slash (/). Refer to the examples below.
- The `mkdir` command can also be used on the secondary CMM.

---

**Examples**

```
-> mkdir test_directory
-> mkdir flash/test_directory
-> mkdir
```

Usage: mkdir [OPTIONS] DIRECTORY...

Create DIRECTORY

Options:

- `-m` Mode
- `-p` No error if exists; make parent directories as needed
**Release History**

Release 7.1.1; command introduced.

**Related Commands**

</tbody>
</table>

### Usage Guidelines

- Separate the directory names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

### Examples

```
-> rmdir ./working
-> rmdir flash/working
-> rmdir ?
```

Usage: rmdir [OPTIONS] DIRECTORY...

Remove DIRECTORY if it is empty

Options:

```
-p|--parents     Include parents
--ignore-fail-on-non-empty
```

### Release History

Release 7.1.1; command introduced.
**Related Commands**

- **cd**  
  Changes the current working directory of the switch.

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

Separate the multiple directory names that are part of the path with a slash (/).

---

**Examples**

- `ls`
- `ls -l /flash/certified`
- `ls ?`

Usage: `ls [-lAacCdeFilnpRrsTtuwxXh] [FILE]...`

List directory contents

Options:

- `-l` List in a single column
- `-A` Don't list . and ..
- `-a` Don't hide entries starting with .
- `-C` List by columns
- `-c` With -l: sort by ctime
- `--color=[{always,never,auto}]` Control coloring
- `-d` List directory entries instead of contents
- `-e` List full date and time
- `-F` Append indicator (one of */=@|) to entries
- `-i` List inode numbers
- `-l` Long listing format
-n  List numeric UIDs and GIDs instead of names
-p  Append indicator (one of /=@|) to entries
-L  List entries pointed to by symlinks
-R  Recurse
-r  Sort in reverse order
-S  Sort by file size
-s  List the size of each file, in blocks
-T N Assume tabstop every N columns
-t  With -l: sort by modification time
-u  With -l: sort by access time
-v  Sort by version
-w N Assume the terminal is N columns wide
-x  List by lines
-X  Sort by extension
-h  List sizes in human readable format (1K 243M 2G)

Release History

Release 7.1.1; command introduced.

Related Commands

cd       Changes the current working directory of the switch.
pwd      Displays the current working directory of the switch.
mkdir    Creates a new directory.
rmdir    Deletes an existing directory.
rm        Displays the contents of a specified directory or the current working directory.

MIB Objects

systemServices
  systemServicesArg1
  systemServicesAction
**rm**

Permanently deletes an existing file.

```
rm [options] [path/filename]
```

### Syntax Definitions

- **options**: Use the ‘?’ on the command line for a list of options.
- **filename**: Specifies the file or directory path.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.
- Use care when deleting files. Depending on your switch and network configurations, specific configuration and image files must be present for your system to work properly.
- This command can also be used on the secondary CMM.

### Examples

- `-> rm test_config_file`
- `-> rm flash/test_config_file`
- `-> rm ?`

Usage: `rm [OPTIONS] FILE...`

Remove (unlink) FILEs

Options:
- `-i` Always prompt before removing
- `-f` Never prompt
- `-R,-r` Recurse
**Release History**

Release 7.1.1; command introduced.

**Related Commands**

`cp`  
Copies an existing file or directory.

**MIB Objects**

`systemServices`
- `systemServicesArg1`
- `systemServicesAction`
**cp**

Copies an existing file. This command can also copy a directory if the `-r` keyword is used.

`cp [options] source destination`

**Syntax Definitions**

- `options` Use the ‘?’ on the command line for a list of options.
- `source` The name of the existing file to be copied.
- `destination` The new user-defined file name for the resulting file copy. If you are copying a file to the same directory as the original, the file name for the copy must be different from the original.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- You should verify that the `/flash` directory of your switch has enough available memory to hold the copies of the files and directories created.
- A file can be copied to a new directory location. Copy of a file can also be created in the same directory that contains the original file.
- Separate the multiple directory names that are part of the path with a slash (`/`). Refer to the examples below.
- This command can also be used on the secondary CMM.

**Examples**

- `cp flash/snapshots/asc.1.snap flash/snapshots/snapshot_copy`
- `cp flash/snapshots/asc.1.snap snapshot_copy`
- `cp asc.1.snap flash/snapshots/snapshot_copy`
- `cp asc.1.snap snapshot_copy`
- `cp ?`

Usage: `cp [OPTIONS] SOURCE DEST`
Copy SOURCE to DEST, or multiple SOURCE(s) to DIRECTORY

Options:
- `-a` Same as `-dpR`
- `-R,-r` Recurse
- `-d,-P` Preserve symlinks (default if `-R`)
- `-L` Follow all symlinks
- `-H` Follow symlinks on command line
- `-p` Preserve file attributes if possible
- `-f` Force overwrite
- `-i` Prompt before overwrite
- `-l,-s` Create (sym)links

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

`mv` Moves an existing file or directory to a new location.

**MIB Objects**

`systemServices`
- `systemServicesArg1`
- `systemServicesArg2`
- `systemServicesAction`
scp

Copies an existing file in a secure manner.

```
scp [options] user_name@remote_ip_addr:[path]/source [path]/target

scp [options] [path]/source user_name@remote_ip_addr:[path]/target
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>options</code></td>
<td>Use the ‘?’ on the command line for a list of options.</td>
</tr>
<tr>
<td><code>user_name@remote_ip_addr:</code></td>
<td>The username along with the IPv4 or IPv6 address of the remote switch.</td>
</tr>
<tr>
<td><code>path/</code></td>
<td>Specifies the path containing the file to be copied and the path where the file will be copied.</td>
</tr>
<tr>
<td><code>source</code></td>
<td>The name of the file(s) to be copied.</td>
</tr>
<tr>
<td><code>target</code></td>
<td>The new user-defined file name for the resulting file copy.</td>
</tr>
</tbody>
</table>

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command will prompt you to enter the admin password, and the names and the path of the files being copied will be displayed.
- A file may be copied to a new location; you are not required to copy a file to the same directory that contains the original.
- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.

### Examples

```
-> scp admin@172.17.11.13:/flash/working/Kos.img /flash/working/Kos.img
admin's password for keyboard-interactive method:

Fetching /flash/working/Kos.img to /flash/working/Kos.img
Connection to 172.17.11.13 closed.

-> scp /flash/working/Kos.img admin@172.17.11.13:/flash/working/Kos.img
admin's password for keyboard-interactive method:
```
Uploading /flash/working/Kos.img to /flash/working/Kos.img
Connection to 172.17.11.13 closed.

-> scp admin@172.17.11.13:/flash/working/*.*img /flash/working
admin's password for keyboard-interactive method:

Fetching /flash/working/K2os.img to /flash/working/K2os.img
Fetching /flash/working/Kadvrout.img to /flash/working/Kadvrout.img
Fetching /flash/working/Kbase.img to /flash/working/Kbase.img
Fetching /flash/working/Keni.img to /flash/working/Keni.img
Fetching /flash/working/Kos.img to /flash/working/Kos.img
Fetching /flash/working/Krelease.img to /flash/working/Krelease.img
Fetching /flash/working/Ksecu.img to /flash/working/Ksecu.img
Connection to 172.17.11.13 closed.

-> scp ?
       [-l limit] [-o ssh_option] [-P port] [-S program]
       [[user@]host1:]file1 ... [[user@]host2:]file2

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

`mv` Moves an existing file or directory to a new location.

**MIB Objects**

systemServices
  systemServicesArg1
  systemServicesArg2
  systemServicesAction
**mv**

Moves an existing file or directory to a new location.

`mv [options] source destination`

---

**Syntax Definitions**

- **options**
  - Use the ‘?’ on the command line for a list of options.
- **source**
  - The name of the existing file to be copied.
- **destination**
  - The new user-defined file name for the resulting file copy. If you are copying a file to the same directory as the original, the file name for the copy must be different from the original.

---

**Defaults**

N/A

---

**PlatformsSupported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- The `mv` command does not make a copy of the file or directory being moved. To copy a file or directory to the current path or to a new location, use the `cp` command.

- Separate the directory names and file names that are part of the path with a slash (/). Refer to the examples below.

- This command can also be used on the secondary CMM.

---

**Examples**

```
-> mv flash/asc.1.snap flash/backup_files/asc.1.snap
-> mv ?

Usage: mv [OPTIONS] SOURCE DEST
or: mv [OPTIONS] SOURCE... DIRECTORY

Rename SOURCE to DEST, or move SOURCE(s) to DIRECTORY

Options:
  -f  Don't prompt before overwriting
  -i  Interactive, prompt before overwrite
```
Release History

Release 7.1.1; command introduced.

MIB Objects

systemServices
  systemServicesArg1
  systemServicesArg2
  systemServicesAction
chmod

Changes the write privileges for a specified file.

```
chmod {+w | -w} [path]/file
```

**Syntax Definitions**

- **+w**
  - Enables read-write privileges for the file.
- **-w**
  - Disables write privileges for the file—i.e., the file becomes read-only.
- **path/**
  - The path containing the file for which privileges are being changed.
- **file**
  - The name of the file for which read-write privileges are being changed.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

\hline
\end{tabular}
\end{center}

\underline{Examples}

\begin{itemize}
\item \texttt{-> freespace /flash}
\item \texttt{/flash 3143680 bytes free}
\item \texttt{-> freespace}
\item \texttt{/flash 3143680 bytes free}
\end{itemize}

\underline{Release History}

Release 7.1.1; command introduced.
Related Commands

**fsck**
Performs a file system check, including diagnostic information in the event of file corruption. If the `fsck` command detects a problem with the `/flash` file system, a message is displayed indicating the problem, along with any steps needed to resolve it.

MIB Objects

- `SystemFileSystemTable`
  - `systemFileSystemFreespace`
**fsck**

Performs a file system check, including diagnostic information in the event of file corruption.

```bash
fsck /uflash {repair | no-repair}
```

### Syntax Definitions

- **/uflash**
  - Indicates that the file system check will be performed on the `/uflash` directory.
- **repair**
  - Attempt to repair any problems found.
- **no-repair**
  - Do not attempt to repair any problems found.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command provides the option to automatically repair errors.

### Examples

```bash
-> fsck /uflash repair
/uflash/  - disk check in progress ..
/uflash/  - Volume is OK
```

```
  total # of clusters: 14,773
  # of free clusters:  4,132
  # of bad clusters:  0
  total free space: 8,264 Kb
  max contiguous free space: 5,163,008 bytes
  # of files:  46
  # of folders: 3
  total bytes in files: 21,229 Kb
  # of lost chains: 0
  total bytes in lost chains: 0
```
**Release History**

Release 7.1.1; command introduced.

**Related Commands**

**freespace**

Displays the amount of free space available in the `/flash` directory.

**MIB Objects**

systemServices

  systemServicesArg1

  systemServicesAction
newfs

Deletes the complete /uflash file system and all files within it, replacing it with a new, empty /uflash file system. Use this command when you want to reload all files in the file system or in the unlikely event that the /uflash file system becomes corrupt.

newfs /uflash

Syntax Definitions

/uflash This indicates that the complete file system will be replaced.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- It is recommended that you preserve all required image and configuration files by saving them to a remote host before executing the newfs command.

- Do not power-down the switch after running the newfs command until you reload all required image and configuration files.

Examples

-> newfs /uflash

Release History

Release 7.1.1; command introduced.

Related Commands

N/A
**MIB Objects**

systemServices
  systemServicesArg1
  systemServicesAction
**vi**

Launches the switch’s Vi text editor. The Vi file editor allows you to view or edit the contents of a specified text file.

`vi [options] [path]/filename`

---

**Syntax Definitions**

- **options**: Use the ‘?’ on the command line for a list of options.
- **path/**: The path (i.e., location) containing the file being viewed or edited. If no path is specified, the command assumes the current directory.
- **filename**: The name of the existing file being viewed or edited.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Until you exit the switch’s file editor, all keystrokes will be passed to the text editor rather than the switch’s command line.

- This command can also be used on the secondary CMM.

**Examples**

```
-> vi test_config_file
-> vi ?

Usage: vi [OPTIONS] [FILE]...

