### Chapter 1 Ethernet Port Commands

- interfaces .......................................................................................................................... 1-1
- interfaces speed .............................................................................................................. 1-4
- interfaces crossover ........................................................................................................ 1-6
- interfaces duplex ............................................................................................................ 1-8
- interfaces alias ............................................................................................................... 1-10
- clear interfaces ............................................................................................................. 1-12
- interfaces max-frame-size ......................................................................................... 1-14
- interfaces inter-frame-gap ......................................................................................... 1-16
- interfaces flood-limit .................................................................................................. 1-18
- interfaces flood-limit action ..................................................................................... 1-20
- interfaces ingress-bandwidth .................................................................................... 1-22
- interfaces pause .......................................................................................................... 1-24
- interfaces link-trap ...................................................................................................... 1-26
- interfaces ddm ............................................................................................................ 1-28
- interfaces ddm-trap ..................................................................................................... 1-30
- interfaces wait-to-restore .......................................................................................... 1-32
- interfaces wait-to-shutdown ...................................................................................... 1-33
- interfaces eee .............................................................................................................. 1-35
- interfaces primary-port split-mode ......................................................................... 1-37
- interfaces port break-out .......................................................................................... 1-39
- interfaces fec .............................................................................................................. 1-41
- interfaces hybrid-mode ............................................................................................. 1-43
- interfaces loopback .................................................................................................... 1-45
- interfaces portgroup .................................................................................................. 1-47
- clear violation .............................................................................................................. 1-49
- violation recovery-maximum ..................................................................................... 1-51
- violation recovery-time .............................................................................................. 1-53
Chapter 2  Power over Ethernet (PoE) Commands ................................................. 2-1
lanpower service ....................................................................................... 2-3
lanpower port admin-state ............................................................... 2-5
lanpower type ....................................................................................... 2-6
lanpower power ................................................................................... 2-6
## Contents

- **Chapter 3** UDLLD Commands  
  - udld .......................................................... 3-1  
  - udld port .................................................... 3-2  
  - udld mode .................................................. 3-4  
  - udld probe-timer ........................................... 3-6  
  - udld echo-wait-timer ...................................... 3-8  
  - clear udld statistics port ................................. 3-10  
  - show udld configuration .................................. 3-12  
  - show udld configuration port ............................ 3-15  
  - show udld statistics port ................................. 3-18  
  - show udld neighbor port ................................. 3-20  
  - show udld status port .................................... 3-22  

- **Chapter 4** Source Learning Commands  
  - mac-learning ................................................ 4-1  
  - mac-learning flush ........................................ 4-2  
  - mac-learning flush domain all ....................... 4-4  
  - mac-learning flush domain vlan .................... 4-6  
  - mac-learning flush domain spb ..................... 4-8  
  - mac-learning flush domain vxlan .................... 4-10  
  - mac-learning flush domain l2gre .................... 4-12  
  - mac-learning flush domain local .................... 4-14  
  - mac-learning flush domain l2gre .................... 4-16

Chapter 18 SIP Commands

- sip-snooping admin-state .......................................................... 18-2
## Chapter 19  Automatic Fabric Commands

- auto-fabric admin-state ................................................................. 19-2
- auto-fabric interface ..................................................................... 19-4
- auto-fabric discovery start ........................................................... 19-6
- auto-fabric protocols ................................................................... 19-7
- auto-fabric config-save interval .................................................... 19-10
- auto-fabric config-save admin-state .............................................. 19-12
- auto-fabric discovery-interval ....................................................... 19-13
- auto-fabric protocols spb default-profile ...................................... 19-14
- auto-fabric protocols spb set-profile ........................................... 19-16
- show auto-fabric config ............................................................... 19-18
- show auto-fabric config interface ................................................ 19-21

## Chapter 20  IP Commands

- ip interface .................................................................................. 20-1
- ip interface rtr-port ..................................................................... 20-5
- ip interface tunnel ....................................................................... 20-9
- ip interface dhcp-client .............................................................. 20-11
- ip router primary-address ............................................................ 20-13
- ip router router-id ....................................................................... 20-16
- ip static-route ............................................................................. 20-17
- ip static-route all bfd-state ......................................................... 20-19
- ip static-route bfd-state .............................................................. 20-22
- ip route-pref ............................................................................... 20-23
- ip default-ttl .............................................................................. 20-25
- ping ............................................................................................ 20-27
- traceroute ................................................................................... 20-28

Chapter 44 FCoE/FC Gateway Commands ............................................. 44-1
    fibre-channel vsan .......................................................................... 44-4
    fibre-channel port mode .................................................................. 44-6
    fibre-channel vsan members ............................................................ 44-8
    fcoe vsan-map ................................................................................. 44-10
Port Mapping Commands

- port-mapping user-port network-port
- port-mapping unidirectional bidirectional
- port-mapping unknown-unicast-flooding
- port-mapping dynamic-proxy-arp
- show port-mapping status
- show port-mapping

Chapter 46

Port Mapping Commands

- port-mapping user-port network-port
- port-mapping unidirectional bidirectional
- port-mapping unknown-unicast-flooding
- port-mapping dynamic-proxy-arp
- show port-mapping status
- show port-mapping

Chapter 45

VXLAN Snooping Commands

- vm-snooping admin-state
- vm-snooping policy-mode
- vm-snooping trap
- vm-snooping filtering-resource trap threshold
- vm-snooping sampling-rate
- vm-snooping aging-timer
- vm-snooping vxlan udp-port
- vm-snooping static-policy rule
- vm-snooping logging-threshold
- vm-snooping port
- show vm-snooping config
- show vm-snooping port
- show vm-snooping database
- clear vm-snooping database
- show vm-snooping virtual-machines
- show vm-snooping filtering-resource
- show vm-snooping statistics
- show vm-snooping static-policy
- clear vm-snooping statistics
Chapter 47  Learned Port Security Commands .......................................................... 47-1
  port-security ......................................................................................................... 47-2
  port-security learning-window ............................................................................. 47-5
  port-security convert-to-static ............................................................................. 47-9
  port-security mac ................................................................................................. 47-11
  port-security maximum ........................................................................................ 47-14
  port-security learn-trap-threshold ....................................................................... 47-16
  port-security port max-filtering .......................................................................... 47-18

  port-security port violation ................................................................................. 47-23
  port-security port pkt-relay ............................................................................... 47-25
  port-security pkt-relay protocol ........................................................................ 47-27
  port-security pkt-relay protocol udp ................................................................. 47-29
  show port-security pkt-relay filter ................................................................. 47-31
  show port-security ......................................................................................... 47-33
  show port-security mac-range ............................................................................ 47-36
  show port-security brief .................................................................................... 47-38
  show port-security learning-window .................................................................. 47-40

Chapter 48  Port Mirroring and Monitoring Commands ........................................... 48-1
  port-mirroring source destination ................................................................. 48-2
  port-mirroring .................................................................................................. 48-6
  port-mirroring traffic-priority .......................................................................... 48-8
  port-monitoring source .................................................................................... 48-9
  port-monitoring ............................................................................................... 48-12
  show port-mirroring status .............................................................................. 48-14
  show port-monitoring status ............................................................................ 48-16
  show port-monitoring file ............................................................................... 48-18

Chapter 49  sFlow Commands ................................................................................. 49-1
  sflow agent ..................................................................................................... 49-3
  sflow receiver ................................................................................................. 49-5
  sflow sampler .................................................................................................. 49-7
  sflow poller ..................................................................................................... 49-9
  show sflow agent ........................................................................................... 49-11
  show sflow receiver ....................................................................................... 49-13
  show sflow sampler ........................................................................................ 49-15
  show sflow poller ........................................................................................... 49-17

Chapter 50  RMON Commands .............................................................................. 50-1
  rmon probes ................................................................................................... 50-2
  show rmon probes ......................................................................................... 50-4
  show rmon events .......................................................................................... 50-7

Chapter 51  Switch Logging Commands ................................................................. 51-1
  swlog ............................................................................................................. 51-2
  swlog syslog-facility-id ............................................................................... 51-4
  swlog appid ................................................................................................... 51-6
  swlog output .................................................................................................. 51-9
  swlog output flash-file-size ............................................................................ 51-13
Chapter 52 Health Monitoring Commands

- health threshold ......................................................... 52-2
- health interval ......................................................... 52-5
- show health configuration ........................................ 52-7
- show health ................................................................. 52-9
- show health all ......................................................... 52-9

Chapter 53 Ethernet OAM Commands

- ethoam vlan ........................................................... 53-3
- ethoam domain ......................................................... 53-5
- ethoam domain mhf .................................................. 53-7
- ethoam domain id-permission .................................. 53-9
- ethoam association .................................................. 53-11
- ethoam association primary vlan ......................... 53-13
- ethoam association mhf ........................................... 53-15
- ethoam association id-permission ......................... 53-17
- ethoam association ccm-interval ......................... 53-19
- ethoam association endpoint-list ......................... 53-21
- ethoam association allowed-cvlan-list .................. 53-23
- clear ethoam statistics .......................................... 53-25
- ethoam default-domain level ......................... 53-27
- ethoam default-domain mhf .................................. 53-28
- ethoam default-domain id-permission ................ 53-29
- ethoam default-domain primary-vlan .................. 53-30
- ethoam endpoint ......................................................... 53-32
- ethoam endpoint admin-state ............................. 53-34
- ethoam endpoint rfp ................................................. 53-36
- ethoam endpoint ccm ............................................. 53-38
- ethoam endpoint priority ....................................... 53-40
- ethoam endpoint lowest-priority-defect ............. 53-42
- ethoam endpoint ctag-priority ............................ 53-44
- ethoam linktrace ......................................................... 53-46
- ethoam loopback ......................................................... 53-48
- ethoam fault-alarm-time ........................................ 53-50
- ethoam fault-reset-time ........................................ 53-52
- ethoam one-way-delay ........................................... 53-54
- ethoam two-way-delay ........................................... 53-56
- clear ethoam ............................................................. 53-58
- show ethoam ............................................................. 53-59
- show ethoam domain .............................................. 53-61
- show ethoam domain association ..................... 53-63
- show ethoam domain association end-point .......... 53-65
- show ethoam default-domain configuration .......... 53-69
Chapter 54 LINK OAM Commands ................................................................. 54-1
efm-oam admin-state ............................................................................ 54-3
efm-oam port admin-state ............................................................ 54-5
efm-oam port mode ............................................................................. 54-7
efm-oam port keepalive-interval .................................................... 54-9
efm-oam port hello-interval ............................................................. 54-11
efm-oam port remote-loopback ....................................................... 54-13
efm-oam port remote-loopback start ............................................ 54-15
efm-oam port propagate-events ....................................................... 54-17
efm-oam errored-frame-period ...................................................... 54-19
efm-oam errored-frame ............................................................... 54-21
efm-oam errored-frame-seconds-summary .................................... 54-23
efm-oam multiple-pdu-count .......................................................... 54-25
efm-oam port 11-ping ...................................................................... 54-26
show efm-oam configuration ........................................................... 54-28
show efm-oam port ........................................................................... 54-30
show efm-oam port detail ............................................................... 54-34
show efm-oam port statistics ............................................................ 54-37
show efm-oam port remote detail ................................................... 54-41
show efm-oam port history .............................................................. 54-43
show efm-oam port 11-ping detail .................................................. 54-45
clear efm-oam statistics ................................................................. 54-47
clear efm-oam log-history .............................................................. 54-49

Chapter 55 CPE Test Head Commands .................................................. 1-1
test-oam .......................................................... 1-3
test-oam direction ............................................................ 1-5
test-oam src-endpoint dst-endpoint ........................................... 1-7
test-oam port ............................................................................... 1-9
test-oam vlan test-frame ............................................................... 1-11
test-oam role .............................................................................. 1-13
test-oam duration rate packet-size ............................................. 1-15
test-oam frame ......................................................................... 1-17
test-oam l2-saa ........................................................................... 1-19
test-oam start stop .................................................................... 1-21
test-oam remote-sys-mac ............................................................ 1-23
test-oam statistics flash-logging ............................................... 1-25
show test-oam ........................................................................... 1-27
show test-oam statistics ............................................................ 1-31
show test-oam saa statistics ...................................................... 1-33
clear test-oam statistics ............................................................ 1-35
## Chapter 56 PPPoE Intermediate Agent

- `pppoe-ia` .............................................................................................................. 1-2
- `pppoe-ia {port | linkagg}` .................................................................................... 1-4
- `pppoe-ia {trust | client}` ...................................................................................... 1-6
- `pppoe-ia access-node-id` ..................................................................................... 1-8
- `pppoe-ia circuit-id` .............................................................................................. 1-10
- `pppoe-ia remote-id` ............................................................................................ 1-13
- `clear pppoe-ia statistics` .................................................................................... 1-15
- `show pppoe-ia configuration` ............................................................................. 1-17
- `show pppoe-ia {port | linkagg}` ........................................................................... 1-20
- `show pppoe-ia statistics` .................................................................................... 1-23

## Chapter 57 Service Assurance Agent Commands

- `saa` ......................................................................................................................... 2-2
- `saa type ip-ping` ............................................................................................... 2-4
- `saa type mac-ping` ............................................................................................. 2-6
- `saa spb` ................................................................................................................ 2-9
- `saa spb reset` ...................................................................................................... 2-12
- `saa spb flush` ...................................................................................................... 2-14
- `saa type ethoam-loopback` ................................................................................ 2-15
- `saa type ethoam-two-way-delay` ...................................................................... 2-18
- `saa start` ............................................................................................................. 2-21
- `saa stop` ............................................................................................................... 2-23
- `saa jitter-calculation enhanced` ........................................................................ 2-25
- `saa xml` ................................................................................................................. 2-27
- `show saa` ............................................................................................................. 2-29
- `show saa type config` ....................................................................................... 2-31
- `show saa spb` .................................................................................................... 2-36
- `show saa xml` ..................................................................................................... 2-38
- `show saa statistics` ............................................................................................ 2-40
- `show saa vrf` ...................................................................................................... 2-43

## Chapter 58 CMM Commands

- `reload secondary` .............................................................................................. 3-1
- `reload all` .......................................................................................................... 3-2
- `reload from` ...................................................................................................... 3-4
- `reload slot` ........................................................................................................ 3-6
## Chapter 59 Chassis Management and Monitoring Commands

About This Guide

This *OmniSwitch AOS Release 8 CLI Reference Guide* is a comprehensive resource to all Command Line Interface (CLI) commands available on the OmniSwitch.

Supported Platforms

The information in this guide applies only to the following products:

- OmniSwitch 6360 Series
- OmniSwitch 6465 Series
- OmniSwitch 6560 Series
- OmniSwitch 6570M Series
- OmniSwitch 6860 Series
- OmniSwitch 6865 Series
- OmniSwitch 6900 Series
- OmniSwitch 9900 Series

Who Should Read this Manual?

The audience for this user guide is network administrators and IT support personnel who need to configure, maintain, and monitor switches and routers in a live network. Anyone wishing to gain knowledge on the details of all CLI commands available on the OmniSwitch will benefit from the material in this reference guide. However, advanced users who have already familiarized themselves with the OmniSwitch CLI commands will benefit most from the detailed content in this guide.

When Should I Read this Manual?

Read this guide whenever you want detailed information on individual CLI commands. Although this guide provides helpful information during any stage of the configuration process, it is a good idea to first familiarize yourself with the software features available on the switch before investigating the detailed command information in this guide.

Overview information, procedures, and live network examples on switch software features can be found in the *OmniSwitch AOS Release 8 Switch Management Guide*, *OmniSwitch AOS Release 8 Network Configuration Guide*, *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide*, and *OmniSwitch AOS Release 8 Data Center Switching Guide*. Once you are familiar with the procedures and
base CLI commands in these configuration guides you can obtain more detailed information on the individual commands in this guide.
What is in this Manual?

This reference guide includes information on every CLI command available in the switch. Command reference information is included for base software commands as well as commands associated with optional software packages, such as Advanced Routing (multicast routing protocols and OSPF). The information provided for each CLI command includes:

- Command description.
- Syntax.
- Description of all keywords and variables included in the syntax.
- Default values.
- Usage guidelines, which include tips on when and how to use the command.
- Examples of command lines using the command.
- Related commands with descriptions.
- Release history, which indicates the release when the command was introduced.
- SNMP information, such as the MIB files related to a set of CLI commands. In addition each CLI command includes the corresponding MIB variables that map to all parameters included in a command.

What is Not in this Manual?

Primarily a reference, this guide does not provide step-by-step instructions on how to set up particular features on the switch. It also does not provide overview or application examples on software features. For comprehensive information on how to configure particular software features in the switch, consult the appropriate configuration guide.

This guide also does not provide any information on the network management applications, WebView and OmniVista. Further information on WebView and OmniVista can be found in the context-sensitive on-line help available with those applications.

How is the Information Organized?

Each chapter in this guide includes reference material for all commands related to a single software feature, such as server load balancing or link aggregation. Typically commands in a single chapter will share a common prefix.
## Text Conventions

The following table contains text conventions and usage guidelines for CLI commands as they are documented in this guide.

<table>
<thead>
<tr>
<th>Text Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>bold text</strong></td>
<td>Indicates basic command and keyword syntax.</td>
</tr>
<tr>
<td>Example:</td>
<td><em>show snmp station</em></td>
</tr>
<tr>
<td><strong>italicized text</strong></td>
<td>Indicates user-specific information such as IP addresses, slot numbers, passwords, names, etc.</td>
</tr>
<tr>
<td>Example:</td>
<td><em>no snmp station ip_address</em></td>
</tr>
<tr>
<td></td>
<td>Italicized text that is not enclosed with straight brackets ([ ]) indicates required information.</td>
</tr>
<tr>
<td><strong>[]</strong> (Straight Brackets)</td>
<td>Indicates optional parameters for a given command.</td>
</tr>
<tr>
<td>Example:</td>
<td><em>show aaa server [server_name]</em></td>
</tr>
<tr>
<td></td>
<td>Here, you can enter either of the following options:</td>
</tr>
<tr>
<td></td>
<td><em>show aaa server</em></td>
</tr>
<tr>
<td></td>
<td><em>show aaa server server_name</em> (where server_name is the user-specified server name, e.g., show aaa server myserver1)</td>
</tr>
<tr>
<td></td>
<td>Note that this example includes <em>italicized text</em>. The optional parameter in this case is a user-specified server name.</td>
</tr>
<tr>
<td><strong>{}</strong> (Curly Braces)</td>
<td>Indicates that the user must choose between one or more parameters.</td>
</tr>
<tr>
<td>Example:</td>
<td>*port mirroring {enable</td>
</tr>
<tr>
<td></td>
<td>Here, you must choose one of the following:</td>
</tr>
<tr>
<td></td>
<td><em>port mirroring enable</em></td>
</tr>
<tr>
<td></td>
<td><em>port mirroring disable</em></td>
</tr>
<tr>
<td>**</td>
<td>** (Vertical Pipes)</td>
</tr>
<tr>
<td>Example:</td>
<td>*show health threshold [rx</td>
</tr>
<tr>
<td></td>
<td>separates the choices <em>rx, txrx, memory</em>, and <em>cpu</em>.</td>
</tr>
<tr>
<td></td>
<td>Examples:</td>
</tr>
<tr>
<td></td>
<td><em>show health threshold rx</em></td>
</tr>
<tr>
<td></td>
<td><em>show health threshold txrx</em></td>
</tr>
<tr>
<td></td>
<td><em>show health threshold memory</em></td>
</tr>
<tr>
<td></td>
<td><em>show health threshold cpu</em></td>
</tr>
<tr>
<td><strong>&quot; &quot;</strong> (Quotation Marks)</td>
<td>Used to enclose text strings that contain spaces. The quotation marks are required input on the command line.</td>
</tr>
<tr>
<td>Example:</td>
<td><em>vlan 2 &quot;new test vlan&quot;</em></td>
</tr>
</tbody>
</table>
Documentation Roadmap

The OmniSwitch user documentation suite was designed to supply you with information at several critical junctures of the configuration process. The following section outlines a roadmap of the manuals that will help you at each stage of the configuration process. Under each stage, we point you to the manual or manuals that will be most helpful to you.

**Stage 1: Using the Switch for the First Time**

**Pertinent Documentation:** *OmniSwitch Hardware Users Guide*  
*Release Notes*

This guide provides all the information you need to get your switch up and running the first time. It provides information on unpacking the switch, rack mounting the switch, installing NI modules, unlocking access control, setting the switch’s IP address, and setting up a password. It also includes succinct overview information on fundamental aspects of the switch, such as hardware LEDs, the software directory structure, CLI conventions, and web-based management.

At this time you should also familiarize yourself with the Release Notes that accompanied your switch. This document includes important information on feature limitations that are not included in other user guides.

**Stage 2: Gaining Familiarity with Basic Switch Functions**

**Pertinent Documentation:** *OmniSwitch Hardware Users Guide*  
*OmniSwitch AOS Release 8 Switch Management Guide*

Once you have your switch up and running, you will want to begin investigating basic aspects of its hardware and software. Information about switch hardware is provided in the *OmniSwitch Hardware Users Guide*. This guide provide specifications, illustrations, and descriptions of all hardware components, such as chassis, power supplies, Chassis Management Modules (CMMs), Network Interface (NI) modules, and cooling fans. It also includes steps for common procedures, such as removing and installing switch components.

The *OmniSwitch AOS Release 8 Switch Management Guide* is the primary users guide for the basic software features on a single switch. This guide contains information on the switch directory structure, basic file and directory utilities, switch access security, SNMP, and web-based management. It is recommended that you read this guide before connecting your switch to the network.

**Stage 3: Integrating the Switch Into a Network**

**Pertinent Documentation:** *OmniSwitch AOS Release 8 Network Configuration Guide*  
*OmniSwitch AOS Release 8 Advanced Routing Configuration Guide*  
*OmniSwitch AOS Release 8 Data Center Switching Guide*

When you are ready to connect your switch to the network, you will need to learn how the OmniSwitch implements fundamental software features, such as 802.1Q, VLANs, Spanning Tree, and network routing protocols. The *OmniSwitch AOS Release 8 Network Configuration Guide* contains overview information, procedures, and examples on how standard networking technologies are configured on the OmniSwitch.

The *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* includes configuration information for networks using advanced routing technologies (OSPF and BGP) and multicast routing protocols (DVMRP and PIM-SM).
The *OmniSwitch AOS Release 8 Data Center Switching Guide* includes configuration information for data center networks using virtualization technologies, such as Data Center Bridging (DCB) protocols, Virtual eXtensible LAN (VxLAN), and Fibre Channel over Ethernet (FCoE) network convergence.

**Anytime**

The *OmniSwitch AOS Release 8 CLI Reference Guide* contains comprehensive information on all CLI commands supported by the switch. This guide includes syntax, default, usage, example, related CLI command, and CLI-to-MIB variable mapping information for all CLI commands supported by the switch. This guide can be consulted anytime during the configuration process to find detailed and specific information on each CLI command.
Related Documentation

The following are the titles and descriptions of all the related OmniSwitch user manuals:

- **OmniSwitch 6360, 6465, 6560, 6570M, 6860, 6865, 6900, 9900 Hardware Users Guides**
  Describes the hardware and software procedures for getting an OmniSwitch up and running as well as complete technical specifications and procedures for all OmniSwitch chassis, power supplies, fans, and Network Interface (NI) modules.

- **OmniSwitch AOS Release 8 CLI Reference Guide**
  Complete reference to all CLI commands supported on the OmniSwitch. Includes syntax definitions, default values, examples, usage guidelines and CLI-to-MIB variable mappings.

- **OmniSwitch AOS Release 8 Switch Management Guide**
  Includes procedures for readying an individual switch for integration into a network. Topics include the software directory architecture, image rollback protections, authenticated switch access, managing switch files, system configuration, using SNMP, and using web management software (WebView).

- **OmniSwitch AOS Release 8 Network Configuration Guide**
  Includes network configuration procedures and descriptive information on all the major software features and protocols included in the base software package. Chapters cover Layer 2 information (Ethernet and VLAN configuration), Layer 3 information (routing protocols, such as RIP and IPX), security options (authenticated VLANs), Quality of Service (QoS), link aggregation, and server load balancing.

- **OmniSwitch AOS Release 8 Advanced Routing Configuration Guide**
  Includes network configuration procedures and descriptive information on all the software features and protocols included in the advanced routing software package. Chapters cover multicast routing (DVMRP and PIM-SM), Open Shortest Path First (OSPF), and Border Gateway Protocol (BGP).

- **OmniSwitch AOS Release 8 Data Center Switching Guide**
  Includes an introduction to the OmniSwitch data center switching architecture as well as network configuration procedures and descriptive information on all the software features and protocols that support this architecture. Chapters cover Data Center Bridging (DCB) protocols, Virtual Network Profile (vNP), VxLAN, and FCoE/FC transit and gateway functionality.

- **OmniSwitch AOS Release 8 Transceivers Guide**
  Includes SFP and XFP transceiver specifications and product compatibility information.

- **OmniSwitch AOS Release 8 Specifications Guide**

- **Technical Tips, Field Notices**
  Includes information published by Alcatel-Lucent Enterprise’s Customer Support group.

- **Release Notes**
  Includes critical Open Problem Reports, feature exceptions, and other important information on the features supported in the current release and any limitations to their support.
Technical Support

An Alcatel-Lucent Enterprise service agreement brings your company the assurance of 7x24 no-excuses technical support. You’ll also receive regular software updates to maintain and maximize your Alcatel-Lucent Enterprise product’s features and functionality and on-site hardware replacement through our global network of highly qualified service delivery partners.

With 24-hour access to Alcatel-Lucent Enterprise’s Service and Support web page, you’ll be able to view and update any case (open or closed) that you have reported to Alcatel-Lucent Enterprise’s technical support, open a new case or access helpful release notes, technical bulletins, and manuals.

Access additional information on Alcatel-Lucent Enterprise’s Service Programs:

   Phone: 1-800-995-2696
   Email: ebg_global_supportcenter@al-enterprise.com
1 Ethernet Port Commands

The Ethernet port software is responsible for configuring and monitoring Ethernet ports. This includes:

• Performing hardware diagnostics, loading software, and initializing hardware.

• Notifying other software modules in the system when Ethernet links become active or inactive.

• Configuring basic line parameters for Ethernet ports.

• Gathering basic line statistics for Ethernet ports and passing this information to the user interface and configuration manager.

MIB information for the Ethernet Port commands is as follows:

 Filename: ALCATEL-IND1-PORT-MIB.mib
 Module: alcatelIND1PortMIB

 Filename: EtherLike-MIB.mib
 Module: etherMIB
A summary of the available commands is listed here.

| clear interfaces macsec statistics |
**interfaces**

Enables or disables auto negotiation or administrative status on a single port, a range of ports, or an entire Network Interface (NI).

```
interfaces {slot chassis/slot| port chassis/slot/port[-port2]} {admin-state | autoneg | epp} {enable |

disable}
```

### Syntax Definitions

- `chassis` The chassis identifier.
- `slot` The slot number for a specific module.
- `port[-port2]` The port number. Use a hyphen to specify a range of ports.
- `admin-state enable` Enables administrative state.
- `admin-state disable` Disables administrative state.
- `autoneg enable` Enables auto negotiation.
- `autoneg disable` Disables auto negotiation.
- `epp enable` Enables Enhanced Port Performance.
- `epp disable` Disables Enhanced Port Performance.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>enable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- If auto negotiation is disabled, auto MDIX, flow control, auto speed, and auto duplex are not accepted. See the **interfaces crossover** command on page 1-8 and the **interfaces duplex** command on page 1-10 for more information.

- When EPP is enabled the fiber port receiver performance is enhanced by increasing its sampling rate. This enhancement can help with port link connection reliability or CRC problems that may occur with direct copper cable interfaces.

- Autonegotiation cannot be disabled on 10GBase-T ports.
- The 2.5G capable ports will advertise either 2.5G or 1G when auto-negotiation is enabled depending on the port's configured speed. The default is 2.5G.

- Autonegotiation is disabled for 10G port types and optical transceivers. It is enabled for 25G, 40G, and 100G direct-attached cables.

- OS6860N models don't support auto-negotiation on SFP28 ports when a 1G transceiver is connected.

**Examples**

-> interfaces port 1/3/1 autoneg disable
-> interfaces slot 1/3 autoneg disable
-> interfaces port 1/3/1-4 autoneg disable

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- **interfaces speed**: Configures interface speed.
- **interfaces crossover**: Configures crossover port settings.
- **interfaces duplex**: Enables or disables flow (pause).
- **show interfaces alias**: Displays interface line settings.
- **show interfaces**: Displays auto negotiation, speed, duplex, and crossover settings.

**MIB Objects**

- **esmConfTable**: esmPortCfgAutoNegotiation
**interfaces speed**

Configures interface line speed.

```
interfaces {slot chassis/slot | port chassis/slot/port [-port2]} speed {10 | 100 | 1000 | 2500 | 10000 | 2000 | 4000 | 8000 | auto | max {100 | 1000 | 4000 | 8000}}
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot**: The slot number for a specific module.
- **port[-port2]**: The port number. Use a hyphen to specify a range of ports.
- **auto**: The switch automatically sets the line speed to match the attached device (auto-sensing).
- **10**: Sets the interface to 10 Mbps.
- **100**: Sets the interface to 100 Mbps.
- **1000**: Sets the interface to 1000 Mbps (1 Gigabit).
- **2500**: Sets the interface to 2500 Mbps (2.5 Gigabits).
- **4000**: Sets the interface to 4000 Mbps for FibreChannel.
- **8000**: Sets the interface to 8000 Mbps for FibreChannel.
- **max 100**: Sets the maximum speed to 100 Mbps.
- **max 1000**: Sets the maximum speed to 1000 Mbps (1 Gigabit).
- **max 4000**: Sets the maximum speed to 4000 Mbps for FibreChannel.
- **max 8000**: Sets the maximum speed to 8000 Mbps for FibreChannel.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>enable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

- The changing of a port's speed, when changing between 100M/1G and 2.5G or vice-versa, is applied in port pairs. Meaning, changing the speed of one port of a pair will cause the other port's speed to change as well. The port pairs are 17/18, 19/20, 21/22, 23/24. This does not apply when changing the speed between 100M and 1G.

- Certain port groups don't support a mix of 1G/10G and 25G speeds on the ports within a group. Ports within a port group must all run at either 1G/10G speed or 25G speed. Mixing 1G and 10G speeds is supported. Refer to the respective hardware guide for additional information.
  - OS6900-V48C8 Port Groups (1,2,3,6), (4,5,7,9), (8,10,11,12), (13,14,15,18), (16,17,19,21), (20,22,23,24), (25,26,27,30), (28,29,31,33), (32,34,35,36), (37,38,39,42), (40,41,43,45), (44,46,47,48)
  - OS6900-X48C4E Port Groups (41,44, 45-48)
  - OS6860N-U28 Port Group (31-34)
  - OS6860N-P48Z Port Group (51-54)
  - OS6860N-P24Z Port Group (27-30)
  - OS68-VNI-U4 Port Group (1-4)

**Examples**

- `-> interfaces slot 1/3 speed auto`
- `-> interfaces port 1/3/1 speed 100`
- `-> interfaces port 1/3/2-8 speed 1000`

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `show interfaces` Displays auto negotiation, speed, duplex, and crossover settings.

**MIB Objects**

- `esmConfTable`
- `esmPortCfgSpeed`
**interfaces crossover**

Configures port crossover settings on a single port, a range of ports, or an entire Network Interface (NI).

```
interfaces {slot chassis/slot| port chassis/slot/port[-port2]} crossover {auto | mdix | mdi}
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot**: The slot number for a specific module.
- **port[-port2]**: The port number. Use a hyphen to specify a range of ports.
- **auto**: The interface automatically detects the crossover settings.
- **mdix**: Sets the crossover configuration to Media Dependent Interface with Crossover (MDIX), which is the standard for hubs and switches.
- **mdi**: Sets the crossover configuration to Media Dependent Interface (MDI), which is the standard for end stations.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>mdix</td>
</tr>
</tbody>
</table>

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- If auto negotiation is disabled, then automatic crossover is also disabled. See the `interfaces` command for more information.
- You cannot configure crossover settings on fiber ports. These ports use the MDI standard.

### Examples

```
-> interfaces slot 1/3 crossover mdi
-> interfaces port 1/3/1 crossover mdix
-> interfaces port 1/3/1-4 crossover auto
```

### Release History

Release 7.1.1; command introduced.
**Related Commands**

*show interfaces*  
Displays auto negotiation, speed, duplex, and crossover settings.

**MIB Objects**

*esmConfTable*

  *esmPortCfgCrossover*
**interfaces duplex**

Configures duplex mode. In full duplex mode, the interface transmits and receives data simultaneously. In half duplex mode, the interface can transmit or receive data at a given time. Auto duplex setting causes the switch to advertise all available duplex modes (half/full/both) for the port during autonegotiation.

```
interfaces {slot chassis/slot| port chassis/slot/port)[-port2]} duplex {full | half | auto}
```

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot` The slot number for a specific module.
- `port[-port2]` The port number. Use a hyphen to specify a range of ports.
- `full` Sets interface to full duplex mode.
- `half` Sets interface to half duplex mode.
- `auto` Switch automatically sets both the duplex mode settings to autonegotiation.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>full</td>
<td>half</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- You can only configure one slot at a time. Repeat the command to configure additional slots.
- The OmniSwitch 6860(E)/6865/6900 do not support 10/100 half-duplex.
- Half duplex mode is not supported on Gigabit modules if a port is detected as Gigabit (1000 Mbps).
- Gigabit and 10 Gigabit fiber ports only support full duplex.

**Examples**

- `-> interfaces port 1/3/1 duplex auto`
- `-> interfaces slot 1/3 duplex half`
- `-> interfaces port 1/3/1-4 auto`
**Release History**
Release 7.1.1; command introduced.

**Related Commands**

- **interfaces**
  Configures interface line speed. Set to `auto` to set speed and duplex mode to auto-sensing.

- **show interfaces**
  Displays auto negotiation, speed, duplex, and crossover settings.

**MIB Objects**

- **esmConfTable**
  - **esmPortAutoDuplexMode**
interfaces alias

Configures a description (alias) for a single port.

`interfaces port chassis/slot/port alias description`

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot**: The slot number for a specific module.
- **port[-port2]**: The port number.
- **description**: A description for the port, which can be up to 64 characters long. Description tags with spaces must be enclosed within quotes (e.g., “IP Phone”).

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- You can only configure one port at time. You cannot configure an alias for multiple ports.
- To remove an alias use a description consisting of two quotes without any spaces (e.g., "").

### Examples

- `-> interfaces port 1/3/1 alias "switch port"
- `-> interfaces port 1/2/2 alias "IP Phone"
- `-> interfaces port 1/3/1 alias ""

### Release History

Release 7.1.1; command introduced.
Related Commands

**show interfaces alias**  Displays port status (up or down) and any aliases for a port.

MIB Objects

*ifXTable*

  *ifAlias*

---
clear interfaces

Resets all Layer 2 statistics counters or Time Domain Reflectometry (TDR) statistics counters.

clear interfaces {slot chassis/slot | port chassis/slot/port[-port2]} {l2-statistics [cli] | tdr-statistics}

**Syntax Definitions**

- **chassis**
  - The chassis identifier when running in virtual chassis mode.
- **slot**
  - The slot number for a specific module.
- **port[-port2]**
  - The port number. Use a hyphen to specify a range of ports.
- **cli**
  - Clears the CLI statistics only.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6</th>
<th>6900 X48C4E/V48C8</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- TDR is supported only on the OmniSwitch 6860 and OmniSwitch 6860.
- There is no global clear statistics command for TDR. The highest level granularity supported for clearing statistics is per `chassis/slot`.

**Examples**

- `-> clear interfaces port 1/1/20 l2-statistics`
- `-> clear interfaces port 1/1/30 l2-statistics cli`
- `-> clear interfaces port 1/1/40 tdr-statistics`

**Release History**

Release 7.1.1; command introduced.
Release 8.1.1; `tdr-statistics` parameter added.
**Related Commands**

- **show interfaces counters** Displays general interface information, including when statistics were last cleared.
- **show interfaces tdr-statistics** Displays the results of the last TDR test performed on a port.

**MIB Objects**

- **alcetherStatsTable**
  - **alcetherClearStats**
- **esmTdrPortTable**
  - **esmTdrPortClearResults**
interfaces max-frame-size

Configures the maximum frame size for Gigabit Ethernet interfaces.

`interfaces {slot chassis/slot | port chassis/slot/port[-port2]} max-frame-size bytes`

**Syntax Definitions**

- `chassis`  The chassis identifier.
- `slot`     The slot number for a specific module.
- `port[-port2]`  The port number. Use a hyphen to specify a range of ports.
- `bytes`     Maximum frame size, in bytes. Valid range is 1518–9216.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>bytes (Gigabit Ethernet Packets)</td>
<td>9216</td>
</tr>
<tr>
<td>bytes (Ethernet Packets)</td>
<td>1553</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>

</table>

**Usage Guidelines**

N/A

**Examples**

- `-> interfaces port 1/3/1 max-frame-size 1518`
- `-> interfaces slot 1/3 max-frame-size 1518`

**Release History**

Release 7.1.1; command introduced.
**Related Commands**

`show interfaces`  
Displays auto negotiation, speed, duplex, and crossover settings.

**MIB Objects**

`esmConfTable`  
`esmPortCfgMaxFrameSize`
interfaces inter-frame-gap

Configures the inter-frame gap.

```
interfaces {slot chassis/slot | port chassis/slot/port[-port2]} inter-frame-gap bytes
```

Syntax Definitions

- `chassis` The chassis identifier.
- `slot` The slot number for a specific module.
- `port[-port2]` The port number. Use a hyphen to specify a range of ports.
- `bytes` Number of bytes for the inter-frame gap. Valid range is 8-31 bytes.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>bytes</td>
<td>12</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

Usage Guidelines

N/A

Examples

```
-> interfaces port 1/1/1 inter-frame-gap 15
```

Release History

Release 8.4.1.R01; command was introduced.
**Related Commands**

*show interfaces* Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

**MIB Objects**

N/A
**interfaces flood-limit**

Configures the flood rate settings on a single port, a range of ports, or an entire Network Interface (NI).

```
interfaces {slot chassis/slot| port chassis/slot/port[-port2]} flood-limit {bcast | mcast | uucast | all} rate {pps pps_num | mbps mbps_num | cap% cap_num | enable | disable | default} [low-threshold low_num]
```

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot` The slot number for a specific module.
- `port[-port2]` The port number. Use a hyphen to specify a range of ports.
- `bcast` Specifies broadcast flood limit.
- `mcast` Specifies multicast flood limit.
- `uucast` Specifies unicast flood limit.
- `all` Specifies flood limit for all types of traffic.
- `pps_num` Packets per second.
- `mbps_num` Megabits per second.
- `cap_num` Percentage of port’s capacity.
- `enable` Enables flood rate limits.
- `disable` Disables flood rate limits.
- `default` Sets default flood rate limits.
- `low_num` Specifies the low threshold value, which must be lower than the high threshold value set for the pps_num, mbps_num, or cap_num value. 

*This parameter is not supported on the OmniSwitch 6360, 6465, 6560, 6570M, 6860N, 6900-V72/C32/X48C6/T48C6/X48C4E/X48C8, 9900 when used with the uucast parameter option.*

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<td>Yes</td>
</tr>
</tbody>
</table>

OmniSwitch AOS Release 8 CLI Reference Guide April 2023
**Usage Guidelines**

- The packets-per-second (**pps**) setting is based on a 512 byte frame size. When configuring the threshold value as a percentage (**cap%**) or in megabits-per-second (**mbps**), only approximate limits can be achieved because values are always estimated based on the packet-per-second size (512 bytes).

- The **low-threshold** parameter is set to help with the auto-recovery of a port that was shutdown because of a STORM violated state. The shutdown action is configured through the **interfaces flood-limit action** command.

**Examples**

```
-> interfaces slot 1/2 flood-limit all rate cap% 50
-> interfaces slot 1/3 flood-limit bcast rate mbps 100
-> interfaces port 1/1/1 flood-limit bcast rate mbps 60 low-threshold 40
-> interfaces port 1/1/5 flood-limit mcast rate pps 2000 low-threshold 1000
-> interfaces slot 1/1 flood-limit all rate disable
```

**Release History**

Release 7.1.1; command introduced.
Release 8.2.1; **default** and **low-threshold** parameters added.

**Related Commands**

- **show interfaces flood-rate** Displays interface flood rate settings.

**MIB Objects**

- `esmConfigTable`
  - `esmPortCfgFlow`
- `dot3PauseTable`
  - `dot3PauseAdminMode`
**interfaces flood-limit action**

Configures the action on a single port, a range of ports, when the port reaches the storm violated state.

```
interfaces {slot chassis/slot| port chassis/slot/port[-port2]} flood-limit {bcast | mcast | uucast | all} action {shutdown | trap | default}
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot**: Slot number to configure.
- **port**: Port number of the interface to configure.
- **port2**: Last port number in a range of ports to configure.
- **bcast**: Broadcast flood limit.
- **mcast**: Multicast flood limit.
- **uucast**: Unicast flood limit. *This parameter is not supported on the OmniSwitch 6360, 6465, 6560, 6570M, 6860N, 6900-V72/C32/X48C6/T48C6/ X48C4E/X48C8, 9900.*
- **all**: Flood limit for all types of traffic.
- **shutdown**: When the high threshold is violated, port is put into a blocked state.
- **trap**: When the high threshold is crossed, trap is sent with the violation reason.
- **default**: When traffic reaches the high threshold, packets above that rate will be dropped.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When high threshold is violated, and the port needs to be put in blocked state, set the action as “shutdown”.
- Use the **low-threshold** parameter of the `interfaces flood-limit` command to assist with auto-recovery of a port that was shutdown.
- When high threshold is crossed, and a trap has to be sent with violation reason, set the action as “trap”.

• When traffic reaches high threshold, and the packets above that rate needs to be dropped, set the action as “default”.

**Examples**

-> interfaces port 1/1/1 flood-limit bcast action shutdown
-> interfaces port 1/1/4 flood uucast action trap
-> interfaces port 1/1/11 flood-limit all action shutdown
-> interfaces port 1/1/14 flood mcast action default

**Release History**

Release 8.2.1; command introduced.

**Related Commands**

- `interfaces flood-limit` Configures the high and low threshold values for flood rate limiting.
- `show interfaces flood-rate` Displays interface flood rate settings.

**MIB Objects**

- `esmConfigTable`
  - `esmPortBcastThresholdAction`
  - `esmPortMcastThresholdAction`
  - `esmPortUucastThresholdAction`
interfaces ingress-bandwidth

Configures the ingress bandwidth settings on a single port, a range of ports, or an entire Network Interface (NI).

**interfaces** {slot chassis/slot | port chassis/slot/port[-port2]} ingress-bandwidth {mbps | enable | disable}

**Syntax Definitions**

- **chassis**: The chassis identifier.
- **slot**: The slot number for a specific module.
- **port[-port2]**: The port number. Use a hyphen to specify a range of ports.
- **mbps**: Specifies the ingress bandwidth in mbps.
- **enable**: Enables ingress bandwidth limiting.
- **disable**: Disables ingress bandwidth limiting.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

N/A

**Examples**

- -> interfaces slot 1/3 ingress-bandwidth enable
- -> interfaces slot 1/3 ingress-bandwidth mbps 30

**Release History**

Release 7.1.1; command introduced.
Related Commands

```
show interfaces ingress-rate-limit
```
Displays the ingress-rate-limit set for each interface port.

MIB Objects

```
esmConfTable
  esmPortIngressRateLimitEnable
```
interfaces pause

Configures whether or not the switch will transmit and/or honor flow control PAUSE frames on the specified interface. PAUSE frames are used to temporarily pause the flow of traffic between two connected devices to help prevent packet loss when traffic congestion occurs between switches.

`interfaces {slot chassis/slot| port chassis/slot/port[-port2]} pause {tx | rx | tx-and-rx | disable}`

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot` The slot number for a specific module.
- `port[-port2]` The port number. Use a hyphen to specify a range of ports.
- `tx` Allows interface to transmit PAUSE frames to peer switches.
- `rx` Allows interface to honor PAUSE frames from peer switches and temporarily stop sending traffic to the peer.
- `tx-and-rx` Allows the interface to transmit and honor PAUSE frames to/from peer switches.
- `disable` Disables flow control on the interface.

**Defaults**

By default, flow control is disabled on all switch interfaces.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Flow control is only supported on interfaces configured to run in full-duplex mode; half-duplex mode is not supported. In addition, flow control is not supported across a virtual fabric link (VFL).
- If both autonegotiation and flow control are enabled on the same local interface, autonegotiation calculates operational flow control settings for that interface. Note that the operational settings override the configured settings as long as autonegotiation and flow control are both enabled for the interface.
- If autonegotiation is disabled, the configured flow control settings are applied to the local interface.

**Examples**

```snmp
-> interfaces port 1/2/4 pause rx
-> interfaces port 1/1/11 pause tx
```
-> interfaces port 1/2/1 pause tx-and-rx
-> interfaces port 1/2/1-6 disable

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `show interfaces status` Displays interface line settings.

**MIB Objects**

- `esmConfTable`
  - `esmPortCfgPause`
**interfaces link-trap**

Enables trap link messages. If enabled, a trap is generated whenever the port changes state.