Edit FILE

Options:
- -c Initial command to run ($EXINIT also available)
- -R Read-only
- -H Short help regarding available features
```
**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tty</td>
<td>Displays current TTY settings.</td>
</tr>
</tbody>
</table>

**MIB Objects**

- `systemServices`
  - `systemServicesTtyLines`
  - `systemServicesTtyColumns`
tty

Specifies the number of lines and columns to be displayed on the terminal screen while the switch is in the edit file mode.

`tty lines columns`

### Syntax Definitions

**lines**

The number of lines to be displayed on the terminal emulation screen for the current session. Values may range from 10 to 150.

**columns**

The number of columns to be displayed for each line. One column is the same width as a single text character. Values may range from 20 to 150.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>lines</td>
<td>24</td>
</tr>
<tr>
<td>columns</td>
<td>80</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The number of lines and columns set with this command controls the screen size when the switch is editing or viewing a text file with the `vi` or `tftp` commands.

- The values set with this command do not control the CLI screen when the switch is operating in normal mode.

- This command can also be used on the secondary CMM.

### Examples

```
-> tty 10 60
```

### Release History

Release 7.1.1; command was introduced.
**Related Commands**

**show tty**
Displays current TTY settings.

**MIB Objects**

```plaintext
systemServices
  systemServicesTtyLines
  systemServicesTtyColumns
```
show tty

Displays current TTY settings.

show tty

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Shows the settings made with the tty command.
- This command can also be used on the secondary CMM.

Examples

-> show tty
lines = 24, columns = 80

Release History

Release 7.1.1; command introduced.

Related Commands

tty Specifies the number of TTY lines and columns to be displayed.

MIB Objects

systemServices
  systemServicesTtyLines
  systemServicesTtyColumns
tftp

Starts a TFTP client session that enables a file transfer to an TFTP server.

\texttt{tftp [options] host [port]}

**Syntax Definitions**

- \textit{options} Enter a question mark (?) to get a list of options.
- \textit{host} Specifies the IP address of the TFTP server.
- \textit{port} Specifies the port for the TFTP transfer.

**Defaults**

- If a path is not specified with the filename, the current path is used by default (for example, /flash).
- If a local filename is not specified, the remote filename is used by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The OmniSwitch supports TFTP client functionality only.
- A TFTP server has no provisions for user authentication.
- When downloading a file to the switch, the file size must not exceed the available flash space.

**Examples**

\texttt{-> tftp -g -l local_file -r remote_file 198.51.100.100}

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- \texttt{cd} Changes the current working directory of the switch.
- \texttt{pwd} Displays the current working directory of the switch.
- \texttt{ls} Displays the contents of a specified directory or the current working directory.

**MIB Objects**
N/A
sftp

Starts an SFTP session. An SFTP session provides a secure file transfer method.

`sftp [options] {ip_address}`

### Syntax Definitions

**options**

Enter a question mark (?) to get a list of options.

**ip_address**

Specifies the IPv4 or IPv6 address for the SFTP session.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- You must have a valid username and a password for the specified host.
- After logging in, SFTP commands are supported. Some of these commands are defined in the following table:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cd path</code></td>
<td>Change remote path to ‘path’.</td>
</tr>
<tr>
<td><code>lcd path</code></td>
<td>Change local directory to ‘path’.</td>
</tr>
<tr>
<td><code>chmod mode path</code></td>
<td>Change permissions of file ‘path’ to ‘mode’.</td>
</tr>
<tr>
<td><code>help</code></td>
<td>Display command help information.</td>
</tr>
<tr>
<td><code>get remote-path [local path]</code></td>
<td>Download a file from the remote path to the local path.</td>
</tr>
<tr>
<td><code>lls [path]</code></td>
<td>Display local directory listing.</td>
</tr>
<tr>
<td><code>ln oldpath newpath</code></td>
<td>Creates a symbolic link (symlink) to the remote file.</td>
</tr>
<tr>
<td><code>symlink oldpath newpath</code></td>
<td>Creates a symbolic link (symlink) to the remote file.</td>
</tr>
<tr>
<td><code>mkdir path</code></td>
<td>Create local directory.</td>
</tr>
<tr>
<td><code>lpwd</code></td>
<td>Print local working directory.</td>
</tr>
<tr>
<td><code>ls [path]</code></td>
<td>Display remote directory listing.</td>
</tr>
<tr>
<td><code>mkdir path</code></td>
<td>Create remote directory.</td>
</tr>
</tbody>
</table>
### Examples

```
-> sftp 12.251.11.122
login as:
-> sftp
       [-o ssh_option] [-P sftp_server_path] [-R num_requests]
       [-S program] [-s subsystem | sftp_server] host
       sftp [[user@]host[:file [file]]]
sftp [[user@]host[:dir[/]]]
sftp -b batchfile [user@]host
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- **ftp**: Starts an FTP session.
- **ssh**: Invokes Secure Shell on the switch. Secure Shell is used to make a secured connection to a remote system or device.

### MIB Objects

**SystemServices**

- `systemServicesArg1`

webview wlan cluster-virtual-ip
show webview
show webview wlan config
```
webview server

Enables or disables the web management server on the switch.

[vrf name] webview server {enable | disable}

Syntax Definitions

name
  The name of the VRF.

enable
  Enables the web management server on the switch.

disable
  Disables the web management server on the switch.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>WebView Server</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- If the WebView Server is disabled, WebView Access is automatically disabled.
- VRF name must either be ‘default’ or pre-defined VRF (user-defined).

Examples

-> webview server enable
-> webview server disable
-> vrf vrf1 webview server enable

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; vrf parameter added.
Related Commands

webview access  Enables/disables WebView access on the switch.
show webview  Displays web management configuration information.

MIB Objects

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The switch contains a self-signed certificate that may prompt a certificate warning.

**Examples**

`-> webview force-ssl enable`
`-> webview force-ssl disable`

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `webview access` Enables/disables WebView access on the switch.
- `show webview` Displays web management configuration information.

**MIB Objects**

- `alaIND1WebMgtConfigMIBGroup`
webview force-ssl
webview http-port

Changes the port number for the embedded web management server.

`webview http-port {default | port port}`

---

**Syntax Definitions**

- **default**
  Restores the port to its default (80) value.

- **port**
  The desired port number for the embedded Web server. The number must be in the range 0 to 65535; well-known port numbers cannot be configured.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>

<td>Yes</td>
<td>Yes (X48C6/T48C6/)</td>
<td>Yes (X48C4E/N48C8/)</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When enabled the following algorithms will not be supported: RC4-SHA, RC4-MD5, ECDHE-RSA-RC4-SHA, IDEA-CBC-SHA, DES-CBC3-SHA, EDH-RSA-DES-CBC3-SHA, ECDHE-RSA-DES-CBC3-SHA, aNULL, eNULL, EXPORT, DES, MD5, PSK, RC4.

**Examples**

- > webview ssl-strong-ciphers enable
- > webview ssl-strong-ciphers disable

**Release History**

Release 8.4.1.R02; command was introduced.

**Related Commands**

- **webview access** Enables/disables WebView access on the switch.
- **show webview** Displays web management configuration information.

**MIB Objects**

alaIND1WebMgtConfigMIBGroup
Web Management Commands

webview ssl-strong-ciphers
**webview wlan cluster-virtual-ip precedence**

Sets the preference for obtaining the cluster virtual IP address for WebView re-direct. The WLAN cluster virtual IP address can be obtained from LLDP or configured manually. The precedence allows to set the preference between the LLDP and manual configuration in case when both are available.

**webview wlan cluster-virtual-ip precedence {lldp | configured}**

### Syntax Definitions

- **lldp**
  - The preference to obtain the WLAN cluster virtual IP address is set to LLDP.

- **configured**
  - The preference to obtain the WLAN cluster virtual IP address is set to the manually configured WLAN cluster virtual IP address.

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>lldp</td>
<td>configured</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use this command to set the preference for obtaining the cluster virtual IP address for WebView re-direct.

- If more than one cluster virtual IP address is obtained through LLDP on the same port, the recently obtained IP is considered.

- If more than one cluster virtual IP is obtained through LLDP on different ports, the recently obtained IP is considered.

- If the precedence is set for LLDP obtained IP address, but there is no LLDP obtained cluster virtual IP address, then the manually configured cluster virtual IP address will be considered if configured.

- If the precedence is set for manually configured cluster virtual IP address, but there is no configured IP address present, then the LLDP obtained cluster virtual IP address will be considered if received.

### Examples

- `-> webview wlan cluster-virtual-ip precedence lldp`
- `-> webview wlan cluster-virtual-ip precedence configured`
**Release History**

Release 8.4.1 R02; command was introduced.

**Related Commands**

`show webview wlan config`  
Displays the AP cluster virtual IP configured on the switch.

**MIB Objects**

`alaIND1WebMgtWlanIpPrecedence`
**webview wlan cluster-virtual-ip**

Configures the cluster virtual IP address of the Access Point (AP) in the switch. The WebView server on the switch redirects the URL to the AP (Virtual IP Address) URL when the WLAN Management is accessed from WebView.

**webview wlan cluster-virtual-ip**  
*virtual-ip-address-of-wlan-cluster*

---

**Syntax Definitions**

```
virtual-ip-address-of-wlan-cluster  Virtual IP address (IPV4) of the AP cluster.
```

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to configure the AP cluster virtual IP address to access the OAW-AP web interface from the WebView.

**Examples**

```
-> webview wlan cluster-virtual-ip 10.25.6.8
```

**Release History**

Release 8.4.1 R02; command was introduced.

**Related Commands**

- **show webview wlan config**  
  Displays the AP cluster virtual IP configured on the switch.

**MIB Objects**

```
alaIND1WebMgtWlanConfiguredIpAddress
```
**show webview wlan config**

Displays the cluster virtual IP precedence configuration, WLAN AP cluster virtual IP configured on the switch, and WLAN AP cluster virtual IP obtained through LLDP.

```
show webview wlan config
```

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

N/A

**Examples**

```
-> show webview wlan config
WebView WLAN Cluster-Virtual-IP Precedence = LLDP
WebView WLAN Cluster-Virtual-IP configured address = 0.0.0.0
WebView WLAN Cluster-Virtual-IP LLDP address = 1.1.1.1
```

**output definitions**

- **WebView WLAN Cluster-Virtual-IP Precedence**: The precedence set for obtaining the cluster virtual IP address of the AP.
- **WebView WLAN Cluster-Virtual-IP configured address**: The manually configured cluster virtual IP address.
- **WebView WLAN Cluster-Virtual-IP LLDP address**: The cluster virtual IP address obtained from the LLDP packets.

**Release History**

Release 8.4.1R02; command was introduced.
Related Commands

**webview wlan cluster-virtual-ip precedence**
Allows to set the preference for the choice of cluster virtual IP address for WebView re-direct.

**webview wlan cluster-virtual-ip**
Configures the virtual IP address of the Access Point (AP) clusters in the switch.

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If a VRF name is specified, the enabled/disabled state for WebView Server and WebView Access for the specified VRF is displayed.

### Examples

```
-> show webview

WebView Server = Enabled
WebView Access = Enabled
WebView Force-SSL = Enabled
WebView HTTPS-Port = 443
WebView SSL-Strong-Ciphers = Enabled
WebView TLS Version = 1.2
```

```
vrf1:-> show webview

WebView Server = Enabled,
WebView Access = Enabled,
WebView Force-SSL = Enabled,
WebView HTTPS-Port = 443
WebView SSL-Strong-Ciphers = Enabled
```

### Output Definitions

- **WebView Server**: Indicates whether web management server is enabled or disabled.
- **WebView Access**: Indicates whether web management access is enabled or disabled.
output definitions (continued)

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Force SSL</td>
<td>Indicates whether Force SSL is enabled or disabled. If this is enabled, it means that SSL is forced on an HTTP session and hence HTTPS protocol is negotiated between the client and server.</td>
</tr>
<tr>
<td>Web Management Https Port</td>
<td>The port configured for a secure HTTP connection (SSL enabled).</td>
</tr>
<tr>
<td>Web SSL-Strong-Ciphers</td>
<td>Indicates whether SSL strong cipher requirement is enabled or disabled.</td>

MIB Objects

alaIND1WebMgtConfigMIBGroup
alaInd1WebMgtServerStatus
alaInd1WebMgtAdminStatus
alaInd1WebMgtSsl
alaInd1WebMgtHttpsPort
alaInd1WebMgtSSLSStrongCiphers
The Configuration Manager feature allows you to configure your switch using an ASCII-based text file. CLI commands may be typed into a text document—referred to as a configuration file—and then uploaded and applied to the switch.

MIB information for the Configuration Manager commands is as follows:

- **Filename:** ALCATEL-IND1-CONFIG-MGR-MIB.mib
- **Module:** alcatelIND1ConfigMgrMIB

A summary of the available commands is listed here:

```
configuration apply
configuration error-file-limit
show configuration status
configuration cancel
configuration syntax-check
configuration snapshot
show configuration snapshot
write terminal
configuration apply network-sync
```
configuration apply

Applies a configuration file to the switch. Files may be applied immediately or after a designated timer session. With the timer session option, files are applied either at a scheduled date and time or after a specified period of time (i.e., a countdown) has passed.

```
configuration apply filename [at hh:mm month dd [year]] | [in hh:mm] [verbose]
```

### Syntax Definitions

- **filename**
  
  The name of the configuration text file to be applied to the switch (e.g., `newfile1`).

- **at hh:mm**
  
  Designates a timer session in which a configuration file is applied at a specified date and time in the future. Values for `hh` range from 00 through 23. Values for `mm` range from 00 through 59. Values for `dd` range from 01 through 31. Values for month range from january through december. The switch assumes either the current year or the next calendar year for month and day pairs that precede the current date.

- **{dd month | month dd} [year]**
  
  Designates a timer session in which the configuration file is applied after a specific amount of time (i.e., a countdown) has passed. Values for `hh` range from 00 through 23. Values for `mm` range from 00–59.

- **in hh:mm**
  
  Designates a timer session in which the configuration file is applied at a specified date and time in the future. Values for `hh` range from 00 through 23. Values for `mm` range from 00 through 59.

- **verbose**
  
  When verbose is entered, information is displayed on your workstation’s console as each command in the configuration file is applied.

### Defaults

By default, `verbose` error checking is not performed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

</tbody>
</table>

### Usage Guidelines

- The `configuration apply` command only applies settings to the running configuration. The `boot.cfg` file does not get overwritten.

- It is recommended that you check all configuration files for syntax errors before applying them to your switch.

- To schedule a timer session in which a file is applied at a specific date and time, enter `at` followed by the hour, minute, month, day, and year. The switch assumes either the current calendar year or the next calendar year for dates beginning January 1.
To schedule a timer session in which a file is applied after a specific amount of time (i.e., a countdown) has passed, enter `in` followed by the number of hours and minutes.

Verbose mode is not supported for timer sessions.

The keyword, `authkey`, along with a related alpha-numeric text string, are automatically included in many snapshot files (e.g., `configuration snapshot all`). The text string following the `authkey` keyword represents a login password that has been encrypted twice. (The first encryption occurs when a password is first created by a user; the second encryption occurs when a configuration snapshot is taken.) This dual encryption further enhances switch security. However, it is important to note that any configuration file (including a generated snapshot) that includes this dual-encrypted password information will result in an error whenever it is applied to the switch via the `configuration apply` command. This is a valid switch function and does not represent a significant problem. If an `authkey`-related error is the only error detected, simply remove all `authkey`-related syntax using a text editor. If a new password is required for the switch, include valid password syntax in the configuration file or immediately issue a new password by using the `password` command at the command prompt. For more information on passwords, refer to page 39-65.

Examples

```
-> configuration apply new_configuration at 12:00 15 november
-> configuration apply new_configuration at 12:00 november 15
-> configuration apply newfile1 in 01:30
-> configuration apply my_switch_config in 00:05
-> configuration apply asc.1.snap in 23:00
-> configuration apply aaa_config in 12
-> configuration apply vlan_config verbose
-> configuration apply vlan_config
...```

Note. When the `configuration apply` command is entered without `at` or `in` syntax information, one or more dots “.” is displayed in the next line, immediately following the command line. This indicates command progress; each dot represents 256 text lines in the configuration file processed by the configuration apply mechanism.

Release History

Release 7.1.1; command was introduced.

Related Commands

`configuration syntax-check`  Performs a syntax and authorization check of all CLI commands contained in a configuration file.

MIB Objects

```
alcatelIND1ConfigMgrMIBObjects
  configFileName
  configFileMode
  configFileAction
  configTimerFileName
  configTimerFileTime
```
configuration error-file-limit

Specifies the maximum number of configuration error files allowed in the switch’s /flash directory. Error files are normally generated when a configuration file is applied to the switch. Error files are identified by their .err extension. When the maximum number of .err files is exceeded, any new error file will overwrite the .err file with the oldest timestamp.

configuration error-file-limit number

Syntax Definitions

number

Indicate the number of error files allowed in the /flash directory. The valid range is from 1 to 25 files.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>1</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- When the error file limit is set to 1 (the default value), the next error file generated by the switch will replace the existing one.
- When the error file limit is set to a value greater than 1, when a new error file that exceeds the maximum limit is created, the switch will automatically remove the error file with the smallest timestamp.
- The error files generated by the switch have the .err extension.
- If you want to save an error file, you may change the file name so that it does not have the .err extension, or you can move it from the /flash directory.

Examples

-> configuration error-file-limit 2
-> configuration error-file-limit 1

Release History

Release 7.1.1; command was introduced.
Related Commands

configuration apply  
Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.

configuration cancel  
Cancels a pending timer session for a configuration file.

MIB Objects

alcatelIND1ConfigMgrMIBobjects  
configErrorFileMaximum
show configuration status

Displays whether there is a pending timer session scheduled for a configuration file and indicates whether the running configuration and the saved configuration files are identical or different. This command also displays the number of error files that will be held in the flash directory.

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6</th>
<th>6900X48C4E/V48C8</th>
<th>9900X24C2</th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- A timer session can be scheduled using the configuration apply command. For more information, refer to page 64-2.
- The screen output File configuration </path/filename>: scheduled at dd/mm hh:mm indicates that a timer session has been scheduled for a later time.
- The output No file configuration has been scheduled indicates an idle timer session (i.e., no timer session has been scheduled for a configuration file).
- The output File configuration is in progress indicates that a file is currently being applied to the switch.
- The output File configuration </path/filename>: completed with 2 errors indicates that the named file was applied to the switch with two recorded errors.
- When the running and saved configurations are the same, the output Running configuration and saved configuration are identical will be displayed.
- When the running and saved configurations are the different, the output Running configuration and saved configuration are different will be displayed.
- To synchronize the running and saved configuration, use the write memory command.
Examples

`-> show configuration status`

show configuration status Displays whether there is a pending timer session scheduled for a configuration file.

MIB Objects

configTimerFileGroup
configTimerClear
**configuration syntax-check**

Performs a syntax and authorization check of all CLI commands contained in a configuration file.

`configuration syntax-check path/filename [verbose]`

**Syntax Definitions**

- **path/filename**: The configuration file being checked for syntax and authorization errors. If a configuration file is located in another directory, be sure to specify the full path. For example, `/flash/working/asc.1.snap`.

- **verbose**: When `verbose` is specified in the command line, all syntax contained in the configuration file is printed to the console, even if no error is detected. When `verbose` is not specified in the command line, cursory information (number of errors and error log file name) will be printed to the console only if a syntax or configuration error is detected.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>Yes</td>
</tr>
<tr>
<td>6465</td>
<td>Yes</td>
</tr>
<tr>
<td>6560</td>
<td>Yes</td>
</tr>
<tr>
<td>6570M</td>
<td>Yes</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
</tr>
<tr>
<td>6860N</td>
<td>Yes</td>
</tr>
<tr>
<td>6865</td>
<td>Yes</td>
</tr>
<tr>
<td>6900</td>
<td>Yes</td>
</tr>
<tr>
<td>6900 V72/C32</td>
<td>Yes</td>
</tr>
<tr>
<td>6900 X48C6/T48C6/X48C8/C32E/T24C2/X24C2</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When an error is detected, an error file (.err) is automatically generated by the switch. By default, this file is placed in the root `/flash` directory. To view the contents of a generated error file, use the `view` command. For example, `view asc.1.snap.1.err`.

- The syntax, `mac alloc`, is automatically included in many snapshot files (e.g., `configuration snapshot all`). All `mac alloc`-related syntax is valid during switch boot up only (i.e., it cannot be applied while the switch is in run-time operation). Because snapshot files are commonly used as configuration files, syntax checks may detect `mac alloc` syntax and issue an error (along with a generated .err file). This is a valid switch function and does not represent a significant problem. If a `mac alloc`-related error is the only error detected, simply remove the syntax using a text editor, then re-check the file using the `configuration syntax-check` command.

- It is recommended that you check all configuration files for syntax errors before applying them to your switch.
Examples

-> configuration syntax-check vlan_file1
  ..

Note. When the configuration syntax-check command is entered, one or more dots “.” is displayed in the command output. This indicates command progress; each dot represents 256 text lines in the configuration file processed by the syntax check mechanism.

Release History

Release 7.1.1; command was introduced.

Related Commands

configuration apply  Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.
show configuration status  Displays whether there is a pending timer session scheduled for a configuration file.

MIB Objects

configFileGroup
  configFileGroupName
  configErrorFileName
  configErrorFileMaximum
  configFileManager
  configFileStatus
configuration snapshot

Generates a snapshot file of the switch’s non-default current running configuration. A snapshot can be generated for all current network features or for one or more specific network features. A snapshot is a single text file that can be viewed, edited, and reused as a configuration file.

configuration snapshot [feature_list | all] [path/filename]

Syntax Definitions

feature_list
The description for the network feature(s) to be included in the snapshot. You may enter more than one network feature in the command line. Enter a question mark (?) on the command line to get a list of features (configuration snapshot ?).

all
Includes all network features in the snapshot.

path/filename
A user-defined name for the resulting snapshot file. For example, test_snmp_snap. You may also enter a specific path for the resulting file. For example, the syntax /flash/working/test_snmp_snap places the test_snmp_snap file in the switch’s /flash/working directory.

Defaults

If a file name is not specified, the default file name asc.#.snap is used. Here, # indicates the order in which the default file is generated. For example, the first default file name to be generated is asc.1.snap, the second default file name to be generated is named asc.2.snap, etc. By default, all snapshot files are placed in the root /flash directory.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Only current, non-default configuration settings are written to the snapshot file.
- You may enter more than one network feature in the command line. Separate each network feature with a space and no comma. Network features may be entered in any order.
- The snapshot file is automatically placed in the root /flash directory unless otherwise specified.

Examples

- -> configuration snapshot all
- -> configuration snapshot qos health aggregation new_file1
- -> configuration snapshot snmp_snapshot snmp
-> configuration snapshot 802.1q
-> configuration snapshot ?

MIB Objects

configManager

    mib_configSnapshotAllSelect
**configuration backup restore**

Allows to backup or restore the user custom configuration in the `/flash` directory.

```
configuration {backup | restore}
```

**Syntax Definitions**

- **backup**: Backups the user custom configuration (session banner, user table and `vcboot.cfg`) in the `/flash` directory.
- **restore**: Restores the user custom configuration in the `/flash` directory.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When backup option is issued, the session banner file, the `vcboot.cfg` of the current running directory and all the `userTable` files are collected and stored in a single tar file (sing tar file) in "'/flash/config-recovery" folder.
- When restore option is issued, the backup file is extracted and restored to the current running directory. The switch must be reloaded for the restored files to be applied.
- The backup option can be issued multiple times. However only 10 backup occurrences will be stored in the recovery folder. Post the 10th occurrence the first occurrence is deleted to save the current backup file.

**Examples**

```
-> configuration backup
-> configuration restore
```

**Release History**

Release 8.7 R2; command was introduced.
Related Commands

N/A

MIB Objects

configFileRecovery
configuration apply network-sync

Performs pre-provisioning or runtime network level synchronization for AOS Micro Services (AMS) using the publisher/subscriber model.

configuration apply network-sync filename [community community-name | local-apply]

Syntax Definitions

filename The name of the file with the AOS configuration to be synchronized.
community-name Performs synchronization only on switches with the corresponding community name.
local-apply Apply the configuration to the local switch.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- Use the configuration syntax-check command to validate the configuration file syntax before network synchronization.
- It is recommended to have only global, and not local, level switch configuration information propagated for network level configurations.
- The file name “preprovision.txt” is a pre-defined name used for pre-provisioning purposes. Pre-provisioning applies only to new nodes that join the network, the configuration will not be applied to existing nodes. Refer to the AMS section of the Switch Management Guide for additional information.

Examples

-> configuration apply network-sync preprovision.txt
-> configuration apply network-sync adaptive-test

Release History

Release 8.6R1; command not supported.

Related Commands

configuration syntax-check Performs a syntax and authorization check of all CLI commands contained in a configuration file.

MIB Objects

N/A
SNMP Commands

This chapter includes descriptions for Trap Manager and SNMP Agent commands. The commands are used for configuring SNMP settings on the switch.

- SNMP station commands can create, modify, or delete an SNMP station. Also included is a show command for monitoring current SNMP station status.

- SNMP trap commands configure SNMP trap settings. Traps can be replayed and filtered. Also, test traps can be generated to verify that individual traps are being correctly handled by the Network Management Station (NMS). The SNMP trap commands set includes show commands for monitoring SNMP trap information.

- SNMP agent commands configure SNMP security levels on the switch. Also includes show commands for monitoring the current SNMP security status.

MIB information for SNMP Community commands is as follows:

- **Filename**: SNMP-COMMUNITY-MIB.mib
- **Module**: snmpCommunityMIB

MIB information for Trap Manager commands is as follows:

- **Filename**: ALCATEL-IND1-TRAP-MGR-MIB.mib
- **Module**: alcatelIND1TrapMgrMIB

MIB information for SNMP Agent commands is as follows:

- **Filename**: ALCATEL-IND1-SNMP-AGENT-MIB.mib
- **Module**: alcatelIND1SNMPAgentMIB
A summary of the available commands is listed here:

| SNMP station commands       | snmp station             |

### snmp station

Adds a new SNMP station; modifies or deletes an existing SNMP station.

```
snmp station {ip_address | ipv6_address | domain_name} {[port] [username] [v1 | v2 | v3 | v3 tsm local-identity local_string remote-identity remote_string] [enable | disable]}
```

```
no snmp station {ip_address | ipv6_address | domain_name}
```

#### Syntax Definitions

- **ip_address**: The IP address to which SNMP unicast traps will be sent.
- **ipv6_address**: The IPv6 address to which SNMP unicast traps will be sent.
- **domain_name**: A Fully Qualified Domain Name (FQDN) to which SNMP unicast traps will be sent. Specify a domain name up to 255 characters in length.
- **port**: A UDP or TLSTCP destination port.
- **username**: The user name on the switch or external server used to send traps to the SNMP station(s). The username specified here must match an existing user account name.
- **v1**: Specifies that traps are sent using SNMP version 1.
- **v2**: Specifies that traps are sent using SNMP version 2.
- **v3**: Specifies that traps are sent using SNMP version 3.
- **tsm**: The TSM security model for SNMP. The security model can be selected only for SNMP version 3.
- **local_string**: The file name of the local certificate. To be configured when TSM mode is selected.
- **remote_string**: The file name of the remote certificate. To be configured when TSM mode is selected.
- **enable**: Enables the specified SNMP station.
- **disable**: Disables the specified SNMP station.

#### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>

<td>6900 C32E/T24C2/</td>
<td>6900 X24C2</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **no** form of the command to remove an existing SNMP station.
- When adding an SNMP station, specify an IP address or FQDN **plus username parameters**. For example, the syntax **snmp station 1.2.3.4** is not a valid command entry; however, **snmp station 1.2.3.4 username1** is a valid command entry.
- A maximum of 50 SNMP sessions can be established in the switch.
- When modifying an SNMP station, specify an IP address or FQDN **plus at least one additional parameter**. For example, the syntax **snmp station 1.2.3.4** is not a valid command entry; however, **snmp station 1.2.3.4 v2** is a valid command entry.
- When an FQDN is specified with this command, the switch will resolve the domain name to an IP address. Make sure the domain name maps to a valid and reachable IP address.
- When the SNMP station is enabled, the switch transmits traps to the specified IP or IPv6 address.
- For UDP the default port 162 is commonly used for traps; however, the destination port can be redefined to accommodate an SNMP station using a nonstandard port. The destination port specified must correspond with the UDP destination port configured at the receiving SNMP station(s).
- For TLSTCP the default port 10162 is commonly used for traps; however, the destination port can be redefined to accommodate an SNMP station using a nonstandard port. The destination port specified must correspond with the TLSTCP destination port configured at the receiving SNMP station(s).
- To send SNMP traps over TLS connection, the SNMP station needs to be configured with TSM user along with certificate identities.
- The local_identity and remote_identity are the names of certificate file. If the contents of local or remote certificates are changed, the updated certificates must be manually copied from master or primary to all secondaries and slaves. A reboot is required for the changes to be applied.
- When TSM security model is enabled, all the v1/v2/v3 USM requests and traps are discarded.
- When TSM security model is disabled, all v1/v2/v3 (USM and TSM) requests and traps are allowed.
- In TSM security model SNMP requests are supported over IPv4 transport only.

### Examples

```bash
-> snmp station 168.22.2.111 username2 v1 disable
-> snmp station 168.151.2.101 "test lab"
-> snmp station 170.1.2.3 username1 enable
-> snmp station 1.1.2.2 v2
-> no snmp station 2.2.2.2
```
- snmp station 300::1 enable
- no snmp station 300::1

**snmp snmp-engineid-type**

Configures a unique engine ID for the OmniSwitch SNMP agent.

```
snmp snmp-engineid-type {text | mac-address | ipv4-address | ipv6-address} snmp-engineid
{text_string | mac_address | ipv4_address | ipv6_address}
```

```
snmp snmp-engineid-type mac-address snmp-engineid default
```

### Syntax Definitions

- **text_string**: A text string that will be converted to a hexadecimal value. The valid range is 1–27 characters.
- **mac_address**: A specific MAC Address (for example, 00:00:39:59:f1:0c).
- **ipv4_address**: An IPv4 address that will be converted to a hexadecimal value.
- **ipv6_address**: An IPv6 address that will be converted to a hexadecimal value.

### Defaults

By default, the SNMP engine ID is set to the base MAC address for the switch appended to the enterprise value for OmniSwitch platforms (for example, if the enterprise value is “8000195603” and the switch base MAC address is “2c:fa:a2:13:e4:02”, then the default engine ID is set to “80001956032cfaa213e402”).

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- To set the engine ID back to the default value, specify the **mac-address** parameter and the **default** parameter with this command. For example, `snmp snmp-engineid-type mac-address snmp-engineid default`.

- Note that the **snmp-engineid** keyword is entered after the parameter that specifies the type of engine ID format to use and before the actual value that matches the specified parameter type. For example, if the **ipv4-address** parameter is specified, enter the IPv4 address value after the **snmp-engineid** keyword (`snmp snmp-engineid-type ipv4-address snmp-engineid 10.2.2.1`).

- When a text string, an IPv4 address, or an IPv6 address is specified, the value is automatically converted to a hexadecimal value that is then appended to the OmniSwitch enterprise value to form the SNMP engine ID for the switch.

### Examples

```
-> snmp snmp-engineid-type text snmp-engineid "test lab"
```
```plaintext
-> snmp snmp-engineid-type mac-address snmp-engineid 00:2a:95:01:02:03
-> snmp snmp-engineid-type ipv4-address snmp-engineid 168.22.2.2 111
-> snmp snmp-engineid-type mac-address snmp-engineid default
```

**Release History**

**Usage Guideline**

N/A

**Examples**

```bash
-> show snmp snmp-engineid
snmp engineId type       snmp engineId
-------------------+--------------------------------
default Mac           80001956032cfaa213e402
```

**output definitions**

<table>
<thead>
<tr>
<th>snmp engineId type</th>
<th>The type of engine ID (default Mac, Text, Ipv4, or Ipv6).</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp engineId</td>
<td>The SNMP engine ID value that uniquely identifies the OmniSwitch SNMP agent. This value is comprised of the OmniSwitch enterprise ID plus the configured SNMP engine ID value, in hexadecimal format.</td>
</tr>
</tbody>
</table>

**Release History**

Release 8.3.1.R02; command was introduced.
Related Commands

**snmp snmp-engineid-type**

Configures the type and value of the SNMP engine ID for the switch.

MIB Objects

- **snmpAgtEngineIdType**
- **snmpAgtEngineId**
**snmp community-map**

Configures and enables a community string on the switch and maps it to an existing user account name.

```plaintext
snmp community-map {
  [hash-key string | community_string] user useraccount_name
} [enable | disable]
```

no snmp community-map community_string

**Syntax Definitions**

- **hash-key string**: The hashed format of a community string.
- **community_string**: A community string in the form of a text string. This string must be between 1 and 32 characters.
- **useraccount_name**: A user name in the form of a text string. This name must match a user login account name already configured on the switch or configured remotely on an external AAA server. This user name must be between 1 and 32 characters.
- **enable**: Enables SNMP community string mapping.
- **disable**: Disables SNMP community string mapping.

**Defaults**

By default, SNMP community map authentication is enabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Community strings are stored in a hashed format in the `show configuration snapshot snmp` output. To view community string mappings in plain-text use the `show snmp community-map` command.
- Community strings configured on the switch are used for v1 and v2c SNMP managers only.
- The user account name must be a current user account recognized by the switch. For a list of current user names use the `show user` command. To create a new user account, use the `user` command.
- There is one to one mapping between each community string and a user account name.
- Privileges attached to the community string are the ones inherited from the user account name that created it.
- The community-map mode must be enabled and the community string carried over each incoming v1 or v2c SNMP request must be mapped to a user account name in order to be processed by the SNMP agent.

**Examples**

- snmp community-map community1 user testname1
- snmp community-map community1 enable

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `snmp community-map mode` Enables the local community strings database.

**MIB Objects**

SNMPCommunityTable
- snmpCommunityIndex
- snmpCommunitySecurityName
- snmpCommunityStatus
**snmp community-map mode**

Enables the local community strings database.

`snmp community-map mode {enable | disable}`

---

**Syntax Definitions**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables SNMP community map database.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables SNMP community map database.</td>
</tr>
</tbody>
</table>

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Community mode</td>
<td>disabled</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- The community-map mode must be enabled and the community string carried over each incoming v1 or v2c SNMP request must be mapped to a user account name with SNMP privileges in order to be processed by the SNMP agent.
- When enabled, mapping is contained in the local community strings database populated by using the `snmp community-map` command.

---

**Examples**

```
-> snmp community-map mode enable
-> snmp community-map mode disable
```

---

**Release History**

Release 7.1.1; command was introduced.
Related Commands

**snmp community-map**  Configures and enables a community string on the switch and maps it to an existing user account name.

MIB Objects

status       community string                 user name
-------------+-------------------------------+--------------------------------
enabled       test_string1          bb_usename
enabled       test_string2          rr_usename
disabled      test_string3          cc_usename
disabled      test_string4          jj_usename
```

**output definitions**

- **Status**: The Enabled/Disabled status of the community string.
- **Community String**: The text that defines the community string.
- **User Name**: The user account name.

### Release History

Release 7.1.1; command was introduced.
**Related Commands**

- **snmp community-map**
  Configures and enables a community string on the switch and maps it to an existing user account name.

**MIB Objects**

- N/A
**snmp security**

Configures SNMP security settings.

```
snmp security {no-security | authentication set | authentication all | privacy set | privacy all | trap-only | tls {enable | disable}}
```

### Syntax Definitions

- **no-security**
  
  The switch will accept all SNMP v1, v2, and v3 requests.

- **authentication set**
  
  The switch will accept all requests *except* v1, v2, and non-authenticated v3 set requests. SNMP v1, v2, and non-authenticated v3 set requests will be rejected.

- **authentication all**
  
  The switch will accept all requests *except* v1, v2, and non-authenticated v3 get, get-next, and set requests. SNMP v1, v2, and non-authenticated v3 get, get-next, and set requests will be rejected.

- **privacy set**
  
  The switch will accept *only* authenticated SNMP v3 get, get-next and encrypted v3 set requests. All other requests will be rejected.

- **privacy all**
  
  The switch will accept only encrypted v3 get, get-next, and set requests. All other requests will be rejected.

- **trap-only**
  
  All SNMP get, get-next, and set requests will be rejected.

- **tls enable | disable**
  
  Unblocks (enable) or blocks (disable) the SNMP TLS port 10161.

### Defaults

</table>

Examples

- `snmp security no-security`
- `snmp security authentication set`
- `snmp security authentication all`
- `snmp security privacy set`
- `snmp security trap-only`

Release History

Release 7.1.1; command was introduced.

Related Commands

`show snmp security` Displays the current SNMP security status.

MIB Objects

`SNMPAgtConfig`

  `SnmpAgtSecurityLevel`
snmp security tsm

Enables or disables TLS encryption for SNMP access.

```bash
snmp security tsm [enable | disable]
```

**Syntax Definitions**

- **enable**: Enables TLS encryption for SNMP access.
- **disable**: Disables TLS encryption for SNMP access.

**Defaults**

By default, the TLS encryption for SNMP access is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The TLS encryption can be enabled only for SNMP version 3.
- In Common Criteria mode (CC mode) TLS encryption for SNMP is enabled by default and cannot be disabled.

**Examples**

```bash
-> snmp security tsm enable
-> snmp security tsm disable
```

**Release History**

Release 8.6R1; command was introduced.

**Related Commands**

- **snmp tsm-map**: Displays the current SNMP security status.

**MIB Objects**

- **SNMPAgtConfig**
  - **snmpAgtTsmAdminState**
**snmp tsm-map**

Allows to map a remote identity or certificate to a user in TSM mode.

```
snmp tsm-map remote-identity remote_string user user_string
```

**Syntax Definitions**

- `remote_string`: File name of remote certificate to be mapped with the user. This string must be between 1 and 128 characters.
- `user_string`: The user name. This string must be between 1 and 32 characters.

**Defaults**

N/A.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The remote identity mapping for user can be done only in TSM mode.
- The remote identity mapping can be done for only one user at a time. It cannot be mapped to multiple users. Mapping it to a different user will replace the existing user.
- If the content of remote certificate is changed, the updated certificate must be manually copied from master or primary to all secondaries and slaves. A reboot is required for the changes to be applied.

**Examples**

```
-> snmp tsm-map remote-identity manager.crt user joe
-> snmp security tsm disable
```

**Release History**

Release 8.6R1; command was introduced.
Related Commands

`show snmp tsm-map` Displays the current SNMP TSM remote identity mapping for a user.

MIB Objects

alaSnmpTsmUserTable
  - alaSnmpTsmUserRemoteIdentity
  - alaSnmpTsmUserName
show snmp tsm-map

Displays the current SNMP TSM remote identity mapping for a user.

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

Enter the specific file name of the remote certificate to view the mapping related to it.

Examples

-> show snmp tsm-map
Remote Identity User
-------------------------------------------------------
manager.crt     adam

-> show snmp tsm-map manager.pem
Remote Identity User
-------------------------------------------------------
manager.pem     joecool

output definitions

Remote Identity Displays the file name of the remote certificate mapped to the user.
User Displays the user name mapped to the remote identity.

Release History

Release 8.6R1; command was introduced.
**Related Commands**

- **snmp tsm-map**
  
  Allows to map a remote identity or certificate to a user in TSM mode.

**MIB Objects**

N/A
**show snmp security**

Displays the current SNMP security status.

`show snmp security [tsm]`

---

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Refer to the command on page 65-18 for descriptions of the five SNMP security states: no security, authentication set, authentication all, privacy set, privacy all, and trap only.

- Use the optional parameter `tsm` along with the command to display the configured SNMP TSM status.

**Examples**

```plaintext
-> show snmp security
snmp security = no security

-> show snmp security
snmp security = authentication set

-> show snmp security
snmp security = authentication all

-> show snmp security
snmp security = privacy set

-> show snmp security
snmp security = privacy all

-> show snmp security
snmp security = trap only

-> show snmp security tsm
snmp security tsm = disable
```
output definitions

<table>
<thead>

</tbody>
</table>

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- `snmp security` Configures the SNMP security settings.

**MIB Objects**

- N/A
**show snmp mib-family**

Displays SNMP MIB information. Information includes MIP ID number, MIB table name, and command family.

`show snmp mib-family [table_name]`

**Syntax Definitions**

`table_name` The name of the MIB table to be displayed.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If a table name is not specified in the command syntax, all MIB table names will be displayed.
- If the command family is not valid for the entire MIB table, the command family will be displayed on a per-object basis.
- Table names are case-sensitive. Therefore, use the exact table names from the MIB database.

**Examples**

```
-> show snmp mib-family trapStationTable
MIP ID  MIB TABLE NAME                                FAMILY
-------+----------------------------------------+---------------------
73733  trapStationTable                      snmp
```

**output definitions**

<table>
<thead>
<tr>
<th>MIP ID</th>
<th>Identification number for the MIP associated with this MIB Table.</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIB Table Name</td>
<td>Name of the MIB table.</td>
</tr>
<tr>
<td>Family</td>
<td>Command family to which this MIB table belongs.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

*show snmp-trap filter-ip*  
Displays the SNMP trap filter information.

**MIB Objects**

N/A
**snmp-trap absorption**

Enables or disables the trap absorption function.