```
interfaces [slot chassis/slot |  port chassis/slot/port [-port2]]  link-trap {enable | disable}
```

---

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot` The slot number for a specific module.
- `port[-port2]` The port number. Use a hyphen to specify a range of ports.
- `enable` Port link up/down traps are displayed on the NMS.
- `disable` Port link up/down traps are not displayed on the NMS.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>enable</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

N/A

---

**Examples**

- `-> interfaces port 1/2/1 link-trap enable`
- `-> interfaces slot 1/3 link-trap enable`
- `-> interfaces port 1/1/1-6 link-trap enable`

---

**Release History**

Release 7.1.1; command introduced.
**Related Commands**

*show interfaces status*  
Displays interface line settings.

**MIB Objects**

esmConfigTable
  esmPortSlot
  esmPortIF
**interfaces ddm**

Configures the Digital Diagnostics Monitoring (DDM) administrative status.

```
interfaces ddm {enable | disable}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables DDM functionality.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables DDM functionality.</td>
</tr>
</tbody>
</table>

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddm</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- DDM capability will vary based on the transceiver manufacturer.
- DDM status must be enabled in order to enable traps; traps are enabled separately.

### Examples

```
-> interfaces ddm enable
-> interfaces ddm disable
```

### Release History

Release 7.1.1; command introduced.
Related Commands

show interfaces ddm  Displays the interface DDM status.

MIB Objects

ddmConfiguration
  ddmConfig
**interfaces ddm-trap**

Configures the Digital Diagnostics Monitoring (DDM) administrative status or trap capability.

`interfaces ddm-trap {enable | disable}`

### Syntax Definitions

- **enable**: Enables DDM trap functionality.
- **disable**: Disables DDM trap functionality.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddm-trap</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

DDM status must be enabled in order to enable traps; traps are enabled separately.

### Examples

- `-> interfaces ddm-trap enable`
- `-> interfaces ddm-trap disable`

### Release History

Release 7.1.1; command introduced.

### Related Commands

- `show interfaces ddm`: Displays the interface DDM status.

### MIB Objects

- `ddmConfiguration`
- `ddmTrapConfig`
- `ddmNotificationType`
interfaces wait-to-restore

Configures the wait to restore timer on a specific slot, port, or a range of specified ports. The timer is enabled when a link up event is detected. Other applications are notified of the link up event only after the wait to restore timer has elapsed.

```
interfaces {slot chassis/slot| port chassis/slot/port|[-port2]} wait-to-restore num
```

**Syntax Definitions**

- **chassis** The chassis identifier.
- **slot** The slot number for a specific module.
- **port[-port2]** The port number. Use a hyphen to specify a range of ports.
- **num** The number of seconds the switch waits before notifying other applications. The valid range is 0-300 in multiples of 5 seconds.

**Defaults**

By default, the timer is set to zero (disabled).

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Set the wait-to-restore timer to zero to disable the timer.
- Enter a slot number to configure the timer value for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the timer value for a specific interface or a range of interfaces.

**Example**

```
-> interfaces slot 1/1 wait-to-restore 30
-> interfaces port 1/1/1 wait-to-restore 10
-> interfaces port 1/1/1-7 wait-to-restore 250
```

**Release History**

Release 7.3.2; command introduced.
Related Commands

*show interfaces* Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects

alaLinkMonConfigTable

alaLinkMonWaitToRestoreTimer
**interfaces wait-to-shutdown**

Configures the wait to shutdown timer on a specific slot, port, or a range of specified ports. The timer is enabled when a link down event is detected. Other applications are notified of the link down event only after the wait to shutdown timer has elapsed.

```
interfaces {slot chassis/slot| port chassis/slot/port[-port2]} wait-to-shutdown num
```

**Syntax Definitions**

- *chassis*  
The chassis identifier.
- *slot*  
The slot number for a specific module.
- *port[-port2]*  
The port number. Use a hyphen to specify a range of ports.
- *num*  
The number of milliseconds the switch waits before notifying other applications. The valid range is 0-300000 in multiples of 10msec.

**Defaults**

By default, the timer is set to zero (disabled).

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command can be used to reduce port flapping. If the port comes back up before the timer expires then the timer will be canceled and other applications will not be notified of the link down event.
- Set the wait-to-shutdown timer to zero to disable the timer.
- The WTS timer is not started when the switch is first booted. But administratively disabling the port will start the timer if enabled.
- The link-status of the remote port will be down when the WTS timer is running. This is due to the port being physically down and only the link-down event not being communicated to other applications.
- The WTS timer configured is the absolute value in milliseconds (i.e. if WTS value is configured as 250, then the WTS timer is set to 250 milliseconds). Timer values other than multiples of 10 (for e.g. 251) are not allowed.

**Example**

```
-> interfaces slot 1/1 wait-to-shutdown 300000
-> interfaces port 1/1/1 wait-to-shutdown 10000
```
interfaces port 1/1/1-7 wait-to-shutdown 250

Release History
Release 7.3.2; command introduced.

Related Commands
show interfaces Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects
alaLinkMonConfigTable
alaLinkMonWaittoShutdownTimer
**interfaces eee**

Enables or disabled Energy Efficient Ethernet.

`interfaces {slot chassis/slot| port chassis/slot/port[-port2]} eee {enable | disable}`

---

**Syntax Definitions**

- **chassis**: The chassis identifier.
- **slot**: The slot number for a specific module.
- **port[-port2]**: The port number. Use a hyphen to specify a range of ports.
- **enable**: Enables EEE functionality.
- **disable**: Disables EEE functionality.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- EEE is only supported on copper ports.
- Enabling EEE will start advertising EEE capability to peer ports. Disabling EEE will stop advertising EEE capability to peer ports.

**Examples**

- `-> interfaces port 1/1/1 eee enable`
- `-> interfaces slot 1/1 eee disable`

**Release History**

Release 7.3.2; command was introduced.
Related Commands

**show interfaces**
Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

**MIB Objects**

interfaces primary-port split-mode

Configures the mode of splitter cable capable ports.

`interfaces primary-port <chassis/slot/port> split-mode {auto | 4X25G | 4X10G | 40G | 100G}`

**Syntax Definitions**

- **chassis**  The chassis identifier.
- **slot**     The slot number for a specific module.
- **port**     The port number.
- **auto**     Automatically detects if a splitter cable is connected.
- **4x10g**    Sets the port to the 4X10G splitter functionality.
- **4x25g**    Sets the port to the 4X25G splitter functionality.
- **40g**      Sets the port to 40G functionality.
- **100g**     Sets the port to 100G functionality.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command is only supported on ports and platforms that support the splitter cable functionality.
- The proper cable should be used based on the port’s configuration. For example, if set to 4X10G with a 40G cable connected, the port will only operate as a 10G port.
- For the OS6900-X48C6/T48C6/X48C4E/V48C8/C32E use the `interfaces port break-out` command.

**Examples**

```
-> interfaces primary-port 1/1/1 split-mode 4X10G
```
Release History

Release 7.3.4; command was introduced.
Release 8.5R2; primary-port keyword added.

Related Commands

**show interfaces split-mode**  Displays the configured and operational state of the splitter cable capable ports.

**interfaces port break-out**  Configures the mode of the splitter cable capable ports.

MIB Objects

- esmPortModeTable
- esmConfiguredMode
interfaces port break-out

Configures the break-out functionality of capable ports.

```
interfaces port {slot chassis/slot | port chassis/slot/port[-port2]} break-out {enable | disable}
```

Syntax Definitions

- **chassis**: The chassis identifier.
- **slot**: The slot number for a specific module.
- **port/-port2**: The port number of a specific interface to display. Use a hyphen to specify a range of ports.
- **enable**: Enables the break-out functionality.
- **disable**: Disables the break-out functionality.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- For other models, see the interfaces primary-port split-mode command.
- Perform a write memory and reload to apply the configuration.
- The following ports support the break-out functionality:
  - OS6900-T48C6 (ports 51, 54 only)
  - OS6900-X48C6 (ports 51, 54 only)
  - OS6900-X48C4E (ports 49 to 52 only)
  - OS6900-V48C8 (ports 49 to 56 only)
  - OS6900-C32E (All ports 1 to 32)
- OS6860N
  - OS68-QNI-U2 (Both ports)
  - OS68-CNI-U1

- VFL links are not supported on port configured in break-out mode.
- If break-out is disabled, both 40G and 100G transceivers are supported.
- If break-out is enabled, both 4X10 and 4X25 splitter cables are supported.
- On modules with a single link LED per port, the LED is controlled by the status of sub-port 'A' only.
- The OS68-QNI-U2 and OS68-CNI-U1 do not have additional LEDs to display the link status of break-out cables. The LED displays link status of only ports 1A and 2A respectively.
- Break-out cables cannot be auto-detected. If break-out cables are connected the break-out mode should explicitly enabled to prevent unexpected behavior such as remote link partners having a false link up.

**Examples**

-> interfaces port 1/1/1 break-out enable

**Release History**

Release 8.7R3; command was introduced.

**Related Commands**

*show interfaces break-out* Displays the break-out configuration.

*interfaces primary-port split-mode* Configures the mode of the splitter cable capable ports.

**MIB Objects**

- esmPortModeTable
- esmConfiguredMode
interfaces fec

Configures the Reed Solomon (RS-FEC) and Fire Code (FC-FEC) FEC also known as BASE-R FEC.

```
interfaces {slot chassis/slot | port chassis/slot/port[-port2]} fec {disable | auto | fc | rs}
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot**: The slot number for a specific module.
- **port[-port2]**: The port number. Use a hyphen to specify a range of ports.
- **disable**: Disables FEC.
- **auto**: Automatically determines the FEC.
- **fc**: FC-FEC is forced.
- **rs**: RS-FEC is forced.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>fec</td>
<td>10G/40G - FC</td>
</tr>
<tr>
<td></td>
<td>25G/100G - RS</td>
</tr>
<tr>
<td></td>
<td>Direct-attached - auto (request RS-FEC and FC-FEC)</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command is only supported on modules that support FEC configuration. Not supported on 1G.
- For 10G/40G FC-FEC will be requested when auto is enabled.
- For 25G/100G RS-FEC will be requested when auto is enabled.
- Beginning in 8.7R2 the default on 25G ports was changed to RS-FEC from FC-FEC.
- The OS6900-C32 does not support RS-FEC. It will be set to FC-FEC. This must be taken into account for interoperability with other models.

### Examples

```
-> interfaces port 1/1/1 fec fc
```
-> interfaces slot 1/2 fec auto

**Release History**

Release 8.4.1.R03; command was introduced.
Release 8.7R2; Default mode for 25G is RS-FEC.

**Related Commands**

- **show interfaces status** Displays the configured and operational state of the ports.

**MIB Objects**

- `esmPortModeTable`
  - `esmConfiguredMode`
**interfaces hybrid-mode**

Configures the mode of a combo port to either fiber or copper.

`interfaces {slot chassis/slot | port chassis/slot/port[-port2]} hybrid-mode {fiber | copper}`

---

**Syntax Definitions**

- **chassis**: The chassis identifier.
- **slot**: The slot number for a specific module.
- **port[-port2]**: The port number. Use a hyphen to specify a range of ports.
- **fiber**: Enables the fiber combo port.
- **copper**: Enables the copper combo port.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>hybrid-mode</td>
<td>fiber</td>
</tr>
</tbody>
</table>

Fiber/Copper Speed       1000Mbps/auto
Fiber/Copper Duplex     Full/auto
Fiber/Copper Autoneg    Enabled/Enabled

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Each combo port can be set to either fiber or copper but not both at the same time.
- When the mode is changed on a port the speed, duplex and auto-negotiation parameters will be set to the default for that port type (see table above). Other port settings will remain the same (i.e. admin status, flood limits, alias, etc.)

---

**Examples**

- `interfaces port 1/1/9 hybrid-mode copper`
- `interfaces port 1/1/10 hybrid-mode fiber`

---

**Release History**

Release 8.6R1; command introduced.
**Related Commands**

- `interfaces speed`  
  Configures interface speed.
- `interfaces crossover`  
  Configures crossover port settings.
- `interfaces duplex`  
  Enables or disables flow (pause).
- `show interfaces status`  
  Displays interface line settings.
- `show interfaces`  
  Displays auto negotiation, speed, duplex, and crossover settings.

**MIB Objects**

- `esmConfTable`
  - `esmPortCfgHybridActiveType`
  - `esmPortCfgHybridMode`
  - `esmPortOperationalHybridType`
interfaces loopback

Enables or disables the loopback mode for the specified front-panel port. Enable the port loopback mode to support L3 VPN in-line routing for an IP over Shortest Path Bridging (SPB) configuration.

```
interfaces port chassis/slot/port[-port2] loopback
no interfaces port chassis/slot/port[-port2] loopback
```

Syntax Definitions

- `chassis` The chassis identifier.
- `slot` The slot number for a specific module.
- `port[-port2]` The port number. Use a hyphen to specify a range of ports.

Defaults

By default, the port loopback mode is disabled.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the `no` form of this command to disable the port loopback mode.
- This command applies only to front-panel ports. A single port can provide the loopback function or the port can be assigned to a static link aggregate that is also configured to run in loopback mode.
- When the loopback mode is enabled, the port can be configured as a bridge and access port to provide the loopback functionality on the same port (no external cable required). However, other switch functionality is not supported on loopback ports.
- For more information about SPB L3 VPN, see the “IP over SPBM” section of the “Configuring Shortest Path Bridging” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide*.

Examples

```
-> interfaces port 1/1/1 loopback
-> interfaces port 1/1/2-5 loopback
-> no interfaces port 1/1/1 loopback
```

Release History

Release 8.6R2; command introduced.
Related Commands

- **linkagg static agg loopback**: Configures a link aggregate to run in the loopback mode.
- **show interfaces status**: Displays the interface line settings (for example, speed and mode).
- **show interfaces**: Displays general interface information (for example, hardware, MAC address, input errors, and output errors).

MIB Objects

- **alaPortXTable**
  - **alaPortXLoopbackStatus**
interfaces portgroup

Configures the speed of the ports within a port group.

`interfaces portgroup port-group-number chassis/slot/group[-group] speed [auto | 25G | 10G]`

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot` The slot number for a specific module.
- `group[-group]` The group number. Use a hyphen to specify a range of groups.

**Defaults**

By default, the group speed is set to `auto`.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>V48C8</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The OmniSwitch 6900-V48C8 does not support a mix of 1G/10G and 25G speeds on the member ports of the same port group. Mixing 1G and 10G speeds is supported.
- Member ports of each port group are non-contiguous, use the `show interfaces portgroup` command to display the port mapping.
- 1G speed is supported when port group speed is set to either `Auto` or `10G` and the operational speed is 10G.
- When the port group speed is set to `auto` the speed of the port group is determined by the first detected transceiver on any of the member ports.

**Examples**

- `interfaces portgroup port-group-number 1/1/1 speed 25G`
- `interfaces portgroup port-group-number 1/1/2-4 speed auto`
- `interfaces portgroup port-group-number 1/1/5 speed 10G`

**Release History**

Release 8.7R2; command introduced.
Related Commands

show interfaces portgroup Displays the port group member port mapping.

MIB Objects

esmPortGroupTable
  esmPortGroupEntry
  esmPortGroupIfIndex
  esmConfiguredPortGroupSpeed
  esmOperationalPortGroupSpeed
**clear violation**

Cleans all the MAC address violation logs for a particular port and session. After the violations are cleared, the specific port resumes normal operation. This includes applying an existing application configuration.

```
clear violation {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

**Syntax Definitions**

- **chassis**
  The chassis identifier when running in virtual chassis mode.

- **slot**
  The slot number for a specific module.

- **port[-port2]**
  The port number. Use a hyphen to specify a range of ports.

- **agg_id[-agg_id2]**
  Enter a link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When a violation is set on a physical port that is part of a link aggregate, the violation is set for the whole link aggregate. All ports on that link aggregate are brought down. When this command is applied to a link aggregate ID, all member ports of the link aggregate are activated.

- When this command is applied, all MAC addresses known to the port are cleared from the MAC address table for the switch.

**Examples**

```
-> clear violation port 1/10
-> clear violation port 2/1-5
-> clear violation linkagg 5
-> clear violation linkagg 10-20
```

**Release History**

Release 7.1.1; command introduced.
**Related Commands**

**show violation**  
Displays the address violations that occur on ports with LPS restrictions.

**MIB Objects**

*portViolationTable*
- *portViolationClearPort*
violation recovery-maximum

Configures the maximum number of recovery attempts allowed before the port is permanently shut down. This value is configurable on a global basis (applies to all ports on all modules) and on a per-slot or per-port basis.

```
violation recovery-maximum {infinite | max_attempts}
```

```
violation [slot chassis/slot | port chassis/slot/port[-port2]] recovery-maximum {infinite | default | max_attempts}
```

Syntax Definitions

- `chassis`: The chassis identifier.
- `slot`: The slot number for a specific module.
- `port[-port2]`: The port number. Use a hyphen to specify a range of ports.
- `infinite`: Sets the recovery attempt to infinite auto recovery.
- `default`: Sets the number of recovery attempts to the global value for the specified ports. This parameter is only available when a slot, port, or range of ports is specified with this command.
- `max_attempts`: The maximum number of recovery attempts. Valid range is 0-50.

Defaults

By default, this command configures the global maximum number of recovery attempts. The global value applies to all ports on all modules in the switch.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Usage Guidelines

- Set the maximum number of recovery attempts value to 0 to disable this recovery mechanism.
- Enter a slot number to configure the number of recovery attempts for all interfaces on a specific slot.
- Enter a slot and port number or a range of ports to configure the number of recovery attempts for a specific interface or a range of interfaces.
• When this command is used to configure the number of recovery attempts for all ports on a slot or for a specific port or range of ports, the value specified overrides the global maximum number of attempts configured for the switch.

• When configuring the number of recovery attempts for a specific slot, port, or range of ports, use the default parameter to reset this value to the global maximum number of attempts.

• The number of recovery attempts increments whenever a port recovers using automatic recovery timer mechanism. When the number of recovery attempts exceeds the configured threshold, the port is permanently shut down.

• Once an interface is permanently shut down, only the clear violation command can be used to recover the interface.

• The recovery mechanism tracks the number of recoveries within a fixed time window (FTW). The \( FTW = 2 \times \text{maximum recovery number} \times \text{recovery timer} \). For example, if the maximum number of recovery attempts is set to 4 and the recovery timer is set to 5, the FTW is 40 seconds \((2 \times 4 \times 5 = 40)\).

**Examples**

-> violation recovery-maximum 25
-> violation slot 1/2 recovery-maximum 10
-> violation port 1/2/3 recovery-maximum 20
-> violation port 1/2/4-9 recovery-maximum 50
-> violation port 1/2/4-9 recovery-maximum default
-> violation port 1/2/3 recovery-maximum 0
-> violation recovery-maximum infinite
-> violation recovery-maximum 0

**Release History**

Release 8.2.1; command was introduced.

**Related Commands**

- **violation recovery-time**: Configures the time interval after which the port is automatically re-activated if the port was shut down for any violation.
- **show interfaces**: Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
- **show interfaces portgroup**: Displays the globally configured recovery time, SNMP recovery trap status, and maximum recovery attempts.

**MIB Objects**

- **alaPortViolationRecoveryTable**
- **alaPortViolationRecoveryMaximum**
violation recovery-time

Configures the time interval after which the port is automatically re-activated if the port was shutdown for any violation. This value is configurable on a global basis (applies to all ports on all modules) and on a per-slot or per-port basis.

```
violation recovery-time seconds
```

```
viiolation [slot chassis/slot | port chassis/slot/port[-port2]] recovery-time {seconds | default}
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot**: The slot number for a specific module.
- **port[-port2]**: The port number. Use a hyphen to specify a range of port.
- **seconds**: The number of seconds after which a port is reactivated. The valid range is 30-600 seconds.
- **default**: Sets the recovery time to the global value for the specified ports. This parameter is only available when a slot, port, or range of ports is specified with this command.

### Defaults

- By default, this command configures the global recovery time. The global value applies to all ports on all modules in the switch.
- By default, the violation recovery time is set to 300 seconds.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When the recovery timer expires, the interface is operationally re-enabled and the violation on the interface is cleared.
- The violation recovery time value does not apply to interfaces that are in a permanent shutdown state. A port in this state is only recoverable using the `clear violation` command.
- The interface violation recovery mechanism is not supported on link aggregates, but is supported on the link aggregate member ports.
- Enter a slot number to configure the recovery time for all interfaces on a specific slot.
- Enter a slot and port number or a range of ports to configure the recovery time for a specific interface or a range of interfaces.

- When this command is used to configure the recovery time for all ports on a slot or for a specific port or range of ports, the value specified overrides the global maximum recovery time configured for the switch.

- When configuring the time for a specific slot, port, or range of ports, use the `default` parameter to reset this value to the global maximum number of attempts.

**Examples**

```plaintext
-> violation recovery-time 600
-> violation slot 1/2 recovery-time 100
-> violation port 1/2/3 recovery-time 200
-> violation port 1/2/4-9 recovery-time 500
-> violation port 1/2/4-9 recovery-time default
```

**Release History**

Release 8.2.1; command introduced.

**Related Commands**

- `violation recovery-maximum` - Configures the maximum number of recovery attempts before a port is permanently shut down.
- `show violation` - Displays the violation and recovery status for the specified port.
- `show interfaces portgroup` - Displays the globally configured recovery time, SNMP recovery trap enable/disable status and maximum recovery attempts.

**MIB Objects**

- `alaPortViolationRecoveryTable`
  - `alaPortViolationRecoveryTime`
violation recovery-trap

Enables or disables the sending of a violation recovery trap when any port is re-enabled after the violation recovery time has expired.

violation recovery-trap {enable | disable}

Syntax Definitions

enable Enables the ports to send violation recovery traps.
disable Disables the ports from sending violation recovery traps.

Defaults

By default, sending of a violation recovery trap is disabled.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

This is a global command that is applied to all ports on all modules.

Examples

-> violation recovery-trap enable
-> violation recovery-trap disable

Release History

Release 8.2.1; command was introduced.
**Related Commands**

- **violation recovery-time**
  Configures the time interval to automatically re-enable the ports that were shutdown due to a violation.

- **show interfaces portgroup**
  Displays the globally configured recovery time, SNMP recovery trap status, and maximum recovery attempts.

**MIB Objects**

- *esmViolationRecovery*
  - *esmViolationRecoveryTrap*
show interfaces

Displays general interface information (for example, hardware, MAC address, input errors, and output errors).

`show interfaces [slot chassis/slot | port chassis/slot/port[-port2]]`

### Syntax Definitions

- **chassis**
  - The chassis identifier.

- **slot**
  - Slot number to display information about all ports on a specific slot.

- **port[-port2]**
  - The port number of a specific interface to display. Use a hyphen to specify a range of ports.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The Link-Quality parameter and Enhanced Port Performance capabilities are only supported on the OmniSwitch 6900.
- EEE will be appended to the Autonegotiation output when EEE is enabled (EEE is supported only on the OmniSwitch 6860, 6865, 6900).

### Examples

```
-> show interfaces port 1/1/2
Chassis/Slot/Port 1/1/2 :
  Operational Status : up,
  Last Time Link Changed : Mon Jan  5 17:09:30 2019,
  Number of Status Change: 1,
  Port-Down/Violation Reason: None,
  Type                   : Ethernet,
  SFP/XFP                : GBIC_SX,
  Interface Type        : Fiber,
  EPP                   : Disabled,
  Link-Quality           : Good
  MAC address            : 00:d0:95:b2:39:85,
  BandWidth (Megabits)   : 1000,                Duplex           : Full,

OmniSwitch AOS Release 8 CLI Reference Guide   April 2023   page 1-59
Long Accept : Enable,            Runt Accept : Disable,  
Long Frame Size(Bytes) : 9216,            Runt Size(Bytes) : 64,  
Inter Frame Gap(Bytes) : 12,             
loopback mode : N/A,               
Rx :          
Bytes Received :  7967624, Unicast Frames : 0,  
Broadcast Frames:  124186, M-cast Frames : 290,  
UnderSize Frames:  0, OverSize Frames: 0,  
Lost Frames : 0, Error Frames : 0,  
CRC Error Frames: 0, Alignments Err : 0,  
Tx :          
Bytes Xmitted : 255804426, Unicast Frames : 24992,  
Broadcast Frames: 3178399, M-cast Frames : 465789,  
UnderSize Frames: 0, OverSize Frames: 0,  
Lost Frames : 0, Collided Frames : 0,  
Error Frames : 0, Collisions : 0,  
Late Collisions : 0, Exc-Collisions : 0,  

output definitions

Chassis/Slot/Port  Interface chassis, slot, and port number.

Operational Status  Interface status:
  up—port is operationally up.
  down—port is operationally down
  dormant—SFP/SFP+ transceiver is inserted into a port configured for Fibre Channel or Fibre Channel transceiver in inserted into a port configured for Ethernet and the link has become active.

Last Time Link Changed  The last time the configuration for this interface was changed.

Number of Status Change  The total number of times that the configuration of this interface has changed.

Port-Down/Violation Reason  This is displayed if the port is down. If the port is down due to software reasons or violations the reason is displayed. If it is down due to physical fault, “None” is displayed. The reason displayed applies only to the physical port, for a link aggregate use the show violation command.

Type  Interface type (Ethernet/Fast Ethernet/Gigabit Ethernet).

SFP/XFP  The type of transceiver detected.

Interface Type  The type of interface for this port. (Copper, Fiber, Combo-Copper, Combo-Fiber)

EPP  Enhanced Port Performance setting.

Link-Quality  The link quality of the connection:
  GOOD—The port will connect with no problems and transfer data with no errors.
  FAIR—The port may have intermittent problems connecting and maintaining its connection to a remote port and/or intermittent CRC's could occur.
  POOR—The port will have problems connecting and maintaining a connection with remote port. If the ports connect, it’s likely CRC errors will occur.
  N/A—The port link quality is either very poor or the port type does not support the Link Quality capability.

MAC address  Interface MAC address.
### Ethernet Port Commands

**show interfaces**

---

=output definitions (continued)=

<table>

**Release History**
Release 7.1.1; command introduced.
Release 8.6R2; “Port-Down Reason/Violation Reason”, “Interface Type”, and “loopback mode” output fields added.

**Related Commands**
- `show interfaces accounting`: Displays interface accounting information (e.g., packets received/transmitted).
- `show interfaces counters`: Displays interface counter information (e.g., unicast packets received/transmitted).
- `show interfaces status`: Displays the interface line settings (e.g., speed and mode).
- `show interfaces traffic`: Displays interface traffic statistics (input/output bytes and packets).

**show interfaces alias**

Displays interface line settings (e.g., speed and mode).

```
show interfaces [slot chassis/slot | port chassis/slot/port[-port2]] alias
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot**: Slot number to display information about all ports on a specific slot.
- **port[-port2]**: The port number of a specific interface to display. Use a hyphen to specify a range of ports.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If no slot/port numbers are entered, line settings for all slots/ports on the switch are displayed.

### Examples

```
-> show interfaces port 1/1/2 alias
Legends: WTS - Wait to shutdown
# - WTS Timer is Running & port is in wait-to-shutdown state

Chas/Slot/Port Admin Link WTR WTS Alias
-----+----------+---------+-----+----+----------------------------------
1/1/2  disable  down  5  #10  ""
```

### output definitions

- **Chas/Slot/Port**: Interface chassis/slot/port number.
- **Admin Status**: The administrative status of the port.
- **Link Status**: The link status of the port. Autonegotiation status (Enable/Disable).
- **WTS (msec)**: The wait-to-shutdown configuration time.
output definitions (continued)

| WTR (sec) | The wait-to-restore configuration time. |
| Alias     | The configured alias for the port.     |

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- **interfaces alias**
  Configures the port alias.

**MIB Objects**

- **ifXTable**
  - **ifAlias**
show interfaces status

Displays interface line settings (for example, speed and mode).

```
show interfaces [slot chassis/slot | port chassis/slot/port[-port2]] status
```

**Syntax Definitions**

- **chassis** The chassis identifier.
- **slot** Slot number to display information about all ports on a specific slot.
- **port[-port2]** The port number of a specific interface to display. Use a hyphen to specify a range of ports.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>

**output definitions**

- **Chas/Slot/Port**: Interface chassis/slot/port number.
- **Admin Status**: The administrative status of the port. Configured through the `interfaces` command.
- **AutoNego**: Autonegotiation status (Enable/Disable). Configured through the `interfaces` command.
- **Detected Speed**: Detected line speed in Mbps.
- **Detected Duplex**: Detected line duplex (Half duplex/Full duplex/Auto).
- **Detected Pause**: Detected pause control configuration.
- **FEC Det**: The detected FEC settings (DIS, FC, RS).
- **Configured Speed**: Configured line speed (10/100/Auto/1000/10000 Mbps). Configured through the `interfaces speed` command.
- **Configured Duplex**: Configured line duplex (Half duplex/Full duplex/Auto). Configured through the `interfaces duplex` command.
- **FEC Cfg**: The configured FEC settings (Disable, Auto, FC, RS).
- **Configured Pause**: Detected pause control configuration. Configured through the `interfaces pause` command.
- **Link Trap**: Link Trap status. Configured through the `interfaces link-trap` command.
- **EEE**: Energy Efficient Ethernet configuration (dis/ena).

**Release History**

Release 7.1.1; command introduced.
Release 8.4.1.R03; **FEC Det** and **FEC Cfg** fields added.

**Related Commands**

- **interfaces**: Configures interface line speed, sets speed, and duplex mode to auto-sensing.
- **interfaces duplex**: Configures interface duplex mode.
- **interfaces fec**: Configures the Reed Solomon (RS-FEC) and Fire Code (FC-FEC) FEC also known as BASE-R FEC.
**MIB Objects**

- esmConfTable
  - esmPortSlot
  - esmPortIF
  - esmPortAutoSpeed
  - esmPortAutoDuplexMode
  - esmPortCfgAutoNegotiation
  - esmPortCfgSpeed
  - esmPortCfgDuplexMode
  - esmPortCfgPause
  - esmPortLinkUpDownTrapEnable
show interfaces capability

Displays default auto negotiation, speed, duplex, flow, and cross-over settings for a single port, a range of ports, or all ports on a Network Interface (NI) module.

```
show interfaces [slot chassis/slot | port chassis/slot/port[-port2]] capability
```

Syntax Definitions

- **chassis**: The chassis identifier when running in virtual chassis mode.
- **slot**: Slot number to display information about all ports on a specific slot.
- **port[-port2]**: The port number of a specific interface to display. Use a hyphen to specify a range of ports.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</tbody>
</table>

**Release History**

Release 7.1.1; command introduced.
Release 8.5 R1; **Macsec Supported** field added.
Release 8.7R1; **Macsec 256-bit** field added.

**Related Commands**

- **interfaces** Enables and disables auto negotiation.
- **interfaces crossover** Configures crossover port settings.
- **interfaces** Configures interface speed.
- **interfaces duplex** Configures duplex settings.
- **show interfaces alias** Displays interface line settings.

**MIB Objects**

- **esmConfTable**
  - **esmPortCfgAutoNegotiation**
  - **esmPortCfgFlow**
  - **esmPortCfgCrossover**
  - **esmPortCfgSpeed**
  - **esmPortAutoDuplexMode**
**show interfaces accounting**

Displays interface accounting information (e.g., packets received/transmitted and deferred frames received).

```
show interfaces [slot chassis[slot | port chassis[slot/port][-port2]]] accounting
```

---

**Syntax Definitions**

- **chassis**: The chassis identifier.
- **slot**: Slot number to display information about all ports on a specific slot.
- **slot/port[-port2]**: The port number of a specific interface to display. Use a hyphen to specify a range of ports.

---

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If no slot/port numbers are entered, accounting information for all slots/ports on the switch is displayed.
- The OmniSwitch 9900 supports different packet size ranges than the other OmniSwitch platforms. All packets sized 1024 octets or larger are classified into the “1024 to MAX” category. As a result, this command displays a different output on the OmniSwitch 9900.

**Examples**

The following command example shows the fields that are displayed on all OmniSwitch platforms, except for the OmniSwitch 9900:

```
-> show interfaces accounting
1/1/39:
  Rx Undersize = 0, Tx Undersize = 0,
  Rx Oversize = 0, Tx Oversize = 0,
  Rx Jabber = 0,
  Rx/Tx 64 Octets = 312890503,
  Rx/Tx 65 ~ 127 Octets = 10496825,
  Rx/Tx 128 ~ 255 Octets = 189426,
  Rx/Tx 256 ~ 511 Octets = 39328,
  Rx/Tx 512 ~ 1023 Octets = 756,
```
The following command example shows the fields that are displayed on an OmniSwitch 9900 (the “Rx/Tx 1024 - MAX Octets” field replaces the “Rx/Tx 1024 - 1518 Octets”, “Rx/Tx 1519 - 4095 Octets”, and “Rx/Tx 4096 - MAX Octets” fields that are displayed on the other platforms:

```
-> show interfaces accounting
1/4/38:
  Rx Undersize              =               0, Tx Undersize =               0,
  Rx Oversize               =               0, Tx Oversize =               0,
  Rx Jabber                 =               0,
  Rx/Tx 64 Octets           =            361616757,
  Rx/Tx 65 ~ 127 Octets     =             20510941,
  Rx/Tx 128 ~ 255 Octets    =               377413,
  Rx/Tx 256 ~ 511 Octets    =               45391,
  Rx/Tx 512 ~ 1023 Octets   =               2319,
  Rx/Tx 1024 ~ MAX Octets   =              63555,
```

**output definitions**

- **Rx Undersize**: Number of undersized packets received.
- **Tx Undersize**: Number of undersized packets transmitted.
- **Rx oversize**: Number of oversized packets received.
- **Tx oversize**: Number of oversized packets transmitted.
- **Rx Jabber**: Number of Jabber packets received (longer than 1518 octets).
- **Rx/Tx Octets**: Number of packets received and transmitted in each listed octet range.

**Release History**

Release 7.1.1; command introduced.
Release 8.3.1; display updated for OmniSwitch 9900.

**Related Commands**

- **interfaces ddm**: Displays general interface information (e.g., hardware, MAC address, and input/output errors).
- **show interfaces counters**: Displays interface counter information (e.g., unicast packets received/transmitted).

show interfaces counters

Displays interface counters information (e.g., unicast, broadcast, and multi-cast packets received/transmitted).

show interfaces [slot chassis/slot | port chassis/slot/port[-port2]] counters

Syntax Definitions

- **chassis**: The chassis identifier.
- **slot**: Slot number to display information about all ports on a specific slot.
- **port[-port2]**: The port number of a specific interface to display. Use a hyphen to specify a range of ports.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

If no slot/port numbers are entered, counter information for all slots/ports on the switch is displayed.

Examples

```
-> show interfaces port 1/3/1 counters
1/3/1,
InOctets   = 5436757858697979, OutOctets = 5.78E19,
InUcastPkts= 55654265276, OutUcastPkts = 5.78E20,
InMcastPkts= 5876786786768777, OutMcastPkts = 5465758756856,
InBcastPkts= 576567567567567576, OutBcastPkts = 786876,
InPauseFrames = 567798768768767, OutPauseFrames= 786876,
```

**output definitions**

- **InOctets**: Number of octets received.
- **OutOctets**: Number of octets transmitted.
- **InUcastPkts**: Number of unicast packets received.
- **OutUcastPkts**: Number of unicast packets transmitted.
- **InMcastPkts**: Number of multicast packets received.
- **OutMcastPkts**: Number of unicast packets transmitted.
**output definitions (continued)**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InBcastPkts</td>
<td>Number of broadcast packets received.</td>
</tr>
<tr>
<td>OutBcastPkts</td>
<td>Number of unicast packets transmitted.</td>
</tr>
<tr>
<td>InPauseFrames</td>
<td>Number of MAC control frames received.</td>
</tr>
<tr>
<td>OutPauseFrames</td>
<td>Number of MAC control frames transmitted.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

**show interfaces counters errors**

Displays interface error frame information (e.g., CRC errors, transit errors, and receive errors).

</tr>
</tbody>
</table>

**Usage Guidelines**

If no slot/port numbers are entered, counter error information for all slots/ports on the switch is displayed.

**Examples**

```
-> show interfaces port 1/2/1 counters errors
1/2/1,
   Alignments Errors = 6.45E13,  FCS Errors = 7.65E12
   IfInErrors      = 6435346,  IfOutErrors = 5543,
   Undersize pkts  = 867568,  Oversize pkts = 5.98E8
```

**output definitions**

- **Chas/Slot/Port**: Interface chassis, slot, and port number.
- **Alignments Errors**: Number of Alignments errors.
- **FCS Errors**: Number of Frame Check Sequence errors.
- **IfInErrors**: Number of received error frames.
- **IfOutErrors**: Number of transmitted error frames.
- **Undersize pkts**: Number of undersized packets.
- **Oversize pkts**: Number of oversized packets (more than 1518 octets).
**Release History**

Release 7.1.1; command introduced.

<td>Interface slot and port numbers.</td>
<td>The value set based on the type of flood limiting.</td>
<td>The type of flood limiting: mbps, pps, or %</td>
<td>Status of the type of flood-limiting: enabled or disabled.</td>
</tr>
</tbody>
</table>
**Release History**

Release 7.1.1; command introduced.

**Related Commands**

```
interfaces flood-limit
```

Configures the peak flood rate for an interface.

**MIB Objects**

```
esmConfTable
  esmPortSlot
  esmPortIF
  esmPortMaxFloodRate
  esmPortFloodMcastEnable
```
show interfaces traffic

Displays interface traffic statistics.

`show interfaces [slot chassis/slot | port chassis/slot/port[-port2]] traffic`

**Syntax Definitions**

- `chassis` The chassis identifier when running in virtual chassis mode.
- `slot` Slot number to display information about all ports on a specific slot.
- `port[-port2]` The port number of a specific interface to display. Use a hyphen to specify a range of ports.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If no slot/port numbers are entered, traffic settings for all slots/ports on the switch are displayed.

**Examples**

```
-> show interfaces traffic
Ch/Slot/Port   Input packets     Input bytes      Output packets    Output bytes
-------------+-----------------+-----------------+-----------------+---------------
1/1/2                322             20624              5125            347216
1/3/2                322             20620              5133            347764
```

**output definitions**

- **Ch/Slot/Port** Interface chassis, slot, and port numbers.
- **Input packets** Input packets detected.
- **Input bytes** Input bytes detected.
- **Output packets** Output packets detected.
- **Output bytes** Output bytes detected.
**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- **interfaces ddm**
  Displays general interface information (e.g., hardware, MAC address, and input/output errors).

- **show interfaces counters**
  Displays interface counter information (e.g., unicast packets received/transmitted).

**MIB Objects**

- **esmConfTable**
  - **esmPortSlot**
  - **esmPortIF**

- **ifXTable**
  - **ifHCInOctets**
  - **ifHCInUcastPkts**
  - **ifHCInMulticastPkts**
  - **ifHCInBroadcastPkts**
  - **ifHCOutOctets**
  - **ifHCOutUcastPkts**
  - **ifHCOutMulticastPkts**
  - **ifHCOutBroadcastPkts**
**show interfaces ingress-rate-limit**

Displays the ingress-rate-limit set for each interface port.

```
show interfaces [slot chassis/slot| port chassis/slot/port[-port]] ingress-rate-limit
```

**Syntax Definitions**

- **chassis**  
  The chassis identifier.

- **slot**  
  Slot number to display information about all ports on a specific slot.

- **port[-port]**  
  The port number of a specific interface to display. Use a hyphen to specify a range of ports.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

If the slot number is not specified, then the switch back pressure feature must be enabled or disabled on an entire chassis.

**Examples**

```
-> show interfaces port 1/1/1-4 ingress-rate-limit
Chas/Slot/Port     Rate Limit (Mbps)     Burst Size (MB)     Status
1/1/1               496                 19                disable
1/1/2               496                 19                disable
1/1/3               496                 19                disable
1/1/4               496                 19                disable
```

**output definitions**

- **Chas/Slot/Port**  
  Interface chassis, slot, and port numbers.

- **Rate Limit (Mbps)**  
  Rate limit in Megabits.

- **Burst Size (MB)**  
  Burst size in Megabytes.

- **Status**  
  Status of rate limiting.
**Release History**

Release 7.1.1; command introduced.

**Related Commands**

`show interfaces ingress-rate-limit` Configures the ingress-rate-limit.

**MIB Objects**

- `esmConfTable`
- `esmPortSlot`
- `esmPortIP`
**show interfaces ddm**

Displays the Digital Diagnostics Monitoring (DDM) information for the specified transceivers.

```
show interfaces [slot chassis/slot| port chassis/slot/port[-port1]] ddm [w-low | w-high | status | a-low | a-high | actual]
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot**: Display all the transceivers on the specified slot.
- **port[-port2]**: The port number of a specific interface to display. Use a hyphen to specify a range of ports.
- **w-low**: Display the transceivers Warning Low value.
- **w-high**: Display the transceivers Warning High value.
- **status**: Display the administrative status of DDM.
- **a-low**: Display the transceivers Alarm Low value.
- **a-high**: Display the transceivers Alarm High value.
- **actual**: The real-time values indicated by the transceiver. Values displayed in parentheses indicate the Warning or Alarm value that has been reached.

### Defaults

N/A

Usage Guidelines

- The output is only displayed for those ports that support the splitter cable functionality.
- On modules with a single link LED per port, the LED is controlled by the status of sub-port 'A' only.

Examples

`-> show interfaces break-out`

<table>

**Release History**

Release 8.7R3; command introduced.

**Related Commands**

`interfaces port break-out` Configures the mode of the splitter cable capable ports.

**MIB Objects**

`esmPortModeTable`  
`esmConfiguredMode`
**show transceivers**

Displays transceiver manufacturer and status information.

`show transceivers [slot chassis/slot [transceiver transceiver_num]]`

**Syntax Definitions**

- **chassis**
  - The chassis identifier.
- **slot**
  - Display all the ports on the specified slot.
- **transceiver_num**
  - The number of the transceiver to display.

**Defaults**

By default, information is displayed for all transceivers.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

**Usage Guidelines**

- Specify a chassis/slot number to display transceiver information for a specific module.
- Specify a transceiver model number to display information for a specific transceiver.

**Examples**

```
-> show transceivers
Chassis ID 1
Slot 1 Transceiver 53
  ALU Model Name:  QSFP-40G-C1M
  ALU Model Number:  120387-90
  Hardware Revision:  A
  Serial Number:  404820066
  Manufacture Date:  Feb 17 2014
  Laser Wave Length:  N/A
  Admin Status:  POWER ON
  Operational Status:  UP

Chassis ID 2
Slot 1 Transceiver 30
  ALU Model Name:  QSFP-40G-C1M
  ALU Model Number:  120387-90
  Hardware Revision:  A
  Serial Number:  404820066
```
Manufacture Date: Feb 17 2014,
Laser Wave Length: N/A,
Admin Status: POWER ON,
Operational Status: UP

Slot 1 Transceiver 39
Manufacturer Name: PICOLIGHT,
Part Number: PL-XPL-00-S13-00,
Hardware Revision: ,
Serial Number: P100Q1F,
Manufacture Date: Jul 2 2002,
Laser Wave Length: N/A,
Admin Status: POWER ON,
Operational Status: UP

-> show transceivers slot 2/1
Slot 1 Transceiver 30
ALU Model Name: QSFP-40G-C1M,
ALU Model Number: 120387-90,
Hardware Revision: A,
Serial Number: 404820066,
Manufacture Date: Feb 17 2014,
Laser Wave Length: N/A,
Admin Status: POWER ON,
Operational Status: UP

Slot 1 Transceiver 39
Manufacturer Name: PICOLIGHT,
Part Number: PL-XPL-00-S13-00,
Hardware Revision: ,
Serial Number: P100Q1F,
Manufacture Date: Jul 2 2002,
Laser Wave Length: N/A,
Admin Status: POWER ON,
Operational Status: UP

-> show transceivers slot 2/1 transceiver 39
Slot 1 Transceiver 39
Manufacturer Name: PICOLIGHT,
Part Number: PL-XPL-00-S13-00,
Hardware Revision: ,
Serial Number: P100Q1F,
Manufacture Date: Jul 2 2002,
Laser Wave Length: N/A,
Admin Status: POWER ON,
Operational Status: UP

output definitions

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

`show interfaces ddm` Displays the DDM administrative status or trap capability.

**MIB Objects**

N/A
show violation

Displays the violation conditions that exist on specific ports or link aggregates.

`show violation [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]]`

---

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot` The slot number for a specific module.
- `port[-port2]` The port number of a specific interface to display. Use a hyphen to specify a range of ports.
- `agg_id[-agg_id2]` Enter a link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs.

---

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

NA

**Examples**

In the following example, the `admin down` action for link aggregate 2 indicates that a port violation has occurred on one of the ports related to the link aggregate group with ID 2.

```
-> show violation
* = Link Agg ID
LAG ID/Port  Source  Action       Reason         WTR  Time  Max/Remain
----------+----------+------------------+---------------+-----+---------+----------
1/1/1     src lrn   simulated down  lps shutdown     0    300     10/5
1/1/1     src lrn   simulated down  lps restrict      0    300     10/10
*0/2      qos       admin down     policy          0    300     10/10
```

**output definitions**

- **Port** The slot and port numbers or link aggregate IDs on which violations occurred.
- **Source** Specifies the source application that detected the violation.
**output definitions**

<table>
<thead>
<tr>
<th>Action</th>
<th>Specifies the action that is taken when the violation is detected on the port. There are two types of actions: admin down - deactivates the physical port. simulated down - the port is put in blocking state.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason</td>
<td>Specifies the reason for the violation.</td>
</tr>
<tr>
<td>WTR</td>
<td>The wait-to-restore timer value. Specifies the number of seconds the switch waits before notifying other applications that the link is up. Configured through the interfaces wait-to-restore command.</td>
</tr>
<tr>
<td>Recovery Time</td>
<td>The amount of time after which the port is automatically re-activated if the port was shutdown. Configured through the violation recovery-time command.</td>
</tr>
<tr>
<td>Recovery Max/Remain</td>
<td>The maximum number of recovery attempts allowed and the number of attempts remaining. Configured through the violation recovery-maximum command.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

clear violation

Clears all the MAC address violation logs for a particular port and session. After the violations are cleared, the specific port resumes normal operation.

**MIB Objects**

  - portViolationTimerAction
**show interfaces portgroup**

Displays the port group mappings on an applicable OmniSwitch.

`show interfaces portgroup [slot chassis/slot | port-group-number chassis/slot/group[-group]]`

---

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot` Slot number to display information about all ports on a specific slot.
- `group[-group]` The group number. Use a hyphen to specify a range of groups.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>6900 V48C8 No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- The OmniSwitch 6900-V48C8 does not support a mix of 1G/10G and 25G speeds on the 4-port groups of ports 1-48 listed below. Mixing 1G and 10G speeds is supported.
- Member ports of each port group are non-contiguous, use this command to display the port mapping.

---

**Examples**

```
-> show interfaces portgroup
Ch/                                           Ch/
Slot/                   Speed                 Slot
Port-Group-Num   Configured   Operational     Member-Port
--------------+--------------+-------------+---------------
1/1/1                 25G          None        1,2,3,6,
1/1/2                 AUTO         10G         4,5,7,9,
1/1/3                 AUTO         10G         8,10,11,12,
1/1/4                 AUTO         None        13,14,15,18,
1/1/5                 AUTO         None        16,17,19,21,
1/1/6                 AUTO         25G         20,22,23,24,
1/1/7                 AUTO         None        25,26,27,30,
1/1/8                 AUTO         25G         28,29,31,33,
1/1/9                 AUTO         25G         32,34,35,36,
1/1/10                AUTO         None        37,38,39,42,
1/1/11                AUTO         None        40,41,43,45,
```
show interfaces portgroup

1/1/12        AUTO       None     44,46,47,48,

output definitions

Ch/Slot/Port-Group-Num  The port group number (1-12).
Configured Speed       The configured speed of the port group (Auto, 25G, 10G).
Operational            The operational speed of the port group.
Ch/Slot/Member-Port     The member ports of the corresponding port group.

Release History

Release 8.2.1; command introduced.

Related Commands

clear violation

Clears all the MAC address violation logs for a particular port and session. After the violations are cleared, the specific port resumes normal operation.

violation recovery-maximum

Configures the maximum number of recovery attempts allowed before the port is permanently shut down.

violation recovery-time

Configures the time interval after which the port is automatically re-activated if the port was shutdown for any violation.

violation recovery-trap

Enables or disables the sending of a violation recovery trap when any port is re-enabled after the violation recovery time has expired.

MIB Objects

portViolationTable

alaPvrGlobalTrapEnable
alaPvrGlobalRetryTime
alaPvrGlobalRecoveryMax
alaPvrRetryTime
alaPvrRecoveryMax
**interfaces link-monitoring admin-status**

Enables or disables link monitoring on a specific slot, port, or a range of specified ports.

`interfaces {slot chassis/slot | port chassis/slot/port[-port2]} link-monitoring admin-status {enable | disable}`

---

**Syntax Definitions**

- **chassis**
  - The chassis identifier.

- **slot**
  - The slot number for a specific module.

- **port[-port2]**
  - The port number. Use a hyphen to specify a range of ports.

- **enable**
  - Enables link monitoring for the specified port.

- **disable**
  - Disables link monitoring for the specified port.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Configuring link monitoring parameters are allowed even if the link monitoring status is disabled for the specified ports.

- The Automatic Recovery Timer and link monitoring must not be enabled on Remote Fault Propagation (RFP) enabled ports.

- Enter a slot number to configure link monitoring for all interfaces on a specific slot.

- Enter a slot and port number or a range of port numbers to configure link monitoring for a specific interface or range of interfaces.

- Link Monitoring can be enabled on the member ports of the link aggregate, but not on the entire link aggregate. Link Monitoring is not supported on the VFL ports.

---

**Example**

```
-> interfaces slot 1/1 link-monitoring admin-status enable
-> interfaces port 1/1/1 link-monitoring admin-status enable
```
interfaces port 1/1/1-7 link-monitoring admin-status enable
interfaces port 1/2/5 link-monitoring admin-status disable
interfaces port 1/2/5-20 link-monitoring admin-status disable

**Release History**

Release 7.3.2; command introduced.

**Related Commands**

- `show interfaces` Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
- `show interfaces ddm` Displays the link monitoring configuration for the specified ports.
- `show interfaces link-monitoring statistics` Displays the link monitoring statistics for the specified ports.

**MIB Objects**

- `alaLinkMonConfigTable`  
- `alaLinkMonStatus`
interfaces link-monitoring time-window

Configures the monitoring time window on a specific slot, port, or a range of specified ports. This is the length of time during which the link is monitored.

`interfaces {slot chassis/slot | port chassis/slot/port[-port2]} link-monitoring time-window seconds`

**Syntax Definitions**

- `chassis`: The chassis identifier.
- `slot`: The slot number for a specific module.
- `port[-port2]`: The port number. Use a hyphen to specify a range of ports.
- `seconds`: The length of time during which the link is monitored. The valid range is 0–3600 seconds.

**Defaults**

By default, the time window value is set to 300 seconds.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | V72/C32 | 6900 | X48C6/T48C6/ | 9900 |
|------|------|------|-------|------|-------|------|------|---------|------| X48C4E/V48C8/ |      |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes     | Yes  | C32E/T24C2/ |      |
|      |      |      |       |      |       |      |      |         |      | X24C2      |      |

**Usage Guidelines**

- Enter a slot number to configure the monitoring time window for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the monitoring time window for a specific interface or a range of interfaces.

**Example**

```
-> interfaces slot 1/1 link-monitoring time-window 20
-> interfaces port 1/1/1 link-monitoring time-window 40
-> interfaces port 1/1/1-7 link-monitoring time-window 2500
```

**Release History**

**Usage Guidelines**

- Enter a slot number to configure the number of MAC errors allowed on all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the number of MAC errors allowed on a specific interface or on a range of interfaces.

**Example**

```
-> interfaces slot 1/1 link-monitoring link-error-threshold 30
-> interfaces port 1/1/1 link-monitoring link-error-threshold 10
-> interfaces port 1/1/1-7 link-monitoring link-error-threshold 35
```

**Release History**

Release 7.3.2; command introduced.
**Related Commands**

- **show interfaces**
  Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

- **show interfaces ddm**
  Displays the link monitoring configuration for the specified ports.

- **show interfaces link-monitoring statistics**
  Displays the link monitoring statistics for the specified ports.

**MIB Objects**

- `alaLinkMonConfigTable`
  - `alaLinkMonLinkErrorThreshold`
interfaces clear-link-monitoring-stats

Clears the link monitoring statistics on a specific slot, port, or a range of specified ports.

```
interfaces {slot chassis/slot| port chassis/slot/port[-port2]} clear-link-monitoring-stats
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot**: The slot number for a specific module.
- **port[-port2]**: The port number. Use a hyphen to specify a range of ports.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Enter a slot number to clear monitoring statistics for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to clear monitoring statistics for a specific interface or a range of interfaces.

### Example

- `-> interfaces slot 1/1 clear-link-monitoring-stats`
- `-> interfaces port 1/1/1 clear-link-monitoring-stats`
- `-> interfaces port 1/1/1-7 clear-link-monitoring-stats`

### Release History

Release 7.3.2; command introduced.
Related Commands

- **show interfaces**
  Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

- **show interfaces ddm**
  Displays the link monitoring configuration for the specified ports.

- **show interfaces link-monitoring statistics**
  Displays the link monitoring statistics for the specified ports.

MIB Objects

- **alaLinkMonStatsTable**
  - **alaLinkMonStatsClearStats**
show interfaces link-monitoring config

Displays configuration information for the Link Monitoring feature. This includes the link monitoring status on a specific slot, port or a range of specified ports, time window, link flap threshold, and link error threshold.

**show interfaces {slot chassis/slot| port chassis/slot/port|-port2]} link-monitoring config**

### Syntax Definitions

- **chassis**
  - The chassis identifier.

- **slot**
  - The slot number for a specific module.

- **port[-port2]**
  - The port number. Use a hyphen to specify a range of ports.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

output definitions

- **Ch/Slot/Port**: Interface chassis, slot, and port number.
- **Status**: Link monitoring status (enable/disable).
- **Time Window**: Time interval, in seconds, for which the link is monitored.
- **Link-flap threshold**: Number of link flaps allowed on a specific slot, port, or a range of specified ports in the time interval before the port is shutdown.
- **Link-error threshold**: Number of MAC errors allowed on a specific slot, port, or a range of specified ports in the time interval before the port is shutdown.

<td>6</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.3.2; command introduced.

**Related Commands**

- `show interfaces` Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
- `show interfaces link-monitoring config` Displays configuration information of the Link Monitoring.
- `interfaces link-monitoring admin-status` Enables or disables link monitoring.
- `interfaces clear-link-monitoring-stats` Clears the Link Monitoring statistics.
- `interfaces link-monitoring link-error-threshold` Configures the number of MAC errors that are allowed before the port is shutdown.

**MIB Objects**

- `alaLinkMonStatsTable`
  - `alaLinkMonStatsPortStatus`
  - `alaLinkMonStatsCurrentLinkFlaps`
  - `alaLinkMonStatsCurrentErrorFrames`
  - `alaLinkMonStatsCurrentCRCErrors`
  - `alaLinkMonStatsCurrentLostFrames`
  - `alaLinkMonStatsCurrentAlignErrors`
  - `alaLinkMonStatsCurrentLinkErrors`
  - `alaLinkMonStatsTotalLinkFlaps`
  - `alaLinkMonStatsTotalLinkErrors`
**interfaces tdr**

Initiates a Time Domain Reflectometry (TDR) cable diagnostics test on the specified port. The TDR feature sends a signal down a cable to determine the distance to a break or other discontinuity in the cable path. The length of time it takes for the signal to reach the break and return is used to estimate the distance to the discontinuity.

**interfaces port chassis/slot/port tdr enable**

---

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot` The slot number for a specific module.
- `port` The port number.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- TDR is an on-demand, out-of-service test. The test is not automatically triggered; data and protocol traffic is interrupted.
- Only one TDR test can be run at any given time.
- TDR is not supported on link aggregate ports, fiber ports, or stacking ports.
- TDR results are automatically cleared when a new test is started on the port or when the module for the port is reset.

---

**Examples**

- `-> interfaces port 1/1/1 tdr enable`

---

**Release History**

Release 8.1.1; command was introduced.
Related Commands

- **clear interfaces**: Clears the statistics of the last test performed on the port.
- **show interfaces tdr-statistics**: Displays the results of the last TDR test performed on a port.

MIB Objects

- esmTdrPortTable
- esmTdrPortTest
show interfaces tdr-statistics

Displays the results of the last TDR test performed on a port.

**show interfaces [slot chassis/slot | port chassis/slot/port[-port2]] tdr-statistics**

**Syntax Definitions**

- **chassis**: The chassis identifier.
- **slot**: The slot number for a specific module.
- **port[-port2]**: The port number. Use a hyphen to specify a range of ports.

**Defaults**

By default, TDR statistics are shown for all ports on all modules

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

**link-fault-propagation group**

Configures a Link Fault Propagation (LFP) group to associate with source and destination ports.

```bash
link-fault-propagation group group_id [admin-status {enable | disable}]
no link-fault-propagation group {group_id[-group_id2]}
```

**Syntax Definitions**

- `group_id`  
  A group ID number. The valid range is 1–8.

- `group_id[-group_id2]`  
  A group ID number to remove. Use a hyphen to specify a range of existing group ID numbers (5-8). Specifying a range is only used to remove group IDs, not to create them.

- `enable`  
  Enables LFP for the specified group.

- `disable`  
  Disables LFP for the specified group.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>X72</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove a LFP group or a range of groups.
- Up to eight LFP groups per switch are allowed.
- Once a LFP group is created, assign source and destination ports to that group.

**Example**

```bash
-> link-fault-propagation group 1
-> no link-fault-propagation group 4
-> no link-fault-propagation group 4-7
```

**Release History**

Release 7.3.2; command introduced.
Related Commands

- **link-fault-propagation group source**
  Configures the source port assignments for the LFP group.

- **link-fault-propagation group destination**
  Configures the destination port assignments for the LFP group.

- **link-fault-propagation group wait-to-shutdown**
  Configures the amount of time LFP waits before shutting down the destination ports.

- **show link-fault-propagation group**
  Displays the LFP group configuration for the switch.

MIB Objects

- **alaLFPGroupTable**
  - **alaLFPGroupId**
  - **alaLFPGroupRowStatus**
link-fault-propagation group source

Configures the source port assignments for a Link Fault Propagation (LFP) group.

```
link-fault-propagation group group_id source {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

```
no link-fault-propagation group group_id source {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

**Syntax Definitions**

- `group_id`: An existing LFP group ID number. The valid range is 1–8.
- `chassis`: The chassis identifier.
- `slot`: The slot number for a specific module.
- `port[-port2]`: The port number. Use a hyphen to specify a range of ports and/or a space to specify multiple port entries.
- `agg_id[-agg_id2]`: The link aggregate ID number. Use a hyphen to specify a range of IDs and/or a space to specify multiple ID entries (1-5 10 12).

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>X72</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove a source port association with the specified LFP group.
- Make sure the LFP group specified with this command already exists in the switch configuration.
- Configuring the source ports and destinations ports for the specified LFP group is allowed within the same command (see the examples on this command page).
- A group can have a maximum of 64 source ports and 64 destination ports.
- A maximum of 64 link aggregates is supported, regardless of the number of ports in each aggregate in a group.
- A port/linkagg added as a source/destination port for a particular group cannot be added as a destination/source port for this group or for any other group.
• If a port is recovered due to the Interface Recovery Timer, then the port will revert to the shutdown state if the error persists.

Example

- `link-fault-propagation group 1 source port 1/2`
- `link-fault-propagation group 1 source port 1/2-5 2/3`
- `link-fault-propagation group 1 source linkagg 1`
- `link-fault-propagation group 1 source linkagg 1-3`
- `link-fault-propagation group 1 source port 2/3 destination port 1/6`
- `link-fault-propagation group 1 source port 3/1-5 destination linkagg 6`
- `no link-fault-propagation group 1 destination port 1/10`

Release History

Release 7.3.2; command introduced.

Related Commands

- `link-fault-propagation group` Configures an LFP group, including the administrative status.
- `link-fault-propagation group destination` Configures the destination port assignments for the LFP group.
- `link-fault-propagation group wait-to-shutdown` Configures the amount of time LFP waits before shutting down the destination ports.
- `show link-fault-propagation group` Displays the LFP group configuration for the switch.

MIB Objects

- `alaLFPGroupTable` (alaLFPGroupId, alaLFPConfigTable) Configures an LFP group, including the administrative status.
- `alaLFPConfigTable` (alaLFPConfigPort, alaLFPConfigPortType, alaLFPConfigRowStatus) Configures the destination port assignments for the LFP group.
**link-fault-propagation group destination**

Configures the destination port assignments for a Link Fault Propagation (LFP) group.

```
link-fault-propagation group group_id destination {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

```
no link-fault-propagation group group_id destination {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

**Syntax Definitions**

- **group_id**
  - An existing LFP group ID number. The valid range is 1–8.
- **chassis**
  - The chassis identifier.
- **port[-port2]**
  - The port number. Use a hyphen to specify a range of ports and/or a space to specify multiple port entries.
- **agg_id[-agg_id2]**
  - The link aggregate ID number. Use a hyphen to specify a range of IDs and/or a space to specify multiple ID entries (1-5 10 12).

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6/</th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>X72</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to remove a destination port association with the specified LFP group.
- Make sure the LFP group specified with this command already exists in the switch configuration.
- Configuring the source ports and destinations ports for the specified LFP group is allowed within the same command (see the examples on this command page).
- A group can have a maximum of 64 source ports and 64 destination ports.
- A maximum of 64 link aggregates is supported regardless of the number of ports in each aggregate in a group.
- A port or link aggregate that is configured as a source port cannot be configured as a destination port for any group. However, a source port can be associated with multiple LFP groups.
• A port or link aggregate that is configured as a destination port cannot be configured as a source port for any group. However, a destination port can be associated with multiple LFP groups.

• If port is recovered due to the Interface Recovery Timer, then the port will revert to the shutdown state if the error persists.

Example

-> link-fault-propagation group 1 destination port 1/4
-> link-fault-propagation group 1 destination port 1/5-8 2/3
-> link-fault-propagation group 1 destination linkagg 6
-> link-fault-propagation group 1 destination linkagg 6-10
-> link-fault-propagation group 1 source port 1/2 2/3 destination port 1/6
-> link-fault-propagation group 1 source port 1/2 2/3 destination linkagg 6
-> link-fault-propagation group 1 source linkagg 3 destination port 1/6 1/9
-> link-fault-propagation group 1 source linkagg 3 destination linkagg 1

-> no link-fault-propagation group 1 source port 1/9
-> no link-fault-propagation group 1 destination port 1/10

- alaLFPConfigRowStatus
link-fault-propagation group wait-to-shutdown

Configures the wait-to-shutdown timer value for the Link Fault Propagation (LFP) group. This is the amount of time after all the source ports go down that LFP waits before shutting down the destination ports.

link-fault-propagation group group_id wait-to-shutdown seconds

Syntax Definitions

group_id
An existing LFP group ID number. The valid range is 1–8.

seconds
The number of seconds LFP waits before shutting down the destination ports. The valid range is 0-300 in multiples of 5.

Defaults

By default, the timer is set to zero (disabled).

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>X72</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Set the wait-to-shutdown timer value to 0 to disable the timer.
- Make sure the LFP group specified with this command already exists in the switch configuration.

Example

-> link-fault-propagation group 1 wait-to-shutdown 40
-> link-fault-propagation group 3 wait-to-shutdown 70
-> link-fault-propagation group 5 wait-to-shutdown 0

Release History

Release 7.3.2; command introduced.
Related Commands

- link-fault-propagation group
  - Configures an LFP group, including the administrative status.
- show link-fault-propagation group
  - Displays the LFP group configuration for the switch.

MIB Objects

show link-fault-propagation group

 Displays information for the specified Link Fault Propagation (LFP) group.

 show link-fault-propagation group [group_id]

**Syntax Definitions**

`group_id` An existing LFP group ID number. The valid range is 1–8.

**Defaults**

By default, information is displayed for all existing LFP groups.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>X72</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Enter a LFP group ID number with this command to display information for a specific group.
- If a virtual port such as a link aggregate is configured as a source or destination port it will be displayed instead of the physical ports.

**Example**

```bash
-> show link-fault-propagation group
Group Id : 2
    Source Port(s) : 0/1-2 1/1/1-5 1/1/7,
    Destination Port(s) : 0/3 1/1/10-13,
    Group-Src-Ports Status : up,
    Admin Status : enable,
    Wait To Shutdown : 10

Group Id : 7
    Source Port(s) : 1/1/1 1/1/3,
    Destination Port(s) : 0/3 1/1/5 1/1/7 1/1/11 1/1/13 1/1/15 1/1/17 1/1/19 1/1/21 1/1/23,
    Group-Src-Ports Status : up,
    Admin Status : enable,
    Wait To Shutdown : 100
```
-> show link-fault-propagation group 2
  Group Id : 2
  Source Port(s) : 0/1-2 1/1/1-5 1/1/7,
  Destination Port(s) : 0/3 1/1/10-13,
  Group-Src-Ports Status : up,
  Admin Status : enable,
  Wait To Shutdown : 10

Release History
Release 7.3.2; command introduced.

**interfaces beacon**

Configures the LED color and behavior for a port or group of ports.

```
interfaces {slot chassis/slot | port chassis/slot/port[-port2]} beacon [admin-status {enable | disable}] [led-color color] [led-mode {solid | activity}]
```

```
no interfaces {slot chassis/slot | port chassis/slot/port[-port2]} beacon
```

**Syntax Definitions**

- **chassis**: The chassis ID for the switch on which the LEDs are being configured. For standalone switches, use 1.
- **slot**: The slot ID for the switch on which the LEDs are being configured. For standalone switches, use 1.
- **port**: The port number of the interface LED you want to configure.
- **-port2**: The last port number in a range of interface LEDs you want to configure. Be sure to insert a hyphen between port range numbers (for example, 7-10)
- **led-mode**: Indicates that LED behavior (activity or solid) is being configured for the corresponding interface LEDs.
- **activity**: The LEDs will blink when traffic is detected on the corresponding ports.
- **solid**: The LEDs will remain solid whether or not traffic is detected on the corresponding ports.
- **led-color**: Indicates that the LED color is being configured for the corresponding port(s).
- **color**: The color to be displayed on the corresponding port LED(s). Options include yellow, white, red, magenta, green, blue, aqua and off.
- **admin-status**: Indicates that the beacon LED administrative status is being configured for the corresponding port(s).
- **enable**: Enables the beacon function on the corresponding port(s).
- **disable**: Disables the beacon function on the corresponding port(s).
- **no**: Adding the no syntax to the beginning of the command clears all information stored in the beacon settings table. Refer to Usage Guidelines below for more information.
Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>led-mode</td>
<td>activity</td>
</tr>
<tr>
<td>led-color</td>
<td>magenta</td>
</tr>
<tr>
<td>admin-status</td>
<td>enable</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>X72/Q32</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Supported on the OmniSwitch 6900-X72/Q32 models only.
- The `no interfaces beacon` command syntax clears the beacon settings from the `show interfaces beacon` table and resets LEDs to original factory-set behavior. (Once stored beacon settings are cleared, they can no longer be retrieved and beacon settings must be reconfigured.)
- The `interfaces beacon` command is supported on all Ethernet ports on the switch. However, when specifying a range in the command line, please note that The Beacon LED feature is not supported on sub-ports 'b', 'c', or 'd' when an interface is operating in 4X10G mode. Additionally, only Solid mode is supported on sub-port 'a' for 4X10G interfaces.

Examples

- `interfaces port 1/1/7-10 beacon led-mode solid admin-status enable led-color aqua`
- `interfaces slot 1/1 beacon led-color magenta`
- `no interfaces slot 1/1/1 beacon`

Release History

Release 7.3.4; command introduced.

Related Commands

- `show interfaces beacon` Displays current interface beacon settings.

show interfaces beacon

Displays current interface beacon settings.

```plaintext
show interfaces [slot chassis/slot | port chassis/slot/port[-port2]] beacon
```

**Syntax Definitions**

- `chassis` The chassis ID for the switch on which beacon settings are being shown. For standalone switches, use 1.
- `slot` The slot ID for the switch on which beacon settings are being shown. For standalone switches, use 1.
- `port` The port number for which beacon settings are being shown.
- `-port2` The last port number in a range for which beacon settings are being shown. Be sure to insert a hyphen between port range numbers (for example, 7-10)

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>X72/Q32</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Supported on the OmniSwitch 6900-X72/Q32 models only.

**Examples**

```plaintext
-> show interfaces beacon
Ch/Slot/Port   Admin-Stat   LED-Color  LED-Mode
------------+-------------+--------------+------------
1/1/1A        Disable     Magenta    Solid
1/1/2A        Disable     Blue       Activity
1/1/30A       Enable      Magenta    Solid
1/1/31A       Enable      Off        Solid
```

**output definitions**

- **Ch/Slot/Port** The chassis/slot/port ID for the switch on which beacon settings are being shown.
- **Admin-Stat** The beacon administrative status (Enable/Disable).
output definitions (continued)

<table>

<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>X72/Q32</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command enables PTP end-to-end transparent clock across all ports.
- PTP end-to-end transparent clock is supported in a standalone mode (virtual chassis of one) and virtual chassis of two. PTP end-to-end on a virtual chassis of two is supported only on OmniSwitch 6900-X72.
- Single loopback port per chassis is required to support PTP in a virtual chassis of two.
- Loopback ports dedicated for PTP must not be used by any other feature. Ensure PTP is configured on unused ports.
- PTP on a virtual chassis of two is not supported on chassis ID 1.
- IGMP snooping must not be configured on PTP reserved IPv4 and IPv6 multicast addresses.
- The two 10G ports, 1/1/27 and 1/1/28 on OmniSwitch 6465-P28 does not support PTP.
- Supported on certain OS6560 models and ports with appropriate FPGA. See the 8.7R2 release notes.
**Examples**

-> interfaces ptp admin-state enable  
-> interfaces ptp admin-state disable  
-> interfaces ptp admin-state enable priority 4  
-> interfaces ptp admin-state enable priority default  
-> interfaces ptp admin-state enable loopback-portlist 2/1/12 3/1/23  
WARNING: User ports 2/1/12 and 3/1/23 will be out of service for users.

**Release History**

Release 8.4.1 R02; command introduced.  
Release 8.4.1 R03; OmniSwitch 6860, 6865 support for PTP added.  
Release 8.5R1; OmniSwitch 6465 support for PTP added.  
Release 8.5R2; **loopback-portlist** keyword added.

**interfaces port ptp p2p**

Enables or disables IEEE 1588 PTP peer-to-peer transparent clock on an interface.

```
interfaces port chassis/slot/port ptp p2p admin-state {enable | disable}
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot/port**: The slot and port number (for example, 3/1).
- **enable**: Enables the PTP peer-to-peer transparent clock on an interface.
- **disable**: Disables the PTP peer-to-peer transparent clock on an interface.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Support</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- PTP must be enabled globally for PTP peer-to-peer support.
- PTP peer-to-peer supports only one-step mode.
- When peer-to-peer is enabled on a port, link delay will be computed dynamically for the corresponding link.
- Ensure Loopback0 IP interface is configured on the switch as loopback0 interface address will be used as the source IP for peer delay measurement packets. If loopback0 IP interface is not configured, then peer delay measurement feature will not work.

### Examples

```
-> interfaces port 1/1/1 ptp p2p admin-state enable
-> interfaces port 1/1/1 ptp p2p admin-state disable
```

### Release History

Release 8.6R1; command introduced.

MIB Objects

N/A
**interfaces macsec admin-state**

This command enables or disables MACsec on a physical port or a port range.

```
interfaces {slot chassis/slot | port chassis/slot/port[-port2]} macsec admin-state {enable | disable}
[transmit-interval tx_interval] [encryption]]
```

```
no interfaces {slot chassis/slot | port chassis/slot/port[-port2]} macsec [sci-rx [hex-num] | sci-tx [keychain [encryption]]]
```

### Syntax Definitions

- **chassis**
  - The chassis identifier.

- **slot**
  - The slot number for a specific module.

- **slot/port[-port2]**
  - The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).

- **admin-state enable**
  - Enables MACsec on a physical port or port range.

- **admin-state disable**
  - Disables MACsec on a physical port or port range.

- **static**
  - Sets the SA (secure association) mode to static. This is enabled by default.

- **dynamic**
  - Sets the SA (secure association) mode to dynamic.

- **hex-num**
  - The SCI (Secure Channel Identifier) value (up to 8 bytes in length) for Tx and Rx channel in the hexadecimal format (0xhex).
  - The default SCI value is ‘0’ (implicit SCI value).

- **keychain_id**
  - The keychain ID associated to Tx/Rx channel.

- **encryption**
  - Enable or disable the encryption option on the Tx/Rx channel.
  - By default, the ‘encryption’ is disabled.

- **cak_kc**
  - The keychain ID for Static-CAK (Connectivity Association Key).

- **priority**
  - Specifies the server priority in the range 0 to 255.

- **tx_interval**
  - Specifies the transmit interval for MKPDU in the range 2 to 10 seconds.
## Defaults

<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>X48C4E</td>
<td>No</td>
</tr>
</tbody>
</table>

## Usage Guidelines

- Use this command to,
  - Enable or disable MACsec on a physical port or port range.
  - Set the MACsec mode: Static SA Mode or Dynamic SA Mode.

- Only users with MACsec read-write privilege can configure MACsec. Use `user` command to enable MACsec read-write permissions to the users. The privilege can be configured by family or by security domain. For example,
  - `-> user securityadmin password Switch@123 read-write macsec`
  - `-> user securityadmin password Switch@123 read-write domain-security`

  See the “AAA Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide* for more information.

- For Static SA Mode - MACsec with Static Secure Association Key (static-SAK), following configurations can be configured:
  - Set the MACsec mode to Static.
  - Create MACsec Tx and Rx channels.
  - Specify the SCI value for Tx and Rx channels.
  - Associate the keychain ID for Tx and Rx channel. For more information on keychain configuration, refer to the “Chassis Management and Monitoring Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide*.
  - Enable or disable encryption on Tx and Rx channel (optional).
• Dynamic SA Mode has two variations - Dynamic SAK using pre-shared keys and Dynamic SAK using Extensible Authentication Protocol (EAP).
  – For Dynamic SAK using pre-shared keys, following configurations can be configured:
    > Set the MACsec mode to Dynamic.
    > Configure the keychain for Static-CAK. For more information on keychain configuration, refer to the “Chassis Management and Monitoring Commands” chapter in the OmniSwitch AOS Release 8 CLI Reference Guide.
    > Configure key server priority (optional).
    > Configure transmit interval for MKPDUs (optional).
    > Enable or disable encryption on dynamic secure channel (optional).
  – For Dynamic SAK using EAPs, the following configurations can be configured:
    > Set the MACsec mode to Radius.
    > Configure transmit interval for MKPDUs (optional).
    > Enable or disable encryption on dynamic secure channel (optional).

• By default, the MACsec mode is set to ‘static’. For static mode configuration, manually configured SA keys are used to secure traffic on the point-to-point link between two nodes. For MACsec mode ‘static’, following are the configuration guidelines:
  – Only one Tx and one Rx channel can be configured per interface.
  – Each node that expects to receive traffic sent in a particular transmit secure channel must configure a ‘matching’ receive secure channel, with an SCI corresponding to the SCI of the transmit secure channel of the peer. MACsec supports one secure channel for Tx and one secure channel for Rx configuration on an interface.
  – The secure channel for both Tx and Rx on an interface can be configured with SCI value of 8 bytes long. It can be provided in short form (that is, 0x01) or full form (0x0000000000000001). 0x00 (all zeros) and 0xFFFFFFFFFFFFFFFF SCI value are not valid.
  – The secure channel for both Tx and Rx on an interface can be configured without specifying a SCI value. In this case, the default value will be considered.
  – The keychain associated with the SCI-Tx and SCI-Rx must have four keys supporting ‘AES-GCM-128’ algorithm, and the number of keys in the keychain associated with both SCI-Tx and SCI-Rx on an interface must be equal.
  – Addition/deletion of keys to/from a keychain already associated with a SCI-Tx and SCI-Rx under MACsec would not be allowed by Security Keychain module. The keychain also cannot be deleted.
  – MACsec cannot be administratively enabled on an interface until both SCI-Tx and SCI-Rx are configured on the interface.
  – The Tx/Rx secure channel cannot be removed without disabling MACsec on the interface.
  – The encryption option on the Tx/Rx channel can either be enabled or disabled. By default, the ‘encryption’ is disabled. Enabling ‘encryption’ option ensures that the data in the Ethernet frame cannot be viewed by anyone monitoring traffic on the link. Use the no form of the command to disable encryption on Tx/Rx channel.
  – MACsec SCI-Tx/SCI-Rx values cannot be updated at run-time. The SCI-Tx/Rx values must be unconfigured and re-configured. Only ‘keychain ID’ and ‘encryption’ parameters can be updated at run-time.
  – During run-time, upon enabling or disabling MACsec on the port, the interface will get re-initialized (interface will be brought down and up), which will result in temporary traffic loss.
  – MACsec mandates specifying SCI-Tx and SCI-Rx value (for configured explicit SCI) while updating its ‘keychain ID’ and ‘encryption’ parameters on an interface.
  – While unconfiguring ‘keychain ID’ and ‘encryption’ parameters on an interface, it is not mandatory to provide MACsec SCI-Tx value, whereas, MACsec mandates specifying SCI-Rx value (for explicit SCI).
For MACsec mode ‘dynamic’ - dynamic SAK using pre-shared keys, following are the configuration guidelines:

- The keychain or pre-shared key for Static-CAK must have the key mapped either to ‘AES-CMAC-128’ algorithm or ‘AES-CMAC-256’ algorithm. AES-CMAC-256 option would be supported only on platforms supporting 256-bit key. View show interfaces capability output to check if the interfaces has the support for MACsec 256-bit encryption.
- If there are multiple pre-shared keys configured in the keychain, only the first key would be used for CAK.
- Key server priority would be in the range 0-255, with lower value having higher precedence.
- Enabling or disabling Encryption enables or disables encryption on dynamic Secure-Channel (SC).

For MACsec mode ‘radius’ - dynamic SAK using EAP, following are the configuration guidelines:

- Dynamic mode using RADIUS server requires the switch end port connecting a host (supplicant) to be enabled with UNP and configured for 802.1x-authentication, and MSK/Key-Name received from Server as part of the authentication. The authentication method must be either EAP-TLS or PEAP authentication framework.
- The switch end port connecting a host (supplicant) must be enabled with UNP and configured for 802.1x-authentication.
- The MACsec mode dynamic on UNP is supported in single supplicant mode only, that is, the UNP port can learn only one supplicant on the MACsec enabled interface. Also, there cannot be any non-suppliant learned on the same port.
- Flushing the supplicant MAC on UNP port would purge the existing MACsec MKA session, (MACSec Key Agreement), and the port would be unsecured until the supplicant is learned again.
- Re-authentication of supplicant may change the UNP profile or VLAN and the policy applied to the MAC. The existing MACsec session established (if any) would remain intact if the re-authentication results in the same MSK/Key-Name from RADIUS server. Otherwise, the existing MKA session would be purged and a new session is established using the new MSK/Key-Name.
- Captive portal authentication, BYOD, and LTP (location/time policy) is not supported on MACsec enabled UNP ports.
- MACsec mode dynamic using ‘radius’ will not be supported on UNP Linkagg.

- Refer to the latest release notes for a detailed list of MACsec platform and module support.

- OmniSwitch 6860(E) and OmniSwitch 6860N models must have encryption enabled when interoperating.

- To confirm the MACsec support on the interface, use the show interfaces capability command. MACsec 128-bit and 256-bit support on a port is listed respectively against the MACsec Supported and Macsec 256-bit fields.

- MACsec must be enabled on all ports (on a per physical port basis) that are part of the same link aggregation.

- MACsec mode cannot be changed if MACsec is already administratively enabled. To change MACsec mode, administratively disable MACsec first.

- ISSU upgrade from previous releases to the latest version is not compatible for MACsec dynamic mode. Hence, it is recommended to run the same version of the AOS image on all the MACsec nodes for MACsec dynamic mode.

- MACsec is supported between two directly connected Service Access Ports or network ports for service type SPB/VXLAN/L2GRE. This is supported only on OmniSwitch 6900-X48C4E, OmniSwitch 6860N, and OmniSwitch 6860E platforms.
• Use the **no** form of this command to disable encryption on Tx/Rx channel, remove keychain configuration on Tx/Rx channel, remove Tx/Rx channel.

**Examples**

-> interface port 1/1/1 macsec admin-state enable mode static sci-Tx 0x1 key-chain 1 encryption sci-rx 0x1 key-chain 1 encryption

-> interface port 1/1/1 macsec admin-state enable mode dynamic key-chain 1 server-priority 10 transmit-interval 3

-> interface port 1/1/1 macsec admin-state enable mode dynamic radius

-> no interface port 1/1/1 macsec sci-rx 0x2 keychain

-> no interface port 1/1/1 macsec sci-tx encryption

**Release History**

Release 8.4.1 R03; command introduced.
Release 8.5R2; Dynamic SA Mode - Dynamic SAK using Pre-Shared Key and Dynamic SAK using EAP support added.

**Related Commands**

- **show interfaces macsec**
  Displays the MACsec configuration on a physical port or port range.
- **show interfaces macsec static**
  Displays the detailed MACsec configuration on a physical port or port range configured with MACsec mode ‘Static’.
- **show interfaces macsec dynamic**
  Displays the detailed MACsec configuration on a physical port or port range configured with MACsec mode ‘Dynamic’.
- **show interfaces macsec statistics**
  Displays the MACsec statistics collected for a physical port.

**MIB Objects**

  - `alaSecyIfMode`
**interfaces macsec key-rotation max-session-time**

Configures the session timer on a single port or a range of ports to perform a Secure Association Key (SAK) re-generation when the session timer gets expired.

```
interfaces {slot chassis/slot | port chassis/slot/port[-port2]} macsec key-rotation {max-session-time num | default}
```

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot` The slot number for a specific module.
- `slot/port[-port2]` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
- `num` The number of minutes a session lasts before the next rekey. Valid range is 5 minutes - 120 minutes (in the increment of 5 minutes).
- `default` Disable the session time.

**Defaults**

By default, the key rotation session time is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>No</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6465</td>
<td>Yes</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6560</td>
<td>Yes</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6570M</td>
<td>No</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6860N</td>
<td>Yes</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6865</td>
<td>No</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6900</td>
<td>No</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6900V72/C32</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>9900</td>
<td>No</td>
<td></td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Enter a slot and port number or a range of port numbers to configure the timer value for a specific interface or a range of interfaces.
- The SAK re-generation is performed at the key server side when the session time reaches the configured limit. In addition, the session time on the port is reset to the configured value.
- The configuration must be configured on both ends of the MACsec enabled interface as either of the sides can be elected as the key server.
- By default, key rotation happens when the Packet Number reaches 0xC0000000 if key rotation is not configured.
- When max-session-time is configured, if the Packet Number reaches 3/4th PN expiry (0xC0000000) or the exchange data reaches the configured limit before the session-time gets expired, the key will still get rotated. In addition, the session time on the port is reset to the configured value.
- Disabling MACsec stops the session timer.
**Examples**

-> interface port 1/1/1 macsec key-rotation max-session-time 20

**Release History**

Release 8.9R1; command introduced.

**Related Commands**

- `show interfaces macsec` Displays the MACsec configuration on a physical port or port range.
- `show interfaces macsec dynamic key-rotation` Displays the remaining session time and the exchanged data on the MACsec interfaces.

**MIB Objects**

alaSecyIfTable
alaSecySessionTime
interfaces macsec key-rotation max-exchange-data

Configures the data exchange on a single port or a range of ports to perform a SAK re-generation each time the limit is reached. This is the data exchanged (received or transmitted) between the MACsec endpoints.

```
interfaces {slot chassis/slot | port chassis/slot/port[-port2]} macsec key-rotation {max-exchange-data num [M(mega)|G(giga)] | default}
```

### Syntax Definitions

- **chassis**
  - The chassis identifier.
- **slot**
  - The slot number for a specific module.
- **slot/port[-port2]**
  - The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).
- **num**
  - The amount of GB data exchanged before the next key re-generation. Valid range is 10M (bytes) – 1000G (bytes). MB is the default value. Configuration allowed in increments like below:
    - 10M, 20M... with 10MB increment
    - 100M, 200M, with 100M increment
    - 1G, 2G, .... with 1GB increment till 100G.
- **default**
  - Disable the data exchange.

### Defaults

```
<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>num</td>
<td>default, which means the data-exchange is disabled.</td>
</tr>
</tbody>
</table>
```

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>X48C4E</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Enter a slot and port number or a range of port numbers to configure the data exchange value for a specific interface or a range of interfaces.
- The SAK re-generation is performed at key server side when the exchanged data reaches the configured value if the key life is less than two minutes.
- The configuration must be configured on both ends of the MACsec enabled interface as either of the sides can be elected as the key server.
• By default, key rotation happens when the Packet Number reaches 0xC0000000 if key rotation is not configured.

• When max-exchange-data is configured, if the Packet Number reaches 3/4th PN expiry (0xC0000000) or the session time gets expired before reaching the configured exchange data, the key will still get rotated. In addition, the count of exchange data on the port is reset to the configured value.

**Examples**

```
-> interface port 1/1/5 macsec key-rotation max-exchange-data 10M
-> interface port 1/1/5 macsec key-rotation max-exchange-data 1G
```

**Release History**

Release 8.9R1; command introduced.

**Related Commands**

```

output definitions

- **Chas/Slot/Port**: The chassis/slot/port identifier.
- **Admin-State**: The interface administrative status.
- **Mode**: The MACsec mode. ‘Keychain’, ‘Radius’ keyword denotes dynamic MACsec using pre-shared key or EAP (RADIUS server) respectively.
- **Keychain**: The keychain ID associated to Tx/Rx channel.
- **Encryption**: Status of encryption on Tx/Rx channel.
- **Server Priority**: The priority configured for the key server.
- **Transmit Interval(Sec)**: The transmit interval configured for MKPDU (in seconds).
- **Key Server**: Indicates the key server.
- **Operation Status**: The MACsec operational status.
- **SCI**: The SCI value dynamically generated for Tx and Rx channel in the hexadecimal format (0xhex).
- **Type**: Specifies the secure channel type: Tx/Rx.
- **In-use SA**: Identifier for currently active Association Number (SA) in use for Tx/Rx channel on the interface.
- **PN**: The packet number of the last packet received on the MACsec interface.

**Release History**

Release 8.5R2; command introduced.

**Related Commands**

- **interfaces macsec admin-state**: Enables or disables MACsec on a physical port or a port range.

**MIB Objects**

- **N/A**
**show interfaces macsec statistics**

Displays the MACsec statistics collected for a physical port.

```
show interfaces macsec statistics [chassis/slot/port|-port]
```

### Syntax Definitions

output definitions

Chas/Slot/Port
Interface chassis, slot and port.
Bytes Xmitted
Number of Bytes transmitted.
TX Untagged Pkts
Number of untagged packets transmitted.
TX Too-Long Pkts
Number of long packets transmitted.
Bytes Received
Number of Bytes received.
RX Untagged Pkts
Number of untagged packets received.
RX Bad-Tag Pkts
Number of bad tag packets received.
Unknown SCI RX Pkts
Number of unknown packets received.
Overrun RX Pkts
Number of packets overrun.
TX Protected Pkts
Number of protected packets transmitted.
TX Encrypted Pkts
Number of encrypted packets transmitted.
TX Octets Protected
Number of packets protected in each listed octet range.
TX Octets Encrypted
Number of packets encrypted in each listed octet range.
RX Unused SA Pkts
Number of unused SA packets received.
RX No Using SA Pkts
Number of SA packets not used.
RX Late Pkts
Number of late packets received.
RX Not Valid Pkts
Number of discarded packets.
RX Invalid Pkts
Number of invalid packets.
RX Delayed Pkts
Number of delayed packets received.
RX Unchecked Pkts
Number of unchecked packets received.
RX OK Pkts
Number of valid packets.
RX Octets Validated
Number of packets validated in each listed octet range.
RX Octets Decrypted
Number of packets decrypted in each listed octet range.
Release History

Release 8.4.1 R03; command introduced.

Related Commands

*interfaces macsec admin-state* Enables or disables MACsec on a physical port or a port range.

show interfaces macsec dynamic key-rotation

Displays the remaining session time and the exchanged data on the MACsec interfaces.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>X48C4E</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command displays the session time and the exchanged data remaining on the MACsec interfaces. This information is available only at the key server side.

**Examples**

```plaintext
-> show interfaces macsec dynamic key-rotation
Chas/Slot/Port   Time to Rekey (Sec)   Data to Rekey (Byte)
---------------------------------------------------------------------
1/1/9            3594                  19999999814
2/1/9            1632                  19869941586
```

**output definitions**

- **Chas/Slot/Port**: The chassis/slot/port identifier.
- **Admin-State**: The interface administrative status.
- **Time to Rekey (Sec)**: The session time remaining on the MACsec interface before key re-generation.
- **Data to Rekey (Byte)**: The exchange data remaining on the MACsec interface before key re-generation.

**Release History**

Release 8.9R1; command introduced.
**Related Commands**

**interfaces macsec key-rotation max-session-time**
Configures the session timer on a single port or a range of ports to perform a Secure Association Key (SAK) re-generation each time the timeout is reached.

**interfaces macsec key-rotation max-exchange-data**
Configures the data exchange on a single port or a range of ports to perform a SAK re-generation each time the limit is reached.

**MIB Objects**

  alaSecyRemainingRekeyTime
  alaSecyRemainingRekeyVolume
clear interfaces macsec statistics

Clears the MACsec statistics globally on all MACsec enabled interfaces.

clear interfaces {slot chassis/slot | port [chassis/slot/port [-port2] | all] macsec-statistics

### Syntax Definitions

- **chassis**
  - The chassis identifier.
- **slot**
  - Slot number to display information about all ports on a specific slot.
- **port[-port2]**
  - The port number of a specific interface to display. Use a hyphen to specify a range of ports.
- **all**
  - Displays information on all MACsec enabled interfaces.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>X48C4E</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is used to clear MACsec statistics on a slot, port, port-range, or on all interfaces globally.

### Examples

- `-> clear interface port 1/1/1 macsec-statistics`
- `-> clear interface port 1/1/1-2 macsec-statistics`
- `-> clear interface slot 1/1 macsec-statistics`
- `-> clear interface all macsec-statistics`

### Release History

- Release 8.4.1 R03; command introduced.
- Release 8.5 R1; **all** keyword added.
Related Commands

`interfaces macsec admin-state` Enables or disables MACsec on a physical port or a port range.

  `alaSecyIfPortClearStats`
2 Power over Ethernet (PoE) Commands

The Power over Ethernet (PoE) feature is supported on OmniSwitch PoE-capable switches. Refer to the OmniSwitch Hardware Users Guide for further details.

**Note on Terminology.** There are several general terms used to describe this feature. The terms Power over Ethernet (PoE), Power over LAN (PoL), Power on LAN (PoL), and Inline Power are synonymous terms used to describe the powering of attached devices via Ethernet ports. For consistency, this chapter and the OmniSwitch AOS Release 8 CLI Reference Guide refer to the feature as Power over Ethernet (PoE).

Additional terms, such as Powered Device (PD) and Power Source Equipment (PSE) are terms that are not synonymous, but are directly related to PoE.

- **PD** refers to any attached device that uses a PoE data cable as its only source of power. Examples include access points such as IP telephones, Ethernet hubs, wireless LAN stations, etc.
- **PSE** refers to the actual hardware source of the electrical current for PoE (e.g., OmniSwitch PoE-capable switches).

PoE commands documented in this section comply with IEEE 802.3, 802.af, and 802.3at.

MIB information for the PoE commands is as follows:

- **Filename**: ALCATEL-IND1-INLINE-POWER-MIB.mib
- **Module**: alcatelIND1INLINEPOWERMIB

- **Filename**: POWER-ETHERNET-MIB.mib
- **Module**: powerEthernetMIB
A summary of the available commands is listed here:

show lanpower
show lanpower power-rule
show lanpower power-policy
show lanpower class-detection
show lanpower capacitor-detection
show lanpower priority-disconnect
show lanpower ni-priority
show lanpower usage-threshold
show lanpower firmware-upgrade-status
show lanpower high-resistance-detection
show lanpower status
```
**lanpower service**

Activates or stops PoE service on all ports in a specified slot.

```
lanpower {chassis chassis | slot chassis/slot} service {start | stop}
```

**Syntax Definitions**

- **chassis**
  The chassis on which the PoE power is being turned on or off.