```
snmp-trap absorption {enable | disable}
```

**Syntax Definitions**

- **enable**: Enables SNMP trap absorption. When trap absorption is enabled, identical, repetitive traps sent by applications during a pre-configured time period will be absorbed, and therefore not sent to SNMP Manager stations configured on the switch.

- **disable**: Disables SNMP trap absorption.

**Defaults**

By default, trap absorption is enabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To view the current trap absorption status, use the `show snmp-trap config` command.

**Examples**

```
-> snmp-trap absorption enable
-> snmp-trap absorption disable
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

**show snmp-trap config**  Displays the SNMP trap information. Information includes trap ID numbers and corresponding trap names and families.

MIB Objects

- `trapFilterTable`
- `trapAbsorption`
snmp-trap to-webview

Enables the forwarding of traps to WebView.

```
snmp-trap to-webview {enable | disable}
```

**Syntax Definitions**

- **enable**: Enables WebView forwarding. When WebView forwarding is enabled, all traps sent by switch applications are also forwarded to WebView. This allows a WebView session to retrieve the trap history log.
- **disable**: Disables WebView forwarding.

**Defaults**

By default, WebView forwarding is enabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To view the current WebView forwarding status, use the `show snmp-trap config` command.

**Examples**

- `-> snmp-trap to-webview enable`
- `-> snmp-trap to-webview disable`

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

- **show snmp-trap config**: Displays the SNMP trap information, including the current status for trap absorption and WebView forwarding.

**MIB Objects**

- `trapFilterTable`  
- `trapToWebView`
**snmp-trap replay-ip**

Replays stored traps from the switch to a specified SNMP station. This command is used to replay (to resend) traps on demand. This is useful in the event when traps are lost in the network.

```
snmp-trap replay-ip {ip_address | ipv6_address | domain_name} [seq_id]
```

### Syntax Definitions

- **ip_address**: The IP address for the SNMP station to which traps will be replayed from the switch.
- **ipv6_address**: The IPv6 address for the SNMP station to which traps will be replayed from the switch.
- **domain_name**: A Fully Qualified Domain Name (FQDN) for the SNMP station to which traps will be replayed. Specify a domain name up to 255 characters in length.
- **seq_id**: The sequence number from which trap replay will begin. Each trap sent by the switch to an SNMP station has a sequence number. The sequence number reflects the order in which the trap was sent to the SNMP station. For example, the first trap sent to an SNMP station has a sequence number of 1; the second trap has a sequence number of 2, etc. If no sequence number is entered, all stored traps are replayed.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `show snmp station` command on page 65-6 to display the latest stored sequence number for each SNMP station.
- The switch replays traps in the same order that they were previously sent, beginning from the specified sequence number.
- When traps are replayed, the original dates on which the trap was issued, rather than the current dates are used.
- When an FQDN is specified with this command, the switch will resolve the domain name to an IP address. Make sure the domain name maps to a valid and reachable IP address.
snmp-trap replay-ip

- If the specified sequence number is lower than the oldest trap sequence number stored in the switch, the switch replays all stored traps.

- If the specified sequence number is equal to or greater than the oldest trap sequence number stored, the switch replays all stored traps from the specified sequence number up to the latest sequence number.

- If the specified sequence number is greater than the latest sequence number, no traps are replayed.

**Examples**

```
-> snmp-trap replay-ip 172.12.2.100
-> snmp-trap replay-ip 300::1
-> snmp-trap replay-ip upam.omnivista.com
```

**Release History**

Release 7.1.1; command was introduced.
Release 8.5R1; `domain_name` parameter option added.

**Related Commands**

- `show snmp station` Displays the current SNMP station status.
- `show snmp-trap replay-ip` Displays the SNMP trap replay information.

**MIB Objects**

- `trapStationTable`
  - `trapStationReplay`
  - `trapStationNextSeq`
- `alaTrapInetStationTable`
  - `alaTrapInetStationReplay`
  - `alaTrapInetStationNextSeq`
**snmp-trap filter-ip**

Enables or disables SNMP trap filtering. Trap filtering is used to determine whether a trap or group of traps will be sent from the switch to a specified SNMP station.

`snmp-trap filter-ip {ip_address | ipv6_address | domain_name} trap_id_list`

`no snmp-trap filter-ip {ip_address | ipv6_address | domain_name} trap_id_list`

### Syntax Definitions

- **ip_address**
  - The IP address for the SNMP station for which trap filtering is enabled or disabled.

- **ipv6_address**
  - The IPv6 address for the SNMP station for which trap filtering is enabled or disabled.

- **domain_name**
  - A Fully Qualified Domain Name (FQDN) for the SNMP station for which trap filtering is enabled or disabled. Specify a domain name up to 255 characters in length.

- **trap_id_list**
  - Specifies the trap(s) for which filtering is being enabled or disabled. Traps must be specified using the numeric trap ID. You can specify more than one trap in the command line; separate each trap ID with a space and no comma.

### Defaults

By default, SNMP trap filtering is disabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>6900 X48C4E/V48C8/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- To *enable* trap filtering, use the syntax `snmp-trap filter-ip ip_address trap_id_list`.
- To *disable* trap filtering, use the syntax `no snmp-trap filter-ip ip_address trap_id_list`.
- When an FQDN is specified with this command, the switch will resolve the domain name to an IP address. Make sure the domain name maps to a valid and reachable IP address.
- When filtering is enabled, the specified trap(s) *will not* be sent to the SNMP station. When filtering is disabled, the specified traps *will* be sent to the SNMP station.
- To display a list of traps and their ID numbers, use the `show snmp-trap config` command.
**Examples**

-> snmp-trap filter-ip 172.1.2.3 1
-> snmp-trap filter-ip 172.1.2.3 0 1 3 5
-> snmp-trap filter-ip 300::1 1 3 4
-> snmp-trap filter-ip upam.omnivista.com 1 3 5
-> no snmp-trap filter-ip 172.1.2.3 1
-> no snmp-trap filter-ip 172.1.2.3 0 1 3 5
-> no snmp-trap filter-ip 300::1 1 3
-> no snmp-trap filter-ip upam.omnivista.com 1 3 5

**Release History**

Related Commands

- **show snmp mib-family** Displays SNMP MIB information.
- **snmp-trap absorption** Enables or disables the trap absorption function.
- **snmp-trap to-webview** Enables or disables the forwarding of SNMP traps to WebView.

MIB Objects

- **trapConfigTable**
  - **trapConfigEntry**
event-action

Triggers the specified script to run when the specified event occurs.

```
event-action {trap trigger_string script script_string | script-time-limit num}

no event-action trap name
```

**Syntax Definitions**

- `trigger_string`: The name of the trigger. In the case of a trap, this is the trap name.
- `script_string`: The path and the name of the script to run.
- `num`: The maximum amount of time a script can run (30-600).
- `name`: The name of the trap to remove the event from.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>script-time-limit</td>
<td>60 seconds.</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If the prefix for the script is not `/flash/python`, the path will be assumed to be under that directory.
- Each event can only be assigned a single script but a script can be assigned to multiple events.
- Only users that have write privileges for the AAA partition management family can create scripts in the `/flash/python` directory.
- The `show snmp-trap config` command can be used to view the list of traps available on the switch.

**Examples**

```
-> event-action trap linkDown script /flash/python/link_event.py
-> event-action trap stpNewRoot script stp_event.py
```

**Release History**

Release 7.3.4; command was introduced.
Related Commands

show event-action  Shows the scripts and statistics associated with the events.

MIB Objects

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

In the case of a virtual-chassis, the event-script can be run independently on the Master or Slave chassis. The Master and slave chassis have separate launch counters and the script launch counter will not be synchronized across chassis.

Examples

```
-> show event-action

<table>
<thead>
<tr>
<th>type</th>
<th>name</th>
<th>script</th>
</tr>
</thead>
<tbody>
<tr>
<td>trap</td>
<td>linkDown</td>
<td>link_event.py</td>
</tr>
<tr>
<td>trap</td>
<td>stpNewRoot</td>
<td>stp_event.py</td>
</tr>
<tr>
<td>trap</td>
<td>sessionAuthenticationTrap</td>
<td>catchAll.py</td>
</tr>
</tbody>
</table>

-> show event-action statistics

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Script</th>
<th>Last Launched</th>
<th>Launch Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>trap</td>
<td>linkDown</td>
<td></td>
<td>2014-10-23 13:45:34</td>
<td>2</td>
</tr>
</tbody>
</table>

output definitions

- **Type**
  - The type of event trigger.
- **Name**
  - The name of the event. In the case of a trap, this is the trap name.
- **Script**
  - The name and location of the script associated with the event.
SNMP Commands

Output Definitions (continued)

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script Last Launched</td>
<td>The date and time the script was last run.</td>
</tr>
<tr>
<td>Launch Count</td>
<td>The number of times the script has been launched by the event.</td>
</tr>
</tbody>
</table>

Release History

Release 7.3.4; command was introduced.

Related Commands

event-action

OmniVista Cirrus is a network management solution to deliver zero touch provisioning using cloud.

OmniVista Cirrus solution provides reduced costs, ease of devices provisioning and a unified wired/wireless management from the cloud. The solution also provides an ability to identify each device uniquely and provide a freemium/premium solution based on the user policy.

Deployment of OmniVista Cirrus provides easy to use management and monitoring tools in a network and the ability to manage the network using devices ranging from workstations to smart phones.

MIB information for the OmniVista Cirrus commands is as follows:

<table>
<thead>
<tr>
<th>Filename:</th>
<th>ALCATEL-IND1-SYSTEM-MIB.mib</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module:</td>
<td>alcatelIND1SystemMIB</td>
</tr>
</tbody>
</table>

A summary of the available commands is listed here.