- **chassis/slot**
  The slot on which the PoE power is being turned on or off.

- **start**
  Activates PoE on all ports in the specified slot.

- **stop**
  Turns off PoE on all ports in the specified slot.

**Defaults**

Power over Ethernet is globally disabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The OmniSwitch 6465 cannot auto-detect the type of power supply connected. The type of power supply connected must be configured so that the system and PoE power information is correctly displayed and utilized. Use the `powersupply type` type command to configure the power supply.

**Examples**

```
-> lanpower slot 2/1 service start
-> lanpower chassis 1 service stop
```

**Release History**

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.
Related Commands

- `lanpower port admin-state` Activates or stops PoE service on an individual port.
- `show lanpower` Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

- `alaPethMainPseTable`
  - `alaPethMainPseAdminStatus`
**lanpower port admin-state**

Activates or stops PoE service on an individual port.

`lanpower port chassis/slot/port admin-state {enable | disable}`

---

**Syntax Definitions**

- **chassis/slot/port** The individual port on which the PoE power is being turned on or off.
- **enable** Activates PoE on the specified port.
- **stop** Turns off PoE on the specified port.

**Defaults**

Power over Ethernet is globally disabled by default.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

N/A

**Examples**

- `-> lanpower port 2/1/1 admin-state enable`
- `-> lanpower port 1/1/12 admin-state disable`

**Release History**

Release 8.1.1; command was introduced.

**Related Commands**

- `lanpower service` Activates or stops PoE service on all ports in a specified slot.
- `show lanpower` Displays the PoE status and related statistics for all ports in a specified slot.

**MIB Objects**

- `pethPsePortTable`
  - `pethPsePortAdminEnable`
**lanpower type**

Assigns a user-defined port type to a specific port (when `chassis/slot/port` values are entered) or across all ports in a chassis or slot.

```plaintext
lanpower {chassis chassis | slot chassis/slot | port chassis/slot/port} type string
```

**Syntax Definitions**

- `chassis`  The chassis on which a port type is being defined.
- `chassis/slot`  The slot on which a port type is being defined.
- `chassis/slot/port`  The specific port on which a port type is being defined.
- `string`  A user-defined text string of up to nine (9) characters. This text string will be listed in the "Type" column in the `lanpower update-from` command output.

**Defaults**

Refer to the `OmniSwitch Hardware Users Guide` for default power settings.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/V48C8/C32E/T24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command is not supported when using PoE 3.xx (802.3bt) firmware. Firmware 3.xx automatically enables class-detection and does not allow per port power limits to be configured.

- Using this command does not immediately allocate the power to the slot or port. Any unused power is still available and remains a part of the overall PoE budget.

- To globally specify the amount of inline power available to all ports in a slot, refer to the `lanpower maxpower` command on page 2-8.

- Be sure that the value specified complies with specific power requirements for all attached PDs.

- Note that the power value for the `lanpower power` command is specified in milliwatts (mW); the related command, `lanpower maxpower`, is specified in watts (W).

**Examples**

- `-> lanpower slot 3/1 power 3200`
- `-> lanpower port 1/1/24 power 25000`
- `-> lanpower chassis 1 power 3000`
**Release History**

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

**Related Commands**

- **lanpower maxpower**
  Specifies the maximum amount of inline power, in watts, available to all PoE ports in a specified slot.

- **show lanpower**
  Displays the PoE status and related statistics for all ports in a specified slot.

**MIB Objects**

`alaPethPsePortTable`

  - `alaPethPsePortPowerMaximum`
**lanpower maxpower**

Specifies the maximum amount of power, in watts, assigned to a specified slot.

```
lanpower {chassis chassis | slot chassis/slot} maxpower {watts | default}
```

### Syntax Definitions

- **chassis**
  The chassis containing PoE ports on which the maximum amount of inline power allowed is being configured.

- **chassis/slot**
  The slot containing PoE ports on which the maximum amount of inline power allowed is being configured.

- **watts**
  The maximum amount of inline power, in watts, available to all PoE ports in the corresponding slot. Refer to the *OmniSwitch Hardware Users Guide* for additional PoE specifications.

- **default**
  Sets the power value back to the default setting.

### Defaults

<table>
<thead>
<tr>
<th>installed power supply</th>
<th>default</th>
<th>range</th>
</tr>
</thead>
<tbody>
<tr>
<td>920W Power Supply (OS6860)</td>
<td>780W</td>
<td>37-780</td>
</tr>
<tr>
<td>600W Power Supply (OS6860)</td>
<td>450W</td>
<td>37-450</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- To specify the maximum amount of inline power available to a single port, refer to the *lanpower power*.

- Note that the power value for the *lanpower maxpower* command is specified in watts (W); the related command, *lanpower power*, is specified in milliwatts (mW).

### Examples

- `-> lanpower slot 3/1 maxpower 400`
- `-> lanpower chassis 1 maxpower 400`
**Release History**

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.
Release 8.8R1; **default** parameter added.

**Related Commands**

- **`lanpower power`**
  Specifies the amount of power, in milliwatts, provided for a specific port (when `chassis/slot/port` values are entered) or across all ports in a slot (if only `slot/port` values are entered).

- **`show lanpower`**
  Displays the PoE status and related statistics for all ports in a specified slot.

**MIB Objects**

- `alaPethMainPseTable`
  - `alaPethMainPseMaxPower`
**lanpower priority**

Specifies PoE power priority level to a port (when *chassis/slot/port* values are entered) or across all ports in a slot (if only *slot/port* values are entered). Levels include critical, high, and low.

```
lanpower {chassis chassis | slot chassis/slot | port chassis/slot/port} priority {critical | high | low}
```

**Syntax Definitions**

- **chassis**
  - The chassis on which the PoE power priority is being set.
- **chassis/slot**
  - The slot on which the PoE power priority is being set.
- **chassis/slot/port**
  - The specific port on which the PoE power priority is being set.
- **critical**
  - Intended for ports that have mission-critical devices attached, and therefore require top (i.e., critical) priority. In the event of a power management issue, power to critical ports is maintained as long as possible.
- **high**
  - Intended for ports that have important, but not mission-critical, devices attached. If other ports in the chassis have been configured as critical, power to high-priority ports is given second priority to critical devices.
- **low**
  - Intended for ports that have low-priority devices attached. In the event of a power management issue, power to low-priority ports is interrupted first (i.e., before critical- and high-priority ports).

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>low</td>
<td>high</td>
</tr>
<tr>
<td>low</td>
<td></td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For OmniSwitch 6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power. For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power.

**Examples**

- `-> lanpower slot 2/1 priority low`
- `-> lanpower port 1/1/6 priority critical`
-> lanpower chassis 1 priority low

**Release History**

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

**Related Commands**

- **lanpower priority-disconnect**: Enables or disables the priority disconnect function on all ports in a specified slot.
- **show lanpower**: Displays the PoE status and related statistics for all ports in a specified slot.

**MIB Objects**

- pethPsePortTable
  - pethPsePortPowerPriority
**lanpower ni-priority**

Specifies power priority level to a Network Interface (NI) module. Levels include critical, high, and low.

`lanpower {chassis chassis | slot chassis/slot} ni-priority {critical | high | low}`

### Syntax Definitions

- **chassis**
  The chassis on which the NI priority is being set.

- **chassis/slot**
  The slot on which the NI priority is being set.

- **critical**
  Intended for modules that have mission-critical devices attached, and therefore require top (i.e., critical) priority. In the event of a power management issue, power to critical NIs is maintained as long as possible.

- **high**
  Intended for modules that have important, but not mission-critical, devices attached. If other NIs in the chassis have been configured as critical, power to high-priority modules is given second priority to critical devices.

- **low**
  Intended for modules that have low-priority devices attached. In the event of a power management issue, power to low-priority modules is interrupted first (i.e., before critical- and high-priority NIs).

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>

### Usage Guidelines

For OmniSwitch 6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power. For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power.

### Examples

- `-> lanpower slot 2/1 ni-priority low`
- `-> lanpower chassis 1 ni-priority low`
Release History
Release 8.3.1; command was introduced.

Related Commands

show lanpower ni-priority
Displays current Network Interface (NI) modules status for a specified chassis or slot.

MIB Objects
N/A
**lanpower priority-disconnect**

Enables or disables the priority disconnect function on all ports in a specified slot. Priority disconnect is used by the system software in determining whether an incoming PD will be granted or denied power when there are too few watts remaining in the PoE power budget for an additional device.

```
lanpower {chassis chassis | slot chassis/slot} priority-disconnect {enable | disable}
```

**Syntax Definitions**

- `chassis` The chassis on which the priority disconnect function is being enabled or disabled.
- `chassis/slot` The particular slot on which the priority disconnect function is being enabled or disabled.
- `enable` Enables priority disconnect on a specified port. When this function is enabled and a power budget deficit occurs in which there is inadequate power for an incoming device, the system software uses priority disconnect rules to determine whether an incoming device will be granted or denied power.
- `disable` Disables priority disconnect on a specified port. When priority disconnect is disabled and there is inadequate power in the budget for an additional device, power will be denied to any incoming PD, regardless of its priority status.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>enable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For OmniSwitch 6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power (per power supply installed). For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power (per power supply installed).

**Examples**

```
-> lanpower slot 2/1 priority-disconnect enable
-> lanpower chassis 1 priority-disconnect disable
```
Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

**lanpower priority**

Specifies PoE power priority level to a port (when *chassis/slot/port* values are entered) or across all ports in a slot (if only *slot/port* values are entered).

**lanpower update-from**

Displays the PoE status and related statistics for all ports in a specified slot.

**show lanpower priority-disconnect**

Displays current priority disconnect status for a specified slot.

MIB Objects

alaPethMainPseTable

alaPethMainPsePriorityDisconnect
**lanpower power-rule**

Specifies user-defined power rules that can be assigned to PoE ports.

```
lanpower power-rule rule-name [admin-state {enable | disable}] [power {on | off}] [at {minutes mm | time hh:mm}] [days {all | day [day...] | date [date...] | months {all | month}] [timezone {local-server | utc | originator-server}]
```

```
no lanpower power-rule rule-name [admin-state {enable | disable}] [power {on | off}] [at {minutes mm | time hh:mm}] [days {all | day [day...] | date [date...] | months {all | month}] [timezone {local-server | utc | originator-server}]
```

---

**Syntax Definitions**

- **rule-name**: A user-defined name (up to 32 characters) for the power rule being configured.

- **admin-state**: Specifies the admin-state for the power rule.
  - **enable**: Enables the power rule.
  - **disable**: Disables the power rule.

- **power**: Specifies the power status (on or off) for devices connected to ports within the power rule.
  - **on**: Powers on devices on ports for which the rule is assigned.
  - **off**: Powers off devices on ports for which the rule is assigned.

- **at**: Activates a power rule timer. Power rules are triggered on a specified date or day of the week or at a particular time, or after a specified amount of time has elapsed.
  - **minutes**: Sets a timer. Power rules will take effect when a specified number of minutes have elapsed.
  - **mm**: The number of minutes that will elapse before the power rules take effect.
  - **time**: Sets a timer. Power rules will take effect at a specified time of day.
    - **hh:mm**: The time of day that the power rule will take effect.

- **days**: Specifies that the power rule will take effect on a particular day of the week.
  - **all**: Specifies that the power rule will take effect on all days of the week (Monday through Sunday).
  - **day**: Specifies a particular day of the month or week the power rule will take effect. When entering a day of the month, enter one or more numbers from 1 to 31. When entering a day of the week, use three-digit abbreviations (e.g., **mon**, **tue**, **wed**, **thu**, **fri**, **sat** and **sun**). Any combination of days may be entered in any order. Refer to command line examples for more information.

- **month**: Specifies that the power rule will take effect during a particular month.
  - **all**: Specifies that the power rule will take effect during all months of the year (January through December).
**month**

Specifies a particular month of the year the power rule will take effect. When entering a month, use three-digit abbreviations (e.g., `jan`, `feb`, `mar`, `apr`, `may`, `jun`, `jul`, `aug`, `sep`, `oct`, `nov` and `dec`). Any combination of months may be entered in any order. Refer to command line examples for more information.

**timezone**

Sets a timezone in which timer-based power rules will take effect.

**local-server**

Time as specified by a local server.

**utc**

Specifies that timer-based rules fall under Universal Time Coordinated (UTC) time.

**originator-server**

Time as specified via the network.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Before a power rule can take effect, the rule must first be assigned to particular slots or ports via the `lanpower power-policy` command.

- Timers are created based on the current system time. If the system time is changed the rules must be recreated.

**Examples**

- `-> lanpower power-rule RuleTest2 admin-state enable power on at minutes 10 days fri thu tue months all timezone utc`
- `-> lanpower power-rule new power on at time 18:30 days all months all timezone utc`
- `-> lanpower power-rule OutgoingPDs power off at time 6:00 days 1 2 3 6 9 12 31 months all timezone utc`
- `-> lanpower power-rule NewRule admin-state enable power off at minutes 4 days all months all timezone utc`

**Release History**

Release 8.1.1; command was introduced.
**Related Commands**

- **lanpower power-policy**
  Allows users to bind existing power rules to particular slots or ports.

- **show lanpower power-rule**
  Displays current PoE power rule settings.

- **show lanpower power-policy**
  Displays existing power policies assigned to a slot, port or rule.

**MIB Objects**

- **alaPethPowerRuleTable**
  - **alaPethPowerRuleAdminStatus**
  - **alaPethPowerRulePowerStatus**
  - **alaPethPowerRuleAtMinute**
  - **alaPethPowerRuleAtTime**
  - **alaPethPowerRuleDaysOfMonth**
  - **alaPethPowerRuleDaysOfWeek**
  - **alaPethPowerRuleMonths**
  - **alaPethPowerRuleTimezone**
  - **alaPethPowerRuleRowStatus**
**lanpower power-policy**

Allows users to bind existing power rules to particular slots or ports.

```
lanpower [slot chassis/slot | port chassis/slot/port-port] power-policy policy-name [power-rule rule-name]
```

```
no lanpower power-policy name
no lanpower [slot chassis/slot | port chassis/slot/port-port] power-policy
```

---

**Syntax Definitions**

- **chassis/slot**: The slot on which the power policy (with its associated power rule) is being assigned. This syntax is used the first time the `lanpower power-policy` command is entered, where a policy is being assigned to a particular slot. See Usage Guidelines below for more information.

- **chassis/slot/port-port**: The specific slot on which the power policy (with its associated power rule) is being assigned. Port values may be entered as a single port or range of ports. This syntax is used the first time the `lanpower power-policy` command is entered, where a policy is being assigned to a particular slot. See Usage Guidelines below for more information.

- **policy-name**: A user-defined name (up to 32 characters) for the power policy being configured (or assigned to an existing power rule).

- **rule-name**: This syntax is used the second time the `lanpower power-policy` command is entered, where a policy is being assigned to an existing power rule. See Usage Guidelines below for more information.

---

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- One or more power rules must be created before using the `lanpower power-policy` command. For information on creating power rules, see the `lanpower power-rule` command on page 2-16.

- Using the `lanpower power-policy` command is a two-step process. First, use the command to assign the policy to specific slots or ports. For example:

  ```
  -> lanpower slot 1/1 power-policy NewPolicy
  -> lanpower port 1/1/23 power-policy NewPolicy
  ```
-> lanpower port 1/1/1-12 power-policy NewPolicy

Next, run the command again to assign the policy (with its associated slots or ports) to an existing power rule. For example:

-> lanpower power-policy NewPolicy power-rule NewRule

- When assigning a policy to a slot or port, be sure to use the syntax, “slot” or “port”, before the chassis/slot or chassis/slot/port values in the command line. Refer to the examples below for more information.

**Examples**

-> lanpower slot 1/1 power-policy NewPolicy
-> lanpower port 1/1/23 power-policy NewPolicy
-> lanpower power-policy NewPolicy power-rule NewRule
-> no lanpower port 1/1/23 power-policy
-> no lanpower power-policy NewPolicy

**Release History**

Release 8.1.1; command was introduced.
Release 8.7R2; port and slot options added for use with the no parameter.

**Related Commands**

- **lanpower power-rule**
  Specifies user-defined power rules that can be assigned to PoE ports.
- **show lanpower power-rule**
  Displays current PoE power rule settings.
- **show lanpower power-policy**
  Displays existing power policies assigned to a slot, port or rule.

**MIB Objects**

- **alaPethPowerPolicyTable**
  - **alaPethPowerPolicyRowStatus**
- **alaPethPowerPortTable**
  - **alaPethPowerPortPolicyName**
  - **alaPethPowerPortRowStatus**
**lanpower class-detection**

Enables or disables class detection of attached devices. When class detection is enabled, attached devices will automatically be limited to their class power, regardless of port power configuration.

```
lanpower {chassis chassis | slot chassis/slot} class-detection {enable | disable}
```

**Syntax Definitions**

- `chassis`  
  The chassis on which class detection is being enabled or disabled.
- `chassis/slot`  
  The particular slot on which class detection is being enabled or disabled.
- `enable`  
  Enables class detection on the specified slot.
- `disable`  
  Disables class detection on the specified slot.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Although class-detection is disabled by default, the OmniSwitch 6860 still provides power to incoming PDs (if available in the power budget). However, to strictly enforce class detection as specified in the 802.3at standard, class detection must be enabled using the `lanpower slot class-detection` command.
- Enabling class detection will reset all PoE ports on the chassis.

**Examples**

```
-> lanpower slot 1/1 class-detection enable
-> lanpower chassis 1 class-detection disable
```

**Release History**

- Release 8.1.1; command was introduced.
- Release 8.3.1; command was updated.
**Related Commands**

- `show lanpower class-detection` Displays class detection status on a specified slot.

**MIB Objects**

- `alaPethMainPseTable`
  - `alaPethMainPseClassDetection`
**lanpower capacitor-detection**

Enables or disables the capacitor detection method.

```
lanpower {chassis chassis | slot chassis/slot | port chassis/slot/port[-port]} capacitor-detection {enable | disable}
```

---

**Syntax Definitions**

- `chassis`: The chassis on which detection is being configured.
- `chassis/slot`: The slot on which detection is being configured.
- `chassis/slot/port-port`: The port or range of ports on which detection is being configured.
- `enable`: Enables the capacitor detection method on the specified slot.
- `disable`: Disables the capacitor detection method on the specified slot.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>release</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

The capacitor detection method should only be enabled if there are legacy IP phones attached to the corresponding slot—this feature is not compatible with IEEE specifications. Please contact your Alcatel-Lucent Enterprise sales engineer or Customer Support representative to find out which Alcatel-Lucent Enterprise IP phones models need capacitive detection enabled.

---

**Examples**

```
-> lanpower slot 3/1 capacitor-detection enable
-> lanpower chassis 1 capacitor-detection disable
```

---

**Release History**

- Release 8.1.1; command was introduced.
- Release 8.3.1; command was updated.
- Release 8.8R1; `port` parameter added.
Related Commands

```
show lanpower capacitor-detection
```
Displays capacitor detection status on a specified slot.

MIB Objects

```
alaPethMainPseTable
  alaPethMainPseCapacitorDetect
```
**lanpower usage-threshold**

Tells the switch to watch for a user-defined, slot-wide threshold for PoE power usage, in percent. When the usage threshold is reached or exceeded, a notification is sent to the user.

```
lanpower {chassis chassis | slot chassis/slot} usage-threshold num
```

**Syntax Definitions**

- `chassis`: The chassis for which usage threshold monitoring is being set.
- `chassis/slot`: The slot for which usage threshold monitoring is being set.
- `num`: The percentage of allowed usage from attached PoE devices before a notification is sent to the user.

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>num</code></td>
<td>99</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `lanpower slot usage-threshold` does not affect the amount of PoE power allocated to a particular slot. The command is a monitoring method that tells the switch to send a “specified usage exceeded” notification (i.e., trap) only when a specified percentage has been reached.

**Examples**

- `-> lanpower slot 1/1 usage-threshold 50`
- `-> lanpower chassis 1 usage-threshold 99`

**Release History**

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.
Related Commands

show lanpower usage-threshold Displays current usage threshold, in percent.

MIB Objects

pethMainPseTable
  pethMainPseUsageThreshold
lanpower dynamic-power-mgmt

Enables dynamic power management for a chassis or slot.

```
lanpower {chassis chassis | slot chassis/slot} dynamic-power-management {enable | disable}
```

### Syntax Definitions

- **chassis**: The chassis on which dynamic power management is being enabled or disabled.
- **chassis/slot**: The particular slot on which dynamic power management is being enabled or disabled.
- **enable**: Enables dynamic power management on the specified chassis or slot.
- **disable**: Disables dynamic power management on the specified chassis or slot.

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Enabling this feature allows the unused allocated PoE power of an NI to be allocated to other NIs.
- Slot ranges are supported in the command line syntax.

### Examples

```
-> lanpower slot 1/1 dynamic-power-mgmt enable
-> lanpower chassis 1 dynamic-power-mgmt disable
```

### Release History

Release 8.3.1; command was introduced.

### MIB Objects

N/A
**lanpower update-from**

Updates the PoE microcontroller firmware.

```
lanpower update-from
```

### Syntax Definitions

- **chassis/slot**
  - The slot to be updated.

- **all**
  - Update all the chassis in a virtual chassis.

- **filename**
  - The file name of the PoE firmware.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The binary file must be placed in the `/flash` directory of the Master.
- Once started, console messages will be displayed during the update procedure which may take up to 10 minutes.
- The lanpower service must be disabled during the update and minimal load should be placed on the switch. The update process must be allowed to finish prior to unplugging or configuring the units.

### Examples

```
-> lanpower slot 1/1 update-from poe_binary_version.bin
```

### Release History

Release 8.1.1; command was introduced.
Related Commands

show lanpower firmware-upgrade-status Displays current PoE firmware update status.

MIB Objects

N/A
**lanpower 4pair**

Configures 2-pair or 4-pair PoE mode.

```
lanpower {slot chassis/slot | port chassis/slot/port-port} 4pair {enable | disable}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chassis/slot</td>
<td>The slot on which to configure the PoE mode.</td>
</tr>
<tr>
<td>chassis/slot/port-port</td>
<td>The port(s) on which to configure the PoE mode.</td>
</tr>
</tbody>
</table>

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>enabled</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>6360-P48X</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command is applicable for 4-pair high power PoE ports to deliver 60 watts or more.
- When 4-pair mode is enabled the switch will consider Alt-A and Alt-B pairs for PoE.
- When 4-pair mode is disabled the switch will only consider Alt-A pairs for PoE.
- When 4-pair mode is disabled the maximum PoE power for the port is 30W.

### Examples

```
-> lanpower slot 1/1 4pair enable
```

### Release History

Release 8.4.1.R03; command was introduced.
Related Commands

show lanpower

Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

alaPethMainPseTable

alaPethPsePort4PairStatus
lanpower power-over-hdmi

Configures power over HDMI (PoH).

```
lanpower {slot chassis/slot | port chassis/slot/port-port} power-over-hdmi {enable | disable}
```

**Syntax Definitions**

- `chassis/slot` The slot on which to configure PoH.
- `chassis/slot/port-port` The port(s) on which to configure PoH.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The OS6860(E) models do not support 802.3.bt. However, this command can be used to enable support for some products such as Aruba and Stellar APs with up to ~40W of PoE power.

**Examples**

```
-> lanpower slot 1/1 power-over-hdmi enable
-> lanpower port 1/1/1 power-over-hdmi enable
```

**Release History**

Release 8.6R2; command was introduced.
Related Commands

**show lanpower**

Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

alaPethPowerPortTable

alaPethPsePortPowerOverHdmi
**lanpower 802.3bt**

Enables IEEE 802.3bt functionality.

```
lanpower {slot chassis/slot | port chassis/slot/port} 802.3bt {enable | disable}
```

### Syntax Definitions

- `chassis/slot/port` The slot or port on which to enable or disable 802.3bt.
- `chassis/slot/port-port` The port(s) on which to enable or disable 802.3bt.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>C32C2</td>
<td>C32C2</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command can only be executed when the lanpower service is stopped.

### Examples

- `-> lanpower slot 1/1 802.3bt enable`
- `-> lanpower port 1/1/1 802.3bt enable`

### Release History

Release 8.6R2; command was introduced.

### Related Commands

- **show lanpower** Displays the PoE status and related statistics for all ports in a specified slot.

### MIB Objects

- `alaPethMainPseTable`
  - `alaPethMainPseDot3bt`
**lanpower fpoe**

Enables fast PoE functionality.

`lanpower {slot chassis/slot} fpoe {enable | disable}`

---

**Syntax Definitions**

- `chassis/slot`: The slot on which to enable or disable fast PoE.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Fast PoE can be used to provide PoE power within a few seconds after powering on the chassis.
- Factory default switches that don't have any PoE configuration must have an initial PoE configuration completed.
- The PoE configuration cannot be modified until the switch is up and the PoE module is completely initialized.
- LLDP-based PoE devices will not function as expected until the switch has completed its bootup and the switch is in a state to respond to LLDP requests.
- When Fast PoE is enabled the vcboot.cfg should not be deleted or manually edited.
- If Fast PoE is disabled all PDs will reset due to the PoE controller having to be reconfigured.
- FPGA/CPLD upgrade may be required. Refer to the release notes.

---

**Examples**

- `-> lanpower slot 1/1 fpoe enable`

---

**Release History**

Release 8.7R1; command was introduced.
**Related Commands**

*show lanpower*  
Displays the PoE status and related statistics for all ports in a specified slot.

**MIB Objects**

alaPethMainPseTable  
alaPethMainPseFastPoE
**lanpower ppoe**

Enables perpetual PoE functionality.

```
lanpower {slot chassis/slot} ppo {enable | disable}
```

### Syntax Definitions

`chassis/slot` The slot on which to enable or disable perpetual PoE.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This feature allows the switch to provide uninterrupted power to connected power device (PD) even when the switch is rebooting.
- When Perpetual PoE is enabled the vcboot.cfg should not be deleted or manually edited.
- FPGA/CPLD upgrade may be required. Refer to the release notes.

### Examples

```
-> lanpower slot 1/1 ppo enable
```

### Release History

Release 8.7R1; command was introduced.
Related Commands

*show lanpower*  Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

*alaPethMainPseTable*

*alaPethMainPsePerpetualPoE*
**lanpower high-resistance-detection**

Configures high resistance detection.

```
lanpower {slot chassis/slot} high-resistance-detection {enable | disable}
```

### Syntax Definitions

- `chassis/slot`: The slot on which to enable or disable high resistance detection.

### Defaults

- `enable` or `disable`

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This capability can be enabled to support the two-port PoE capability on APs with two PoE ports (i.e. AP225). This capability enables the switch to support the appropriate detection range and recognize the AP as a PD.

- The AP will be powered in an active/standby mode, meaning only one port of the AP will be powered at a time.

- Only two-pair PoE will be supported when this feature is enabled, even on ports connected with a 4-pair Ethernet cable.

- The capability of PSE-to-PSE protection function is reduced when this feature is enabled. It is recommended to disable PoE on ports that do not have PDs connected.

- Enabling this feature will cause the PoE functionality to restart on the OmniSwitch. Additionally, this functionality does not follow the PoE IEEE standards.

### Examples

```
-> lanpower slot 1/1 high-resistance-detection enable
```

### Release History

Release 8.7R1; command was introduced.
Related Commands

*show lanpower high-resistance-detection* Displays the high resistance detection status.

MIB Objects

alaPethMainPseTable
- alaPethMainPseHighResistanceDetection
**lanpower trust**

Configures a port as trusted so that it can be powered down through 802.3bt LLDP tlv.

```bash
lanpower trust {slot chassis/slot| port chassis/slot/port-port} trust {enable | disable}
```

**Syntax Definitions**

- `chassis/slot`: The slot on which to enable or disable port trust.
- `chassis/slot/port-port`: The port(s) on which to enable or disable port trust.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In the 802.3BT LLDP standard the tlv has an option to power down the PSE port through LLDP for a specific time or indefinitely if the port is set as trusted.

**Examples**

```bash
-> lanpower port 1/1/1 trust enable
```

**Release History**

Release 8.7R1; command was introduced.

**Related Commands**

- **show lanpower**: Displays the PoE status and related statistics for all ports in a specified slot.

**MIB Objects**

- `alaPethPsePortTable`:
  - `alaPethPsePortTrusted`
show lanpower

Displays the PoE status and related statistics for all ports in a specified slot.

show lanpower {slot chassis/slot | port-config | chassis chassis port-config}

Syntax Definitions

chassis
The virtual chassis ID for which current inline power status and related statistics are to be displayed.

slot
The slot for which current inline power status and related statistics are to be displayed.

port-config
Displays detailed port configuration information and settings.

Defaults
N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>

### Power over Ethernet (PoE) Commands

#### show lanpower

**output definitions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
<td>A PoE port for which current status and related statistics are being displayed.</td>
</tr>
<tr>
<td>Maximum (mW)</td>
<td>The current maximum amount of power available to the corresponding PoE port, in milliwatts. For more information on this parameter, including default values and changing the settings, refer to the <a href="#">lanpower power</a> command.</td>
</tr>
<tr>
<td>Actual Used (mW)</td>
<td>The actual amount of power being used by an attached device (if applicable), in milliwatts. If no device is attached to the corresponding port, this row displays a value of 0.</td>
</tr>
<tr>
<td>Status</td>
<td>Displays the port's current operational status. Options include Powered On, Powered Off, Searching, Fault, Deny and Test. Powered On indicates that PoE power activation is complete and the attached device is receiving power. Powered Off indicates that no PoE device is attached and/or the port is not receiving PoE power. Searching indicates that PoE activation has started and a powered device PD has been detected, but activation or class detection is incomplete. Fault indicates that PoE activation or class detection has failed. Deny indicates that PoE power management has denied power to the port due to priority disconnect or over subscription. Test indicates that the port has been forced on and will remain on until it is forced off by RTP functions.</td>
</tr>
<tr>
<td>Priority</td>
<td>The current priority level for the corresponding PoE port. Options include Critical, High, and Low. Critical should be reserved for ports that have mission-critical devices attached, and therefore require top (i.e., critical) priority. In the event of a power management issue, inline power to critical ports is maintained as long as possible. High indicates ports that have important, but not mission-critical, devices attached. If other ports in the chassis have been configured as critical, inline power to high-priority ports is given second priority. Low priority is for ports that have low-priority devices attached. In the event of a power management issue, inline power to low-priority ports is interrupted first (i.e., before critical and high-priority ports). The default value is Low. Priority levels can be changed using the <a href="#">lanpower priority</a> command.</td>
</tr>
<tr>
<td>On/Off</td>
<td>Displays whether a port has been manually turned on or off by the user. ON indicates that the port has been turned on by the user via the <a href="#">lanpower service</a> command. OFF is the default value and can also indicate that the port has been turned off by the user via the <a href="#">lanpower service</a> command.</td>
</tr>
<tr>
<td>Class</td>
<td>PoE class detected on the attached Powered Device. See the <a href="#">lanpower class-detection</a> command on page 2-21 for more information.</td>
</tr>
<tr>
<td>Type</td>
<td>A user-defined name port type (i.e., text string) for the port. See the <a href="#">lanpower type</a> command on page 2-6 for more information.</td>
</tr>
<tr>
<td>Max Watts</td>
<td>The maximum watts available to the corresponding slot. The maximum watts value for a slot can be changed using the <a href="#">lanpower maxpower</a> command.</td>
</tr>
</tbody>
</table>
**output definitions (continued)**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Actual Power Consumed</td>
<td>The amount of power being used by attached PoE devices.</td>
</tr>
<tr>
<td>Actual Power Budget Remaining</td>
<td>The amount of power budget remaining for PoE. If the total power budget remaining is exceeded, a power error will occur and the switch’s chassis management software will begin shutting down power to PoE ports according to their priority levels.</td>
</tr>
<tr>
<td>Total Power Budget Available</td>
<td>The total amount of power budget available for PoE.</td>
</tr>
<tr>
<td>Power Supplies Available</td>
<td>The number of power supplies currently installed and operating in the switch.</td>
</tr>
<tr>
<td>*</td>
<td>An asterisk indicates a 4-pair PoE port is operating in 2-pair mode.</td>
</tr>
</tbody>
</table>

**Release History**

Release 8.1.1; command was introduced.  
Release 8.8R1; `port-config` parameter added.

**Related Commands**

N/A

show lanpower power-rule

Displays current PoE power rule settings.

show lanpower power-rule [name]

Syntax Definitions

name

The name of an existing power rule.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

Entering the show lanpower power-rule command without the name string provides top-level information for all existing power rules. To view detailed information for a particular rule (e.g., timer and timezone settings, etc.), specify the name string in the command line.

Examples

-> show lanpower power-rule
Power-Rule                          Admin-state   Power
----------------------------------+------------+---------------------
test                                 Disabled      Off

-> show lanpower power-rule test
Power-Rule : test
Admin-state : Disabled
Power : Off
At HH:MM : 00:00
Day-of-Week : All
Month-of-Year : All
Timezone : Local

output definitions

| Power-Rule | The name(s) of existing PoE power rule(s). |
| Admin-state | The port PoE status assigned to the rule. Refer to page 2-16 for more information. |
**Output Definitions (continued)**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power</td>
<td>The PoE power status assigned to the rule. Refer to page 2-16 for more information.</td>
</tr>
<tr>
<td>At HH:MM</td>
<td>The time of day the power rule takes effect. Refer to page 2-16 for more information.</td>
</tr>
<tr>
<td>Day-of-Week</td>
<td>The day of the week the power rule takes effect. Refer to page 2-17 for more information.</td>
</tr>
<tr>
<td>Month-of-Year</td>
<td>The month of year the power rule takes effect. Refer to page 2-17 for more information.</td>
</tr>
<tr>
<td>Timezone</td>
<td>The timezone under which the power rule takes effect. Options include local-server, originator-server and utc. Refer to page 2-17 for more information.</td>
</tr>
</tbody>
</table>

**Release History**

Release 8.1.1; command was introduced.

**Related Commands**

`lanpower power-rule` Specifies user-defined power rules that can be assigned to PoE ports.

**MIB Objects**

N/A
show lanpower power-policy

Displays existing power policies assigned to a slot, port or rule.

show lanpower power-policy [policy-name slot | policy-name power-rule | policy-name port]

Syntax Definitions

policy-name  The text string for an existing power policy.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6/</th>
<th>6900V48C8/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

Entering the show lanpower power-policy command without the policy-name string provides top-level information for all existing policies, including associated power rules (if any). To view detailed information for a particular policy, specify the policy-name string in the command line, along with the policy’s associated slot, port or rule. See Examples below for additional information.

Examples

-> show lanpower power-policy
  Power-Policy name                  Power-rules
  ----------------------------------+----------------------------------
  Mar25                              RuleTest2

-> show lanpower power-policy Mar25 power-rule
  Power-Policy name                  : Mar25
  Power-rules                        : RuleTest2

output definitions

<table>
<thead>
<tr>
<th>Power-Policy name</th>
<th>The names of existing PoE power policies.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power-rules</td>
<td>The power rules associated with the existing power policies.</td>
</tr>
</tbody>
</table>

Release History

Release 8.1.1; command was introduced.
Related Commands

**lanpower power-policy**

Allows users to bind existing power rules to particular slots or ports.

MIB Objects

- N/A
show lanpower class-detection

Displays class detection status on a specified slot.

show lanpower {chassis chassis | slot chassis/slot } class-detection

Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chassis</td>
<td>The chassis for which class detection is being displayed.</td>
</tr>
<tr>
<td>chassis/slot</td>
<td>The slot for which class detection is being displayed.</td>
</tr>
</tbody>
</table>

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Although class-detection is disabled by default, the OmniSwitch 6860 still provides power to incoming PDs (if available in the power budget). However, to strictly enforce class detection as specified in the 802.3at standard, class detection must be enabled using the lanpower slot class-detection command.

- Enabling class detection will reset all PoE ports on the chassis.

Examples

-> show lanpower slot 1/1 class-detection
Class Detection disabled on ChassisId 1 Slot 1

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

lanpower class-detection Enables or disables class detection of attached devices.

MIB Objects

N/A
show lanpower capacitor-detection

Displays capacitor detection status on a specified slot.

`show lanpower {chassis chassis | slot chassis/slot} capacitor-detection`

**Syntax Definitions**

- `chassis` The chassis for which capacitor detection is being displayed.
- `chassis/slot` The slot for which capacitor detection is being displayed.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

N/A

**Examples**

```
-> show lanpower slot 1/1 capacitor-detection
Capacitor Detection disabled on ChassisId 1 Slot 1
```

**Release History**

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

**Related Commands**

- `lanpower capacitor-detection` Enables or disables the capacitor detection method.

**MIB Objects**

N/A
show lanpower priority-disconnect

Displays current priority disconnect status for a specified slot.

```bash
show lanpower {chassis chassis | slot chassis/slot} priority-disconnect
```

### Syntax Definitions

- **chassis**: The chassis on which priority disconnect status is being displayed.
- **chassis/slot**: The particular slot on which priority disconnect status is being displayed.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

For OmniSwitch 6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power (per power supply installed). For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power (per power supply installed).

### Examples

```bash
$ show lanpower slot 1/1 priority-disconnect
Priority Disconnect enabled on ChassisId 1 Slot 1
```

### Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

### Related Commands

- **lanpower priority-disconnect**: Enables or disables the priority disconnect function on all ports in a specified slot.

### MIB Objects

N/A
show lanpower ni-priority

Displays current Network Interface (NI) modules status for a specified chassis or slot.

show lanpower {chassis chassis | slot chassis/slot} ni-priority

Syntax Definitions

chassis          The chassis on which NI priority is being displayed.
chassis/slot     The particular slot on which NI priority is being displayed.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</thead>
<tbody>
<tr>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

For OmniSwitch 6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power (per power supply installed). For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power (per power supply installed).

Examples

-> show lanpower slot 1/1 priority-disconnect
Priority Disconnect enabled on ChassisId 1 Slot 1

Release History

Release 8.3.1; command was introduced.

Related Commands

lanpower ni-priority Specifies power priority level to a Network Interface (NI) module. Levels include critical, high, and low.

MIB Objects

N/A
show lanpower usage-threshold

Displays current usage threshold, in percent.

show lanpower {chassis chassis | slot chassis/slot} usage-threshold

Syntax Definitions

chassis
The chassis on which priority disconnect status is being displayed.

chassis/slot
The particular slot on which priority disconnect status is being displayed.

Defaults
N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</tbody>
</table>

Usage Guidelines

N/A

Examples

```
-> show lanpower slot 1/1 usage-threshold
Usage Threshold 99% on ChassisId 1 Slot 1
```

Release History

Release 8.1.1; command was introduced.
Release 8.3.1; command was updated.

Related Commands

lanpower usage-threshold Sets a slot-wide threshold for PoE power usage, in percent.

MIB Objects

N/A
show lanpower firmware-upgrade-status

Displays the PoE firmware update status.

show lanpower slot \{chassis/slot | all\} firmware-upgrade-status

**Syntax Definitions**

- **chassis/slot**: Display the update status for a slot.
- **all**: Display the update status for all chassis.

**Defaults**

N/A

**Platforms Supported**

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command can be used to display the update progress from a remote session such as Telnet or SSH.

**Examples**

```
-> show lanpower slot all firmware-upgrade-status
Chas/Slot   FW-Upgrade Status  FW Upgrade %   FW Rev   Fail Reason
-----------------------------------------------+-----------------+--------+------------------------------
1/1         SUCCESS           0            352    FIRMWARE UPGRADED
```

**Release History**

Release 8.1.1; command was introduced.

**Related Commands**

- **lanpower update-from**: Updates the PoE microcontroller firmware.

**MIB Objects**

N/A
show lanpower high-resistance-detection

Displays the high resistance detection configuration.

show lanpower slot chassis/slot high-resistance-detection

Syntax Definitions

chassis/slot

Display the status for a slot.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

### Usage Guidelines

N/A

### Examples

```
-> show lanpower slot 1/1 status
Chas/Slot Status  Init Status  8023BT Supported  Priority Disconnect  Capacitor Detection  FPoE  PPoE  F/W Rev
--------------------------------------------------------------------------------------------------------
  1/1   enable  initialized  enable  disable  disable  disable  enable  352
```

Not Available

### output definitions

- **Chas/Slot**: Chassis/slot.
- **Status**: The lanpower status.
- **Init Status**: The lanpower initialization status.
- **8023BT Supported**: 802.3bt support status.
- **Priority Disconnect**: Priority disconnect status.
- **Capacitor Detection**: Capacitor detection status.
- **FPoE**: Fast PoE status.
- **PPoE**: Perpetual PoE status.
- **F/W Rev**: Firmware revision.
**Release History**

Release 8.7R2; command was introduced.

**Related Commands**

- **show lanpower**
  
  Displays the PoE status and related statistics for all ports in a specified slot.

**MIB Objects**

- `alaPethMainPseAdminStatus`
- `alaPethMainPsePriorityDisconnect`
- `alaPethMainPseCapacitorDetect`
- `alaPethMainPseFastPoE`
- `alaPethMainPsePerptualPoE`
3 UDLD Commands

This chapter describes the CLI commands used to configure the UDLD (UniDirectional Link Detection) protocol. UDLD operates at Layer 2 in conjunction with IEEE 802.3 Layer 1 fault detection mechanism. It is a protocol used for detecting and disabling unidirectional Ethernet fiber or copper connections to avoid interface malfunctions, Spanning Tree loops, media faults, and so on. It operates in two main modes normal and aggressive.

The two basic mechanisms that UDLD follows are:

- Advertises port identity and learns about its neighbors. This information is maintained in a cache table.
- It sends continuous echo messages when fast notifications are required.

MIB information for the UDLD commands is as follows:

<table>
<thead>
<tr>
<th>Filename</th>
<th>ALCATEL-IND1-UDLD-MIB.mib</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module</td>
<td>alcatelIND1UDLDMIB</td>
</tr>
</tbody>
</table>

A summary of available commands is listed here:

```
udld
udld port
udld mode
udld probe-timer
udld echo-wait-timer
clear udld statistics port
show udld configuration
show udld configuration port
show udld statistics port
show udld neighbor port
show udld status port
```

Configuration procedures for UDLD are explained in “Configuring UDLD,” *OmniSwitch AOS Release 8 Network Configuration Guide.*
udld

Globally enables or disables UDLD protocol on the switch.

`udld {enable | disable}`

### Syntax Definitions

- **enable**: Globally enables UDLD on the switch.
- **disable**: Globally disables UDLD on the switch.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

```
+----------------+----------------+----------------+----------------+----------------+----------------+----------------+----------------+----------------+
| Yes            | Yes            | Yes            | Yes            | Yes            | Yes            | Yes            | No             | Yes             | No             |
+----------------+----------------+----------------+----------------+----------------+----------------+----------------+----------------+----------------+----------------+
```

### Usage Guidelines

- Auto-negotiation should be disabled on both ends of the link for UDLD to operate properly.
- The port shutdown by this command can be reset by using the `interfaces admin` command.

### Examples

```
-> udld enable
-> udld disable
```

### Release History

Release 7.1.1; command introduced.
Related Commands

- **udld port** Enables or disables UDLD status on a specific port or a range of ports.
- **show udld configuration** Displays the global status of UDLD configuration.
- **show udld configuration port** Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

- **alaUdldGlobalStatus**
  - **alaUdldGlobalConfigUdldStatus**
**udld port**

Enables or disables UDLD status on a specific port or a range of ports.

`udld port chassis/slot/port[-port2] [enable | disable]`

---

**Syntax Definitions**

- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number.
- **enable**: Enables UDLD status on a port.
- **disable**: Disables UDLD status on a port.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>chassis</th>
<th>6250</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>

**Usage Guidelines**

- Auto-negotiation should be disabled on both ends of the link for UDLD to operate properly.
- The UDLD protocol must be enabled before using this command.
- The UDLD protocol is supported on link aggregate member ports.

**Examples**

- `udld port 1/1/3 enable`
- `udld port 1/1/6-10 enable`
- `udld port 1/2/4 disable`

**Release History**

Release 7.1.1; command introduced.
Related Commands

**udld**
Globally enables or disabled UDLD protocol on the switch.

**show udld configuration port**
Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

alaUdldPortConfigTable
alaUdldPortConfigUdldStatus
**udld mode**

Configures the UDLD operational mode on a specific port, a range of ports, or all ports.