```
cloud-agent admin-state
cloud-agent discovery-interval
cloud-agent remove-inconsistent-certificate
show cloud-agent status
show cloud-agent vpn status
naas license call-home interval
naas license apply file
show naas license
show naas-agent status
```
cloud-agent admin-state

Enables or disables OmniVista Cirrus functionality globally for the switch.

`cloud-agent admin-state {enable | disable | disable force | restart}`

Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables OmniVista Cirrus for the switch.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables OmniVista Cirrus for the switch.</td>
</tr>
<tr>
<td>disable force</td>
<td>Disables OmniVista Cirrus for the switch and disconnects from the VPN.</td>
</tr>
<tr>
<td>restart</td>
<td>Restart option implicitly triggers “disable force” followed by “enabled”.</td>
</tr>
</tbody>
</table>

Defaults

By default, OmniVista Cirrus is globally enabled for the switch.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- OmniVista Cirrus is globally enabled for the switch only when the switch boots up without a configuration file [vcboot.cfg] or the configuration file size is zero bytes.

- If the switch boots up with a configuration file, the feature is enabled only if the administrative state of OmniVista Cirrus is explicitly enabled using the `cloud-agent admin-state` command. Hence, the default value is disabled in this case.

- The switch must have access to the DHCP server in the customer network with zero configurations on the devices.

- If the OmniVista Cirrus administrative state is disabled at run-time, it will take effect only after a reboot.

- If the OmniVista Cirrus administrative state is enabled at run-time, it will immediately trigger call-home with the activation server, if a connection was not established prior to that.

- When the OmniVista Cirrus administrative state is disabled at run-time while the connection is in progress or established, it will not have any consequences on the switch. If `write memory` is issued, the switch will not call-home even if the switch reboots or has a takeover. However, if the discovery interval timer is running, the next call-home will be terminated.
• The restart option implicitly triggers the administrative states of disable force followed by enabled. This will enable a user to restart call-home from OmniVista Cirrus.

• If the switch is in an intermediate state (downloading an image from image server, pre-provisioning, write memory, flash syncro, call-home, etc.), the cloud agent admin state disable force will display an error message: “OV Cloud agent is in progress. Please retry after some time.”

**Examples**

-> cloud-agent admin-state enable
-> cloud-agent admin-state disable

**Release History**

Release 8.4.1 R03; command introduced.
Release 8.5R1; restart parameter added.

**Related Commands**

*cloud-agent discovery-interval* Configures the time interval after which the switch will call-home the activation server, in case of any fatal error.

*show cloud-agent status* Displays the OmniVista Cirrus status and parameters received from the DHCP and activation server.

**MIB Objects**

*ovCloudAgent*
  
  ovCloudAgentAdminState
cloud-agent discovery-interval

Configures the time interval after which the switch will call-home to the activation server, in case of any error.

cloud-agent discovery-interval minutes

Syntax Definitions

minutes The time interval to call-home after an error. The valid range is 2-3600 minutes.

Defaults

By default, the discovery interval is set to 30 minutes.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>N</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Call-home with the activation server will be immediately triggered when OmniVista Cirrus administrative state is enabled at run-time, if a connection was not established prior to that.

- When the OmniVista Cirrus administrative state is disabled at run-time while the connection is in progress or in an established connection, it will not have any consequences on the switch. If write memory is issued, the switch will not call-home even if the switch reboots or has a takeover. However, if the discovery interval timer is running, the next call home will be terminated.

- When trying to connect to the openVPN server, if the connection is not established in 90 seconds, the switch will move to an error state and will call home after the expiry of the discovery interval.

Examples

- -> cloud-agent discovery-interval 60
- -> cloud-agent discovery-interval 90

Release History

Release 8.4.1 R03; command introduced.
Related Commands

- **cloud-agent admin-state**: Enables or disables OmniVista Cirrus functionality globally for the switch.
- **show cloud-agent status**: Displays the OmniVista Cirrus status and parameters received from the DHCP and activation server.

MIB Objects

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- When this command is issued, a warning is generated: "This command may render the switch incapable of connecting with OV-Cloud if not used with caution. Confirm (Y/N)."

- If accepted by pressing (Y) and the certificate status is not inconsistent, an error message is displayed: “Certificate status is Consistent. Cannot delete certificate.” The existing OmniVista Cirrus agent state machine will not be interrupted.

Examples

-> cloud-agent remove-inconsistent-certificate

Release History

Release 8.5R1; command introduced.
Related Commands

  ovCloudAgentTimeToNextCallhome
show cloud-agent vpn status

Displays the OmniVista Cirrus VPN status.

Examples

-> show cloud-agent vpn status
  VPN status                : Connected,
  VPN Assigned IP           : 10.8.0.4,
  VPN DPD time (sec)        : 600

output definitions

VPN Status               Refers to OmniVista Cirrus VPN status. The various VPN states are:
                        • Connecting—OpenVPN’s initial state
                        • Wait—Waiting for initial response from server
                        • Auth—Authenticating with server
                        • Get_Config—Downloading configuration options from server
                        • Assign_IP—Assigning IP address to virtual network interface
                        • Add_Routes—Adding routes to system
                        • Connected—Initialization sequence completed
                        • Reconnecting—A restart has occurred
                        • Exiting—A graceful exit is in progress

VPN Assigned IP          Displays the VPN server assigned IP for the VPN connection towards
                          the OmniVista Cirrus.

VPN DPD time (sec)       Displays the VPN Dead Peer Detection (DPD) time value in seconds.
**Release History**
Release 8.4.1 R03; command introduced.

**Related Commands**
- `cloud-agent admin-state` Enables or disables OmniVista Cirrus functionality globally for the switch.

  - `ovCloudAgentDeviceState`
  - `ovCloudAgentVpnStatus`
naas license call-home interval

Configures the time interval for on-demand call-home to ALE License Activation Server instead of waiting for the next call-home interval.

naas license call-home interval \{minutes | now\}

**Syntax Definitions**

- **minutes**
  The time interval to call-home to ALE License Activation Server. The valid range is 0-1440 minutes.

- **now**
  Specify "now" or "1" minute interval parameter for the call-home to start immediately without waiting for the already set time interval.

**Defaults**

By default, the call-home interval is set to 30 minutes.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Call-home with the ALE License Activation Server will be immediately triggered, when this command is applied on the switch.
- The call-home to the ALE License Activation Server will be continuous after this command is applied.
- On specifying the now parameter or 1 minute interval, call-home starts immediately without waiting for the already set time interval.
- If the call-home interval is set to “0” and device is in CAPEX undecided state, the NaaS call home will be disabled.
- The configured call-home interval can be modified or overridden by the ALE License Activation Server response later.

**Examples**

- `-> naas license call-home interval 60`
- `-> naas license call-home interval now`

**Release History**

Release 8.8R1; command introduced.
Related Commands

**show naas-agent status**
Displays the status and parameters received from the DHCP and ALE License Activation Server.

**show naas license**
Displays all information related to NaaS license received from the ALE License Activation Server.

MIB Objects

`alaNaasConfig`

`alaNaasConfigCallhomeInterval`
**naas license apply file**

Activates the NaaS license on the switch.

`naas license apply file_name`

---

**Syntax Definitions**

`file_name` The name of the license file containing the license keys.

**Defaults**

NaaS Essential License is the base license enabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

67 OpenFlow Commands

OpenFlow is a communications interface defined between the control and forwarding layers that is used in a Software Defined Network (SDN). OpenFlow separates the control plane and the data plane in the switch. Traditionally, switches and routers have made decisions on where packets should travel based on rules local to the device. With OpenFlow, only the data plane exists on the switch itself, and all control decisions are communicated to the switch from a central Controller. The OmniSwitch can operate in AOS or OpenFlow mode, including a modified OpenFlow mode known as Hybrid mode.

MIB information for the Web Management commands is as follows:

- **Filename:** ALCATEL-IND1-OPENFLOW-MIB.mib
- **Module:** alcatelIND1OpenflowMIB

A summary of the available commands is listed here:

<table>
<thead>
<tr>
<th>OpenFlow Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>openflow back-off-max</td>
</tr>
<tr>
<td>openflow idle-probe-timeout</td>

</tr>
<tr>
<td>openflow logical-switch interfaces</td>
</tr>
<tr>
<td>show openflow</td>
</tr>
<tr>
<td>show openflow logical-switch</td>
</tr>
</tbody>
</table>
**openflow back-off-max**

Configures the maximum amount of time to wait between Controller connection attempts.

```
openflow back-off-max seconds
```

**Syntax Definitions**

```
seconds
```

The back-off-max value, in seconds. The valid range is from 0 - 60.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>60</td>
</tr>
</tbody>
</table>

openflow logical-switch

Configures an OpenFlow Logical Switch. An OpenFlow Logical Switch consists of a portion of the switch's resources that are managed by an OpenFlow Controller (or set of Controllers) via the OpenFlow Agent.

**openflow logical-switch name** [probe-time num | failure-detect-time num | tcp-buffer-size num | dpid string] [admin-state {enable | disable}] [mode {normal | api | pfc-channel}] [version {1.0 | 1.3.1}+] [learned-mac-update {enable | disable}] [vlan vlan_id] [table-miss-action {drop | controller}]

**no openflow logical-switch <name>**

### Syntax Definitions

- **name**
  The Logical Switch name (up to 32 characters).

- **probe-time num**
  Configures probe-time for a logical switch in the pfc-channel mode which will override the existing global idle-probe-time for sending echo-requests to the OpenFlow Controller. (1-60)

- **failure-detect-time num**
  Configures the failure-detect-time for a logical switch in the pfc-channel mode for detecting a disconnection to the OpenFlow Controller if there was no echo reply or message from the controller. (1-60)

- **tcp-buffer-size num**
  Configures the TCP buffer size for socket connection to OpenFlow controllers configured for the logical-switch in the pfc-channel mode (2–32).

- **dpid string**
  Configures a unique 8-byte Datapath Identifier (DPID) for a logical switch in pfc-channel mode. Value must be entered in hex format only (starting with 0x) and must be less than 8-bytes.

- **admin-state enable**
  Enables the Logical Switch.

- **admin-state disable**
  Disables the Logical Switch.

- **normal**
  Configures the Logical Switch to run in Normal Mode.

- **api**
  Configures the Logical Switch to run in Hybrid (API) Mode. Only one (1) Logical Switch can be configured in Hybrid Mode.

- **pfc-channel**
  Configures the Logical Switch for NEC pfc-channel mode.

- **1.0**
  Configures the Logical Switch to run OpenFlow Version 1.0.

- **1.3.1**
  Configures the Logical Switch to run OpenFlow Version 1.3.1.

- **learned-mac-update enable**
  Enables the forwarding of new source learned MAC addresses to a WLAN controller.

- **learned-mac-update disable**
  Disables the forwarding of new source learned MAC address to a WLAN controller.

- **vlan_id**
  The Default VLAN for all ports assigned to the Logical Switch. Traffic on this VLAN on these ports will not carry an 802.1q tag. Traffic on all other VLANs on these ports will carry an 802.1q tag. The valid range is 2 - 4093.

- **drop | controller**
  Configures whether packets are dropped or sent to the Controller when an OpenFlow Table Miss occurs.

<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Up to three (3) OpenFlow Logical Switches can be configured on an OmniSwitch.
- Use the `no` form of the command to delete an OpenFlow Logical Switch and all Controller/port configurations for that Logical Switch.
- When a Logical Switch is disabled, all Controllers for that Logical Switch are operationally disabled, and flows added by those Controllers are removed.
- In Normal Mode, the switch operates as per the OpenFlow standards. In Hybrid mode, OpenFlow operates as an interface through which the Controller may add over-ride policies to the switch much like QoS. In Hybrid mode, no traffic is forwarded to the Controller(s) and AOS operates normally.
- OpenFlow versions 1.0 and 1.3.1 are both enabled by default. At least one version must be enabled.
- “vlan” is not valid if the configured mode for the Logical Switch is API. An API Logical Switch implicitly operates on all ports, link aggregates, and VLANs not assigned to other OpenFlow Logical Switches.
- OpenFlow version 1.0 and 1.3.1 use TCP port 6633.
- Enabling learned MAC update only applies if the configured mode for the Logical Switch is API.
Examples

-> openflow logical-switch vswitch1
-> openflow logical-switch vswitch1 admin-state enable
-> openflow logical-switch vswitch1 mode normal version 1.0 vlan 5
-> openflow logical-switch vswitchnc mode pfc-channel
-> no openflow logical-switch vswitch1

openflow logical-switch controller

Configures a Controller for an OpenFlow Logical Switch. You can configure up to three (3) Controllers per Logical Switch.

**openflow logical-switch name controller** `{ip_address | domain_name} [:port] [priority num] admin-state {enable | disable}`

**no openflow logical-switch name controller** `{ip_address | domain_name} [:port]`

---

**Syntax Definitions**

- **name**: The Logical Switch name (up to 32 characters).
- **ip_address**: The IP address of Controller.
- **domain_name**: The Fully Qualified Domain Name (FQDN) of the Controller. Specify a domain name up to 255 characters in length.
- **port**: The Controller IP Port (1 - 65535).
- **priority num**: Configures the priority value for the specified Controller in pfc-channel mode (0-2). 0 = highest, 2 = lowest.
- **enable**: Enables the connection to the Controller.
- **disable**: Disables the connection to the Controller.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>6633</td>
</tr>
<tr>
<td>priority num</td>
<td>2</td>
</tr>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to remove a Controller for a Logical Switch.
- Specify either the IPv4 address or the FQDN for the Controller. When an FQDN is specified, the switch will resolve the IP address for that domain.
• If a Logical Switch cannot connect to any of its Controllers, it runs in “Fail Secure Mode”. All flow aging, etc., continues unaffected while the Controllers are disconnected.

• Use the priority parameter to configure the priority for the specified Controller. If Controllers have the same priority, the one configured first will have priority.

Examples

-> openflow logical-switch vswitch1 controller 1.2.3.4
-> openflow logical-switch vswitch1 controller 1.2.3.4:6634
-> openflow logical-switch vswitch1 controller 1.2.3.4:6634 admin-state disable
-> openflow logical-switch vswitch1 controller 1.2.3.4:6634 priority 1
-> openflow logical-switch vswitchnec controller opendaylight.abc.com
-> openflow logical-switch vswitchnec controller opendaylight.abc.com:6635
-> openflow logical-switch vswitchnec controller opendaylight.abc.com:6635 disable
-> openflow logical-switch vswitchnec controller opendaylight.abc.com priority 1
-> no openflow logical-switch vswitch1 controller 1.2.3.4
-> no openflow logical-switch vswitchnec controller opendaylight.abc.com

Release History

openflow logical-switch interfaces

Configures a range of interfaces to/from a Logical Switch.

```
openflow logical-switch name interfaces {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2] | [type {trunk | access}] | [native-vlan vlan] | [vlan-tag vlan[-vlan2]]}
```

```
no openflow logical-switch name interfaces {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]}
```

**Syntax Definitions**

- **name**: The Logical Switch name (up to 32 characters).
- **chassis/slot/port[-port2]**: The chassis ID, slot, and port number.
- **agg_id[-agg_id2]**: The link aggregate ID number.
- **trunk**: Configures the interface type as trunk.
- **access**: Configures the interface type as access.
- **native-vlan vlan**: The default VLAN for an interface in the logical switch. Traffic on this port will be untagged for the native VLAN. Traffic on all other VLANs on this port will be tagged. (2-4093)
- **vlan-tag vlan[-vlan2]**: The list of allowed tagged VLANs for an interface. Traffic on these allowed VLAN(s) of the ports and Untagged traffic will not carry an 802.1q tag. Traffic on all other VLANs on the port will be dropped. (2-4093)

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>access</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The **native-vlan** and **vlan-tag** parameters are valid only if the logical switch mode is pfc-channel.

**Examples**

- `-> openflow logical-switch vswitch1 interfaces port 1/1/1`
- `-> no openflow logical-switch vswitch1 interfaces port 1/1/1`
- `-> openflow logical-switch vswitch2 interfaces linkagg 5`
-> no openflow logical-switch vswitch2 interfaces linkagg 5
-> openflow logical-switch vswitch1 interfaces port 1/1/1-8
-> no openflow logical-switch vswitch1 interfaces port 1/1/1-8
-> openflow logical-switch vswitchnec interfaces port 1/1/20 type trunk
-> openflow logical-switch vswitchnec interfaces port 1/1/20 native-vlan 3
-> openflow logical-switch vswitchnec interfaces port 1/1/20 vlan-tag 4-5

show openflow logical-switch

Displays information about configured OpenFlow Logical Switches.

show openflow logical-switch [name | controllers | interfaces [vlans | port | linkagg] | details]

Syntax Definitions

name
The Logical Switch name (up to 32 characters).

controllers
The controllers assigned to this logical switch.

interfaces
The interfaces assigned to this logical switch.

details
The details of the logical switch.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Enter a Logical Switch name to display only information about a specific Logical Switch.
- The DPID, TCP-Buffer-Size, Probe-Time, and Failure-Detect-Time are only applicable for a logical switch in PFC mode.

Examples

-> show openflow logical-switch

Logical Switch Admin State Mode Versions VLAN MAC Ctrlrs Intf Flows
vswitch1     Ena     Norm  1.0   1     Dis   1     4    0
vswitch2     Dis     Norm  1.0, 1.3.1 5     Dis   3     4    2
vswitchnec   Ena     PFC  1.0, 1.3.1 N/A   Dis   1     0    0

output definitions

Logical Switch The Logical Switch name
Admin State The Logical Switch administrative state (Enabled or Disabled).
Mode The Logical Switch operational Mode (Normal/API/PFC).
### versions
The OpenFlow versions enabled on the Logical Switch (1.0/1.3.1).

### VLAN
The default VLAN for all ports assigned to the Logical Switch. Zero (0) indicates no VLAN configured.

### Learn MAC
Whether new source learned MAC addresses are forwarded to a WLAN controller (Enabled or Disabled).

### Ctrlrs
The number of Controllers configured for the Logical Switch (up to three (3) Controllers can be configured per Logical Switch).

### Intf
The number of interfaces (ports and link aggregations) configured for the Logical Switch.

### flows
The number of flows pushed to the Logical Switch by its Controllers.