```
udld [port [chassis/slot/port[-port2]]] mode {normal | aggressive}
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number.
- **normal**: Specifies UDLD operation in the normal mode.
- **aggressive**: Specifies UDLD operation in the aggressive mode.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal</td>
<td>aggressive</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>V72/C32</td>
<td>X48C6/T48C6</td>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The UDLD protocol must be enabled before using this command.
- In case of faulty cable connection, the port which is configured in normal mode of operation is considered to be in the shutdown state.

### Examples

```
-> udld mode aggressive
-> udld mode normal
-> udld port 1/1/3 mode aggressive
-> udld port 1/2/4 mode normal
-> udld port 1/2/9-18 mode aggressive
```

### Release History

Release 7.1.1; command introduced.
**Related Commands**

- `udld`  
  Globally enables or disables UDLD protocol on the switch.

- `show udld configuration port`  
  Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

**MIB Objects**

- `alaUdldPortConfigTable`  
- `alaUdldPortConfigUdldMode`
**udld probe-timer**

Configures the probe-message advertisement timer on a specific port, a range of ports, or all ports. Probe messages are transmitted periodically after this timer expires.

```
udld [port [chassis/slot/port|-port2]] probe-timer seconds
no udld [port [chassis/slot/port|-port2]] probe-timer
```

### Syntax Definitions

- `chassis` The chassis identifier.
- `slot/port|-port2` The slot and port number.
- `seconds` The probe-message transmission interval, in seconds.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>15</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to reset the probe-message timer to the default value. Note that it is not necessary to specify the probe-message interval to reset it.

- The UDLD protocol must be enabled before using this command.

- Configure probe-advertisement timer with values varying in a range of 12-18 seconds for better convergence time and to avoid burst of probe advertisements.

### Examples

```
-> udld probe-timer 20
-> udld port 1/1/3 probe-timer 16
-> udld port 1/1/8-21 probe-timer 18
-> no udld probe-timer
-> no udld port 1/1/3 probe-timer
```
**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- **udld**  
  Globally enables or disables UDLD protocol on the switch.

- **show udld configuration port**  
  Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

**MIB Objects**

- **alaUdldPortConfigTable**
  - **alaUdldPortConfigUdldProbeIntervalTimer**
**udld echo-wait-timer**

Configures the echo based detection timer on a specific port, a range of ports, or all the ports. This is known as link detection period.

```
udld [port [chassis/slot/port[-port2]]] echo-wait-timer seconds
no udld [port [chassis/slot/port[-port2]]] echo-wait-timer
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number.
- **seconds**: The echo based detection period, in seconds.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>8</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **no** form of this command to reset the echo based detection timer to the default value. Note that it is not necessary to specify the echo based timer to reset it.
- The UDLD protocol must be enabled before using this command.
- An echo message is expected in reply from the neighbor within this time duration, otherwise, the port is considered as faulty.

### Examples

```
-> udld echo-wait-timer 9
-> udld port 1/1/5 echo-wait-timer 12
-> udld port 1/1/7-16 echo-wait-timer 12
-> no udld echo-wait-timer
-> no udld port 1/1/3 echo-wait-timer
```
**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**MIB Objects**

alaUdldPortConfigTable
  alaUdldPortConfigUdldDetectionPeriodTimer
**clear udld statistics port**

Clears the UDLD statistics for a specific port or for all the ports.

```
clear udld statistics [port chassis/slot/port]
```

### Syntax Definitions

- `chassis` The chassis identifier.
- `slot/port` The slot and port number.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| Platform          | Supported
|-------------------|-----------
| 6360              | Yes       |
| 6465              | Yes       |
| 6560              | Yes       |

| 6860              | Yes       |
| 6860N             | Yes       |
| 6865              | Yes       |
| 6900              | No        |
| V72/C32           | Yes       |
| 6900 X48C6/T48C6/V48C8/C32E/T24C2/X24C2 | Yes |
| 9900              | No        |

### Usage Guidelines

If the slot/port option is not specified, UDLD statistics for the switch is cleared.

**Examples**

```
-> clear udld statistics port 1/1/4
-> clear udld statistics
```

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- **udld** Globally enables or disables UDLD protocol on the switch.
- **show udld statistics port** Displays the UDLD statistics for a specific port.

**MIB Objects**

- `alaUdldGlobalClearStats`
show udlD configuration

Displays the global status of UDLD configuration.

show udlD configuration

4 Source Learning Commands

The Source Learning capability of OmniSwitch is responsible for creating, updating, and deleting source and destination MAC Address entries in the MAC Address Table. This chapter includes descriptions of Source Learning commands used to create or delete static MAC addresses, define the aging time value for static and dynamically learned MAC addresses, and display MAC Address Table entries and statistics.

MIB information for Source Learning commands is as follows:

Filename: ALCATEL-IND1-MAC-ADDRESS-MIB.mib
Module: alcatelIND1MacAddressMIB

A summary of the available commands is listed here:

mac-learning
mac-learning flush

mac-learning

Configures the status of source MAC address learning on a VLAN, a single port, a range of ports, or on a link aggregate of ports.

`mac-learning {vlan vlan[-vlan2] | port chassis/slot/port[-port2] | linkagg agg_id} {enable | disable}`

### Syntax Definitions

- `vlan[-vlan2]` The VLAN ID number. Use a hyphen to specify a range of VLAN IDs.
- `chassis` The chassis identifier.
- `slot/port[-port2]` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `agg_id` The link aggregate ID number.
- `enable` Enables source learning.
- `disable` Disables source learning.

### Defaults

By default, source learning is enabled on all ports.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Disabling source learning on a port or link aggregate is not supported on the OmniSwitch 6360, 6465, 6560, 6570M or 9900.
- Configuring source learning is not supported on Learned Port Security (LPS) and Universal Network Profile (UNP) ports, as well as individual ports that are members of a link aggregate.
- When port-based source learning is configured for a link aggregate ID, it affects all the ports that are members of the link aggregate.
- When source learning is disabled on a port or link aggregate, dynamic learning of MAC addresses is stopped.
- Static MAC addresses associated with a port or link aggregate are *not* cleared when source learning is disabled. Also, new static MAC address configurations are allowed on ports or link aggregates on which source learning is disabled.
Disabling source learning on a port or link aggregate is useful on a ring configuration, where switch A does not have to learn MAC addresses from switch B, or for a Transparent LAN Service, where service provider does not require the MAC addresses of the customer network.

**Examples**

-> mac-learning port 1/2 enable
-> mac-learning linkagg 10 disable
-> mac-learning vlan 10 disable

**Release History**

Release 7.1.1; command added.

**Related Commands**

- show mac-learning learning-state Displays the source learning status of a port or link aggregate on the switch.

**MIB Objects**

  - slMacLearningControlStatus
mac-learning flush

Clears the specified MAC addresses from the Source Learning MAC Address Table on the local switch.

```
mac-learning flush {dynamic | static | multicast} [mac-address mac_address]
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic</td>
<td>Clears dynamically learned MAC addresses.</td>
</tr>
<tr>
<td>static</td>
<td>Removes static MAC addresses.</td>
</tr>
<tr>
<td>multicast</td>
<td>Removes static multicast MAC addresses.</td>
</tr>
<tr>
<td>mac_address</td>
<td>Enter the MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c).</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Release</th>
<th>Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>6465</td>

</tr>
<tr>
<td>9900</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command flushes dynamically learned addresses from the MAC Address Table.
- Static unicast and static multicast addresses are removed. This command replaces the `no` form of the `mac-learning` command that was used in previous releases.

**Examples**

```
-> mac-learning flush dynamic
-> mac-learning flush dynamic mac-address 00:00:39:59:f1:0c
-> mac-learning flush static
-> mac-learning flush static mac-address 00:00:39:59:f1:0d
-> mac-learning flush multicast
-> mac-learning flush multicast mac-address 01:25:9a:5c:2f:10
```

**Release History**

Release 7.3.1; command added.
Related Commands

**show mac-learning**
Displays Source Learning MAC Address Table information for the local switch.

MIB Objects

alaSlMacAddressGlobalTable
slMacAddressGblManagement
slMacAddressGblRowStatus
**mac-learning flush domain all**

Clears the specified MAC addresses from the Source Learning MAC Address Table for all learning domains on the local switch.

```
mac-learning flush domain all {dynamic | static}
```

### Syntax Definitions

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic</td>
<td>Clears dynamically learned MAC addresses from all of the domains.</td>
</tr>
<tr>
<td>static</td>
<td>Removes static MAC addresses from all of the domains.</td>
</tr>
</tbody>
</table>

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command flushes dynamically learned addresses from the MAC Address Table that were learned or statically configured for all domains.
- Static unicast and static multicast addresses are removed.
- The `mac-learning flush` command replaces the `no` form of the `mac-learning` command that was used in previous releases.

### Examples

```
-> mac-learning flush domain all dynamic
-> mac-learning flush domain all static
```

### Release History

Release 7.3.1; command added.

MIB Objects

- slMacAddressGblManagement
- slMacAddressGblRowStatus
**mac-learning flush domain vlan**

Clears the specified MAC addresses from the Source Learning MAC Address Table for the VLAN learning domain on the local switch.

```plaintext
mac-learning flush domain vlan {vlan vlan_id} {port chassis/slot/port | linkagg agg_id} | {dynamic | static | static-multicast} [mac-address mac_address]
```

**Syntax Definitions**

- `vlan_id`: VLAN ID number.
- `chassis`: The chassis identifier.
- `slot/port`: The slot and port number (3/1).
- `agg_id`: Enter a link aggregate ID number.
- `dynamic`: Clears dynamically learned MAC addresses from the VLAN domain.
- `static`: Removes static MAC addresses from the VLAN domain.
- `static-multicast`: Removes static multicast MAC addresses from the VLAN domain.
- `mac_address`: Enter a specific MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c) for the specified domain.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac-address</td>
<td>all MAC addresses</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>

</tr>
</tbody>
</table>

**Usage Guidelines**

- This command flushes dynamically learned addresses from the MAC Address Table that were learned or statically configured for the VLAN domain.
- Static unicast and static multicast addresses are removed.
• The **static-multicast** parameter is *not* available for use with the following **mac-learning flush** commands:
  - **mac-learning flush domain all**
  - **mac-learning flush domain spb**
  - **mac-learning flush domain vxlan**
  - **mac-learning flush domain l2gre**
  - **mac-learning flush domain local**

• The **mac-learning flush** command replaces the **no** form of the **mac-learning** command that was used in previous releases.

**Examples**

```
-> mac-learning flush domain vlan vlan 20 port 1/2 dynamic
-> mac-learning flush domain vlan static
-> mac-learning flush domain vlan linkagg 10 static
```

**Release History**

Release 7.3.1; command added.

**Related Commands**

- **mac-learning flush**
  Clears the MAC Address Table for the local switch.

  Displays Source Learning MAC Address Table information for the local switch.

**MIB Objects**

- **alaSlMacAddressGlobalTable**
- **slMacAddressGblManagement**
- **slMacAddressGblRowStatus**
mac-learning flush domain spb

Clears the specified MAC addresses from the Source Learning MAC Address Table for the Shortest Path Bridging (SPB) learning domain on the local switch.

```
mac-learning flush domain spb {serviceid service_id | sap chassis/slot/port:encap | bind-sdp sdp_id[:service_id] | isid instance_id} {dynamic | static} [mac-address mac_address]
```

**Syntax Definitions**

- **service_id**
  - An existing SPB service ID.
- **chassis**
  - The chassis identifier.
- **slot/port:encap**
  - The SPB access port and encapsulation (0, all, qtag, or outer_qtag.inner_qtag) for an SPB Service Access Point (SAP).
- **sdp_id[:service_id]**
  - Clears MAC addresses learned on an SPB Service Distribution Point (SDP) binding. Specify the SDP ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are cleared.
- **instance_id**
  - An SPB backbone service instance identifier (I-SID).
- **dynamic**
  - Clears dynamically learned MAC addresses from the SPB domain.
- **static**
  - Removes static MAC addresses from the SPB domain.
- **mac_address**
  - Enter a specific MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c) for the specified domain.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac-address</td>
<td>all MAC addresses</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>

- `slMacAddressGblManagement`
- `slSvcISID`
- `slMacAddressGblRowStatus`
mac-learning flush domain vxlan

Clears the specified MAC addresses from the Source Learning MAC Address Table for the Virtual eXtensible LAN (VXLAN) learning domain on the local switch.

```
mac-learning flush domain vxlan {serviceid service_id | sap chassis/slot/port:encap | bind-sdp sdp_id[:service_id] | vnid vxlan_id} {dynamic | static} [mac-address mac_address]
```

**Syntax Definitions**

- **service_id**: An existing VXLAN service ID.
- **chassis**: The chassis identifier.
- **slot/port:encap**: The VXLAN access port and encapsulation (0, all, qtag, or outer_qtag,inner_qtag) for a VXLAN Service Access Point (SAP).
- **sdp_id[:service_id]**: Clears MAC addresses learned on a VXLAN Service Distribution Point (SDP) binding. Specify the SDP ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are displayed.
- **vxlan_id**: A 24-bit numerical value that identifies a VXLAN segment (a VXLAN network ID). The valid range is 1–2147483647 (or 000.000.001–255.255.255 in decimal notation format). Use a hyphen to specify a range of IDs (25001-25005).
- **dynamic**: Clears dynamically learned MAC addresses from the VXLAN domain.
- **static**: Removes static MAC addresses from the VXLAN domain.
- **mac_address**: Enter a specific MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c) for the specified domain.

**Defaults**

  - `slMacAddressGblManagement`
  - `slVxLanVnID`
  - `slMacAddressGblRowStatus`
mac-learning flush domain l2gre

Clears the specified MAC addresses from the Source Learning MAC Address Table for the Layer 2 Generic Routing Encapsulation (L2 GRE) learning domain on the local switch.

Syntax

```
mac-learning flush domain l2gre {serviceid service_id | sap chassis/slot/port:encap | bind-sdp sdp_id[:service_id] | vpnid vpn_id} {dynamic | static} [mac-address mac_address]
```

Syntax Definitions

- **service_id**: An existing L2 GRE service ID.
- **chassis**: The chassis identifier.
- **slot/port:encap**: The access port and encapsulation (0, all, qtag, or outer_qtag.inner_qtag) for an L2 GRE Service Access Point (SAP).
- **sdp_id[:service_id]**: Clears MAC addresses learned on an L2 GRE Service Distribution Point (SDP) binding. Specify the SDP ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are displayed.
- **vpnid**: A tunnel ID that identifies a GRE tunnel VPN.
- **dynamic**: Clears dynamically learned MAC addresses from the L2 GRE domain.
- **static**: Removes static MAC addresses from the L2 GRE domain.
- **mac_address**: Enter a specific MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c) for the specified domain.

Defaults

<table>

**mac-learning static mac-address**

Configures a static destination unicast MAC address. The configured MAC address is assigned to a fixed switch port or link aggregate ID and VLAN. If the destination of the data packets received on the VLAN ports is the configured MAC address, then they are forwarded to the specific MAC address port.

```
mac-learning {vlan vlan_id [port chassis/slot/port | linkagg agg_id]} static mac-address mac_address [bridging | filtering]
```

```
mac-learning flush [vlan vlan_id [port chassis/slot/port | linkagg agg_id]] static [mac-address mac_address]
```

### Syntax Definitions

- `vlan_id`: VLAN ID number.
- `chassis`: The chassis identifier.
- `slot/port`: The slot and port number (3/1) that is assigned to the static MAC address.
- `agg_id`: Enter a link aggregate ID number. See Chapter 12, “Link Aggregation Commands.”
- `mac_address`: Enter a destination MAC Address (for example, 00:00:39:59:f1:0c).
- `bridging`: Specifies that all packets to or from this MAC address are bridged.
- `filtering`: Specifies that all packets to or from this MAC address are filtered or dropped.

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridging, filtering</td>
<td>bridging</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `mac-learning flush` command to remove a static MAC address from the Source Learning MAC Address Table. Note that if no parameters are specified with this command, then all static addresses are removed.

- Enter a port number or link aggregate ID that is already associated with the specified VLAN ID. Only traffic from other ports associated with the same VLAN is directed to the static MAC address port.
• Select the **filtering** parameter to set up a denial of service to block potential hostile attacks. Traffic sent to or from a filtered MAC address is dropped. Select the **bridging** parameter for regular traffic flow to or from the MAC address.

• The destination MAC addresses are maintained in the Source Learning MAC address table.

• If a packet received on a port associated with the same VLAN contains a source address that matches a static MAC address, then the packet is discarded.

**Examples**

- `mac-learning vlan 10 port 1/10 static mac-address 00:00:39:59:f1:0c bridging`
- `mac-learning vlan 20 linkagg 5 static mac-address 00:00:9a:55:e0:01 filtering`
- `mac-learning flush vlan 500 static`
- `mac-learning flush vlan 10 port 1/10 static mac-address 00:00:39:59:f1:0c`
- `mac-learning flush vlan 20 linkagg 5 static`
- `mac-learning flush static`

**Release History**

Release 7.1.1; command introduced.
Release 7.3.1: `mac-learning flush` command replaced the `no mac-learning` command.

**Related Commands**

- `vlan members untagged` Assigns ports and link aggregates to a VLAN.
- `mac-learning multicast mac-address` Configures a static multicast MAC address and assigns the address to one or more egress ports or link aggregates.
- `show mac-learning` Displays Source Learning MAC Address Table information.

**MIB Objects**

- `alaSlMacAddressGlobalTable`  
  `slOriginId`  
  `slServiceId`  
  `slMacAddressGbl`  
  `slMacAddressGblManagement`  
  `slMacAddressGblDisposition`
mac-learning domain vlan static mac-address

Configures a static destination unicast MAC address in the VLAN source learning domain. The configured MAC address is assigned to a fixed switch port or link aggregate ID and VLAN. If the destination of the data packets received on the VLAN ports is the configured static MAC address, then they are forwarded to the specific MAC address port.

```
mac-learning domain vlan vlan vlan_id [port chassis/slot/port | linkagg agg_id] static mac-address mac_address [bridging | filtering]
```

```
mac-learning flush domain vlan [vlan vlan_id [port chassis/slot/port | linkagg agg_id]] static [mac-address mac_address]
```

**Syntax Definitions**

- **vlan_id**: VLAN ID number.
- **chassis**: The chassis identifier.
- **slot/port**: The slot and port number (3/1) that is assigned to the static MAC address.
- **agg_id**: Enter a link aggregate ID number. See Chapter 12, “Link Aggregation Commands.”
- **mac_address**: Enter a destination MAC Address (for example, 00:00:39:59:f1:0c).
- **bridging**: Specifies that all packets to or from this MAC address are bridged.
- **filtering**: Specifies that all packets to or from this MAC address are filtered or dropped.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridging</td>
<td>bridging</td>
</tr>
<tr>
<td>filtering</td>
<td></td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `mac-learning flush` command to remove a static MAC address from the Source Learning MAC Address Table. Note that if no parameters are specified with this command, then all static addresses are removed.
• Enter a port number or link aggregate ID that is already associated with the specified VLAN ID. Only traffic from other ports associated with the same VLAN is directed to the static MAC address port.

• Select the filtering parameter to set up a denial of service to block potential hostile attacks. Traffic sent to or from a filtered MAC address is dropped. Select the bridging parameter for regular traffic flow to or from the MAC address.

• The destination MAC addresses are maintained in the Source Learning MAC address table.

• If a packet received on a port associated with the same VLAN contains a source address that matches a static MAC address, then the packet is discarded.

**Examples**

```
-> mac-learning domain vlan vlan 10 port 1/1/10 static mac-address 00:00:39:59:f1:0c bridging
-> mac-learning domain vlan vlan 20 linkagg 5 static mac-address 00:00:9a:55:e0:01 filtering
-> mac-learning flush domain vlan vlan 500 static
-> mac-learning flush domain vlan vlan 10 port 1/1/10 static mac-address 00:00:39:59:f1:0c
-> mac-learning flush domain vlan vlan 20 linkagg 5 static
-> mac-learning flush domain vlan static
```

**Release History**

Release 7.1.1; command introduced.
Release 7.3.1: **mac-learning flush** command replaced the **no mac-learning** command.

**Related Commands**

- **vlan members untagged** Assigns ports and link aggregates to a VLAN.

mac-learning domain spb static mac-address

Configures a static destination unicast MAC address in the Shortest Path Bridging (SPB) source learning domain.

```
mac-learning domain spb {serviceid service_id | sap chassis/slot/port:encap | bind-sdp sdp_id:service_id} static mac-address mac_address [bridging | filtering]
```

```
mac-learning domain spb {instance_id |.sap chassis/slot/port:encap | bind-sdp sdp_id:service_id} static mac-address mac_address [bridging | filtering]
```

```
mac-learning flush domain spb {serviceid service_id | sap chassis/slot/port:encap | bind-sdp sdp_id:service_id | isid instance_id} static [mac-address mac_address]
```

### Syntax Definitions

- **service_id**: An existing SPB service ID.
- **instance_id**: An SPB backbone service instance identifier (I-SID).
- **chassis**: The chassis identifier.
- **slot/port:encap**: The SPB access port and encapsulation (0, qtag, or outer_qtag.inner_qtag) for an SPB Service Access Point (SAP).
- **sdp_id:service_id**: The SPB Service Distribution Point (SDP) ID number and service ID number for a specific binding.
- **mac_address**: Enter a destination MAC Address (for example, 00:00:39:59:f1:0c).
- **bridging**: Specifies that all packets to or from this MAC address are bridged.
- **filtering**: Specifies that all packets to or from this MAC address are filtered or dropped.

### Defaults

**mac-learning domain local static mac-address**

Configures a static destination unicast MAC address for a local service in the source learning domain

```
mac-learning domain local serviceid service_id sap chassis/slot/port:encap static mac-address
mac_address [bridging | filtering]
```

```
mac-learning flush domain local serviceid service_id [sap chassis/slot/port:encap] static [mac-address mac_address]
```

### Syntax Definitions

- `service_id`: An existing service ID.
- `chassis`: The chassis identifier.
- `slot/port:encap`: The service access port and encapsulation (`qtag`, or `outer_qtag.inner_qtag`) for a VXLAN Service Access Point (SAP).
- `mac_address`: Enter a destination MAC Address (for example, 00:00:39:59:f1:0c).
- `bridging`: Specifies that all packets to or from this MAC address are bridged.
- `filtering`: Specifies that all packets to or from this MAC address are filtered or dropped.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridging</td>

mac-learning multicast mac-address

Configures a static multicast MAC address and assigns the address to one or more egress ports. Packets received on ports associated with the specified VLAN that contain a destination MAC address that matches the static multicast address are forwarded to the specified egress ports. Static multicast MAC addresses are maintained in the Source Learning MAC address table.

```
mac-learning {vlan vlan_id {port chassis/slot/port | linkagg agg_id }} multicast mac-address multicast_address [group group_id]
```

```
mac-learning flush {vlan vlan_id [port chassis/slot/port | linkagg agg_id ]] multicast [mac-address multicast_address]
```

**Syntax Definitions**

- `vlan_id` VLAN ID number.
- `chassis` The chassis identifier.
- `slot/port` The egress slot and port number (3/1) that is assigned to the static multicast MAC address.
- `agg_id` Enter a link aggregate ID number. See Chapter 12, "Link Aggregation Commands."
- `multicast_address` Enter the destination multicast MAC Address to add to the MAC Address Table (for example, 01:00:39:59:f1:0c).
- `group_id` This keyword cannot be user defined.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6</th>
<th>6900X48C4E/V48C8C32E/T24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `mac-learning flush` command to remove a static multicast MAC address from the Source Learning MAC Address Table. Note that If no parameters are specified with this command, then all static multicast addresses are removed.
- Note that a MAC address is considered a multicast MAC address if the least significant bit of the most significant octet of the address is enabled. For example, MAC addresses with a prefix of 01, 03, 05, 13, and so on, are multicast MAC addresses.
If a multicast prefix value is not present, then the address is treated as a regular MAC address and not allowed when using the `mac-learning vlan multicast mac-address` command. Also note that multicast addresses within the following ranges are not supported:

01:00:5E:00:00:00 to 01:00:5E:7F:FF
01:80:C2:XX.XX.XX
33:33:XX:XX:XX

The configured (static) multicast MAC address is assigned to a fixed switch port or link aggregate ID and VLAN.

In addition to configuring the same static multicast address for multiple ports within a given VLAN, it is also possible to use the same multicast address across multiple VLANs.

Enter a port number or link aggregate ID that is already associated with the specified VLAN ID. Only traffic from other ports associated with the same VLAN is directed to the static MAC address port.

If the `configuration snapshot` or `write memory` command is entered after a static multicast MAC address is configured, the resulting ASCII file or `boot.cfg` file includes the “`group group_id`” as the additional syntax for the `mac-learning static-multicast` command. The “`group group_id`” indicates the number of the multicast group that the switch has assigned to the multicast MAC address for the given VLAN association. Each multicast address – VLAN association is treated as a unique instance and assigned a group number specific to that instance.

Note that if the port assigned to a multicast MAC address is down or administratively disabled when the `configuration snapshot` or `write memory` command is used, the multicast MAC address is not saved to the resulting ASCII file or `boot.cfg` file.

**Examples**

```
-> mac-learning vlan 1500 port 1/10 multicast mac-address 01:25:9a:5c:2f:10
-> mac-learning vlan 355 port 4/2-10 multicast mac-address 01:25:9a:5c:2f:11
-> mac-learning vlan 455 linkagg 10 multicast mac-address 01:25:9a:5c:2f:12
-> mac-learning flush vlan 500 multicast
-> mac-learning flush vlan 1500 port 1/10 multicast mac-address 01:25:9a:5c:2f:10
-> mac-learning flush vlan 455 linkagg 10 multicast mac-address 01:25:9a:5c:2f:12
-> mac-learning flush multicast
```

**Release History**

Release 7.1.1; command introduced.
Release 7.3.1; `mac-learning flush` command replaced the `no mac-learning` command.

**Related Commands**

- `vlan members untagged`: Assigns ports and link aggregates to a VLAN.
- `mac-learning static mac-address`: Configures a static MAC address and assigns the address to a port or link aggregate.
- `show mac-learning`: Displays Source Learning MAC Address Table information.

**MIB Objects**

- `alaSlMacAddressGlobalTable`
- `slOriginId`
- `slServiceId`
slMacAddressGbl
slMacAddressGblManagement
slMacAddressGblDisposition
mac-learning aging-time

Configures aging time, in seconds, for static and dynamically learned MAC addresses. When a MAC address has aged beyond the aging-time value, the MAC address is discarded.

**Command Syntax**

```plaintext
mac-learning aging-time {seconds | default}
no mac-learning aging-time
```

**Syntax Definitions**

- **seconds**: Aging time value (in seconds). Do not use commas in value.
- **default**: The aging time is set to the default value of 300 seconds.

**Defaults**

By default, the aging time is set to 300 seconds.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **default** parameter to set the aging-time back to the default value of 300 seconds.
- The aging time value is a global value that applies to all VLANs. Configuring this value on a per VLAN basis is not supported.
- Note that an inactive MAC address can take up to twice as long as the aging time value specified to be removed from the MAC address table. For example, if an aging time of 60 seconds is specified, the MAC address ages out any time between 60 and 120 seconds of inactivity.
- When a new MAC aging time is set, the aging process could take up to 3 aging cycles to age out the inactive macs. This only applies to the first time the aging time is set. Subsequent aging processes can take up to twice as long as the aging time value as described above.
- The MAC address table aging time is also used as the timeout value for the Address Resolution Protocol (ARP) table. This timeout value determines how long the switch retains dynamically learned ARP table entries.

**Examples**

```
-> mac-learning aging-time 1200
-> mac-learning aging-time default
```
**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `show mac-learning` Displays Source Learning MAC Address Table information.
- `show mac-learning aging-time` Displays the current aging time value for the Source Learning MAC Address Table.

**MIB Objects**

- `slMacAddressAgingTable`
- `slMacAgingValue`
mac-learning mode

Specifies the source learning mode for the chassis.

mac-learning mode [centralized | distributed]

Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>centralized</td>
<td>Enables centralized MAC source learning mode.</td>
</tr>
<tr>
<td>distributed</td>
<td>Enables distributed MAC source learning mode.</td>
</tr>
</tbody>
</table>

Defaults

By default, centralized MAC source learning mode is enabled for the chassis.

Platforms Supported

Not supported in this release.

Usage Guidelines

After the distributed MAC mode is either enabled or disabled using this command, immediately save the switch configuration using the write memory command and then reboot the switch.

Examples

- `-> mac-learning mode centralized`
- `-> mac-learning mode distributed`

Release History

Release 7.1.1; command introduced.

Related Commands

`show mac-learning mode` Displays the current status of the MAC source learning mode.

MIB Objects

<table>
<thead>
<tr>
<th>Object ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>slDistributedMacMode</td>
<td></td>
</tr>
</tbody>
</table>
show mac-learning

Displays Source Learning MAC Address Table information for the switch.

**Syntax**

```
show mac-learning [summary | dynamic | static | multicast | bmac] [port chassis/slot/port] [linkagg agg_id] [mac-address mac_address] [remote [mac-address mac_address]]
```

**Syntax Definitions**

- **summary**: Displays a summary of all the MAC address information.
- **dynamic**: Displays only dynamically learned MAC addresses.
- **static**: Displays only static MAC addresses with a permanent status.
- **multicast**: Displays only multicast MAC addresses.
- **bmac**: Displays only backbone MAC addresses (BMACs). A BMAC is the bridge MAC address of a Shortest Path Bridging (SPB) switch.
- **chassis**: The chassis identifier.
- **slot/port**: The slot and port number (3/1).
- **agg_id**: The link aggregate ID number.
- **mac_address**: A MAC Address (for example, 00:00:39:59:f1:0c).

**Defaults**

By default, information is displayed for all MAC addresses contained in the table.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the `show mac-learning` command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.

- If there is a duplicate static MAC address occurrence, a “&” will appear to the right of the address in the `show mac-learning` command display.
Examples

-> show mac-learning summary

Total number of Valid MAC addresses above = 12

output definitions

- **Domain**: The domain in which the MAC address was learned or statically configured (VLAN, SPB, VXLAN, L2GRE).

- **Vlan/SrvclId/[ISId/vnID]**: This field contains one of the following values depending on the domain type associated with the MAC address:
  - The VLAN ID number.
  - The SPB or VXLAN service ID number.
  - The ISID number associated with the SPB service ID number.
  - The VXLAN Network ID (VNID) number associated with the VXLAN service ID.
  - The GRE tunnel VPN ID number associated with the L2 GRE tunnel service ID.

- **Mac Address**: MAC address that is currently learned or statically assigned.

- **Type**: MAC address management status (dynamic, static, bmac).

- **Operation**: The disposition of the MAC address (bridging, filtering, servicing, quarantined).

- **Interface**: The slot/port number that is associated with the static or dynamically learned MAC address. If the interface is a link aggregate ID, zero is displayed as the slot number (for example, 0/29). In the service domain, the Service Access Point (SAP) or the Service Distribution Point (SDP) associated with the MAC address is displayed.

**Release History**

- Release 7.1.1; command introduced.
- Release 7.3.1; show command display modified to include domain and service information.
- Release 7.3.4; vnID field added.
Related Commands

- **show mac-learning domain vlan**  Displays MAC Address Table information for the VLAN source learning domain.
- **show mac-learning domain spb**  Displays MAC Address Table information for the Shortest Path Bridging (SPB source learning domain.
- **show mac-learning domain vxlan**  Displays MAC Address Table information for the Virtual eXtensible LAN (VXLAN) source learning domain.
- **show mac-learning domain l2gre**  Displays MAC Address Table information for the L2 GRE tunnel source learning domain.
- **show mac-learning aging-time**  Displays the current aging time value for the Source Learning MAC Address Table.

show mac-learning domain all

Displays MAC Address Table information for all source learning domains.

show mac-learning domain all [summary]

Syntax Definitions

summary Displays a summary count of the MAC addresses known to the MAC address table for the specified domain.

Defaults

By default, all MAC address entries learned are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.

- If there is a duplicate static MAC address occurrence, an “&” symbol will appear to the right of the address in the command display.

Release 7.3.4; vnID field added.
Source Learning Commands

show mac-learning
Displays Source Learning MAC Address Table information for the switch.

show mac-learning domain vlan
Displays MAC Address Table information for the VLAN source learning domain.

show mac-learning domain spb
Displays MAC Address Table information for the Shortest Path Bridging (SPB) source learning domain.

show mac-learning domain vxlan
Displays MAC Address Table information for the Virtual eXtensible LAN (VXLAN) source learning domain.

show mac-learning domain l2gre
Displays MAC Address Table information for the L2 GRE tunnel source learning domain.

show mac-learning aging-time
Displays the current aging time value for the Source Learning MAC Address Table.

MIB Objects

show mac-learning domain vlan

Displays MAC Address Table information for the VLAN source learning domain.

show mac-learning domain vlan [vlan vlan_id] [port chassis/slot/port | linkagg agg_id] [dynamic | static | static-multicast | bmac] [mac-address mac_address] [summary]

Syntax Definitions

- **vlan_id**: VLAN ID number.
- **chassis**: The chassis identifier.
- **slot/port**: The slot and port number (3/1) that is assigned to the static MAC address.
- **agg_id**: A link aggregate ID number.
- **dynamic**: Displays dynamically learned MAC addresses.
- **static**: Displays static MAC addresses with a permanent status.
- **static-multicast**: Displays static multicast MAC addresses. This parameter applies only to the VLAN domain.
- **bmac**: Displays backbone MAC addresses (BMACs). A BMAC is the bridge MAC address of a SPB switch. This parameter applies only to the VLAN domain.
- **mac_address**: A MAC Address (for example, 00:00:39:59:f1:0c).
- **summary**: Displays a summary count of the MAC addresses known to the MAC address table for the specified domain.

Defaults

By default, all MAC address entries learned for the VLAN domain are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

  slOriginId
  slMacAddressGbl
  slMacAddressGblManagement
  slMacAddressGblDisposition
  slMacAddressGblRowStatus
  slMacAddressGblGroupField
show mac-learning domain spb

Displays MAC Address Table information for the Shortest Path Bridging (SPB) source learning domain.

```
show mac-learning domain spb [isid instance_id | serviceid service_id [isid instance_id]] [sap chassis/slot/port:encap | bind-sdp sdp_id[:service_id]] [dynamic | static] [mac-address mac_address] [summary]
```

**Syntax Definitions**

- **instance_id**: A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network. The valid range is 256–16777214.
- **service_id**: An existing SPB service ID.
- **chassis/slot/port:encap**: The SPB access port and encapsulation (all, qtag, or outer_qtag.inner_qtag) for an SPB Service Access Point (SAP). For example, 1/1/2:10.
- **mesh_id**: A SPB service distribution point (SDP) ID.
- **sdp_id[:service_id]**: Displays MAC addresses learned on an SPB Service Distribution Point (SDP) binding. Specify the SDP ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are displayed.
- **dynamic**: Displays dynamically learned MAC addresses.
- **static**: Displays static MAC addresses with a permanent status.
- **mac_address**: A MAC Address (for example, 00:00:39:59:f1:0c).
- **summary**: Displays a summary count of the MAC addresses known to the MAC address table for the specified domain.

**Defaults**

By default, all MAC address entries learned for the SPB domain are displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the command display. The asterisk indicates that this is an invalid MAC...
address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.

- If there is a duplicate static MAC address occurrence, an “&” symbol will appear to the right of the address in the command display.

**Examples**

```
-> show mac-learning domain spb summary

- slSvcISID
**show mac-learning domain vxlan**

Displays MAC Address Table information for the Virtual eXtensible LAN (VXLAN) source learning domain.

```
show mac-learning domain vxlan [vnid vxlan_id | serviceid service_id [vnid vxlan_id]] [sap chassis/slot/port:encap | bind-sdp sdp_id[:service_id]] [dynamic | static] [mac-address mac_address] [summary]
```

### Syntax Definitions

- **vxlan_id**: A 24-bit numerical value that identifies a VXLAN segment (a VXLAN network ID). The valid range is 1–2147483647 (or 000.000.001–255.255.255 in decimal notation format). Use a hyphen to specify a range of IDs (25001-25005).

- **service_id**: An existing VXLAN service ID.

- **chassis(slot/port:encap**: The VXLAN service access port and encapsulation (0, all, qtag, or outer_qtag.inner_qtag) for a VXLAN Service Access Point (SAP). For example, 1/1/2:10.

- **sdp_id[:service_id]**: Displays MAC addresses learned on a VXLAN Service Distribution Point (SDP) binding. Specify the SDP ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are displayed.

- **dynamic**: Displays dynamically learned MAC addresses.

- **static**: Displays static MAC addresses with a permanent status.

- **mac_address**: A MAC Address (for example, 00:00:39:59:f1:0c).

- **summary**: Displays a summary count of the MAC addresses known to the MAC address table for the specified domain.

### Defaults

By default, all MAC address entries learned for the VXLAN domain are displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

show mac-learning domain l2gre

Displays MAC Address Table information for the Layer 2 Generic Routing Encapsulation (L2 GRE) source learning domain.

show mac-learning domain l2gre {serviceid service_id | sap chassis/slot/port:encap | bind-sdp sdp_id[:service_id] | vpnid vpn_id} {dynamic | static} [mac-address mac_address] [summary]

Syntax Definitions

service_id An existing L2 GRE service ID.
chassis The chassis identifier.
slot/port:encap The access port and encapsulation (0, all, qtag, or outer_qtag.inner_qtag) for an L2 GRE Service Access Point (SAP).
sdp_id[:service_id] Displays MAC addresses learned on an L2 GRE Service Distribution Point (SDP) binding. Specify the SDP ID number and service ID number for a specific binding. If the optional service ID is not specified, MAC addresses learned for all bindings associated with the SDP ID are displayed.
vpnid A tunnel ID that identifies a GRE tunnel VPN.
dynamic Displays dynamically learned MAC addresses from the specified domain.
static Displays static MAC addresses from the specified domain.
mac_address A specific MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c) for the specified domain.
summary Displays a summary count of the MAC addresses known to the MAC address table for the specified domain.

Defaults

By default, all MAC address entries learned in the L2 GRE tunnel domain are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

show mac-learning domain local

Displays MAC Address Table information for the local service source learning domain.

```
show mac-learning domain local [serviceid service_id] [sap chassis/slot/port:encap | dynamic | static | mac-address mac_address] [summary]
```

**Syntax Definitions**

- `service_id`: An existing service ID.
- `chassis/slot/port:encap`: The service access port and encapsulation (0, all, qtag, or outer_qtag.inner_qtag) for the local Service Access Point (SAP). For example, 1/1/2:10.
- `dynamic`: Displays dynamically learned MAC addresses.
- `static`: Displays static MAC addresses with a permanent status.
- `mac_address`: A MAC Address (for example, 00:00:39:59:f1:0c).
- `summary`: Displays a summary count of the MAC addresses known to the MAC address table for the specified domain.

**Defaults**

By default, all MAC address entries learned for the local domain are displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

Usage Guidelines

Note that the aging time is the same for all VLANs because it is not configurable on a per-VLAN basis. The aging time value on this platform is a global parameter that applies to all VLANs.

Examples

-> show mac-learning aging-time
Mac Address Aging Time (seconds) = 300

Release History

Release 7.1.1; command introduced.

Related Commands

show mac-learning Displays Source Learning MAC Address Table information.

MIB Objects

s1MacAddressAgingTable
s1MacAgingValue
**show mac-learning learning-state**

Displays the source learning status of a VLAN, port, or link aggregate.

```
show mac-learning learning-state [vlan vlan[1-vlan2] | port chassis/slot/port | linkagg agg_id]
```

**Syntax Definitions**

- **vlan**
  - The VLAN ID number.

- **-vlan2**
  - The last VLAN ID in a range of VLAN IDs.

- **chassis**
  - The chassis identifier.

- **slot/port**
  - The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

- **agg_id**
  - Specifies the link aggregate identifier.

**Defaults**

By default, the source learning status for all switch ports and link aggregates is displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **port** or **linkagg** keywords along with the port ID and link aggregate ID to display the source learning status for a specific port or link aggregate ID.

- Use the **vlan** keyword along with the VLAN ID or a range of VLAN IDs to display the source learning status for the specified VLAN or range of VLANs.

- Output display for a range of port IDs is supported with this command. However, output display for a range of link aggregate IDs is not supported.

- When the source learning status is configured for a link aggregate ID, it affects all the ports that are members of the link aggregate. However, the source learning status cannot be configured on individual ports which are members of the link aggregate.

**Example**

```
-> show mac-learning learning-state

port source-learning
----------
1/1       disabled
```
1/2    enabled
1/3    disabled

-> show mac-learning learning-state port 1/2

port  source-learning
-----+----------------
1/2    enabled

-> show mac-learning learning-state linkagg 10

port  source-learning
-----+----------------
0/10   disabled

**output definitions**

<table>
<thead>
<tr>
<th>port</th>
<th>The slot/port number for a switch port or a link aggregate ID number. If the interface is a link aggregate ID, zero is displayed as the slot number (for example, 0/29).</th>
</tr>
</thead>
<tbody>
<tr>
<td>source-learning</td>
<td>The source learning status of the port or link aggregate (<strong>enabled</strong> or <strong>disabled</strong>). Configured through the <strong>mac-learning</strong> command.</td>
</tr>
</tbody>
</table>

-> show mac-learning learning-state vlan 1-5

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Learning State</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Enabled</td>
</tr>
<tr>
<td>5</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

**output definitions**

<table>
<thead>
<tr>
<th>Vlan</th>
<th>The VLAN ID numbers of the VLANs that are active.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Learning State</td>
<td>The MAC learning state of the VLANs.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command introduced

**Related Commands**

- **mac-learning** Configures the status of source MAC address learning on a single port, a range of ports or on a link aggregate of ports.

**MIB Objects**

- slMacAddressTable
  - slMacLearningControlTable
  - slMacLearningControlEntry

show mac-learning mode

Displays the current source learning mode (centralized or distributed) for the switch.

show mac-learning mode

Syntax Definitions
N/A

Defaults
N/A

Platforms Supported
Not supported in this release.

Usage Guidelines
N/A

Examples
-> show mac-learning mode
MAC Learning Mode Configuration = CENTRALIZED
New Configured MAC Learning Mode After Reboot = DISTRIBUTED

-> show mac-learning mode
MAC Learning Mode Configuration = DISTRIBUTED

Release History
Release 7.1.1; command introduced.

Related Commands
mac-learning mode Enables or disables the distributed MAC source learning mode.

MIB Objects
slMacAddressTable
    slDistributedMacMode
mac-ping

Configure a MAC address ping for testing Layer 2 connectivity.

```
mac-ping dst-mac mac_address vlan vlan_id [priority vlan_priority] [drop-eligible {true | false}] [count count] [interval delay] [size size] [isid-check isid]
```

**Syntax Definitions**

- **mac**
  The destination MAC address to ping.

- **vlan-id**
  The VLAN on which the packets will be sent out. Valid range is 1-4094.

- **vlan-priority**
  Specifies both the internal priority of the Mac ping and the 802.1p value on the vlan tag header. Valid range is 0-7.

- **true | false**
  Specifies both the internal drop precedence of the MAC ping and the CFI bit on the vlan tag header. Default is false.

- **count**
  The number of packets to send in one ping iteration. Valid range is 1–5.

- **delay**
  The delay between packets sent during a ping iteration, in milliseconds. Valid range is from 100 ms to 1000 ms in multiples of 100 ms.

- **size**
  The size of the ICMP payload to be used for the ping iteration. Valid range is 32–1500 bytes.

- **isid**
  A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan-priority</td>
<td>0</td>
</tr>
<tr>
<td>drop-eligible</td>
<td>false</td>
</tr>
<tr>
<td>count</td>
<td>5</td>
</tr>
<tr>
<td>delay</td>
<td>1000 ms</td>
</tr>
<tr>
<td>size</td>
<td>36 bytes</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The timeout for each ping request packet is one second. This value is not configurable.
- Destination MAC cannot be a broadcast, multicast, or NULL address.
- Enable the Network Time Protocol (NTP) using the NTP client command for a MAC address ping to work correctly across Virtual Chassis.

**Examples**

-> mac-ping dst-mac 00:11:11:11:11:11 vlan 10  
-> mac-ping dst-mac 00:11:11:11:11:11 vlan 10 count 5 size 100  
-> mac-ping dst-mac 00:11:11:11:11:11 vlan 1001 isid-check 1002

**Release History**

Release 7.3.1; command was introduced.

**Related Commands**

- **show mac-learning** Displays Source Learning MAC Address Table information.

**MIB Objects**

5  VLAN Management Commands

VLAN management software handles VLAN configuration and the reporting of VLAN configuration changes to other switch tasks. A VLAN defines a broadcast domain that contains physical ports and can span across multiple switches. All switches contain a default VLAN 1. Physical switch ports are initially assigned to VLAN 1 until they are statically or dynamically assigned to other VLANs.

This chapter includes descriptions of VLAN management commands used to create, modify or remove VLANs. These commands allow you to enable or disable Spanning Tree Protocol (STP), add or remove virtual router interfaces, statically assign physical switch ports to a default VLAN, and display VLAN configuration information.

MIB information is as follows:

Filename:  ALCATEL-IND1-VLAN-MGR-MIB.mib  
Module:  alcatelIND1VLANManagerMIB

A summary of the available commands is listed here:

<table>
<thead>
<tr>

<td>show pvlan members</td>
<td>show pvlan</td>
</tr>
</tbody>
</table>
**vlan**

Creates a new VLAN with the specified VLAN ID (VID) and an optional description.

```
vlan vlan_id [admin-state {enable | disable}] [name description]
no vlan vlan_id
```

---

### Syntax Definitions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan_id</code></td>
<td>A numeric value that uniquely identifies an individual VLAN. This value becomes the VLAN ID for the new VLAN.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enable VLAN administrative status.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disable VLAN administrative status.</td>
</tr>
<tr>
<td><code>description</code></td>
<td>An alphanumeric string. Optional name description for the VLAN ID.</td>
</tr>
</tbody>
</table>

---

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td><code>enable</code></td>
</tr>
</tbody>
</table>

---

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

### Usage Guidelines

- Use the **no** form of this command to delete a VLAN from the configuration.
- All VLAN ports and routers are detached before the VLAN is removed. If the VLAN deleted is a default VLAN on the port, the port returns to default VLAN 1.
- If the VLAN deleted is not a default VLAN, then the ports are directly detached from the VLAN.
- A VLAN is not operationally active until at least one of the member ports of the VLAN is active and can forward traffic.
- Note that specifying multiple VLAN IDs and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range of VLAN ID entries (for example, `vlan 10-15`).
- When a VLAN is administratively disabled, static port assignments are retained but traffic is not forwarded from these ports.
- The description can be any alphanumeric string. Enclose the description in double quotes if it contains more than one word with space in between.
### Examples

```
-> vlan 200 name "Corporate VLAN"
-> vlan 720 admin-state disable
-> no vlan 1020
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

- `vlan members untagged` Statically assigns ports to a VLAN.
- `show vlan` Displays a list of existing VLANs.
- `show vlan members` Displays VLAN port assignments.

### MIB Objects

- `vlanTable`
  - `vlanNumber`
  - `vlanDescription`
  - `vlanAdmStatus`
  - `vlanOperStatus`
  - `vlanStatus`
vlans return to the VLAN configuration prompt.

The chassis identifier.

An existing VLAN ID number of the VLAN to assign as the default VLAN configured for the port.

The slot number for the module and the physical port number (for example, 3/1 specifies port 1 on slot 3) or a range of physical port numbers on that module (for example, 3/1-16).

The link aggregate ID number or range of IDs to be assigned to the specified VLAN.

VLAN 1 is the default VLAN for all ports.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to remove a port or link aggregate from its configured default VLAN and restore VLAN 1 as the default VLAN.
- The VLAN ID and link aggregate ID specified with this command must already exist in the switch configuration.
- This command configures the port or link aggregate to send and receive untagged packets for the specified VLAN ID, which becomes the default VLAN of the port.
- Every switch port or link aggregate has only one configured default VLAN. The 802.1Q tagged ports, however, can have additional VLAN assignments, which are often referred to as secondary VLANs.
- NNI interface can be configured with normal VLANs (other than VLAN 1). This allows NNI ports to carry untagged packets for the specified VLAN ID.
  - If an interface is already an untagged member of a standard VLAN other than VLAN 1, then on
making it an NNI interface, there will be no change in the default VLAN of the interface.

- If the default VLAN is removed from the NNI interface, then the default VLAN would automatically change to 4095 for the NNI port, either physical or logical.
- Untagged packets ingressing on the NNI interface (whose default VLAN is other than 4095) shall be forwarded on the default VLAN on the NNI interface.

**Examples**

- `vlan 20 members port 4/1-24 tagged`
- `vlan 20 members linkagg 2-4 untagged`
- `no vlan 1-4 members port 4/1-24`
- `no vlan 20 members linkagg 2-4`

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- **vlan**
  - Creates a VLAN.
- **vlan members tagged**
  - Configures a port to accept 802.1q-tagged packets for a specific VLAN.
- **show vlan**
  - Displays list of existing VLANs.
- **show vlan members**
  - Displays VLAN port assignments.

**MIB Objects**

- **vpaTable**
  - **vpaVlanNumber**
  - **vpaIfIndex**
  - **vpaType**
  - **vpaState**
  - **vpaStatus**
**VLAN Management Commands**

**VLAN members tagged**

Configures a port or link aggregate ID to send and receive 802.1q-tagged packets with the specified VLAN ID.

```
vlan vlan_id[-vlan_id] members {port chassis/slot/port[-port] | linkagg agg_id[-agg_id]} tagged
```

```
no vlan vlan_id[-vlan_id] members {port chassis/slot/port[-port] | linkagg agg_id[-agg_id]}
```

### Syntax Definitions

- **vlan_id**
  - The VLAN ID number for a pre-configured VLAN that will handle the 802.1Q-tagged traffic for this port. Use a hyphen to specify a range of VLAN IDs (for example, `vlan 10-15`). The valid range is 1–4094.

- **chassis**
  - The chassis identifier.

- **slot/port[-port]**
  - The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-10).

- **agg_id[-agg_id]**
  - A link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs.

### Defaults

By default, all ports are untagged (they only carry untagged traffic for the default VLAN to which the port belongs).

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to delete 802.1Q tagging on a port or an aggregate of ports.

- The VLAN ID and link aggregate ID specified with this command must already exist in the switch configuration.

- A port or link aggregate cannot be tagged with its own default VLAN ID.

- NNI interface can be tagged with normal VLANs. This allows NNI ports to carry regular 802.1q tagged traffic as well as SVLAN tagged traffic.
  - 802.1q VLAN tagging to an NNI interface will not be allowed if the interface is set with TPID other than 0x8100.
  - Tagged packets ingressing on the NNI interface (default VLAN other than 4095), with TPID other than the one configured on the interface shall be forwarded on the default VLAN of the
NNI interface.

- The TPID (other than 0x8100) of a NNI interface cannot be modified if the interface is already a tagged member of a legacy VLAN.

**Examples**

- `vlan 100 members port 3/1 tagged`
- `vlan 100 members port 4/1-10 tagged`
- `vlan 100 members linkagg 10 tagged`
- `vlan 100 members linkagg 1-4 tagged`
- `no vlan 100 members port 3/1`

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `vlan` Creates a VLAN.
- `vlan members untagged` Configures the default VLAN for the specified port or link aggregate.
- `show vlan members` Displays VLAN port assignments.

**MIB Objects**

- `qPortVlanTable`
- `qPortVlanSlot`
- `qPortVlanPort`
- `qPortVlanStatus`
- `qPortVlanTagValue`
- `qPortVlanDescription`
- `qAggregateVlanTagValue`
- `qAggregateVlanAggregateId`
- `qAggregateVlanStatus`
- `qAggregateVlanDescription`
**vlan mtu-ip**

Configures the maximum transmission unit (MTU) packet size allowed for all ports associated with a VLAN. This value is configured on a per VLAN basis, so all IP interfaces assigned to the VLAN apply the same MTU value to packets sent on VLAN ports.

`vlan vlan_id mtu-ip size`

**Syntax Definitions**

- **vlan_id**: An existing VLAN ID number of the VLAN to assign as the default VLAN configured for the port.
- **size**: Packet size value specified in bytes.

**Defaults**

By default, the MTU size is set to 1500 bytes (the standard Ethernet MTU size).

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The MTU size applies to traffic sent on all switch ports that are associated with the specified VLAN regardless of the port speed (for example, 10/100 Ethernet, Gigabit Ethernet). Therefore, assign only ports that are capable of handling the MTU size restriction to the VLAN. If the VLAN MTU size is greater than 1500, do not assign 10/100 Ethernet ports to the VLAN.

- By default, packets that exceed the MTU size are dropped. To enable MTU discovery and fragmentation, use the `icmp type` command to enable the “frag needed but DF bit set” control (for example, `icmp type 3 code 4 enable`).

- The maximum MTU size value for a VLAN is 9198.

**Examples**

- `-> vlan 200 mtu-ip 1280`
- `-> vlan 1503 mtu-ip 9198`

**Release History**

Release 7.1.1; command introduced.
Related Commands

- `vlan` Creates a VLAN.
- `vlan members tagged` Configures a port to accept 802.1q-tagged packets for a specific VLAN.
- `show vlan` Displays list of existing VLANs.

MIB objects

- `vlanTable`
  - `vlanMtu`
show vlan

Displays a list of VLANs configured on the switch.

`show vlan [vlan_id]`

**Syntax Definitions**

`vlan_id`  
VLAN ID number.

**Defaults**

By default, a list of all VLANs is displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Specify a VLAN ID with this command to display information about a specific VLAN.
- Note that specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (for example, `show vlan 10-15`). Note that only one VLAN entry - a single VLAN ID or a range of VLAN IDs is allowed with this command. Multiple entries are not accepted.

**Examples**

```
-> show vlan

vlan  type   admin  oper  ip   mtu  name
-----+-------+-----+-----+-----+-----+---------------------
 1     std   Ena  Dis  Dis   1500 Finance IP
10    unpd  Ena  Dis  Dis   1500 UNP-DYN-VLAN
11    std   Ena  Dis  Dis   1500 VLAN 11
400   spb   Ena  Dis  Dis   1524 VLAN 500
500   fcoe  Ena  Dis  Dis   1500 VLAN 500
600   pvlan-p Ena  Dis  Dis   1500 PVLAN 600
601   pvlan-c Ena  Dis  Dis   1500 PVLAN 601
602   pvlan-i Ena  Dis  Dis   1500 PVLAN 602
```

-> show vlan 600
Name           : PVLAN 600,
Type           : PVLAN Primary vlan,
Administrative State : enabled,
Operational State    : disabled,
IP Routing         : disabled,
IP MTU            : 1500
MAC Tunneling     : disabled,
```
**output definitions**

| IP Routing | IP routing status: **enabled** (IP interface exists for the VLAN) or **disabled** (no IP interface exists for the VLAN). Use the `ip interface` command to define an IP router interface for a VLAN. |
| IP MTU | Maximum Transmission Unit: Size of largest data packet that the VLAN port can transmit. |
| MAC Tunneling | MAC tunneling status for the VLAN Stacking SVLAN: **enabled** or **disabled**. Use the `ethernet-service svlan mac-tunneling` to change the MAC tunneling status for the SVLAN. |

**Release History**

Release 7.1.1; command introduced.
Release 8.6R1; “MAC Tunneling” field added.
Release 8.7R1; “IP Router Port” field changed to “IP Routing”

**Related Commands**

- `show vlan members` Displays VLAN port assignments.

**MIB Objects**

- `vlanTable`
  - `vlanNumber`
  - `vlanDescription`
  - `vlanAdmStatus`
  - `vlanOperStatus`
  - `vlanRouterStatus`
  - `vlanType`
  - `vlanMtu`
  - `vlanMacTunneling`
**show vlan members**

Displays VLAN-port associations (VPAs) for all VLANs, a specific VLAN, or for a specific port.

```plaintext
show vlan [vlan_id[-vlan_id]] members [port chassis/slot/port[-port]] linkagg agg_id[-agg_id]]
```

### Syntax Definitions

- **vlan_id**: VLAN ID number. Use a hyphen to specify a range of VLAN IDs (for example, `vlan 10-15`).
- **chassis**: The chassis identifier.
- **slot/port[-port]**: The slot and port number (3/1) of a specific interface to display. Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[-agg_id]**: Enter a link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs.

### Defaults

If no parameters are specified with this command, a list of all VLANs and their assigned ports is displayed by default.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- If the `vlan_id` is specified without a `slot/port` or `agg_id`, then all port assignments for that VLAN are displayed.
- If the `slot/port` or `agg_id` is specified without a `vlan_id`, then all VLAN assignments for that port are displayed.
- If both the `vlan_id` and `slot/port` or `agg_id` are specified, then information only for that VLAN and slot/port or link aggregate ID is displayed.
- Note that specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (for example, `show vlan 10-15 port`). Note that only one VLAN entry - a single VLAN ID or a range of VLAN IDs is allowed with this command. Multiple entries are not accepted.
- The following types of VPAs may appear in the “type” field based on the switch configuration:

<table>
<thead>
<tr>
<th>VPA Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>untagged</td>
<td>Statically configured untagged VLAN assignment for the port.</td>
</tr>
</tbody>
</table>
### VLAN Management Commands

**show vlan members**

#### Examples

```plaintext
-> show vlan members

<table>
<thead>
<tr>
<th>vlan</th>

<th>type</th>
<th>status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1/1</td>
<td>untagged</td>
<td>inactive</td>
</tr>
<tr>
<td>2</td>
<td>1/2</td>
<td>untagged</td>
<td>blocking</td>
</tr>
<tr>
<td>3</td>
<td>1/2</td>
<td>tagged</td>
<td>forwarding</td>
</tr>
<tr>
<td></td>
<td>11/4</td>
<td>tagged</td>
<td>forwarding</td>
</tr>
<tr>
<td>2</td>
<td>2/5</td>
<td>dynamic</td>
<td>forwarding</td>
</tr>
</tbody>
</table>
```

```plaintext
-> show vlan 10 members

<table>
<thead>
<tr>
<th>port</th>
<th>type</th>
<th>status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/1</td>
<td>untagged</td>
<td>forwarding</td>
</tr>
<tr>
<td>1/2</td>
<td>tagged</td>
<td>forwarding</td>
</tr>
</tbody>
</table>
```

```plaintext
-> show vlan members port 3/2

<table>
<thead>
<tr>
<th>vlan</th>
<th>type</th>
<th>status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>untagged</td>
<td>forwarding</td>
</tr>
<tr>
<td>2</td>
<td>tagged</td>
<td>forwarding</td>
</tr>
<tr>
<td>5</td>
<td>dynamic</td>
<td>blocking</td>
</tr>
<tr>
<td>3</td>
<td>tagged</td>
<td>blocking</td>
</tr>
</tbody>
</table>
```

```plaintext
-> show vlan 1-11 members port 1/3

type : untagged,
status : inactive,
vlan admin : enabled,
vlan oper : disabled,
```

#### output definitions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan</td>
<td>Numerical VLAN ID. Identifies the VLAN assignment of the port.</td>
</tr>
<tr>
<td>port</td>
<td>The slot number for the module and the physical port number on that module (for example 3/1 specifies port 1 on slot 3).</td>
</tr>
</tbody>
</table>
**VLAN Management Commands**

**show vlan members**

---

**Output Definitions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>type</strong></td>
<td>The type of VPA: <strong>untagged</strong> (configured untagged VLAN assignment for the port), <strong>tagged</strong> (802.1Q-tagged secondary VLAN assignment for the port), <strong>mirror</strong> (port is mirroring the VLAN assignment of another port), <strong>dynamic</strong> (dynamically configured VLAN assignment for the port).</td>
</tr>
<tr>
<td><strong>status</strong></td>
<td>The VPA status: <strong>inactive</strong> (port is not active), <strong>forwarding</strong> (traffic is forwarding on this VPA), <strong>blocking</strong> (traffic is not forwarding on this VPA).</td>

<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Specify a VLAN ID that does not already exist in the switch configuration.
- Use a hyphen to indicate a contiguous range of VLAN ID entries.
- Enclose the description in double quotes if it contains more than one word with a space in between each word.
- The `capability shared-vlan-learning` command must be enabled on the OS6860N and OS6900-X48C6/T48C6/X48C4E/V48C8/C32E/T24C2/X24C2 models when configuring PVLAN.

---

**Examples**

- `-> pvlan 200 name "Corporate PVLAN"`
- `-> pvlan 200 admin-state disable`
- `-> pvlan 300-302 admin-state enable`
Release History

Release 8.3.1; command introduced.

alaPrivateVlanTable
   - alaPrivateVlanID
   - alaPrivateVlanAdminState
   - alaPrivateVlanName
   - alaPrivateVlanType
   - alaPrivateVlanMtuIp
**pvlan secondary**

Creates a new Secondary VLAN and associates it with the Primary VLAN in a Private VLAN (PVLAN) configuration.

```
pvlan vlan_id secondary vlan_id[-vlan_id] type {isolated | community}
no pvlan vlan_id secondary vlan_id[-vlan_id]
```

**Syntax Definitions**

- **pvlan vlan_id**  
  A numeric value that uniquely identifies the Primary VLAN. The valid range is 2–4094.

- **secondary vlan_id**  
  A numeric value that uniquely identifies the Secondary VLAN to assign to the specified Primary VLAN. The valid range is 2–4094.

- **isolated**  
  Configures the secondary VLAN as an Isolated VLAN.

- **community**  
  Configures the secondary VLAN as a Community VLAN.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td></td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
+----------------+----------------+----------------+----------------+----------------+----------------+----------------+----------------+----------------+
|                | 6360           | 6465           | 6560           | 6570M          | 6860           | 6860N          | 6865           | 6900 V72/C32   |
|----------------+----------------+----------------+----------------+----------------+----------------+----------------+----------------+----------------+
|                | No             | No             | No             | No             | Yes            | Yes            | Yes            | No             |
| No             | Yes            | Yes            | No             | Yes            | No             | Yes            | No             | No             |
```

**Usage Guidelines**

- Use the **no** form of the command to remove the Secondary VLAN assignment.
- The Primary VLAN ID must already exist.
- The Secondary VLAN ID must not already exist.
- Use a hyphen to indicate a contiguous range of VLAN ID entries.
- There can only be one Isolated Secondary VLAN associated with a Primary VLAN.

**Examples**

```bash
-> pvlan 200 secondary 250 type isolated
-> pvlan 200 secondary 251 type community
-> no pvlan 200 secondary 251
```
**Release History**

Release 8.3.1; command introduced.

**Related Commands**

- **pvlan**
  Creates a new Primary VLAN with the specified VLAN ID and an optional description.

- **pvlan members**
  Assigns ports or link aggregates to a Primary or Secondary VLAN in a PVLAN configuration.

- **show pvlan**
  Displays a list of PVLANs configured on the switch.

- **show pvlan mapping**
  Displays the Primary VLAN and Secondary VLAN mapping.

- **show pvlan members**
  Displays VPAs for all or specific VLANs in a PVLAN configuration.

**MIB Objects**

alaPrivateVlanMappingTable

- alaPrivateVlanMappingPrimaryVlanID
- alaPrivateVlanMappingSecondaryVlanID
- alaPrivateVlanMappingSecondaryVlanType
pvlan members

Configures a tagged or untagged VLAN-port association (VPA) between ports or link aggregates and the specified VLAN ID in a Private VLAN (PVLAN) configuration.

```
 pvlan vlan_id members {port chassis/slot/port[-port] | linkagg agg_id[-agg_id]} {tagged | untagged} | isl
```

```
 no pvlan vlan_id members {port chassis/slot/port[-port] | linkagg agg_id[-agg_id]}
```

### Syntax Definitions

- **vlan_id**
  - A numeric value that uniquely identifies a Primary VLAN or Secondary VLAN in a PVLAN configuration. The valid range is 2–4094.
- **chassis**
  - The chassis identifier.
- **slot/port[-port]**
  - The slot and port number.
- **agg_id[-agg_id]**
  - The link aggregate ID number or range of IDs. The ID must be in the range 1 to 128.
- **tagged**
  - Configures the port or link aggregate ID to send and receive 802.1q-tagged packets with the specified PVLAN ID.
- **untagged**
  - Configures the port or link aggregate ID to send and receive non-802.1q-tagged packets.
- **isl**
  - Configures the port as an inter-switch link (ISL) port capable of carrying PVLAN traffic for all the VLANs that are members of a PVLAN between PVLAN-aware switches.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6/</th>
<th>6900X48C8/C32E/T24C2/</th>
<th>9900</th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the no form of this command to remove a port or link aggregate from the specified VLAN ID.
- The VLAN ID must already exist in the switch configuration.
- An ISL port can only be assigned to a Primary VLAN.
When a port is assigned to a PVLAN configuration, the port type is determined by the type of VLAN to which the port is assigned. For example:

- Ports assigned to a Primary VLAN are designated as promiscuous ports.
- Ports assigned to a Secondary VLAN configured as a Community VLAN are designated as community ports.
- Ports assigned to a Secondary VLAN configured as an Isolated VLAN are designated as isolated ports.

A port or link aggregate can only belong to one Primary VLAN or one Secondary VLAN at any given time. The exception to this is on the OmniSwitch 9900, where multiple VPAs for one port are allowed with the following conditions:

- Each VLAN tagged on the port must be of the same PVLAN type. For example, port 1/1/2 must belong to either all Primary VLANs, all Isolated Secondary VLANs, or all Community Secondary VLANs.
- Each VLAN tagged on the port must belong to a different PVLAN domain. For example, port 1/1/2 can be tagged with Primary VLAN 200 and Primary VLAN 300 because both VLANs are in separate PVLAN domains.

Only one untagged VPA is allowed per port.

On ports with only tagged VPAs, all untagged traffic is dropped.

Examples

- `pvlan 200 members port 1/1/1-5 tagged`
- `pvlan 200 members linkagg 2-4 untagged`
- `pvlan 200 members port 1/1/20 isl`
- `no pvlan 200 members port 1/1/1`
- `no pvlan 200 members linkagg 2`

Release History

Release 8.3.1; command introduced.

Related Commands

`pvlan` Creates a new Primary VLAN with the specified VLAN ID and an optional description.

`pvlan secondary` Creates a new Secondary VLAN that is assigned to a Primary VLAN.

`show pvlan` Displays a list of PVLANs configured on the switch.

`show pvlan mapping` Displays the Primary VLAN and Secondary VLAN mapping.

`show pvlan members` Displays VPAs for all or specific VLANs in a PVLAN configuration.

MIB Objects

<table>
<thead>

</tr>
</tbody>
</table>
show pvlan

Displays a list of Private VLANs (PVLANs) configured on the switch.

`show pvlan [vlan_id-vlan_id]`

**Syntax Definitions**

`vlan_id` PVLAN ID number.

**Defaults**

By default, a list of all PVLANs is displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Specify a VLAN ID with this command to display information about a specific VLAN in a PVLAN configuration.

**Examples**

```
-> show pvlan
pvlan   type      admin   oper    mtu          name
------+----------+-------+------+------+------------------
200   Primary    Ena     Dis    1500   PVLAN 200
250   Isolated   Ena     Dis    1500   PVLAN 250
251   Community  Ena     Dis    1500   PVLAN 251
```

**output definitions**

`pvlan` The PVLAN ID.

`type` The type of PVLAN (Primary, Isolated, Community)

`admin` PVLAN administrative status: **Ena** specifies that PVLAN functions are enabled; **Dis** specifies that PVLAN functions are disabled.

`oper` PVLAN operational status: **Ena** (enabled) or **Dis** (disabled). The operational status remains disabled until an active port is assigned to the PVLAN. When the operational status is enabled, then PVLAN properties (for example router interfaces, Spanning Tree) are applied to ports and traffic flow. A PVLAN must have an enabled administrative status before it can become operationally enabled.
show pvlan

-> show pvlan 200
Name : PVLAN 200,
Type : PVLAN Primary vlan,
Administrative State : enabled,
Operational State : disabled,
IP MTU : 1500

- `alaPrivateVlanPortAssociationVlanOption`
- `alaPrivateVlanPortAssociationPortStatus`
- `alaPrivateVlanPortAssociationPortType`
6 High Availability VLAN

Commands

High availability (HA) VLANs send traffic intended for a single destination MAC address to multiple switch ports. The OmniSwitch HA VLAN feature provides an elegant and flexible way to connect server cluster nodes directly to the ingress network. This involves multicasting the service requests on the configured ports. The multicast criteria is configurable based on destination MAC and destination IP address. Egress ports can be statically configured on a server cluster or they can be registered by IGMP reports. The HA VLAN server cluster feature multicasts the incoming packets based on the server cluster configuration on the ports associated with the server cluster.

An HAVLAN is configured by specifying the match criteria, a VLAN and a port list. Match criteria is used to identify the incoming traffic that has to be processed by the HA VLAN server-clusters. The specified VLAN is an ingress and egress VLAN in the case of a L2 server-cluster. In the case of a L3 server-cluster, the VLAN is not configured explicitly, but the IP address specified in the match criteria determines the VLAN. The port list specifies the egress switch ports within the VLAN. The cluster is connected to these switch ports.

There are typically two modes of implementation of server clusters in HA VLAN.

**Layer 2** - The server cluster is attached to a L2 switch on which the frames destined to the cluster MAC address are to be flooded on all interfaces.

**Layer 3** - The server cluster is attached to a L3 switch on which the frames destined to the server cluster IP address are to be routed to the server cluster IP and then flooded on all interfaces.

For more information, see the application examples in Chapter 28, “Configuring High Availability VLANs” in the OmniSwitch AOS Release 8 Network Configuration Guide.

MIB information is as follows:

<table>
<thead>
<tr>
<th>Filename</th>
<th>Module</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALCATEL-IND1-VLAN-MGR-MIB.mib</td>
<td>alcatelIND1VLANManagerMIB</td>
</tr>
<tr>
<td>ALCATEL-IND1-MAC-ADDRESS-MIB.mib</td>
<td>alcatelIND1MacAddressMIB</td>
</tr>
</tbody>
</table>

A summary of the available commands is listed here:

```
server-cluster
server-cluster vlan
server-cluster mac-address
server-cluster ip
server-cluster igmp mode
server-cluster ip-multicast
server-cluster port
show server-cluster
```
server-cluster

Configures a cluster with an ID, name, mode and the administrative state.

```
server-cluster cluster_id [name cluster_name] [mode {L2 | L3}] [admin-state {enable | disable}]
no server-cluster cluster_id
```

**Syntax Definitions**

- `cluster_id` : A numerical identifier of the cluster. The valid range is 1–16.
- `cluster_name` : Specifies a name (up to 32 characters) to represent the cluster.
- `L2` : Specifies L2 for the cluster mode.
- `L3` : Specifies L3 for the cluster mode.
- `enable` : Enables the administrative state of the cluster.
- `disable` : Disables the administrative state of the cluster.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>L2</td>
</tr>
<tr>
<td>admin-state</td>
<td>enable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>9000</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use **no** form of this command to remove the cluster ID from the switch configuration.
- Once the cluster mode is set, the mode cannot be changed.
- Use the **admin-state disable** parameter option to disable an existing cluster before attempting to modify any of the cluster parameters.

**Examples**

```
-> server-cluster 1
-> server-cluster 1 mode 12
-> server-cluster 1 name l2_cluster mode 12
-> server-cluster 2 name l3_cluster mode 13
-> no server-cluster 1
```
Release History

Release 7.2.1; command was introduced.

Related Commands

- vlan
  Creates and deletes VLANs.
- server-cluster mac-address
  Configures a MAC address, VLAN of the specified cluster.
- server-cluster port
  Configures the specified IP, ARP entry to a given cluster and/or a multicast IP.
- show server-cluster
  Displays the clusters configured in the system.

MIB Objects

alaHAVlanClusterTable
- alaHAVlanClusterId
- alaHAVlanClusterName
- alaHAVlanClusterAdminStatus
- alaHAVlanClusterMode
- alaHAVlanClusterRowStatus
server-cluster vlan

Configures a VLAN assignment for the specified cluster. This command is used to assign VLANs to an L2 cluster.

server-cluster cluster_id vlan vlan_id

Syntax Definitions

cluster_id

The numerical identifier of an existing server cluster.

vlan_id

The VLAN identifier to assign to the cluster. The valid range is 1–4094.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- If the specified VLAN ID does not exist in the switch configuration, the cluster will remain operationally disabled.
- Modifying the existing VLAN assignment for a cluster is only allowed when the cluster is administratively disabled.

Examples

- server-cluster 1 vlan 10
- server-cluster 5 vlan 10
- server-cluster 6 mac-address 00:11:22:33:44:55

Release History

Release 7.2.1; command was introduced.
Related Commands

server-cluster ip  Configures the specified IP, ARP entry to a given cluster.
server-cluster port  Configures the specified IP, ARP entry to a given cluster and/or a multicast IP.
show server-cluster  Displays the clusters configured in the system.
show mac-learning  Displays Source Learning MAC Address Table information.

MIB Objects

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- Modifying the existing MAC address assignment for a cluster is only allowed when the cluster is administratively disabled.
- The MAC address that is assigned to a cluster can be a unicast, L2 multicast, or IP multicast address. However reserved multicast MAC addresses cannot be assigned to the cluster.
- The multicast addresses within the following reserved ranges are not supported:
  - 01:00:5E:00:00:00 to 01:00:5E:7F:FF:FF
  - 01:80:C2:XX:XX:XX
  - 33:33:XX:XX:XX:XX

Examples

- server-cluster 1 vlan 10 mac-address 00:11:22:33:44
- server-cluster 5 vlan 10
- server-cluster 5 mac-address 01:
- server-cluster 6 mac-address 00:11:22:33:44:55

Release History

Release 7.2.1; command was introduced.
Related Commands

server-cluster ip       Configures the specified IP, ARP entry to a given cluster.
server-cluster port    Configures the port or linkagg to be assigned to a specific cluster.
show server-cluster    Displays the clusters configured in the system.
show mac-learning      Displays Source Learning MAC Address Table information.

MIB Objects

alaHAVlanClusterId     
alaHAVlanClusterVlan   
alaHAVlanClusterMacAddress 
alaHAVlanClusterRowStatus
**server-cluster ip**

Configures an IP address and ARP entry for the specified cluster. This command is used to assign an IP address to an L3 cluster.

```
server-cluster cluster_id ip ip_address [mac-address {static mac_address | dynamic}]
```

### Syntax Definitions

- **cluster_id**
  - The numerical identifier of an existing server cluster.

- **ip_address**
  - The unicast IP address to assign to the cluster.

- **mac_address**
  - The MAC address for the static ARP entry.

- **dynamic**
  - Dynamically resolve the ARP entry for the cluster.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>V72/C32</td>
<td>X48C6/T48C6</td>
<td>X48C4E/V48C8</td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- A cluster can be assigned an IP address and ARP entry MAC address. Each cluster should have a unique IP address.
- Reserved MAC address cannot be configured as an ARP.
- Modifying the existing IP address parameters for a cluster is only allowed when the cluster is administratively disabled.

### Examples

- `-> server-cluster 1 ip 10.135.33.203 mac-address static 00 :11 :22 :33 :44`
- `-> server-cluster 3 ip 10.135.33.205 mac-address dynamic`
- `-> server-cluster 5 ip 10.135.33.207`
- `-> server-cluster 6 mac-address dynamic`
- `-> server-cluster 7 mac-address static 00 :11 :22 :33 :44`

### Release History

Release 7.2.1; command was introduced.
**Related Commands**

- `server-cluster mac-address`  
  Configures a MAC address of the specified cluster.

- `server-cluster port`  
  Configures the port or linkagg to be assigned to a specific cluster.

- `show server-cluster`  
  Displays the clusters configured in the system.

**MIB Objects**

- `alaHAVlanClusterTable`  
  - `alaHAVlanClusterId`  
  - `alaHAVlanClusterIfIndex`  
  - `alaHAVlanClusterInetAddressType`  
  - `alaHAVlanClusterInetAddress`  
  - `alaHAVlanClusterMacAddressType`  
  - `alaHAVlanClusterMacAddress`  
  - `alaHAVlanClusterMulticastStatus`  
  - `alaHAVlanClusterMulticastInetAddressType`  
  - `alaHAVlanClusterMulticastInetAddress`  
  - `alaHAVlanClusterRowStatus`
server-cluster igmp mode

Configures the IGMP mode status for specified cluster.

`server-cluster cluster_id igmp-mode {enable | disable}`

**Syntax Definitions**

- **cluster_id**: The numerical identifier of an existing server cluster.
- **enable**: Enables IGMP mode for cluster ports.
- **disable**: Disables IGMP mode for cluster ports.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The cluster ID specified with this command must already exist in the switch configuration.
- When the IGMP mode is enabled for the cluster, the port list is dynamically learned using the IGMP protocol for the configured IP multicast address.
- For HA VLAN IGMP to work, IGMP must be enabled globally on the switch using the command `ip multicast admin-state enable` command.

**Examples**

- `-> server-cluster 4 igmp-mode enable`
- `-> server-cluster 4 igmp-mode disable`

**Release History**

Release 7.2.1; command was introduced.

**Related Commands**

- `server-cluster ip`: Configures the specified IP, ARP entry to a given cluster.
- `show server-cluster`: Displays the clusters configured in the system.
MIB Objects

  alaHAVlanClusterMulticastInetAddressType
  alaHAVlanClusterMulticastInetAddress
  alaHAVlanClusterRowStatus
**server-cluster ip-multicast**

Configures a multicast IP address for the specified cluster. This command configures an IP multicast address for an L3 cluster.

`server-cluster cluster_id ip-multicast ipm_address`

---

**Syntax Definitions**

- `cluster_id`  
  The numerical identifier of an existing server cluster.

- `ipm_address`  
  The multicast IP address to assign to the cluster.

---

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The cluster ID specified with this command must already exist in the switch configuration.

- A cluster can be assigned an IP address an ARP entry MAC address. Each cluster should have a unique IP-address. IP address is configurable only for L3 clusters.

- Cluster parameters like IP, multicast IP and MAC address can be modified only when the cluster admin status is disabled.

**Examples**

- `-> server-cluster 2 ip-multicast 226.0.0.12`
- `-> server-cluster 4 ip-multicast 226.0.0.14`

**Release History**

Release 7.2.1; command was introduced.

**Related Commands**

- `server-cluster`  
  Configures cluster parameters to create or modify a cluster ID.

- `show server-cluster`  
  Displays the clusters configured in the system.
**MIB Objects**

`alaHAVlanClusterTable`  
`alaHAVlanClusterId`  
`alaHAVlanClusterIfIndex`

`alaHAVlanClusterMulticastStatus`  
`alaHAVlanClusterMulticastInetAddressType`  
`alaHAVlanClusterMulticastInetAddress`  
`alaHAVlanClusterRowStatus`
server-cluster port

Configures a port assignment for the port list of the specified cluster.

```
server-cluster cluster_id port {chassis/slot/port[-port2] | all}
no server-cluster cluster_id port {chassis/slot/port[-port2] | all}
```

**Syntax Definitions**

- `cluster_id` The numerical identifier of an existing server cluster.
- `chassis` The chassis identifier.
- `slot/port[-port2]` The slot and port number to assign to the cluster port list. Use a hyphen to specify a range of ports (1/15-20).
- `all` Assigns all of the ports that belong to the associated VLAN and NOT all ports on the NI. This parameter applies only to L3 clusters.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6/V48C8C32E/T24C2/32</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove a port from the specified cluster port list.
- The cluster ID specified with this command must already exist in the switch configuration.
- Using a port list is not valid for a cluster operating with IGMP mode enabled.
- The `all` parameter does not apply to L2 clusters.

**Examples**

```
-> server-cluster 1 port 1/1/21
-> server-cluster 2 port 1/1/21-23
-> server-cluster 5 port all
-> no server-cluster 1 port 1/1/21
-> no server-cluster 2 port 1/1/21-23
-> no server-cluster 3 port all
```
**Release History**
Release 7.2.1; command was introduced.

**Related Commands**

- **server-cluster**: Configures cluster parameters to create or modify a cluster ID.
- **show server-cluster**: Displays the clusters configured in the system.
- **show mac-learning**: Displays Source Learning MAC Address table information.
- **show vlan**: Displays a list of existing VLANs.
- **show vlan members**: Displays VLAN port assignments.

**MIB Objects**

- **alaHAVlanClusterPortTable**
  - **alaHAVlanClusterId**
  - **alaHAVlanClusterPortIfIndex**
  - **alaHAVlanClusterPortRowStatus**
server-cluster linkagg

Configures a link aggregate assignment for the port list of the specified cluster.

server-cluster cluster_id linkagg agg_id[-agg_id2]

no server-cluster cluster_id linkagg agg_id[-agg_id2]}

Syntax Definitions

cluster_id

agg_id[-agg_id2] The numerical identifier of an existing server cluster.
The link aggregate ID number to assign to the cluster port list. Use a hyphen to specify a range of IDs (10-15).

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>6900 X48C4E/V48C8/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to remove a link aggregate ID from the specified cluster port list.
- The cluster ID and link aggregate ID specified with this command must already exist in the switch configuration.
- Using a port list is not valid for a cluster operating with IGMP mode enabled.

Examples

- server-cluster 3 linkagg 1
- server-cluster 4 linkagg 1-3
- no server-cluster 3 linkagg 1

Release History

Release 7.2.1; command was introduced.
Related Commands

- **server-cluster**: Configures cluster parameters to create or modify a cluster ID.
- **show server-cluster**: Displays the clusters configured in the system.
- **show mac-learning**: Displays Source Learning MAC Address table information.
- **show vlan**: Displays a list of existing VLANs.
- **show vlan members**: Displays VLAN port assignments.

MIB Objects

- alaHAVlanClusterPortTable
- alaHAVlanClusterId
- alaHAVlanClusterPortIfIndex
- alaHAVlanClusterPortRowStatus
show server-cluster

Displays the cluster configuration information for the switch.

show server-cluster [cluster_id [port]]

Syntax Definitions

cluster_id The numerical identifier of an existing server cluster.
port Displays the ports and/or link aggregates assigned to a specific cluster.

Defaults

Displays a list of all server clusters configured for the switch.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6880</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Specify a cluster ID with this command to display information for a single cluster.
- Use the port parameter with the cluster_id parameter to display information about the ports assigned to the specified cluster.
- An asterisk (*) is displayed to indicate invalid cases, as shown in the command example.

Examples

```
-> show server-cluster
Legend: * = operational state: disabled

The VLAN Stacking feature provides a method for tunneling multiple customer VLANs (CVLAN) through a service provider network using one or more service provider VLANs by way of 802.1Q double tagging or VLAN Translation. This feature enables service providers to provide their customers with Transparent LAN Services (TLS). This service is multipoint in nature to support multiple customer sites or networks distributed over the edges of a service provider network.

MIB information for the VLAN Stacking commands is as follows:

- **Filename:** ALCATEL-IND1-E-SERVICE-MIB.mib
- **Module:** alcatelIND1EServiceMIB

- **Filename:** ALCATEL-IND1-VLAN-MGR-MIB.mib
- **Module:** alcatelIND1VLANManagerMIB
A summary of the available commands is listed here:

| VLAN Stacking Service Mode | ethernet-service svlan  
|                           | ethernet-service service-name 
|                           | ethernet-service nni 
|                           | ethernet-service svlan nni 
|                           | ethernet-service sap 
|                           | ethernet-service sap uni 
|                           | ethernet-service sap cvlan 
|                           | ethernet-service sap-profile 
|                           | ethernet-service sap-profile uni-profile 
|                           | ethernet-service uni-profile 
|                           | ethernet-service uni-profile inbound 802.1ab 
|                           | ethernet-service uni uni-profile

ethernet-service svlan

Creates a VLAN Stacking VLAN (SVLAN) for tunneling customer traffic.

\[
\text{ethernet-service svlan } \{\text{svlan_id}|-\text{svlan_id2}\} \ [\text{admin-state } \{\text{enable} | \text{disable}\}] \ [\text{name description}]
\]

\[
\text{no ethernet-service svlan } \{\text{svlan_id}|-\text{svlan_id2}\}
\]

**Syntax Definitions**

- **svlan_id|-svlan_id2**: The VLAN ID number identifying the SVLAN. Use a hyphen to specify a range of VLAN IDs (10-12).
- **enable**: Enables the SVLAN administrative status.
- **disable**: Disables the SVLAN administrative status, which blocks all ports bound to that SVLAN.
- **description**: An alphanumeric string. Use quotes around the string if the VLAN name contains multiple words with spaces between them (for example, “ALE Engineering”).

**Defaults**

By default, the Spanning Tree status is enabled in both the **per-vlan** and **flat** mode when the SVLAN is created.

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
<tr>
<td>description</td>
<td>VLAN ID number</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>V72/C32</td>
<td>X48C6/T48C6/X48C4E/V48C8/C32E/T24C2/X24C2</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to delete an SVLAN or a range of SVLANs. Note that SVLAN port associations are also removed when the SVLAN is deleted.
- This command does not work if the **svlan_id** specified already exists as a standard VLAN.

**Note.** Spanning Tree status for an SVLAN only applies to the Spanning Tree topology calculations for the service provider network. This status is not applied to customer VLANs (CVLANs) and does not affect the customer network topology.
Examples

-> ethernet-service svlan 1001-1005 admin-state enable name “Customer ABC”
-> no ethernet-service svlan 1001

Release History

Release 7.1.1; command introduced.

  vlanType
  vlanAdmStatus
  vlanStatus
**ethernet-service service-name**

Creates a VLAN Stacking service and associates the service with an SVLAN. A service can be carried only on a single SVLAN. All traffic within the associated service is carried on the SVLAN.

```
ethernet-service service-name service_name svlan svlan_id
no ethernet-service service-name service_name svlan svlan_id
```

**Syntax Definitions**

- `service_name` The name of the VLAN Stacking service; an alphanumeric string. Use quotes around string if the service name contains multiple words with spaces between them (for example, “ALE Engineering”).

- `svlan_id` The VLAN ID number that identifies an existing SVLAN to associate with the VLAN Stacking service.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove a VLAN Stacking service. Note that when a service is removed, the SVLAN association with that service is also removed.

- If the VLAN Stacking service is associated with a Service Access Point (SAP), then remove the SAP associations before attempting to remove the VLAN Stacking service.

- Each VLAN Stacking service is associated with one SVLAN. Specifying an additional VLAN ID for an existing service is not allowed.

**Examples**

```
-> ethernet-service service-name Marketing svlan 10
-> no ethernet-service service-name Marketing svlan 10
```

**Release History**

Release 7.1.1; command introduced.
Related Commands

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to revert the VLAN Stacking NNI port or link aggregate back to a conventional switch port or aggregate.
- When this command is used, the default VLAN for the NNI port is changed to a VLAN reserved by the switch for applications such as VLAN Stacking. The reserved VLAN cannot be configured using standard VLAN management commands.
• An interface configured with any standard VLAN (non-service) and 802.1q VLAN can now be configured as NNI port. This allows NNI ports to configure 802.1q services, QinQ service, and untagged services using the same uplink NNI port.
  – 802.1q VLAN tagging to a NNI interface will not be allowed if the interface is set with TPID other than 0x8100.
  – The TPID (other than 0x8100) of a NNI interface cannot be modified if the interface is already a tagged member of a legacy VLAN.
  – The binding of service VLAN to a NNI interface is allowed even if the NNI interface is already untagged or tagged with the standard VLAN.

• Enable legacy BPDU support only on VLAN Stacking network ports that are connected to legacy BPDU switches. Enabling legacy BPDU between AOS switches can cause flooding or an unstable network.

• If legacy BPDU is enabled on a network port while at same time BPDU flooding is enabled on user ports, make sure that tagged customer BPDUs are not interpreted by intermediate switches in the provider network.

• Note that if the peer switch connected to the VLAN Stacking network port supports the Provider MAC address (STP, 802.1ad/D6.0 MAC), then enabling legacy BPDU support is not required on the network port. Refer to the following table to determine the type of STP MAC used:

<table>
<thead>
<tr>
<th>STP</th>
<th>Customer MAC</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>{0x01, 0x80, 0xc2, 0x00, 0x00, 0x00}</td>
</tr>
<tr>
<td>Provider MAC address (802.1ad/D6.0)</td>
<td>{0x01, 0x80, 0xc2, 0x00, 0x00, 0x08}</td>
</tr>
<tr>
<td>Provider MAC address (Legacy MAC)</td>
<td>{0x01, 0x80, 0xc2, 0x00, 0x00, 0x00}</td>
</tr>
</tbody>
</table>

• STP legacy BPDU are supported only when the flat Spanning Tree mode is active on the switch.

Examples

-> ethernet-service 10 nni port 1/1/3-5
-> ethernet-service 255 nni port 1/2/1-5 tpid 88a8
-> ethernet-service 500 nni port 1/1/3-5 stp legacy-bpdu enable
-> no ethernet-service 10 nni port 1/1/3
-> no ethernet-service 255 nni linkagg 12-15

Release History

Release 7.1.1; command introduced.

Related Commands

ethernet-service svlan nni Associates a switch port or link aggregate with a SVLAN.

ethernet-service svlan nni

Associates an NNI port with an SVLAN. A network port connects to another provider bridge and carries both customer and provider traffic.