```
-> show openflow logical-switch controllers
<table>
<thead>
<tr>
<th>Logical Switch</th>
<th>Controller</th>
<th>Role</th>
<th>Admin State</th>
<th>Oper State</th>

<td>Master</td>
<td>Ena</td>
<td>Active</td>
</tr>
</tbody>
</table>
```

### Logical Switch
The Logical Switch name

### Controller
The Controller IP address or Fully Qualified Domain Name (FQDN) and port. If the FQDN is longer than 22 characters, the name may appear truncated in this field.

### Role
Current role of the Controller (Equal, Master, or Slave).

### Admin State
The Logical Switch administrative state (Enabled or Disabled).

### Oper State
Current connection state of the Controller (invalid, operDisabled, sendError, init, connecting, backoff, exchangingHello, active, idle, disconnected).

```
-> show openflow logical-switch interfaces
<table>
<thead>
<tr>
<th>Logical Switch</th>
<th>Interface</th>
<th>Mode</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>vswitch1</td>
<td>1/1/1</td>
<td>Norm</td>
<td></td>
</tr>
<tr>
<td>vswitch2</td>
<td>1/1/2</td>
<td>Norm</td>
<td></td>
</tr>
<tr>
<td>vswitch2</td>
<td>1/1/3</td>
<td>Norm</td>
<td></td>
</tr>
<tr>
<td>vswitch2</td>
<td>1/1/5</td>

<td></td>
</tr>
<tr>
<td>vswitch2</td>
<td>1/1/10</td>
<td>Norm</td>
<td></td>
</tr>
<tr>
<td>vswitchnec</td>
<td>1/1/5</td>
<td>PFC</td>
<td>Access</td>
</tr>
<tr>
<td>vswitchnec</td>
<td>0/5</td>
<td>PFC</td>
<td>Access</td>
</tr>
</tbody>
</table>
```

### Logical Switch
The Logical Switch name

### Interface
The interface slot/port or link aggregate ID configured for the Logical Switch.
-> show openflow logical-switch vswitchnec details
Logical-Switch: vswitchnec
DPID = 0x1234567890123456
TCP-Buffer-Size = 2 Kilobytes
Probe-Time = 5 Sec
Failure-Detect-Time = 4 Sec
Table-Miss-Action = DROP

output definitions

Mode The Logical Switch operational Mode (Normal/API/PFC).
Type The type of interface assigned to the logical switch (Access or Trunk).
• Access interfaces support only untagged ports in the native VLAN.
• Trunk interfaces support untagged ports in the native VLAN and tagged ports in other VLANs.

68  DNS Commands

A Domain Name System resolver is an internet service that translates host names into IP addresses. Every time you use a host name, a DNS service must resolve the name to an IP address. You can configure up to three domain name servers. If the primary DNS server does not know how to translate a particular host name, it asks the secondary DNS server (if specified). If this fails, it asks the third DNS server (if specified), until the correct IP address is returned (resolved). If all DNS servers have been queried and the name is still not resolved to an IP address, the DNS resolver will fail and issue an error message.

MIB information for the DNS commands is as follows:

Filename:  ALCATEL-IND1-SYSTEM.mib
Module:    alcatelIND1SystemMIB

A summary of the available commands is listed here.

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip domain-lookup</td>
</tr>
<tr>
<td>ip name-server</td>
</tr>
<tr>
<td>ipv6 name-server</td>
</tr>
<tr>
<td>ip domain-name</td>
</tr>
<tr>
<td>show dns</td>
</tr>
</tbody>
</table>
**ip domain-lookup**

Enables or disables the DNS resolver.

-ip domain-lookup

-no ip domain-lookup

---

**Syntax Definitions**

N/A

**Defaults**

By default, the DNS resolver is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to disable the DNS resolver.

- You must use the **ip domain-name** command to set a default domain name for your DNS resolver(s) and the **ip name-server** command to specify up to three DNS servers to query on host lookups.

- The **ip domain-lookup** command enables the DNS resolver.

**Examples**

- `-> ip domain-lookup`
- `-> no ip domain-lookup`

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

<table>

</table>
**ip name-server**

Specify the IP addresses of up to three servers to query on a host lookup.

```
ip name-server server_address1 [server_address2 [server_address3]]
```

**Syntax Definitions**

- `server_address1`: The IP address of the primary DNS server to query for host lookup. This is the only address that is required.
- `server_address2`: The IP address of the secondary DNS server to query for host lookup. This server will be queried only if the desired host name or host IP address is not located by the primary DNS server. A second IP address is optional.
- `server_address3`: The IP address of the DNS server with the lower priority. This server will be queried only if the desired host name or IP address is not located by the primary and secondary DNS servers. A third IP address is optional.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>V72/C32</th>
<th>6900</th>
<th>X48C6/T48C6/</th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Configuration of the DNS resolver to resolve any host query requires that you first set the default domain name with the `ip domain-name` command and enable the DNS resolver function with the `ip domain-lookup` command before you specify the IP addresses of the DNS servers by using the `ip name-server` command.

- You can configure up to three IPv4 DNS servers and three IPv6 DNS servers in a switch.

**Examples**

```
-> ip name-server 10.255.11.66
```

**Release History**

Release 7.1.1; command was introduced.
Related Commands

- **ip domain-lookup** Enables or disables the DNS resolver.
- **ip domain-name** Sets or deletes the default domain name for DNS lookups.
- **show dns** Displays the current DNS resolver configuration and status.

MIB Objects

- **systemDNS**
  - systemDNSNsAddr1
  - systemDNSNsAddr2
  - systemDNSNsAddr3
**ipv6 name-server**

Specifies the IPv6 addresses of up to three IPv6 DNS servers to query on a host lookup.

```
ipv6 name-server server_ipv6_address1 [server_ipv6_address2 [server_ipv6_address3]]
```

**Syntax Definitions**

- `server_ipv6_address1`: The IPv6 address of the primary IPv6 DNS server to query for host lookup. Specifying the primary IPv6 DNS address is mandatory.
- `server_ipv6_address2`: The IPv6 address of the secondary IPv6 DNS server to query for host lookup. This server will be queried only if the desired host name is not able to be resolved by the primary IPv6 DNS server. A second IPv6 address is optional.
- `server_ipv6_address3`: The IPv6 address of the IPv6 DNS server with the lower priority. This server will be queried only if the desired host name is not able to be resolved by both the primary and secondary IPv6 DNS servers. A third IPv6 address is optional.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

</table>

**Usage Guidelines**

- Configuration of the DNS resolver to resolve any host query requires that you first set the default domain name with the `ip domain-name` command and enable the DNS resolver function with the `ip domain-lookup` command before you specify the IPv6 addresses of the IPv6 DNS servers by using the `ipv6 name-server` command.
- You cannot use multicast, loopback, link-local and unspecified IPv6 addresses for specifying IPv6 DNS servers.
- You can configure up to three IPv6 DNS servers and three IPv4 DNS servers in a switch.

**Examples**