```plaintext
ethernet-service svlan {svlan_id[svlan_id2]} nni {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}

no ethernet-service svlan {svlan_id[svlan_id2]} nni {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

**Syntax Definitions**

- **svlan_id[svlan_id2]**: The VLAN ID number identifying the SVLAN. Use a hyphen to specify a range of VLAN IDs (10-12).
- **chassis**: The chassis identifier.
- **slot/port [-port2]**: The slot and port number (3/1) of an NNI port. Use a hyphen to specify a range of ports (3/1-5).
- **agg_id[-agg_id2]**: The link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (5-10).

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove an association between an NNI port and an SVLAN.
- Only SVLAN IDs are accepted with this command. This SVLAN ID specified must already exist in the switch configuration.
- This command only applies to ports or link aggregates configured as VLAN Stacking NNI ports.
- NNI ports can be associated with normal VLANs. This allows NNI ports to carry regular 802.1q tagged traffic as well as SVLAN tagged traffic, and untagged traffic.

**Examples**

- `-> ethernet-service svlan 10 nni port 1/1/3`
- `-> ethernet-service svlan 255 nni port 1/2/1-5`
- `-> ethernet-service svlan 500 nni linkagg 31-35`
-> no ethernet-service svlan 10 nni port 1/1/3
-> no ethernet-service svlan 255 nni port 1/2/5

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- **ethernet-service svlan** Creates an SVLAN for tunneling customer traffic.
- **ethernet-service nni** Configures a switch port or link aggregate as a VLAN Stacking NNI.

**MIB Objects**

alaEServiceNniSvlanTable
  alaEServiceNniSvlanNni
  alaEServiceNniSvlanSvlan
  alaEServiceNniSvlanRowStatus
**ethernet-service sap**

Creates a VLAN Stacking Service Access Point (SAP) and associates the SAP with a VLAN Stacking service.

```
ethernet-service sap sap_id service-name service_name
```

```
no ethernet-service sap sap_id
```

**Syntax Definitions**

- `sap_id` The SAP ID number identifying the service instance.
- `service_name` The name of the service to associate with this SAP.

**Defaults**

The “default-sap-profile” profile is automatically associated with the SAP ID when the SAP is created.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to delete a VLAN Stacking SAP. When a SAP is deleted, all port and CVLAN associations with the SAP are also deleted.
- The service name specified with this command must already exist in the switch configuration. Use the `ethernet-service service-name` command to create a service to associate with the SAP.
- Each SAP ID is associated with only one service; however, it is possible to associate one service with multiple SAP IDs.

**Examples**

```
-> ethernet-service sap 10 service-name CustomerA
```

```
-> no ethernet-service sap 11
```

**Release History**

Release 7.1.1; command introduced.
Related Commands

- **ethernet-service service-name**  Creates a VLAN Stacking service and associates the service with an SVLAN.
- **ethernet-service sap-profile**  Creates a VLAN Stacking SAP profile.
- **ethernet-service sap sap-profile**  Associates a SAP profile with a SAP ID.

MIB Objects

alaEServiceSapTable
   alaEServiceSapID
   alaEServiceSapServiceID
   alaEServiceSapProfile
   alaEServiceSapRowStatus
**ethernet-service sap uni**

Configures the switch port as a VLAN Stacking User Network Interface (UNI) and associates the port with a VLAN Stacking Service Access Point (SAP). A UNI port is a customer facing port on which traffic enters the SAP.

```
ethernet-service sap sap_id uni {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
no ethernet-service sap sap_id uni {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

**Syntax Definitions**

- `sap_id` The SAP ID number identifying the service instance.
- `chassis` The chassis identifier.
- `slot/port [-port2]` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-5).
- `agg_id[-agg_id2]` The link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (5-10).

**Defaults**

A switch port or a link aggregate becomes a VLAN Stacking UNI port by default when the port or link aggregate is associated with a VLAN Stacking SAP.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove an association between a UNI port and a SAP. Note that when the last SAP association is removed, the UNI port converts back to a conventional switch port.
- Only fixed ports can be configured as UNI ports.
- The SAP ID specified with this command must already exist. Use the `ethernet-service sap` command to create a SAP.
- When this command is used, the default VLAN for the UNI port is changed to a reserved VLAN and all customer traffic received is dropped until the type of traffic for the port is configured using the `ethernet-service sap cvlan` command.

**Examples**

```
-> ethernet-service sap 10 uni port 1/1/3
```
-> ethernet-service sap 10 uni port 1/2/1-5
-> ethernet-service sap 10 uni linkagg 31-40
-> no ethernet-service sap 10 uni port 1/2/1-5
-> no ethernet-service sap 10 uni linkagg 31

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- **ethernet-service sap** Creates a VLAN Stacking SAP and associates the SAP with a VLAN Stacking SAP profile and service.
- **ethernet-service uni-profile** Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.
- **ethernet-service uni uni-profile** Associates a VLAN Stacking UNI profile with a UNI port.

**MIB Objects**

- `alaEServiceSapUniTable`  
  - `alaEServiceSapUniSap`  
  - `alaEServiceSapUniUni`  
  - `alaEServiceSapUniRowStatus`
**ethernet-service sap cvlan**

Associates customer VLAN (CVLAN) traffic with a VLAN Stacking Service Access Point (SAP). The parameter values configured with this command are applied to frames received on all SAP UNI ports and determines the type of customer traffic that is accepted on the UNI ports and processed by the service.

```
ethernet-service sap sap_id cvlan {all | cvlan_id[-cvlan_id2] | untagged}

no ethernet-service sap sap_id cvlan {all | cvlan_id[-cvlan_id2] | untagged}
```

### Syntax Definitions

- **sap_id**: The SAP ID number.
- **all**: Applies the SAP profile to tagged and untagged frames.
- **cvlan_id[-cvlan_id2]**: Applies the SAP profile to frames tagged with the specified CVLAN ID. Use a hyphen to specify a range of CVLAN IDs (for example, 10-12 applies the SAP profile to frames tagged with CVLAN 10, 11, or 12).
- **untagged**: Applies the SAP profile only to untagged frames.

### Defaults

By default, no CVLAN traffic is associated with the SAP ID when the SAP is created.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **no** form of this command to remove a CVLAN ID or the designation for **all** or **untagged** frames from the SAP. Note that when the last CVLAN parameter is deleted from an SAP configuration, the SAP is not automatically deleted.
- The **all** and **untagged** parameters are configurable in combination with a CVLAN ID. For example, if **untagged** and a CVLAN ID are associated with the same SAP ID, then the SAP profile is applied to only untagged traffic and traffic tagged with the specified CVLAN ID. All other traffic is dropped.
- The SAP ID specified with this command must already exist. Use the **ethernet-service sap** command to create a SAP.
- Configuring the **all** and **untagged** parameters for the same SAP is not allowed. Specify only one of these two parameters per SAP.
• Either the **all** or **untagged** parameters can be configured for the SAP. In such an instance, the default VLAN for the UNI ports associated with the SAP is changed to the VLAN assigned to the SAP related service.

• Only one SAP, with the **all** or **untagged** option, is allowed per UNI. For example, if UNI port 1/17 is part of SAP 10 and SAP 20 and SAP 10 is configured for **all** traffic, then only **untagged** parameter or a CVLAN ID is allowed for SAP 20.

• If you do not specify **all** or **untagged** options with a UNI, then the default VLAN 4095 is set for the UNI and all untagged, untagged control traffic and unmatched tag traffic is dropped.

**Examples**

```plaintext
-> ethernet-service sap 10 cvlan 200  
-> ethernet-service sap 10 cvlan all  
-> ethernet-service sap 11 cvlan 100-150  
-> ethernet-service sap 11 cvlan untagged  
-> no ethernet-service sap 10 cvlan 200  
-> no ethernet-service sap 10 cvlan all  
-> no ethernet-service sap 10 cvlan 100-150  
```

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

**ethernet-service sap**  
Creates a VLAN Stacking Service Access Point (SAP) and associates the SAP with a VLAN Stacking service.

alaEServiceSapCvlanTable  
alaEServiceSapCvlanSapId  
alaEServiceSapCvlanCvlan  
alaEServiceSapCvlanMapType  
alaEServiceSapRowStatus
**ethernet-service sap-profile**

Creates a profile for a VLAN Stacking Service Access Point (SAP). Profile attributes are used to define traffic engineering policies that are applied to traffic serviced by the SAP.

```
ethernet-service sap-profile sap_profile_name [bandwidth not-assigned] [[shared | not-shared] ingress-bandwidth mbps] [cvlan-tag {preserve | translate}] priority [not-assigned | map-inner-to-outer-p | map-dscp-to-outer-p | fixed value] [egress-bandwidth mbps]
```

```
no ethernet-service sap-profile sap_profile_name
```

**Syntax Definitions**

- **sap_profile_name**
  - An alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, “ALE Engineering”).

- **bandwidth not-assigned**
  - Specifies that the SAP profile does not allocate switch resources to enforce bandwidth requirements. Applies only when the profile specifies the default ingress bandwidth value (zero).

- **shared**
  - Shares the ingress bandwidth limit across all SAP ports and CVLANs.

- **not shared**
  - Applies the ingress bandwidth limit to individual SAP ports and CVLANs; bandwidth is not shared.

- **ingress bandwidth mbps**
  - The maximum amount of bandwidth to be allowed for SAP ports, for the incoming traffic, in megabits per second. This parameter can be used only along with the shared option or not-shared option.

- **preserve**
  - Retains the customer VLAN ID (inner tag) and double tags the frame with the SVLAN ID (outer tag).

- **translate**
  - Replaces the customer VLAN ID with the SVLAN ID.

- **priority not-assigned**
  - Specifies that the SAP profile is not assigned with a priority value or priority mapping.

- **map-inner-to-outer-p**
  - Maps the customer VLAN (inner tag) priority bit value to the SVLAN (outer tag) priority bit value.

- **map-dscp-to-outer-p**
  - Maps the customer VLAN (inner tag) DSCP value to the SVLAN (outer tag) priority bit value.

- **fixed value**
  - Sets the SVLAN (outer tag) priority bit to the specified value.

- **egress-bandwidth mbps**
  - The maximum amount of bandwidth to be allowed for SAP ports, for the outgoing traffic, in megabits per second. *This parameter is not supported on an OmniSwitch 6900.*
ethernet-service sap-profile

</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to delete a SAP profile.
- If a profile is not specified when a SAP is created, a default profile (default-sap-profile) is automatically associated with the SAP.
- Use the ethernet-service sap sap-profile command to associate a profile to a VLAN Stacking SAP.
- Only one SAP profile name is associated with each SAP ID; however, it is possible to associate the same SAP profile name to multiple SAP IDs.
- Configure the ingress-bandwidth or egress-bandwidth parameters to define rate limiting values for the SAP.

Examples

- ethernet-service sap-profile video1 egress-bandwidth 10 cvlan-tag translate priority map-inner-to-outer-p
- ethernet-service sap-profile voice1 not-shared ingress-bandwidth 10 cvlan-tag preserve
- ethernet-service sap-profile voice2 shared ingress-bandwidth 10
- no ethernet-service sap-profile video1

Release History

Release 7.1.1; command introduced.
Related Commands

ethernet-service sap  Creates a VLAN Stacking SAP and associates the SAP with a service.
ethernet-service sap sap-profile  Associates a SAP profile with a SAP ID.

ethernet-service sap sap-profile

Associates a VLAN Stacking Service Access Point (SAP) with a SAP profile. This command is also used to change an existing SAP profile association.

```
ethernet-service sap sap_id sap-profile sap_profile_name
no ethernet-service sap sap_id
```

### Syntax Definitions

- **sap_id**: The SAP ID number.
- **sap_profile_name**: The name of the SAP profile to associate with this SAP ID.

### Defaults

The “default-sap-profile” profile is automatically associated with the SAP ID when the SAP is created.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **no** form of this command along with the SAP ID to remove the SAP profile.
- If a profile association already exists for the specified SAP ID, the current profile is replaced with the profile specified with this command.
- To change the profile associated with the SAP back to the default profile, enter “default-sap-profile” with this command.
- Do not specify a service name; doing so returns an error message. This command is only for associating an existing profile to a VLAN Stacking SAP.

### Examples

```
-> ethernet-service sap 10 sap-profile CustomerC
-> ethernet-service sap 11 sap-profile CustomerD
-> ethernet-service sap 11 sap-profile default-sap-profile
```

### Release History

Release 7.1.1; command introduced.
**Related Commands**

- `ethernet-service sap` Creates a VLAN Stacking SAP and associates the SAP with a VLAN Stacking SAP profile and service.
- `ethernet-service sap-profile` Creates a VLAN Stacking SAP profile.

**MIB Objects**

- `alaEServiceSapTable`
  - `alaEServiceSapID`
  - `alaEServiceSapProfile`
  - `alaEServiceSapRowStatus`
ethernet-service uni-profile

Creates a User Network Interface (UNI) profile that is used to specify how to process control packets ingressing on UNI ports.

```bash
ethernet-service uni-profile uni_profile_name [tunnel-mac mac_address] [l2-protocol protocol] {peer | discard | tunnel | mac-tunnel}
```

```bash
no ethernet-service uni-profile uni_profile_name
```

**Syntax Definitions**

- `uni_profile_name`: Alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, “ALE Engineering”).
- `mac_address`: The tunnel MAC address to use when configuring MAC tunneling. This parameter is not supported on the OmniSwitch 6900.
- `protocol`: The protocol to which the specified action is applied. Refer to the table in the “Usage Guidelines” section of this command page for a list of protocol keywords to select.
- `peer`: Allows the UNI port to participate in the specified protocol.
- `discard`: Discards the specified PDU.
- `tunnel`: Tunnels the specified PDU across the provider network.
- `mac-tunnel`: Changes the destination MAC address to either the configured or default tunnel MAC address before forwarding. This parameter is not supported on the OmniSwitch 6900.

**Defaults**

By default, the tunnel MAC address is set to 01:00:0c:cd:cd:d0. Refer to the table in the “Usage Guidelines” section of this command page for the default action settings for each protocol parameter.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to delete a UNI profile. Remove any UNI profile associations with UNI ports before attempting to modify or delete the profile.
- If a user-configured UNI profile is not associated with a UNI port, then the default profile (`default-uni-profile`) is used to process control packets ingressing on the port.
The following table provides the default and supported profile actions for each protocol parameter:
The `oam`, `lacpmarker`, `udld`, `pagp`, `cdp`, `vtp`, `dtp`, `pvst`, `vlan`, and `uplink` protocol keywords are not supported with this command on the OmniSwitch 6900.

To specify how to process tagged and untagged 802.1AB control frames, use the `ethernet-service uni-profile inbound` command.

Up to five unique UNI profile combinations, including the default and built-in profiles, are allowed per switch.

### Examples

```bash
-> ethernet-service uni-profile uni_1 12-protocol mvrp discard
-> ethernet-service uni-profile uni_2 tunnel-mac 01:00:0c:cd:cd:cd 12-protocol pagp mac-tunnel
-> ethernet-service uni-profile uni_3 12-protocol uplink tunnel
ERROR: Only 5 profiles are allowed for this type
-> no ethernet-service uni-profile uni_1
-> no ethernet-service uni-profile uni_2
```

### Release History

Release 7.1.1; command introduced.
Release 8.6R1; `tunnel-mac` address and protocol parameters added, `mac-tunnel` action parameter added.
Release 8.9R1; Omniswitch 6560 support added.
Related Commands

- `ethernet-service uni-profile custom-L2-protocol` Assigns a custom L2 protocol MAC address entry to a UNI profile.

ethernet-service uni-profile inbound 802.1ab

Configures the treatment of Layer 2 tagged and untagged 802.1AB control frames that are received on UNI ports. Use this command to specify a different action (peer, drop, or tunnel) based on the tagged and untagged state of an 802.1AB control frame.

```
ethernet-service uni-profile uni_profile_name inbound {tagged | untagged | both} l2-protocol 802.1ab
{peer | discard | tunnel}
```

```
no ethernet-service uni-profile uni_profile_name
```

**Syntax Definitions**

- `uni_profile_name`  
  Alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, “ALE Engineering”).

- `tagged`  
  The specified action is applied only to tagged 802.1AB control frames.

- `untagged`  
  The specified action is applied only to untagged 802.1AB control frames.

- `both`  
  The specified action is applied to both tagged and untagged 802.1AB control frames.

- `peer`  
  Allows the UNI port to participate in the 802.1AB protocol.

- `discard`  
  Discards 802.1AB PDUs.

- `tunnel`  
  Tunnels 802.1AB PDUs across the provider network.

**Defaults**

By default, tagged and untagged 802.1AB control frames are dropped.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to delete a UNI profile. Remove any UNI profile associations with UNI ports before attempting to modify or delete the profile.

- When only the `tagged` keyword is used, the specified action is applied to tagged traffic and the default action (`discard`) is applied to untagged traffic.

- When only the `untagged` keyword is used, the specified action is applied to untagged traffic and the default action (`discard`) is applied to tagged traffic.
• Only the **tunnel** and **discard** actions can be configured for tagged control frames.

• Only the **peer** and **discard** actions can be configured for untagged control frames.

• The treatment of 802.1AB control frames received on access ports can either be mixed (different for tagged, different for untagged) or the same for both tagged and untagged control frames. To switch between mixed and the same, set the action for tagged and untagged frames back to the default (**discard**).

• Use the **ethernet-service uni-profile** command to configure the treatment for other protocol control frames. This command applies only to 801.1AB frames.

**Examples**

```
-> ethernet-service uni-profile lldp-tagged inbound tagged l2-protocol 802.1ab tunnel
-> ethernet-service uni-profile lldp-untagged inbound untagged l2-protocol 802.1ab peer
-> ethernet-service uni-profile lldp-diff inbound tagged l2-protocol 802.1ab tunnel inbound untagged l2-protocol 802.1ab peer
-> ethernet-service uni-profile lldp-both inbound both l2-protocol 802.1ab discard
-> no ethernet-service uni-profile lldp-tagged
-> no ethernet-service uni-profile lldp-untagged
-> no ethernet-service uni-profile lldp-diff
-> no ethernet-service uni-profile lldp-both
```

**Release History**

Release 8.6R2; command introduced.

**Related Commands**

**ethernet-service uni-profile**  Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.

**show ethernet-service uni-profile**  Displays the profile attribute configuration for VLAN Stacking UNI profiles.

ethernet-service uni uni-profile

 Associates a VLAN Stacking User Network Interface (UNI) profile with a UNI port.

 ethernet-service uni {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} uni-profile
 uni_profile_name

 **Syntax Definitions**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chassis</td>
<td>The chassis identifier.</td>
</tr>
<tr>
<td>slot/port [-port2]</td>
<td>The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-5).</td>
</tr>
<tr>
<td>agg_id[-agg_id2]</td>
<td>The link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (5-10).</td>
</tr>
<tr>
<td>uni_profile_name</td>
<td>Alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, “ALE Engineering”).</td>
</tr>
</tbody>
</table>

**Defaults**

The default profile (default-uni-profile) is used to process control packets ingressing on a UNI port. This profile is assigned at the time a port is configured as a VLAN Stacking UNI.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This UNI profile name specified with this command must already exist in the switch configuration.
- To change the profile associated with a UNI port, use this command and specify a different profile name than the one currently associated with the port. The last profile associated with the port, is the profile that is applied to UNI port traffic.
- To change the profile associated with a UNI port back to the default profile, enter “default-uni-profile” with this command.
- On the OmniSwitch 6465, OmniSwitch 6860, OmniSwitch 6860N, and OmniSwitch 6865, there are also two built-in UNI profiles (ieee-fwd-all and ieee-drop-all) that can be assigned to a UNI port. Use one of the profiles to tunnel or discard all IEEE multicast MAC address traffic received on the UNI port.
  - When a UNI port is assigned to the ieee-fwd-all profile, all L2 protocol control packets destined for 01:80:C2:00:00:XX are forwarded as normal data. However, control packets with a destination MAC address of 01:80:C2:00:00:01, 01:80:C2:00:00:04, or 01:80:C2:00:00:08 are not forwarded.
VLAN Stacking Commands

end-to-end.

- When a UNI port is assigned to the `ieee-drop-all` profile, all L2 protocol control packets destined for 01:80:C2:00:00:XX are discarded.
- When a UNI port is assigned to either one of the built-in profiles (`ieee-fwd-all` or `ieee-drop-all`), tunneled L2 protocol control packets (tagged packets with SVLAN ID) received on NNI ports are forwarded as normal data.

**Examples**

```bash
-> ethernet-service uni port 1/1/3 uni-profile uni_1
-> ethernet-service uni linkagg 1-5 uni-profile uni_2
-> ethernet-service uni port 1/2/1-5 uni-profile default-uni-profile
-> ethernet-service uni port 1/1/6 uni-profile ieee-fwd-all
-> ethernet-service uni port 1/1/7 uni-profile ieee-drop-all
```

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `ethernet-service uni-profile` Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.
- `ethernet-service sap uni` Configures the switch port as a VLAN Stacking UNI and associates the port with a VLAN Stacking Service Access Point (SAP).

**MIB Objects**

- `alaEServicePortTable`
  - `alaEServicePortID`
  - `alaEServicePortType`
  - `alaEServicePortUniProfile`
  - `alaEServiceSapUniRowStatus`
**ethernet-service custom-L2-protocol**

Creates a custom L2 protocol MAC address entry with an optional mask, EtherType, or SSAP/DSAP protocol identifier. A custom L2 protocol entry is configured for a proprietary protocol with a destination multicast MAC address and is assigned to a UNI profile for specific packet control.

```
ethernet-service custom-L2-protocol custom_protocol_name mac mac_address [mask mask | ethertype ethertype [subtype subtype] | ssap/dsap ssap/dsap pid pid]
no ethernet-service custom-L2-protocol name
```

**Syntax Definitions**

- `custom_protocol_name`: An alphanumeric string (up to 32 characters) that identifies the custom L2 protocol entry.
- `mac_address`: A multicast MAC address for the custom L2 protocol entry (for example, 01:80:c2:00:11:11).
- `mask`: A mask defines a range of MAC addresses for the custom L2 protocol MAC address entry (for example, ff:ff:ff:ff:00).
- `ethertype`: An integer value to specify a generic EtherType.
- `subtype`: An integer value to specify a Sub-Type for the EtherType.
- `ssap/dsap`: Source service access point and destination service access point specific to LLC/SNAP in numerical or hexadecimal format.
- `pid`: Protocol identifier.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to delete the configured custom L2 protocol entry. A custom L2 protocol entry cannot be deleted if the entry is assigned to a UNI profile that is assigned to a UNI port.
- Consider the following command guidelines when configuring a custom L2 protocol:
When configuring a custom L2 protocol with ...

<table>
<thead>
<tr>
<th>The ...</th>
</tr>
</thead>
<tbody>
<tr>
<td>a MAC address and no mask</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>a MAC address with a mask</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>an EtherType and optional Sub-Type</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>an optional SSAP/DSAP and PID</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

- The MAC address, mask, EtherType, Sub-Type, SSAP/DSAP, and PID cannot be modified once the custom L2 protocol is created. The custom L2 protocol must be deleted and created again with the new values required.
- A custom L2 protocol is assigned to an existing UNI L2 protocol profile using the **ethernet-service uni-profile custom-L2-protocol** command. The action for the custom L2 protocol entry is specified when the entry is assigned to a UNI L2 protocol profile.

**Examples**

- `-> ethernet-service custom-L2-protocol tunnel-mac mac 01:80:c2:00:11:11`
- `-> ethernet-service custom-L2-protocol tunnel-mac-range mac 01:80:c2:00:11:11 mask ff:ff:ff:ff:ff:00`
- `-> ethernet-service custom-L2-protocol tunnel-mac-ethertype mac 01:80:c2:00:11:11 ethertype 0x5555`
- `-> ethernet-service custom-L2-protocol tunnel-mac-ethersubtype mac 01:80:c2:00:11:11 ethertype 0x5556 subtype 120`
- `-> ethernet-service custom-L2-protocol tunnel-mac-ssap mac 01:80:c2:00:11:11 ssap/dsap 43/43 pid 3`
- `-> ethernet-service custom-L2-protocol discard-mac-range mac 01:80:c2:00:11:11 mask ff:ff:ff:00:ff:ff`

**Release History**

Release 8.6R1; command introduced.
Release 8.9R1; Omniswitch 6560 support added.
### Related Commands

  Assigns a custom L2 protocol entry to a UNI profile.

- **show ethernet-service custom-L2-protocol**
  Displays the custom L2 protocol configuration for the switch.

### MIB Objects

- alaEServiceCustomL2ProtocolTable
  - alaEServiceCustomL2ProtocolName
  - alaEServiceCustomL2ProtocolMac
  - alaEServiceCustomL2ProtocolMask
  - alaEServiceCustomL2ProtocolEtherType
  - alaEServiceCustomL2ProtocolEtherSubType
  - alaEServiceCustomL2ProtocolSsap
  - alaEServiceCustomL2ProtocolDsap
  - alaEServiceCustomL2ProtocolId
  - alaEServiceCustomL2ProtocolRowStatus
ethernet-service uni-profile custom-L2-protocol

Assigns a custom L2 protocol entry to a UNI profile.

```
ethernet-service uni-profile uni_profile_name custom-L2-protocol custom_protocol_name {tunnel | discard | mac-tunnel}
```

```
no ethernet-service uni-profile uni_profile_name custom-L2-protocol custom_protocol_name
```

**Syntax Definitions**

- `uni_profile_name` Name of the configured UNI profile.
- `custom_protocol_name` Name of the configured custom L2 protocol entry to assign to the specified UNI profile.
- `tunnel` Tunnels packets with a destination MAC address that matches the MAC address configured for the custom L2 protocol. The MAC address of the packet is not changed.
- `discard` Discards packets with a destination MAC address that matches the MAC address configured for the custom L2 protocol.
- `mac-tunnel` Changes the destination MAC address of a packet to the configured tunnel MAC address for the specified UNI profile.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove the custom L2 protocol entry from the UNI profile.
- If the specified UNI profile is already assigned to a UNI port, then a custom L2 protocol entry cannot be assigned or deleted from the UNI profile.
- The `tunnel` and `discard` actions apply to all traffic matching a custom L2 protocol entry.
- The `mac-tunnel` action applies only to traffic matching a custom L2 protocol entry that was configured with an EtherType and optional Sub-Type value or an SSAP/DSAP PID value.
- More than one custom L2 protocol entry can be assigned to a UNI profile, but not in the same command line. Configure each custom L2 protocol assignment one at a time; a separate command for each entry.
Examples

-> ethernet-service uni-profile uni-prof1 custom-L2-protocol tunnel-mac tunnel
-> ethernet-service uni-profile uni-prof2 custom-L2-protocol tunnel-mac-range tunnel
-> ethernet-service uni-profile uni-prof3 custom-L2-protocol tunnel-mac-ethertype mac-tunnel
-> ethernet-service uni-profile uni-prof4 custom-L2-protocol tunnel-mac-ethersubtype tunnel
-> ethernet-service uni-profile uni-prof5 custom-L2-protocol tunnel-mac-ssap mac-tunnel
-> ethernet-service uni-profile uni-prof6 custom-L2-protocol discard-mac-range discard
-> ethernet-service uni-profile uni-prof6 custom-L2-protocol discard-mac-ethertype discard
-> ethernet-service uni-profile uni-prof6 custom-L2-protocol discard-mac-ssap discard
-> ethernet-service uni-profile uni-prof7 custom-L2-protocol tunnel-mac tunnel ERROR: A profile that is bound to a UNI cannot be modified

-> no ethernet-service uni-profile uni-prof1 custom-L2-protocol tunnel-mac-ethertype
-> no ethernet-service uni-profile uni-prof7 custom-l2-protocol tunnel-mac
ERROR: UNI Profile must be unused by any UNI port before disassociation of a Custom L2 Protocol

Release History

### Usage Guidelines

- The status of MAC tunneling can be configured on a global or per-SVLAN basis.
  - When MAC tunneling is enabled globally, the per-SVLAN MAC tunneling configuration is not active.
  - When MAC tunneling is disabled globally, the per-SVLAN MAC tunneling configuration is active.
- Any changes to the global MAC tunneling status requires a switch reload to activate.
- The global tunnel MAC address is set to 01:00:0C:CD:CD:D0 by default, which is the CISCO tunnel MAC address that is used for Generic Bridge PDU Tunneling (GBPT). A different tunnel MAC address can also be configured for a specific UNI profile and will apply only to packets processed by that profile.
- When L2 protocol packets are received on a UNI port and the associated UNI profile for that port is configured with a MAC tunnel action for that protocol, the destination MAC address for the packets is changed to the tunnel MAC address. The packets are then sent out the NNI port associated with the SVLAN.
- When L2 tunneled packets (with a tunnel MAC as the destination address) are received on an NNI port, the tunnel MAC address is replaced with the protocol MAC address. The packets are then forwarded to the respective UNI port associated with the SVLAN.
Examples

-> ethernet-service mac-tunneling disable
INFO :Changed mac-tunnel feature status will take effect if command is saved on next switch reboot
-> ethernet-service mac-tunneling enable

Release History

Release 8.6R1; command introduced.
Release 8.9R1; Omniswitch 6560 support added.

Related Commands

- `ethernet-service svlan mac-tunneling` Configures the MAC tunneling status for an SVLAN.
- `show ethernet-service mac-tunneling` Displays the global status of MAC tunneling for the switch.

MIB Objects

- alaEServiceGlobals
  - alaEServiceGlobalMacTunneling
ethernet-service svlan mac-tunneling

Configures the MAC tunneling status on a per-SVLAN basis. Enabling MAC tunneling for specific SVLANs limits the trapping of GBPT packets for processing to only those SVLANs.

**ethernet-service svlan svid1[-svid2] mac-tunneling {enable | disable}**

---

### Syntax Definitions

**svlan_id[svlan_id2]**

The VLAN ID number identifying the SVLAN. Use a hyphen to specify a range of VLAN IDs (10-12).

**enable**

Enables the MAC tunneling status for the specified SVLAN.

**disable**

Disables the MAC tunneling status for the specified SVLAN.

---

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

---

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

### Usage Guidelines

- Enabling MAC tunneling on a per-SVLAN basis or on a global basis is mutually exclusive; make sure MAC tunneling is globally disabled before attempting to enable MAC tunneling for the specified SVLAN.

- When MAC tunneling is enabled globally, all GBPT packets are trapped for processing even if there is no MAC tunneling action configured for the associated UNI profile. This limits the rate at which these packets are forwarded.

- Enabling MAC tunneling for specific SVLANs limits the trapping of GBPT packets to only those SVLANs where it is needed for MAC tunneling; other SVLANs forward the traffic without trapping the GBPT packets.

- Use the **show ethernet-service vlan** command to display the MAC tunneling status for the SVLAN ID.

- A maximum of four SVLANs can have MAC tunneling enabled at the same time.
Examples

-> ethernet-service svlan 1000 mac-tunneling enable
-> ethernet-service svlan 2000-2005 mac-tunneling enable
-> ethernet-service svlan 1000 mac-tunneling disable
-> show ethernet-service vlan 2000

Name : VLAN 2000,
Type : Service Vlan,
Administrative State : enabled,
Operational State : disabled,
IP Router Port : disabled,
IP MTU : 1500
MAC Tunneling : enabled,

ethernet-service mac-tunneling   Configures the global MAC tunneling status.
show ethernet-service vlan      Displays a list of VLANs and their attributes configured on the switch.

MIB Objects

vlanTable
  vlanNumber
  vlanDescription
  vlanMacTunneling
**ethernet-service transparent-bridging**

Configures transparent bridging which associates VLAN Stacking Network Interface (NNI) ports with all VLANs even if they are not created on the switch.

```
ethernet-service transparent-bridging [nni port chassis/slot/port[-port2] | nni linkagg agg_id[-agg_id2] {enable | disable}]
```

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot/port [-port2]` The slot and port number.
- `agg_id[-agg_id2]` The link aggregate ID.
- `enable` Enables the specified legacy BPDU support.
- `disable` Disables the specified legacy BPDU support.

**Defaults**

```
<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>
```

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Transparent bridging supports both global and port level enable/disable commands.
- Port level configuration is not accepted if transparent bridging is not enabled globally.
- When transparent bridging is disabled globally, the port level transparent bridging configuration is deleted. The port level configuration must be re-configured after re-enabling transparent bridging globally.
- Transparent bridging is only supported on NNI ports and only on NNI ports that are configured with at least one SVLAN.
- Transparent bridging can only be configured when STP is set to operate in flat mode; it is not supported when the STP is set to operate in MSTP mode.
- Dual-homed Link (DHL) and transparent bridging are not supported on the same NNI port.
Examples

-> ethernet-service transparent-bridging enable
-> ethernet-service nni port 1/1/5 transparent-bridging enable
-> ethernet-service nni linkagg 5 transparent-bridging enable

Release History

Release 8.3.1; command introduced.

show ethernet-service

Displays configuration information for VLAN Stacking Ethernet services.

show ethernet-service [service-name service_name | svlan svlan_id | transparent-bridging]

Syntax Definitions

service_name

The name of an existing VLAN Stacking service. Use quotes around string if the service name contains multiple words with spaces between them (for example, “ALE Engineering”).

svlan_id

The VLAN ID number that identifies an existing SVLAN.

transparent-bridging

Display the global status of transparent bridging for the switch.

Defaults

By default, all services are displayed if a service name or SVLAN ID is not specified with this command.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>

show ethernet-service nni l2pt-statistics

Displays statistics collected for Network Network Interface (NNI) ports.

show ethernet-services nni [port chassis/slot/port | linkagg agg_id] l2pt-statistics

## Syntax Definitions

- **chassis/slot/port**
  
  The chassis, slot, and port number (1/1/6).

- **agg_id**
  
  The link aggregate ID number (0–31).

## Defaults

By default, statistics for all NNI ports is displayed.

## Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>6900 X48C4E/V48C8/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

## Usage Guidelines

- Use the `port chassis/slot/port` or `linkagg agg_id` parameter to display statistics information for a specific switch port or link aggregate ID.

- Make sure the specified port or link aggregate is configured as an NNI port.

## Examples

```
-> show ethernet-service nni l2pt-statistics
Port Rx Mac-Tunnel Mac-tunnel discard
-------------------------------------
1/1/23 1234 2
1/1/24 256 0

-> show ethernet-service nni port 1/1/24 l2pt-statistics
Port Rx Mac-Tunnel Mac-tunnel discard
-------------------------------------
1/1/24 256 0

-> show ethernet-service nni port 1/1/5 l2pt-statistics
ERROR: Port (1/1/5) is not bound to any svlan
```
show ethernet-service nni l2pt-statistics

output definitions

<table>
<thead>
<tr>
<th>Port</th>
<th>The chassis, slot, and port number or link aggregate ID for the NNI.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rx Mac-Tunnel</td>
<td>The total number of frames that were trapped for processing with tunnel MAC.</td>
</tr>
<tr>
<td>Mac-tunnel discard</td>
<td>The total number of discarded frames that were trapped for processing with tunnel MAC.</td>
</tr>
</tbody>
</table>

Release History

Release 8.6R2; command was introduced.  
Release 8.9R1; Omniswitch 6560 support added.

clear ethernet-service nni l2pt-statistics

Clears statistics collected for Network Network Interface (NNI) ports.

clear ethernet-services nni [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]] l2pt-statistics

Syntax Definitions

chassis/slot/port[-port2] The chassis, slot, and port number (1/1/6) on which to clear the statistics. Use a hyphen to specify a range of ports (1/1/6-10).

agg_id[-agg_id2] The link aggregate ID number on which to clear the statistics. Use a hyphen to specify a range of link aggregate IDs (5-10)

Defaults

By default, the statistics for all NNI ports are cleared if a port or link aggregate ID number is not specified.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</table>
Release History

Release 7.1.1; command introduced.

Related Commands

**ethernet-service sap uni**
Configures the switch port as a VLAN Stacking UNI and associates the port with a VLAN Stacking Service Access Point (SAP).

**ethernet-service uni-profile**
Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.

**ethernet-service uni uni-profile**
Associates a VLAN Stacking UNI profile with a UNI port.

**show ethernet-service uni-profile**
Displays the profile attribute configuration for VLAN Stacking UNI profiles.

MIB Objects

alaEServiceUniProfileTable
- alaEServicePortID
- alaEServicePortProfileID
show ethernet-service uni l2pt-statistics

Displays statistics collected for each tunneling protocol on a per-UNI port basis.

show ethernet-service uni [port chassis/slot/port | linkagg agg_id] l2pt-statistics

Syntax Definitions

chassis/slot/port The chassis, slot, and port number (3/1).
agg_id The link aggregate ID number.

Defaults

By default, statistics information for all UNI ports and associated tunneling protocols is displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the port chassis/slot/port or linkagg agg_id parameter to display statistics information for a specific switch port or link aggregate ID.
- Make sure the specified port or link aggregate is configured as a UNI port.
- UNI port statistics are cleared when a switch takeover occurs. However, unless NNI port statistics are cleared, the de-tunnel statistics for a UNI port are not cleared after a takeover. For example, during a takeover, an NNI port that is not on the reloading chassis remains up and the UNI port on the reloading chassis goes down. Even though the UNI port goes down, the de-tunnel statistics for the UNI port are not cleared. However, all other statistics for the UNP port are cleared.

Note. Clearing both UNI and corresponding NNI port statistics after a takeover is highly recommended to ensure old UNI port statistics are not displayed.

Examples

-> show ethernet-service uni L2PT-statistics

clear ethernet-service uni l2pt-statistics

Clears tunneling protocol statistics collected for UNI ports.

```
clear ethernet-service uni [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]] l2pt-statistics
```

**Syntax Definitions**

- `chassis/slot/port[-port2]` : The chassis, slot, and port number (1/1/6) on which to clear the statistics. Use a hyphen to specify a range of ports (1/1/6-10).
- `agg_id[-agg_id2]` : The link aggregate ID number on which to clear the statistics. Use a hyphen to specify a range of link aggregate IDs (5-10)

**Defaults**

By default, tunneling protocol statistics are cleared on all UNI ports if a port or link aggregate ID number is not specified.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>

-> clear ethernet-service uni linkagg 20 l2pt-statistics
ERROR: Port or Linkagg not Vlan Stacking Port

Release History

Release 8.6R2; command was introduced.
Release 8.9R1; Omniswitch 6560 support added.

Related Commands

show ethernet-service uni l2pt-statistics
  Displays tunneling protocol statistics on a per-UNI port.

MIB Objects

alaEServiceUNIPortL2GlobalClearStatistics
alaEServiceUNIPortL2ProtocolStatisticsClearTable
  alaEServiceUNIPortClearID,
  alaEServiceUNIPortL2ClearStats
show ethernet-service uni-profile

Displays the profile attribute configuration for VLAN Stacking User Network Interface (UNI) profiles.

**show ethernet-service uni-profile [uni_profile_name]**

### Syntax Definitions

**uni_profile_name**

An alphanumeric string. Use quotes around the string if the profile name contains multiple words with spaces between them (for example, “ALE Engineering”).

### Defaults

By default, all UNI profiles are displayed if a UNI profile name is not specified with this command.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Specify a UNI profile name to display attributes for a single UNI profile.
- UNI profile information is displayed based on the switch platform. For example, UNI profile settings to process CISCO control packets and custom L2 protocol assignments for UNI profiles are supported only on the OmniSwitch 6465, OmniSwitch 6860, OmniSwitch 6860N, and OmniSwitch 6865, so that information is displayed only on those switches.

### Examples

Sample output on an OmniSwitch 6465, OmniSwitch 6860, OmniSwitch 6860N, and OmniSwitch 6865:

```
-> show ethernet-service uni-profile
Profile Name: default-uni-profile
  Tunnel MAC : 01:00:0c:cd:cd:d0,
  STP : tunnel, 802.1x : drop, 802.3ad : peer, 802.1ab : drop,

  Mac specific control frame : 01:80:C2:00:00:04 : drop
```
Profile Name: uni-prof1
  Tunnel MAC : 01:00:0c:cd:cd:d0,
  STP : tunnel,  802.1x : drop,  802.3ad : peer,  802.1ab : drop,
  MVRP: tunnel,  AMAP : drop,  OAM : peer,  LACPMARKER : peer,
  UDLD: peer,  CDP : drop,  VLAN : drop,  UPILINK : drop,
  802.1AB Tagged : drop,  802.1AB UnTagged: drop,  802.1AB Mode : default

output definitions

Profile Name
The name of the UNI profile.

Tunnel MAC
The MAC address used for MAC tunneling.

PROTOCOL: action
The protocol and configured action:
- peer—The UNI port is participating in the specified protocol.
- drop—Discards the specified PDU.
- tunnel—The PDU is tunneled across the provider network without
  modifying the MAC address.
- mac-tunnel—The PDU is tunneled across the provider network after
  changing the destination MAC address to the tunnel MAC address.

Custom L2 Protocol
The name of a custom L2 protocol that is assigned to the UNI profile.

Sample output on an OmniSwitch 6900:
-> show ethernet-service uni-profile

<table>
<thead>
<tr>
<th>Profile Name</th>
<th>Stp</th>
<th>802.1x</th>
<th>802.3ad</th>
<th>MVRP</th>

show ethernet-service custom-l2-protocol

Displays the custom L2 protocol configuration for the switch.

show ethernet-service custom-l2-profile [custom_protocol_name]

Syntax Definitions

custom_protocol_name                   The name of a configured custom L2 protocol entry.

Defaults

By default, all custom L2 protocol entries are displayed if a custom L2 protocol name is not specified with this command.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

Release History

Release 8.6R1; command introduced.
Release 8.9R1; Omniswitch 6560 support added.

Related Commands

- `ethernet-service custom-L2-protocol` Creates a custom L2 protocol MAC address entry with an optional mask, EtherType, or SSAP/DSAP protocol identifier.
- `ethernet-service uni-profile custom-L2-protocol` Assigns a custom L2 protocol entry to a UNI profile.
- `show ethernet-service uni-profile` Displays the UNI profile configuration for the switch, which includes any custom L2 protocol assignments.

MIB Objects

show ethernet-service uni-profile l2pt-statistics

Displays the profile statistics collected for User Network Interface (UNI) profiles. Statistics are collected for all protocol frames (including custom L2 protocols) that are received on all ports that are bound to the UNI profile.

show ethernet-service uni-profile [uni_profile_name] l2pt-statistics

Syntax Definitions

uni_profile_name The name of the UNI profile.

Defaults

By default, statistics for all UNI profiles are displayed if a UNI profile name is not specified with this command.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

show ethernet-service mac-tunneling

Displays the global MAC tunneling status for the switch.

Syntax Definitions
N/A

Defaults
N/A

Platforms Supported
This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines
Any changes to the global MAC tunneling status requires a switch reload to activate.

Examples

-> show ethernet-service mac-tunneling
Mac-Tunneling Feature: enable

-> ethernet-service mac-tunneling disable
INFO :Changed mac-tunnel feature status will take effect if command is saved on next switch reboot

-> show ethernet-service mac-tunneling
(*=new mac-tunneling feature will be applied after reboot)
Mac-Tunneling Feature: disable*

Release History
Release 8.6R1; command introduced.
Release 8.9R1; Omniswitch 6560 support added.

Related Commands

ethernet-service mac-tunneling Configures the global MAC tunneling status for the switch

MIB Objects
alaEServiceGlobals
  alaEServiceGlobalMacTunneling
show ethernet-service sap-profile

Displays the profile attribute configuration for VLAN Stacking Service Access Point (SAP) profiles.

show ethernet-service sap-profile sap_profile_name

Syntax Definitions

uni-profile-name An alphanumeric string. Use quotes around the string if the profile name contains multiple words with spaces between them (for example, “ALE Engineering”).

Defaults

By default, all SAP profiles are displayed if a SAP profile name is not specified with this command.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

output definitions

<table>
<thead>
<tr>
<th>Profile Name</th>
<th>The name of the SAP profile.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ingr/Egr Bw</td>
<td><strong>Ingress Egress Bandwidth</strong> - The maximum amount of ingress and egress bandwidth to allow for SAP ports.</td>
</tr>
<tr>
<td>Ingr Bw Sharing</td>
<td><strong>Ingress Bandwidth Sharing</strong> - The status of bandwidth sharing (enable, disable, or NA). If enabled, the ingress bandwidth value is shared across all SAP ports and CVLANs. If disabled, the bandwidth value is not shared and applied to individual SAP ports and CVLANs.</td>
</tr>
<tr>
<td>Inner Tag Option</td>
<td>Indicates how the CVLAN tag is processed (translate or preserve). If set to preserve, the CVLAN tag is retained and the SVLAN is added to the frame. If set to translate, the CVLAN tag is changed to the SVLAN tag.</td>
</tr>
<tr>
<td>Priority Mapping</td>
<td>Indicates how the priority value is configured for the SVLAN (NA, in-out or fixed). If set to in-out, the CVLAN priority value is mapped to the SVLAN. If set to fixed, a user-specified priority value is used for the SVLAN priority.</td>
</tr>
<tr>
<td>Priority Value</td>
<td>Indicates the priority value mapped to the SVLAN (NA, default 0, a number, P, or DSCP). A number indicates a fixed, user-specified value is used; P indicates the CVLAN 802.1p bit value is used; DSCP indicates the CVLAN DSCP value is used.</td>
</tr>
</tbody>
</table>

Release History

Release 7.1.1; command introduced.

Related Commands

- **ethernet-service sap-profile** Creates a profile for a VLAN Stacking Service Access Point (SAP).
- **ethernet-service sap** Creates a VLAN Stacking SAP and associates the SAP with a service and SAP profile.
- **ethernet-service sap-profile** Specifies a different SAP profile for the SAP.
- **show ethernet-service sap** Displays configuration information for VLAN Stacking SAPs.

MIB Objects

- alaEServiceSapProfileTable
  - alaEServiceSapProfileID
  - alaEServiceSapProfileCVLANTreatment
  - alaEServiceSapProfilePriorityMapMode
  - alaEServiceSapProfileFixedPriority
  - alaEServiceSapProfileIngressBW
  - alaEServiceSapProfileEgressBW
  - alaEServiceSapProfileBandwidthShare
**loopback-test**

Configures a wire-rate hardware loopback test profile and enables or disables the activation of the profile. The loopback test profile specifies the switch attributes that are required to conduct an ingress or egress loopback operation on a switch port.

```
loopback-test profile_name destination-mac dest_address {port chassis/slot/port | linkagg agg_id}
source-mac src_address vlan vlan_id [type {inward | outward {sap sap_id}}]
```

```
loopback-test profile_name admin-state {enable | disable}
```

[no] loopback-test profile_name

---

**Syntax Definitions**

- **profile_name**: Alphanumeric string of up to 31 characters. Use quotes around string if the profile name contains multiple words with spaces between them (for example, “ALE Engineering”).
- **src_address**: A unique source MAC address for the test frame.
- **dest_address**: A unique destination MAC address for the test frame.
- **vlan_id**: The VLAN ID of the test frame. Always use the outer VLAN ID.
- **chassis/slot/port**: The switch port number to use for the loopback test.
- **agg_id**: The linkagg ID for the loopback test. *This is currently not supported.*
- **inward**: Sets the type of loopback test to ingress.
- **outward**: Sets the type of loopback test to egress.
- **sap_id**: An existing Service Access Point (SAP) ID to use for an outward loopback test. *This parameter is supported on the OmniSwitch 6465.* See “Usage Guidelines - OmniSwitch 6465” on page 7-80.
- **enable**: Enables the loopback test profile.
- **disable**: Disables the loopback test profile.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>inward</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>X72/Q32</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

- Use the `no` form of this command to delete a loopback profile.

- Use the `loopback-test admin-state enable` command to enable the loopback test profile on the specified port. When the profile is enabled, the loopback operation is enabled for the port.

- Use the `loopback-test admin-state disable` command to disable the loopback operation for the specified port.

- The `loopback-test admin-state enable` command does not appear in the `show configuration snapshot` command display; it is not saved to the switch configuration file.

- When a port is configured as outward loopback port, it goes “out-of-service” and will no longer carry customer traffic but remains active for test frame traffic. However, an inward loopback port remains “in-service” and will continue to carry customer traffic as well as test frame traffic.

- Only Layer 2 loopback tests are supported, so test frames are not routed. As a result, the loopback test operation will only swap the source and destination MAC address of bridged test frames.

- L3 frames should be used for test frames and L3 headers should be included in test frames. Loopback will not be possible with pure L2 frames.

- Traffic with all the valid CVLANs, which are part of the SVLAN gets looped-back, as hardware loopback cannot identify which CVLAN traffic to loopback.

- During outward loopback test, port will enter MAC-loopback, STP and Source Learning will be disabled on that port.

- In outward UNI/NNI loopback, destination MAC is learned as static MAC on loopback port on `loopback-test enable` and is removed on `loopback-test disable`. This destination MAC is not displayed in `show mac-learning` command.

- The destination MAC address for the test frame must be unique to the network and must not be used anywhere in the device.

- The destination MAC address, source MAC address, loopback-port and VLAN ID are the mandatory parameters for configuring the hardware loopback profile.

**Usage Guidelines - OmniSwitch 6465**

Consider the following differences when configuring a loopback test profile on an OmniSwitch 6465:

- The `loopback-test admin-state enable` command is saved to the switch configuration file. This allows a test to automatically start after the switch reboots.

- A maximum of 28 inward and 8 outward loopback profiles can be configured, but only 2 profiles can be enabled at any given time.

- When defining an inward loopback test profile, specifying a source MAC address and VLAN ID is optional.

- When defining an outward loopback test profile, specifying a source MAC address or SAP ID is optional.

- A SAP ID can be specified for outward loopback test profiles; not supported with inward loopback test profiles. If a SAP ID is not specified, then the SAP with the lowest ID number is used by default.

- If the loopback port is administratively down, then an outward loopback test cannot be started.
The test frame does not have to be an L3 frame; both L2 and L3 test frames are supported.

The hardware loopback feature and CPE Test Head feature can both be operational at the same time. However, Test-OAM and hardware loopback cannot be configured on the same port.

**Usage Guidelines - OmniSwitch 6560 and 6570M**

Consider the following differences when configuring a loopback test profile on an OmniSwitch 6560 or OmniSwitch 6570M:

- The `loopback-test admin-state enable` command is saved to the switch configuration file. This allows a test to automatically start after the switch reboots.
- A maximum of 28 inward and 8 outward loopback profiles can be configured and all the 36 profiles can be enabled at any given time.
- When defining an outward loopback test profile, specifying a VLAN ID is optional and SAP ID is not required.
- When defining an inward loopback test profile, specifying a source MAC address and type is optional.

**Examples**

The following example creates an ingress loopback test profile:

```
-> loopback-test PE1-inward-UNI destination-mac 00:00:00:cc:aa:bb port 1/1/2
    source-mac 00:00:00:dd:aa:01 vlan 1001 type inward
```

The following examples create egress loopback test profiles (the “PE3-outward-UNI” profile specifies a SAP ID, which is supported on the OmniSwitch 6465 and OmniSwitch 6560):

```
-> loopback-test PE2-outward-UNI destination-mac 00:00:00:cc:ab:bb port 1/1/2
    source-mac 00:00:00:dd:ab:01 vlan 1001 type outward
```

The following command examples enable and disable a loopback test profile:

```
-> loopback-test inward1 admin-state enable
-> loopback-test outward1 admin-state disable
-> loopback-test outward1 admin-state enable
```

**Release History**

Release 8.6R1; command was introduced.
Release 8.7R1; `sap` parameter added.
Release 8.9R1; Hardware loopback-test support added for OmniSwitch 6560.
Release 8.9R2; Hardware loopback-test support added for OmniSwitch 6570M.

**Related Commands**

- `show loopback-test` Displays the profile configuration for a loopback test profile.

**MIB Objects**

- `alaTestHwLoopbackProfileTable`

show loopback-test

Displays the profile configuration for a hardware loopback test profile.

show loopback-test [profile_name] [counters]

Syntax Definitions

profile_name The name of an existing hardware loopback test profile.
counters Counters for given or all loopback test profiles.

Defaults

By default, all profiles are displayed if a profile name is not specified with this command.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>X72/Q32</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the profile_name parameter to display the loopback test configuration for a specific profile.
- This command will display “Any” in the “Src-Mac”, “Vlan”, or “SapId” fields if the following optional parameters are not specified when configuring a loopback test on an OmniSwitch 6560, OmniSwitch 6570M and OmniSwitch 6465:
  - Optional inward loopback test parameters: source MAC address and VLAN ID.
  - Optional outward loopback test parameters: source MAC address and SAP ID.
- Hardware counters are displayed only when the test profile is enabled.

Examples

```
-> show loopback-test
Profile-Name  Src-Mac          Dest-Mac          Vlan    Port    Type    Status  SapId

The Spanning Tree Algorithm and Protocol (STP) is a self-configuring algorithm that maintains a loop-free topology while providing data path redundancy and network scalability. Based on the IEEE 802.1D standard, the OmniSwitch STP implementation distributes the Spanning Tree load between the primary management module and the network interface modules. This functionality improves network robustness by providing a Spanning Tree that continues to respond to BPDUs and port link up and down states in the event of a fail over to a backup management module or switch.

In addition to a distributed architecture, this implementation also provides the following Spanning Tree features:

- Automatic configuration of a physical topology into a single Spanning Tree to ensure that there is only one data path between any two switches.
- Fault tolerance within the network topology. The Spanning Tree is reconfigured in the event of a data path or bridge failure or when a new switch is added to the topology.
- Support for four Spanning Tree protocols: 802.1D (STP), 802.1W (RSTP), and 802.1Q 2005 (MSTP).
- A flat Spanning Tree operating mode. If STP or RSTP is used, this mode applies a single STP instance across all VLANs. If MSTP is used, this mode applies a single STP instance to each Multiple Spanning Tree Instance (MSTI), which identifies a set of VLANs.
- A per-VLAN Spanning Tree operating mode that applies a single STP instance for each defined VLAN on the switch.
- An STP topology that includes 802.1Q tagged ports and link aggregate logical ports in the calculation of the physical topology.

MIB information for Distributed Spanning Tree commands is as follows:

*Filename:* ALCATEL-IND1-VLAN-STP-MIB.mib  
*Module:* alcatelIND1VLANSTPMIB
A summary of the available commands is listed here:

| Bridge commands          | spantree mode

**spantree mode**

Selects the flat Spanning Tree or per-VLAN Spanning Tree operating mode for the switch. These modes are exclusive; however, it is not necessary to reboot the switch when the STP modes are changed.

**spantree mode {flat | per-vlan}**

---

**Syntax Definitions**

- **flat**
  One Spanning Tree instance per switch.
- **per-vlan**
  One Spanning Tree instance for each VLAN configured on a switch.

---

**Defaults**

By default, the Spanning Tree mode for the switch is set to per-VLAN.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- The Multiple Spanning Tree Protocol (MSTP), as defined in the IEEE 802.1Q 2005 standard, is only supported on switches operating in the flat Spanning Tree mode.

- If standard STP or RSTP is used when the switch is running in the flat mode, a single STP instance is applied across all VLANs. For example, if a port belonging to VLAN 10 and a port belonging to VLAN 20 connect to the same switch together, then STP blocks one of these ports.

- If MSTP is used when the switch is running in the flat mode, a single STP instance is applied to each Multiple Spanning Tree Instance (MSTI). Each MSTI represents a set of VLANs.

- Flat Spanning Tree mode supports fixed (untagged) and 802.1Q tagged ports in each VLAN. However, Bridge Protocol Data Units (BPDUs) are always untagged.

- If the per-VLAN mode is selected, a single Spanning Tree instance is enabled for each VLAN configured on the switch. For example, if there are five VLANs configured on the switch, then there are five separate Spanning Tree instances. In essence, a VLAN is a virtual bridge that has its own bridge ID and configurable STP parameters, such as protocol, priority, hello time, max-age, and forward delay.

- When operating in per-VLAN mode, 802.1Q tagged ports participate in an 802.1Q Spanning Tree instance that allows the Spanning Tree to extend across tagged VLANs. As a result, a tagged port can participate in more than one Spanning Tree instance; one for each VLAN that the port carries.
• If a VLAN contains both fixed and tagged ports and the switch is operating in per-VLAN Spanning Tree mode, then a hybrid of the two Spanning Tree instances (single and 802.1Q) is applied. If a VLAN appears as a tag on a port, then the BPDU for that VLAN are also tagged. However, if a VLAN appears as the configured default VLAN for the port, then BPDU are not tagged and the single Spanning Tree instance applies.

• Regardless of which mode the switch is running in, it is possible to administratively disable the Spanning Tree status for an individual VLAN (see Chapter 5, “VLAN Management Commands”).

**Note.** Active ports associated with such a VLAN are excluded from any Spanning Tree calculations and remain in a forwarding state.

**Examples**

--> spantree mode flat
--> spantree mode per-vlan

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- **spantree protocol**
  Selects the Spanning Tree protocol for the specified instance.

- **spantree bpdu-switching**
  Enables the switching of Spanning Tree BPDU on a VLAN that has Spanning Tree disabled.

- **show spantree**
  Displays VLAN Spanning Tree parameter values.

**MIB Objects**

- **vStpTable**
  - **vStpNumber**
  - **vStpMode**
**spantree protocol**

Configures the Spanning Tree protocol for the flat mode Common and Internal Spanning Tree (CIST) instance or for an individual VLAN instance.

```
spantree [cist | vlan vlan_id] protocol {stp | rstp | mstp}
```

### Syntax Definitions

- **cist**: The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
- **vlan_id**: An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
- **stp**: IEEE 802.1D standard Spanning Tree Algorithm and Protocol.
- **rstp**: IEEE 802.1W Rapid Spanning Tree Protocol.
- **mstp**: IEEE 802.1Q 2005 Multiple Spanning Tree Protocol. This protocol is not supported on a per-VLAN basis.

### Defaults

By default, the Spanning Tree protocol is set to RSTP.

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>cist</td>
<td>vlan vlan_id</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

- If the optional **cist** or **vlan** parameter is not specified with this command, the protocol is set for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active.

**Note.** Selecting MSTP is only an option for the flat mode CIST instance and is required to configure Multiple Spanning Tree Instances (MSTI).

- MSTP is only active when the switch is operating in the flat Spanning Tree mode. STP and RSTP are active when the switch is operating in either the flat or per-VLAN Spanning Tree mode.
- Deleting all existing MSTIs is required before changing the protocol from MSTP to STP or RSTP.
**Note.** When the protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values. However, if the path cost mode was set to 32-bit prior to the protocol change, the path cost is *not* reset to the default value. See the `spantree path-cost-mode` command page for more information.

**Examples**

-> spantree protocol mstp  
-> spantree cist protocol mstp  
-> spantree vlan 5 protocol rstp

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- **spantree mode**  
  Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

- **show spantree**  
  Displays the Spanning Tree instance configuration.

**MIB Objects**

- vStpInsTable
  - vStpInsNumber
  - vStpInsMode
  - vStpInsProtocolSpecification
**spantree vlan admin-state**

Enables or disables the Spanning Tree status for a VLAN.

```
spantree vlan vlan_id [-vlan_id2] admin-state {enable | disable}
```

### Syntax Definitions

- `vlan_id[-vlan_id2]`: An existing VLAN ID number. Use a hyphen to specify a range of VLANs (10-15).
- `enable`: Enables Spanning Tree for the specified VLAN.
- `disable`: Disables Spanning Tree for the specified VLAN.

### Defaults

By default, the Spanning tree status is enabled for a VLAN instance.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

VLAN Spanning Tree instances are only active when the switch is running in the per-VLAN mode. However, configuring the VLAN Spanning Tree status is allowed in both modes (per-VLAN and flat).

### Examples

- `-> spantree vlan 850-900 admin-state enable`
- `-> spantree vlan 720-750 admin-state disable`
- `-> spantree vlan 500 admin-state disable`

### Release History

Release 7.1.1; command introduced.
Related Commands

- **vlan**
  Creates a VLAN.

- **show vlan**
  Displays a list of existing VLANs.

- **show vlan members**
  Displays VLAN port assignments.

MIB Objects

- **vlanTable**
  - **vlanNumber**
  - **vlanAdmStatus**
  - **vlanOperStatus**
  - **vlanStatus**
spantree mst region name

Defines the name for a Multiple Spanning Tree (MST) region. One of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

no spantree mst region name

Syntax Definitions

name

An alphanumeric string. Use quotes around string if the name contains multiple words with spaces between them (for example, “ALE Marketing”).

Defaults

By default, the MST region name is left blank.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to remove the MST region name.

Note. It is not necessary to specify the region name to remove it.

- To change the existing region, use this command with a string value that is different than the existing region name.

- Specifying an MST region name is allowed regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values, such as region name, only apply when the switch is operating in the flat Spanning Tree mode and using MSTP.

Examples

- > spantree mst region name SalesRegion
- > spantree mst region name "ALE Marketing"
- > no spantree mst region name
**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `spantree mst region revision-level`  Defines the revision level for an MST region.
- `spantree mst region max-hops`  Defines the maximum number of hops for the MST region.
- `spantree msti`  Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
- `spantree msti vlan`  Defines an association between a range of VLANs and a single MSTI.

**MIB Objects**

- `vStpMstRegionTable`
  - `vStpMstRegionNumber`
  - `vStpMstRegionConfigName`
spantree mst region revision-level

Defines the revision level for a Multiple Spanning Tree (MST) region. One of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

\[
\text{spantree mst region revision-level} \ rev\_level
\]

### Syntax Definitions

- **rev_level**: A numeric value that identifies the MST region revision level for the switch.

### Defaults

By default, the MST revision level is set to zero.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

An MST region revision level can be assigned to the MST region regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values, such as revision level, only apply when the switch is operating in the flat Spanning Tree mode, using the MSTP.

### Examples

- `-> spantree mst region revision-level 1000`
- `-> spantree mst region revision-level 2000`

### Release History

Release 7.1.1; command introduced.
Related Commands

- `spantree mst region name` Defines the name for an MST region.
- `spantree mst region max-hops` Defines the maximum number of hops for the MST region.
- `spantree msti` Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
- `spantree msti vlan` Defines an association between a range of VLANs and a single MSTI.

MIB Objects

- `vStpMstRegionTable`
  - `vStpMstRegionNumber`
  - `vStpMstRegionConfigRevisionLevel`
**spantree mst region max-hops**

Configures the maximum number of hops that are authorized to receive Multiple Spanning Tree (MST) regional information. Use this command to assign the maximum number of hops a BPDU is allowed to traverse, before it is discarded and related information is aged out.

**Syntax Definitions**

*max_hops*  
A numeric value that designates the maximum number of hops.

**Defaults**

By default, the maximum number of hops is set to 20.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The value configured with this command is a regional value that applies to all instances and is used to determine the size of the region.

- The maximum hop count value is the initial value of the “remaining hops” parameter in the MST BPDU that originates from the bridge that is serving as the root bridge for the region. Each bridge that in turn receives the MST BPDU decrements the “remaining hops” count value by one and passes the new value along to the next bridge. When the count reaches 0, the BPDU is discarded.

- Specifying an MST maximum hop count is allowed regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values only apply when the switch is operating in the flat Spanning Tree mode and using the MSTP.

**Examples**

```
-> spantree mst region max-hops 40
```

**Release History**

Release 7.1.1; command introduced.
### Related Commands

</table>
**spantree msti**

Defines a Multiple Spanning Tree Instance (MSTI) number. This number identifies an association between a range of VLANs and a single Spanning Tree instance. In addition, it is possible to assign an optional name to the MSTI for further identification.

```
spantree msti msti_id [name name]
no spantree msti msti_id [name]
```

**Syntax Definitions**

- **msti_id**
  - A numeric MSTI ID number. A range of VLANs is associated to an MSTI ID number.
- **name**
  - An alphanumeric string. Use quotes around string if the name contains multiple words with spaces between them (for example, “ALE Marketing”).

**Defaults**

By default, a flat mode Common and Internal Spanning Tree (CIST) instance always exists. The MSTI ID number for this instance is 0.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to remove the MSTI from the switch configuration.
- Use the **no** form of this command along with the **name** parameter to remove the optional MSTI name from the specified instance. The instance itself is not removed; only the name.
- There is always one CIST per switch. Initially all VLANs are associated with the CIST instance.
- Creating an MSTI is allowed when the switch is operating in either the per-VLAN or flat Spanning Tree mode, as long as MSTP is the selected flat mode protocol. The MSTI configuration, however, is not active unless the switch is running in the flat mode.

**Examples**

```
-> spantree msti 10
-> spantree msti 20 name BldgOneST10
-> no spantree msti 20 name
-> no spantree msti 10
```
Release History

  - `vStpMstInstanceVlanBitmapDeletion`
  - `vStpMstInstanceVlanBitmapState`
**spantree msti vlan**

Defines an association between a range of VLANs and a single Multiple Spanning Tree Instance (MSTI). The MSTI-to-VLAN mapping created with this command is one of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

```
spantree msti msti_id vlan vlan_id[,-vlan_id2]
```

```
no spantree msti msti_id vlan vlan_id[,-vlan_id2]
```

**Syntax Definitions**

- `msti_id`: A numeric MSTI identification number. A range of VLANs are associated to an MSTI ID number.
- `vlan_id[,-vlan_id2]`: A VLAN ID number. Use a hyphen to specify a range of VLAN IDs (for example, `vlan 10-15`).

**Defaults**

By default, all VLANs are associated with the flat mode Common and Internal Spanning Tree (CIST) instance, which is also known as MSTI 0.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove a VLAN or a range of VLANs from the specified MSTI association.

- Note that the VLAN ID specified with this command does not have to already exist in the switch configuration. This command maps VLAN IDs to MSTIs, but does not create VLANs.

- A VLAN is associated with only one MSTI at a time, but it is possible to move a VLAN from one MSTI to another. In addition, it is also possible to assign only one VLAN to an MSTI; a range of VLANs is not required.

- To associate multiple VLANS in a single command, use a hyphen to specify a range of VLAN IDs and a space to separate multiple VLAN IDs and/or ranges (for example 100-115 122 135 200-210).

- Configuring an MSTI-to-VLAN mapping is allowed when the switch is operating in either the per-VLAN or flat Spanning Tree mode, as long as MSTP is the selected flat mode protocol. The MSTI configuration, however, is not active unless the switch is running in the flat mode.
**Examples**

-> `spantree msti 10 vlan 100-115`
-> `spantree msti 20 vlan 122`
-> `no spantree msti 10 vlan 100-115`

**Release History**

  - `vStpMstVlanAssignmentVlanNumber`
  - `vStpMstVlanAssignmentEntry`
  - `vStpMstVlanAssignmentMstiNumber`
**spantree priority**

Configures the bridge priority value for the Common and Internal Spanning Tree (CIST) instance, a Multiple Spanning Tree Instance (MSTI), or a VLAN instance. This command is also used to configure the priority value for a port or link aggregate associated with the CIST, an MSTI, or a VLAN.

```
spantree [cist | msti msti_id | vlan vlan_id] [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]] priority priority
```

**Syntax Definitions**

- **cist**: The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
- **msti_id**: An existing MSTI ID number. If MSTI 0 is specified, the priority applies to the CIST instance. This parameter is configurable in both modes (flat or per-VLAN) but only if the flat mode protocol is set to MSTP.
- **vlan_id**: An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
- **agg_id[-agg_id2]**: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- **priority**: A bridge or port priority value. The valid range for the bridge priority is 0–65535. The valid range for the port priority is 0–15. If MSTP is the active flat mode protocol, enter a value that is a multiple of 4096 (for example, 4096, 8192, 12288).

**Defaults**

- By default, the bridge priority value is set to 32768 for the CIST, an MSTI, and a VLAN instance.
- By default, the port or link aggregate priority value is set to 7.

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>cist</td>
<td>msti msti_id</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Usage Guidelines

- The bridge priority is used to determine which bridge the Spanning Tree algorithm designates as the root bridge. The port priority value is used to determine the most favorable port when a bridge has multiple ports with the same path cost to the root bridge.

- The lower the bridge or port priority number assigned, the higher the priority that is associated with the bridge or port.

- If none of the optional instance parameters (`cist`, `msti`, or `vlan`) or `port` and `linkagg` parameters are specified with this command, the bridge priority is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.

- Although the `cist`, `msti`, and `vlan` parameters are configurable in both the flat and per-VLAN mode, the specified priority values are not applied unless the supporting mode (flat for CIST/MSTI or per-VLAN for a VLAN instance) is active.

- To configure the bridge priority with this command, specify the instance (`cist`, `msti`, or `vlan`) and the priority value; do not specify a port number or link aggregate ID.

- The bridge priority value for an MSTI is calculated by adding the configured priority value to the Spanning Tree instance number. For example, if the priority value of MSTI 10 equals 32768 (the default), then the Spanning Tree priority value advertised for this instance is 32770 (32768 + 10).

- When the protocol is changed to/from MSTP, the bridge priority for the flat mode CIST instance is reset to the default value.

- The bridge priority specifies the priority value for the first two octets of the Bridge ID (eight octets long). The remaining six octets of the Bridge ID contain a dedicated bridge MAC address. In regards to the priority for an MSTI, only the four most significant bits are used.

- To configure the port priority with this command, specify the instance (`cist`, `msti`, or `vlan`), a port number or link aggregate ID that is associated with that instance, and the priority value.

- The port priority value configured with this command is only applied to the specified instance. As a result, a single port can have different priority values for each instance. For example, in flat mode, port 1/24 can have a priority value of 7 for MSTI 2 and a priority value of 5 for MSTI 3.

- The port priority specifies the value of the priority field contained in the first byte of the port ID. The second byte contains the physical switch port number.

Examples

The following command examples set the bridge priority for the specified instance:

```
-> spantree priority 8192
-> spantree cist priority 8192
-> spantree vlan 2 priority 32679
-> spantree msti 1 priority 2500
ERROR: Valid bridge priority values are multiples of 4096: 0, 4096, 8192, 12288, 16384 ... 61440
-> spantree msti 1 priority 8192
```

The following command examples set the port priority for the specified instance:

```
-> spantree port 1/10 priority 10
-> spantree cist port 1/10 priority 10
-> spantree cist linkagg 10 priority 1
-> spantree vlan 200 port 2/1 priority 15
-> spantree vlan 2 linkagg 5 priority 2
```
Distributed Spanning Tree Commands

-> spantree msti 2 port 1/24 priority 5
-> spantree msti 3 linkagg 6-8 priority 10

spantree hello-time

Configures the Spanning Tree hello time value for the flat mode Common and Internal Spanning Tree (CIST) instance or for a per-VLAN mode VLAN instance. This value specifies the amount of time, in seconds, between each transmission of a BPDU on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root.

`spantree [cist | vlan vlan_id] hello-time seconds`

**Syntax Definitions**

- **cist**: The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
- **vlan_id**: An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
- **seconds**: Specifies the Hello time value in seconds. The valid range is 1–10.

**Defaults**

By default, the bridge hello time value is set to 2 seconds.

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>cist</td>
<td>cist</td>
</tr>
<tr>
<td>vlan_id</td>
<td>vlan_id</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Lowering the Hello Time interval improves the robustness of the Spanning Tree Algorithm. Increasing the Hello Time interval lowers the overhead of the Spanning Tree Algorithm.

- If the optional `cist` or `vlan` parameter is not specified with this command, the hello time is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.

- Although the `cist` and `vlan` parameters are configurable in both the flat and per-VLAN mode, the specified hello time value is not applied unless the supporting mode (flat for CIST or per-VLAN for a VLAN instance) is active.

- Note that for Multiple Spanning Tree Instances (MSTI), the hello time value is inherited from the CIST instance and is not a configurable parameter.
Examples

-> spantree hello-time 5
-> spantree cist hello-time 5
-> spantree vlan 10 hello-time 3

Release History

Release 7.1.1; command introduced.

  vStpInsMode
  vStpInsBridgeHelloTime
**spantree max-age**

Configures the bridge maximum age time value for the flat mode Common and Internal Spanning Tree (CIST) instance or for a per-VLAN mode VLAN instance. This value is the amount of time, in seconds, that the Spanning Tree Protocol information learned from the network on any port is retained. This information is discarded when it ages beyond the maximum age value.

`spantree [cist | vlan vlan_id] max-age seconds`

**Syntax Definitions**

- **cist**
  - The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).

- **vlan_id**
  - An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).

- **seconds**
  - Max-age time in seconds. The valid range is 6–40.

**Defaults**

By default, the bridge maximum age time value is set to 20 seconds.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- A low maximum age time causes the Spanning Tree Algorithm to reconfigure more often.

- If the optional **cist** or **vlan** parameter is not specified with this command, the maximum age time is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.

- Although the **cist** and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified maximum age time value is not applied unless the supporting mode (flat for CIST or per-VLAN for a VLAN instance) is active.

- Note that for Multiple Spanning Tree Instances (MSTI), the maximum age time value is inherited from the CIST instance and is not a configurable parameter.
**Examples**

-> spantree max-age 10  
-> spantree cist max-age 10  
-> spantree vlan 10 max-age 30

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- **spantree mode**

- **show spantree**
  Displays the Spanning Tree instance configuration.

**MIB Objects**

- vStpInsTable
  - vStpInsNumber
  - vStpInsBridgeMaxAge
**spantree forward-delay**

Configures the bridge forward delay time for the flat mode Common and Internal Spanning Tree (CIST) instance or for a per-VLAN mode VLAN instance. This value is the amount of time, in seconds, that determines how fast a port changes its Spanning Tree state until it reaches a forwarding state. The forward delay time specifies how long a port stays in the listening and learning states, which precede the forwarding state.

```plaintext
spantree [cist | vlan vlan_id] forward-delay seconds
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>parameter</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>cist</td>
<td>The CIST instance (also known as MST1 0). This parameter is configurable in both modes (flat or per-VLAN).</td>
</tr>
<tr>
<td>vlan_id</td>
<td>An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).</td>
</tr>
<tr>
<td>seconds</td>
<td>Forward delay time, in seconds. The valid range is 4–30.</td>
</tr>
</tbody>
</table>

**Defaults**

By default, the bridge forward delay time value is set to 15 seconds.

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>cist</td>
<td>vlan vlan_id</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- A low forward delay time can cause temporary loops in the network, because data may get forwarded before the reconfiguration message has reached all nodes on the network.
- The forward delay time is also used to age out all dynamic MAC address entries in the forwarding table (MAC address table) when a topology change occurs.
- If the optional `cist` or `vlan` parameter is not specified with this command, the forward delay time is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the `cist` and `vlan` parameters are configurable in both the flat and per-VLAN mode, the specified forward delay time value is not applied unless the supporting mode (flat for CIST or per-VLAN for a VLAN instance) is active.
- Note that for Multiple Spanning Tree Instances (MSTI), the forward delay time is inherited from the CIST instance and is not a configurable parameter.

**Examples**

- `-> spantree forward-delay 30`
- `-> spantree cist forward-delay 30`
- `-> spantree vlan 5 forward-delay 10`

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `spantree mode` Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
- `show spantree` Displays the Spanning Tree instance configuration.

**MIB Objects**

- `vStpInsTable`
  - `vStpInsNumber`
  - `vStpInsMode`

spantree bpdu-switching

Enables or disables the switching of Spanning Tree BPDU for VLAN and CIST instances if the switch is running in the per-VLAN mode.

`spantree {vlan vlan_id | cist} bpdu-switching {enable | disable}`

### Syntax Definitions

- **vlan_id**: An existing VLAN ID number.
- **enable**: Enables BPDU switching for the specified instance.
- **disable**: Disables BPDU switching for the specified instance.

### Defaults

By default, BPDU switching is disabled for VLAN or CIST instance.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Specifying the BPDU switching status for a VLAN does not depend on the current VLAN Spanning Tree status. For example, setting the BPDU switching status to enabled is allowed on a VLAN that also has Spanning Tree enabled.

- Use the `vlan` parameter along with the `vlan_id` to enable or disable BPDU switching for a particular VLAN.

- Use the `cist` parameter to enable or disable BPDU switching for the CIST instance.

### Examples

- `spantree mode flat`
- `spantree bpdu-switching enable`
- `spantree bpdu-switching disable`
- `spantree cist bpdu-switching enable`
- `spantree cist bpdu-switching disable`

- `spantree mode per-vlan`
- `spantree vlan 10 bpdu-switching enable`
- `spantree vlan 10 bpdu-switching disable`
**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `vlan members untagged` Enables or disables Spanning Tree instance for the specified VLAN.
- `show spantree` Displays VLAN Spanning Tree parameter values.

**MIB Objects**

- `vStpInsTable`
  - `vStpInsBpduSwitching`
spantree path-cost-mode

Configures the automatic selection of a 16-bit path cost for STP/RSTP ports and a 32-bit path cost for MSTP ports or sets all path costs to use a 32-bit value.

spantree path-cost-mode {auto | 32bit}

Syntax Definitions

auto The port path cost value is automatically set depending on which protocol is active on the switch (32-bit for MSTP, 16-bit for STP/RSTP).

32bit Specifies that a 32-bit value is used for the port path cost value regardless of which protocol is active on the switch.

Defaults

By default, the path cost mode is set to auto.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- All path cost values, except those for MSTIs, are reset to the default path cost value when this mode is changed.
- When connecting a switch running in the 32-bit path cost mode to a switch running in the 16-bit mode, the 32-bit switch has a higher path cost value and thus an inferior path cost to the 16-bit switch. To avoid this, use the spantree path-cost-mode command to change the 32-bit switch to a 16-bit switch.
- Note that when the protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values. The exception to this is if the path cost mode is set to 32-bit prior to the protocol change, the path cost is not reset to its default value.

Examples

- `spantree path-cost-mode 32bit`
- `spantree path-cost-mode auto`

Release History

Release 7.1.1; command introduced.
Related Commands

**spantree protocol**  
Configures the protocol for the flat mode CIST instance or a per-VLAN mode VLAN instance.

MIB Objects

vStpBridge  
vStpPathCostMode
**spantree pvst+compatibility**

Enables or disables PVST+ mode on the switch, port or link aggregate enabling them to operate with Cisco switches.

```plaintext
spantree pvst+compatibility {port chassis/slot/port | linkagg agg_id} {enable | disable | auto}
```

### Syntax Definitions

- **chassis**
  The chassis identifier.
- **slot/port[-port2]**
  The slot number and port number of the physical port.
- **agg_id[-agg_id2]**
  The link aggregate ID number.
- **enable**
  Enables the PVST+ mode.
- **disable**
  Disables the PVST+ mode.
- **auto**
  IEEE BPDUs are used until a PVST+ BPDU is detected.

### Defaults

PVST+ is disabled by default.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- In order to handle PVST+ mode, the ports must be configured in per-VLAN mode.
- Specify `pvst+compatibility enable` to enable all the ports on the switch to handle PVST+ BPDUs.
- Initially, a port sends or receive IEEE BPDUs. Once a PVST+ BPDU is received, the port sends and receives only PVST+ BPDUs for tagged VLANs and IEEE BPDUs for default VLANs.

### Examples

```plaintext
-> spantree pvst+compatibility enable
-> spantree pvst+compatibility disable
-> spantree port 1/3 pvst+compatibility enable
-> spantree port 2/2 pvst+compatibility auto
-> spantree linkagg 2 pvst+compatibility enable
```

### Release History

Release 7.1.1; command introduced.
Related Commands

- **show spantree**: Displays Spanning Tree bridge information for all flat mode Common and Internal Spanning Tree (CIST) instance and per-VLAN mode VLAN instance.
- **show spantree ports**: Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance or a per-VLAN mode VLAN instance.
- **show spantree cist ports**: Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance.
- **show spantree msti ports**: Displays Spanning Tree port information for a flat mode Multiple Spanning Tree Instance (MSTI).

MIB Objects

- vStpPortConfigPVST
- vStpPortConfigStatePVST
- vStpBridgeModePVST
**spantree auto-vlan-containment**

Enables or disables Auto VLAN Containment (AVC). When enabled, AVC prevents a port that has no VLANs mapped to an Multiple Spanning Tree Instance (MSTI) from becoming the root port for that instance. Such ports are automatically assigned an infinite path cost value to make them an inferior choice for root port.

```
spantree [msti msti_id] auto-vlan-containment {enable | disable}
```

**Syntax Definitions**

- `msti_id` An existing MSTI ID number. A range of VLANs are associated to an MSTI ID number.
- `enable` Enables automatic VLAN containment.
- `disable` Disables automatic VLAN containment.

**Defaults**

By default, automatic VLAN containment is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The AVC feature is not active for any MSTI until it is globally enabled. To globally enable this feature, use the `spantree auto-vlan-containment` command but do not specify an `msti_id`.
- When AVC is globally enabled, it is active for all MSTIs. To disable AVC for a single instance, specify the `msti_id` for the instance and use the `disable` form of this command.
- Use the `enable` form of this command and specify an `msti_id` to enable AVC for an instance that was previously disabled.
- An administratively set port path cost takes precedence and prevents AVC configuration of the path cost. However, if the port path cost is administratively set to zero, then the path cost is reset to the default value.
- Note that when AVC is disabled, a port assigned to a VLAN that is not mapped to a specific instance, can become the root port for that instance and cause a loss of connectivity between other VLANs.
- AVC does not have any effect on root bridges.
**Examples**

-> spantree auto-vlan-containment enable  
-> spantree auto-vlan-containment disable  
-> spantree msti 1 auto-vlan-containment disable  
-> spantree msti 1 auto-vlan-containment enable

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

**show spantree msti ports**  
Displays Spanning Tree port information for a flat mode Multiple Spanning Tree Instance (MSTI).

**MIB Objects**

vStpInsTable
  vStpInsAutoVlanContainment

**spantree cist**

Enables or disables the Spanning Tree status on a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance.

```
spantree cist {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} {enable | disable}
```

**Syntax Definitions**

- `chassis`: The chassis identifier.
- `slot/port[-port2]`: The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
- `agg_id[-agg_id2]`: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `enable`: Enables Spanning Tree on the specified port for the CIST instance.
- `disable`: Disables Spanning Tree on the specified port for the CIST instance.

**Defaults**

By default, the Spanning Tree status is enabled on eligible ports.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 \ V72/C32</th>
<th>6900 \ X48C6/T48C6/ X48C4E/V48C8/ C32E/T24C2/ X24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command only applies to the CIST instance regardless of which Spanning Tree operating mode (flat or per-VLAN) or protocol is active for the switch.

- If the switch is running in per-VLAN mode when this command is used, the Spanning Tree status configured for the port is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.

- When the Spanning Tree status is disabled on a port, the port is set to a forwarding state for the specified instance.

- Physical ports that are reserved for link aggregation do not participate in the Spanning Tree Algorithm. Instead, the algorithm is applied to the aggregate logical link (virtual port) that represents a collection of physical ports.

**Examples**

```
-> spantree cist port 4/1 enable
-> spantree cist port 4/2-5 disable
```
- spantree cist linkagg 16 disable
- spantree cist linkagg 22-26 enable

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- **spantree mode**
  Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

- **spantree vlan**
  Configures the Spanning Tree status on a port or a link aggregate of ports for a VLAN instance.

**MIB Objects**

- vStpInsPortTable
  - vStpInsPortNumber
  - vStpInsPortEnable
**spantree vlan**

Enables or disables the Spanning Tree status on a port or a link aggregate of ports for the specified VLAN instance.

`spantree vlan vlan_id [-vlan2] [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]] {enable | disable}`

**Syntax Definitions**

- `vlan_id`  
  An existing VLAN ID number.
- `chassis`  
  The chassis identifier.
- `slot/port[-port2]`  
  The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
- `agg_id[-agg_id2]`  
  The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `enable`  
  Enables Spanning Tree on the specified port for the specified instance.
- `disable`  
  Disables Spanning Tree on the specified port for the specified instance.

**Defaults**

By default, the Spanning Tree status is enabled on eligible ports.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command only applies to the specified VLAN instance regardless of which Spanning Tree operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the Spanning Tree status configured for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- When the Spanning Tree status is disabled on a port, the port is set to a forwarding state for the specified instance.
- If STP is disabled on a VLAN in the per-VLAN mode, the port Spanning Tree status is ignored and all active ports associated with the VLAN are put in a forwarding state and not included in the Spanning Tree Algorithm. Note that when this occurs, ports will *not* bridge BPDU unless the BPDU switching status for the VLAN is enabled.
Physical ports that are reserved for link aggregation do not participate in the Spanning Tree Algorithm. Instead, the algorithm is applied to the aggregate logical link (virtual port) that represents a collection of physical ports.

**Examples**

- `-> spantree vlan 2 port 4/1 enable`
- `-> spantree vlan 2 port 4/2-5 disable`
- `-> spantree vlan 3 linkagg 16 disable`
- `-> spantree vlan 3 linkagg 22-25 disable`

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `spantree mode` Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
- `spantree cist` Configures the Spanning Tree status on a port or an aggregate of ports for the CIST instance when the switch is operating in either the per-VLAN or flat mode.
- `spantree vlan admin-state` Enables or disables Spanning Tree instance for the specified VLAN.
- `spantree bpdu-switching` Enables or disables the switching of Spanning Tree BPDU for all VLAN instances if the switch is running in the per-VLAN mode.

**MIB Objects**

- `vStpInsPortTable`
  - `vStpInsPortNumber`
  - `vStpInsPortEnable`
**spantree cist path-cost**

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance. This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

```
spantree cist {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} path-cost path_cost
```

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot/port[-port2]` The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
- `agg_id[-agg_id2]` The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `path_cost` Path cost value. The valid range is 0 - 65535 for 16-bit, 0–200000000 for 32-bit.

**Defaults**

By default, the path cost is set to zero.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

</table>

**Usage Guidelines**

- This command only applies to the port path cost value for the CIST instance regardless of which operating mode (flat or per-VLAN) or protocol is active for the switch.

- If the switch is running in per-VLAN mode when this command is used, the specified path cost value is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.

- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.

- Use the `spantree path-cost-mode` command to automatically select the path cost value based on the active Spanning Tree protocol (16-bit for STP and RSTP, 32-bit for MSTP) or to use a 32-bit path cost value regardless of which protocol is active.

- If the `path_cost` is set to zero, there are recommended 16-bit and 32-bit values which are used by default depending on the link speed. Refer to the “Configuring Spanning Tree Parameters” chapter in the OmniSwitch AOS Release 8 Network Configuration Guide for a list of values.
Examples

- `spantree cist port 4/1 path-cost 19`
- `spantree cist port 4/2-5 path-cost 19`
- `spantree cist linkagg 16 path-cost 12000`
- `spantree cist linkagg 17-20 path-cost 12000`

Release History

- `spantree path-cost-mode` Selects a 32-bit or automatic path cost mode for the switch.
- `spantree msti path-cost` Configures the Spanning Tree path cost value for a port or a link aggregate of ports for an MSTI.
- `spantree vlan path-cost` Configures the Spanning Tree path cost value for a port or a link aggregate of ports for a VLAN instance.

MIB Objects

- `vStpInsPortTable`
  - `vStpInsPortNumber`
  - `vStpInsPortPathCost`
**spantree msti path-cost**

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the specified flat mode Multiple Spanning Tree Instance (MSTI). This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

**spantree msti msti_id {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} path-cost path_cost**

**Syntax Definitions**

- **msti_id**
  An existing MSTI ID number. If MSTI 0 is specified, the priority applies to the CIST instance.

- **chassis**
  The chassis identifier.

- **slot/port[-port2]**
  The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).

- **agg_id[-agg_id2]**
  The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

- **path_cost**
  Path cost value. The valid range is 0 - 65535 for 16-bit, 0–200000000 for 32-bit.

**Defaults**

By default, the path cost is set to zero.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command only applies to the specified MSTI regardless of which operating mode (flat or per-VLAN) is active for the switch. However, if MSTP is not the selected flat mode protocol, the path cost value for any MSTI is not configurable.

- Note that if zero is entered for the *msti_id* value, the specified path cost value is applied to the CIST instance.

- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.

- The path cost value configured with this command is only applied to the specified instance. As a result, a single port can have a different path cost for each instance. For example, in flat mode, port 1/24 can have a path cost of 20000 for MSTI 2 and a path cost of 35000 for MSTI 3.
• If the switch is running in per-VLAN mode when this command is used, the specified path cost value is not active for the specified MSTI until the operating mode for the switch is changed to the flat mode.

• When MSTP is the active protocol on the switch, only a 32-bit path cost value is used. Using a 16-bit path cost value is not an option.

• If the path_cost is set to zero, there are recommended 16-bit and 32-bit values which are used by default depending on the link speed. Refer to the “Configuring Spanning Tree Parameters” chapter for a list of values.

**Examples**

```
-> spantree msti 0 port 4/1 path-cost 35000
-> spantree msti 0 port 1/20-24 path-cost 12000
-> spantree msti 2 linkagg 10 path-cost 20000
-> spantree msti 2 linkagg 10-12 path-cost 65000
```

**Release History**

Release 7.1.1; command introduced.

  - `vStpInsPortPathCost`
spantree vlan path-cost

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the specified VLAN instance. This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

```
spantree vlan vlan_id {port chassis/slot/port|-port2] | linkagg agg_id[-agg_id2]} path-cost path_cost
```

**Syntax Definitions**

- `vlan_id`: An existing VLAN ID number.
- `chassis`: The chassis identifier.
- `slot/port|-port2]`: The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
- `agg_id][-agg_id2]`: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `path_cost`: Path cost value. The valid range is 0 - 65535 for 16-bit, 0–200000000 for 32-bit.

**Defaults**

By default, the path cost is set to zero.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

**Usage Guidelines**

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.

- If the switch is running in the flat mode when this command is used, the specified path cost for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.

- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.

- Use the `spantree path-cost-mode` command to automatically select the path cost value based on the active Spanning Tree protocol (16-bit for STP and RSTP, 32-bit for MSTP) or to use a 32-bit path cost value regardless of which protocol is active.
• If the `path_cost` is set to zero, there are recommended 16-bit and 32-bit values which are used by default depending on the link speed. Refer to the “Configuring Spanning Tree Parameters” chapter for a list of values.

**Examples**

- `spantree vlan 200 port 4/1 path-cost 4`
- `spantree vlan 200 port 4/2-5 path-cost 4`
- `spantree vlan 300 linkagg 16 path-cost 200000`
- `spantree vlan 500 linkagg 24-28 path-cost 20000`

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `spantree mode`  
  Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

- `spantree cist path-cost`  
  