```
-> ipv6 name-server fec0::2d0:d3:f3fc
-> ipv6 name-server fe2d::2c f302::3de1:1 f1bc::202:fd40:f3
```

**Release History**
Release 7.1.1; command was introduced.

**Related Commands**

- `ip domain-lookup`: Enables or disables the DNS resolver.
- `ip domain-name`: Sets or deletes the default domain name for DNS lookups.
- `show dns`: Displays the current DNS resolver configuration and status.

**MIB Objects**

- `systemDNS`
  - `systemDNSIPv6Addr1`
  - `systemDNSIPv6Addr2`
  - `systemDNSIPv6Addr3`
**ip domain-name**

Sets or deletes the default domain name for DNS lookups.

`ip domain-name name`

`no ip domain-name`

---

**Syntax Definitions**

`name` The default domain name for host lookups.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6/</th>
<th>9900</th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to delete the default domain name.
- Use this command to set the default domain name for DNS lookups.

**Examples**

- `ip domain-name company.com`
- `no ip domain-name`

**Release History**

Release 7.1.1; command was introduced.
**Related Commands**

- **ip domain-lookup** Enables or disables the DNS resolver.
- **ip name-server** Specifies the IP addresses of up to three servers to query on a host lookup.
- **ipv6 name-server** Specifies the IPv6 addresses of up to three IPv6 DNS servers to query on a host lookup.
- **show dns** Displays the current DNS resolver configuration and status.

**MIB Objects**

- systemDNS
  - systemDNSDomainName
show dns

Displays the current DNS resolver configuration and status.

A Software License and Copyright Statements

This appendix contains ALE USA, Inc. and third-party software vendor license and copyright statements.

ALE USA, Inc. License Agreement

ALE USA, INC. SOFTWARE LICENSE AGREEMENT

IMPORTANT. Please read the terms and conditions of this license agreement carefully before opening this package.

By opening this package, you accept and agree to the terms of this license agreement. If you are not willing to be bound by the terms of this license agreement, do not open this package. Please promptly return the product and any materials in unopened form to the place where you obtained it for a full refund.

1. License Grant. This is a license, not a sales agreement, between you (the “Licensee”) and ALE USA, Inc. ALE USA, Inc. hereby grants to Licensee, and Licensee accepts, a non-exclusive license to use program media and computer software contained therein (the “Licensed Files”) and the accompanying user documentation (collectively the “Licensed Materials”), only as authorized in this License Agreement. Licensee, subject to the terms of this License Agreement, may use one copy of the Licensed Files on the Licensee’s system. Licensee agrees not to assign, sublicense, transfer, pledge, lease, rent, or share their rights under this License Agreement. Licensee may retain the program media for backup purposes with retention of the copyright and other proprietary notices. Except as authorized under this paragraph, no copies of the Licensed Materials or any portions thereof may be made by Licensee and Licensee shall not modify, decompile, disassemble, reverse engineer, or otherwise attempt to derive the Source Code. Licensee is also advised that ALE USA, Inc. products contain embedded software known as firmware which resides in silicon. Licensee may not copy the firmware or transfer the firmware to another medium.

2. ALE USA, Inc.’s Rights. Licensee acknowledges and agrees that the Licensed Materials are the sole property of ALE USA, Inc. and its licensors (herein “its licensors”), protected by U.S. copyright law, trademark law, and are licensed on a right to use basis. Licensee further acknowledges and agrees that all rights, title, and interest in and to the Licensed Materials are and shall remain with ALE USA, Inc. and its licensors and that no such right, license, or interest shall be asserted with respect to such copyrights and trademarks. This License Agreement does not convey to Licensee an interest in or to the Licensed Materials, but only a limited right to use revocable in accordance with the terms of this License Agreement.
3. **Confidentiality.** ALE USA, Inc. considers the Licensed Files to contain valuable trade secrets of ALE USA, Inc., the unauthorized disclosure of which could cause irreparable harm to ALE USA, Inc.. Except as expressly set forth herein, Licensee agrees to use reasonable efforts not to disclose the Licensed Files to any third party and not to use the Licensed Files other than for the purpose authorized by this License Agreement. This confidentiality obligation shall continue after any termination of this License Agreement.

4. **Indemnity.** Licensee agrees to indemnify, defend and hold ALE USA, Inc. harmless from any claim, lawsuit, legal proceeding, settlement or judgment (including without limitation ALE USA, Inc.’s reasonable United States and local attorneys’ and expert witnesses’ fees and costs) arising out of or in connection with the unauthorized copying, marketing, performance or distribution of the Licensed Files.

5. **Limited Warranty.** ALE USA, Inc. warrants, for Licensee’s benefit alone, that the program media shall, for a period of ninety (90) days from the date of commencement of this License Agreement (referred to as the Warranty Period), be free from defects in material and workmanship. ALE USA, Inc. further warrants, for Licensee benefit alone, that during the Warranty Period the Licensed Files shall operate substantially in accordance with the functional specifications in the User Guide. If during the Warranty Period, a defect in the Licensed Files appears, Licensee may return the Licensed Files to ALE USA, Inc. for either replacement or, if so elected by ALE USA, Inc., refund of amounts paid by Licensee under this License Agreement. EXCEPT FOR THE WARRANTIES SET FORTH ABOVE, THE LICENSED MATERIALS ARE LICENSED “AS IS” AND ALE USA, INC. AND ITS LICENSORS DISCLAIM ANY AND ALL OTHER WARRANTIES, WHETHER EXPRESS OR IMPLIED, INCLUDING (WITHOUT LIMITATION) ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. SOME STATES DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES SO THE ABOVE EXCLUSIONS MAY NOT APPLY TO LICENSEE. THIS WARRANTY GIVES THE LICENSEE SPECIFIC LEGAL RIGHTS. LICENSEE MAY ALSO HAVE OTHER RIGHTS WHICH VARY FROM STATE TO STATE.

6. **Limitation of Liability.** ALE USA, Inc.’s cumulative liability to Licensee or any other party for any loss or damages resulting from any claims, demands, or actions arising out of or relating to this License Agreement shall not exceed the license fee paid to ALE USA, Inc. for the Licensed Materials. IN NO EVENT SHALL ALE USA, INC. BE LIABLE FOR ANY INDIRECT, INCIDENTAL, CONSEQUENTIAL, SPECIAL, OR EXEMPLARY DAMAGES OR LOST PROFITS, EVEN IF ALE USA, INC. HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. SOME STATES DO NOT ALLOW THE LIMITATION OR EXCLUSION OF LIABILITY FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATION OR EXCLUSION TO INCIDENTAL OR CONSEQUENTIAL DAMAGES MAY NOT APPLY TO LICENSEE.

7. **Export Control.** This product is subject to the jurisdiction of the United States. Licensee may not export or reexport the Licensed Files, without complying with all United States export laws and regulations, including but not limited to (i) obtaining prior authorization from the U.S. Department of Commerce if a validated export license is required, and (ii) obtaining “written assurances” from licensees, if required.

8. **Support and Maintenance.** Except as may be provided in a separate agreement between ALE USA, Inc. and Licensee, if any, ALE USA, Inc. is under no obligation to maintain or support the copies of the Licensed Files made and distributed hereunder and ALE USA, Inc. has no obligation to furnish Licensee with any further assistance, documentation or information of any nature or kind.

9. **Term.** This License Agreement is effective upon Licensee opening this package and shall continue until terminated. Licensee may terminate this License Agreement at any time by returning the Licensed Materials and all copies thereof and extracts therefrom to ALE USA, Inc. and certifying to ALE USA, Inc. in writing that all Licensed Materials and all copies thereof and extracts therefrom have been returned or erased by the memory of Licensee’s computer or made non-readable. ALE USA, Inc. may terminate this License Agreement upon the breach by Licensee of any term hereof. Upon such termination by
ALE USA, Inc., Licensee agrees to return to ALE USA, Inc. or destroy the Licensed Materials and all copies and portions thereof.

10. **Governing Law.** This License Agreement shall be construed and governed in accordance with the laws of the State of California.

11. **Severability.** Should any term of this License Agreement be declared void or unenforceable by any court of competent jurisdiction, such declaration shall have no effect on the remaining terms herein.

12. **No Waiver.** The failure of either party to enforce any rights granted hereunder or to take action against the other party in the event of any breach hereunder shall not be deemed a waiver by that party as to subsequent enforcement of rights or subsequent actions in the event of future breaches.

13. **Notes to United States Government Users.** Software and documentation are provided with restricted rights. Use, duplication or disclosure by the government is subject to (i) restrictions set forth in GSA ADP Schedule Contract with ALE USA, Inc.’s reseller(s), or (ii) restrictions set forth in subparagraph (c) (1) and (2) of 48 CFR 52.227-19, as applicable.

14. **Third Party Materials.** Licensee is notified that the Licensed Files contain third party software and materials licensed to ALE USA, Inc. by certain third party licensors. Some third party licensors are third part beneficiaries to this License Agreement with full rights of enforcement. Please refer to the section entitled “Third Party Licenses and Notices” on page -4 for the third party license and notice terms.
Third Party Licenses and Notices

Legal Notices applicable to any software distributed alone or in connection with the product to which this document pertains, are contained in files within the software itself located at: /\texttt{flash/foss}.

Also, if needed, we provide all FOSS (Free and Open Source Software) source code used in this release at the following URL: https://github.com/Alcatel-LucentEnterpriseData.

OmniSwitch AOS Release 8 CLI Reference Guide April 2023
**IPsec Commands**

- `ipsec key name {sa-authentication | sa-encryption} [encrypted] key`
- `no ipsec key name {sa-authentication | sa-encryption}`
- `ipsec security-key [old_key] new_key`
- `ipsec policy name [service {telnet | ftp | ssh | snmp | http | https}] [priority priority] [source {ipv6_address|ipv4_address}[prefix_length]] [port port] [destination {ipv6_address|ipv4_address}[prefix_length]] [port port] [protocol {any | icmp6 [type type] | tcp | udp | ospf | vrrp | number protocol}] [in | out] [discard | ipsec | none] [description description] [admin-state {enable | disable}]`
- `no ipsec policy name`
- `ipsec policy name rule index [ah | esp]`
- `no ipsec policy name`
- `ipsec sa name {esp | ah} [source {ipv6_address | ipv4_address}] [destination {ipv6_address | ipv4_address}] [spi spi] [encryption {null | 3des-cbc | aes-cbc [key-size key_length]}] [authentication {none | hmac-md5 | hmac-sha1 | hmac-sha256 | hmac-sha384 | hmac-sha512 | aes-xcbc-mac}] [description description] [admin-state {enable | disable}]`
- `no ipsec sa name`
- `ipsec default-discard {ipv4 | ipv6} admin-state {enable | disable}`
- `show ipsec policy [name | ipv4 | ipv6]`
- `show ipsec sa [name] [esp | ah] [source ipv6_address | ipv4_address] [destination ipv6_address | ipv4_address] [spi] [encryption null | 3des-cbc | aes-cbc [key-size key_length]] [authentication none | hmac-md5 | hmac-sha1 | hmac-sha256 | hmac-sha384 | hmac-sha512 | aes-xcbc-mac] [description description] [admin-state enable | disable]`
- `show ipsec statistics`

**RIP Commands**

- `ip load rip`
- `ip rip admin-state {enable | disable}`
- `ip rip interface {interface_name}`
- `no ip rip interface {interface_name}`
- `ip rip interface {interface_name} admin-state {enable | disable}`
- `ip rip interface {interface_name} metric value`
- `ip rip interface {interface_name} send-version {none | v1 | v1compatible | v2}`
- `ip rip interface {interface_name} receive-version {v1 | v2 | both | none}`
- `ip rip interface {interface_name} ingress-filter {filter_name}`
- `ip rip interface {interface_name} egress-filter {filter_name}`
- `ip rip force-hold-down-timer seconds`
- `ip rip host-route`
- `no ip rip host-route`
- `ip rip route-tag value`
- `ip rip interface {interface_name} auth-type {none | simple | md5}`
- `ip rip interface {interface_name} key-key string`
- `ip rip update-interval seconds`
- `ip rip invalid-timer seconds`
- `ip rip garbage-timer seconds`
- `ip rip hold-down-timer seconds`
- `show ip rip`
- `show ip rip routes [ip_address ip_mask]`
- `show ip rip interface [interface_name]`
- `show ip rip peer [ip_address]`
- `ipv6 load rip`
- `ipv6 rip admin-state {enable | disable}`
- `ipv6 rip invalid-timer seconds`
- `ipv6 rip garbage-timer seconds`
- `ipv6 rip hold-down-timer seconds`
- `ipv6 rip jitter value`
- `ipv6 rip route-tag value`
- `ipv6 rip update-interval seconds`
- `ipv6 rip triggered-sends {all | updated-only | none}`
- `ipv6 rip interface if_name`
- `no ipv6 rip interface if_name`

- app-fingerprint {port chassis/slot/port | linkagg agg_id[-agg_id2]} {monitor-group group_name | policy-list-name policy_list | unp-profile}
- no app-fingerprint {port chassis/slot/port | linkagg agg_id[-agg_id2]}
- app-fingerprint signature-file filename
- app-fingerprint reload-signature-file
- app-fingerprint trap {enable | disable}
- show app-fingerprint configuration
- show app-fingerprint {port chassis/slot/port | linkagg agg_id}
- show app-fingerprint app-name [app_name]
- show app-fingerprint app-group [group_name]
- show app-fingerprint database {port chassis/slot/port | linkagg agg_id} [detail]
- show app-fingerprint statistics {port chassis/slot/port | linkagg agg_id}

**FCoE/FC Gateway Commands**

- fibre-channel vsan {vsan_id[-vsan_id2]} [admin-state {enable | disable}] [name description]
- no fibre-channel vsan {vsan_id[-vsan_id2]}
- fibre-channel port chassis/slot/port[-port2] mode {np | f | te} [bb-sc-n buffer_num]
- no fibre-channel port chassis/slot/port[-port2]
- fibre-channel vsan vsan_id members port chassis/slot/port[-port2]
- no fibre-channel vsan vsan_id members port chassis/slot/port[-port2]
- fcoe vsan-map vsan vsan_id [admin-state {enable | disable}] [name description]
- no fcoe vsan-map vsan vsan_id
- fibre-channel npiv-proxy load-balance static {default | dynamic-reorder | node-based}
fibre-channel npiv-proxy load-balance static {port chassis/slot/port | linkagg agg_id} fc-port
no fibre-channel npiv-proxy load-balance static {port chassis/slot/port | linkagg agg_id}
fibre-channel npiv-proxy load-balance static {port chassis/slot/port | linkagg agg_id}
no fibre-channel npiv-proxy load-balance static {port chassis/slot/port | linkagg agg_id}

VM-Snooping Commands

vm-snooping static-policing rule_name [list list_name]
no vm-snooping static-policing rule_name [list list_name]
vm-snooping logging-threshold number-of-flows [flow_num | default]
vm-snooping {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} [admin-state {enable | disable}]
no vm-snooping {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
show vm-snooping config
show vm-snooping port
show vm-snooping database [vxlan udp-port udp_port_num | vtep-ip ip_address] | vni vxlan_id | vm-src-mac mac_address | vm-ip ip_address [detail] [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]] [detail]
clear vm-snooping database /port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]
show vm-snooping virtual-machines
show vm-snooping filtering-resource
show vm-snooping statistics [hardware | sampling] [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]]
show vm-snooping static-policy
clear vm-snooping statistics [sampling [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]]][hardware]

Port Mapping Commands

port-mapping_session_id [user-port {slot chassis/slot | chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} | network-port {slot chassis/slot | chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}]
no port-mapping_session_id [user-port {slot chassis/slot | chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} | network-port {slot chassis/slot | chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}]
port-mapping_session_id [enable | disable]
no port-mapping_session_id
port-mapping_session_id [unidirectional | bidirectional]
port-mapping_session_id unknown-unicast-flooding [enable | disable]
port-mapping_session_id dynamic-proxy-arp [enable | disable]
show port-mapping [session_id] status
show port-mapping [session_id]
show ip dynamic-proxy-arp

Learned Port Security Commands

port-security {port chassis/slot/port[-port2] | chassis} | {sap {port {linkagg sap_id} [admin-state {enable | disable | locked}] | no-aging {enable | disable}} [mac-move {enable | disable}] [learn-as-static {enable | disable}] [boot-up {enable | disable}]

VXLAN Snooping Commands

vm-snooping vxlan udp-port [udp_port_num[-udp_port_num2] | linkagg agg_id[-agg_id2] | chassis]
no vm-snooping vxlan udp-port [udp_port_num[-udp_port_num2] | linkagg agg_id[-agg_id2] | chassis]
no port-security learning-window
port-security {port chassis/slot/port[-port2] | chassis} | {sap [port | linkagg] sap_id} convert-to-static
port-security {port chassis/slot/port[-port2] | sap [port | linkagg] sap_id} mac mac_address [vlan vlan id]
no port-security {port chassis/slot/port[-port2] | sap [port | linkagg] sap_id} mac | all | mac_address [vlan vlan id]
port-security {port chassis/slot/port[-port2] | sap [port | linkagg] sap_id} maximum number
port-security {port chassis/slot/port[-port2] | sap [port | linkagg] sap_id} learn-trap-threshold number
port-security {port chassis/slot/port[-port2] | sap [port | linkagg] sap_id} max-filtering number
port-security {port chassis/slot/port[-port2] | sap [port | linkagg] sap_id} mac-range [low mac_address | high mac_address]
no port-security {port chassis/slot/port[-port2] | sap [port | linkagg] sap_id} mac-range [low mac_address]
port-security {port chassis/slot/port[-port2] | sap [port | linkagg] sap_id} violation
  {shutdown | restrict | discard} | violation recovery-time {default | seconds} | violation recovery-maximum {infinite | default | max_attempts}
port-security {port chassis/slot/port[-port2] | pkt-relay} no-pkt-relay
no port-security {port chassis/slot/port[-port2] | pkt-relay} no-pkt-relay
port-security pkt-relay protocol [udp] {icmp} {igmp}
port-security pkt-relay protocol udp [src-port port1[-port2]] [dst-port port1[-port2]]
show port-security pkt-relay filter
show port-security {port chassis/slot/port[-port2] | slot chassis/slot} | sap [violation | {port | linkagg} sap_id]
show port-security brief
show port-security learning-window

Port Mirroring and Monitoring Commands
port-mirroring port_mirror_sessionid source {port chassis/slot/port[-port2]} destination
  {port chassis/slot/port[-port2] | linkagg linkagg[-linkagg2]} [rpmir-vlan vlan id]
  [bidirectional | import | export | loopback] [unblocked-vlan vlan id] [tag-remove]
  [enable | disable]
port-mirroring port_mirror_sessionid no source {port chassis/slot/port[-port2] \[chassis/slot/
  port[-port2]...]
port-mirroring port_mirror_sessionid no destination {port chassis/slot/port[-port2] \[chassis/
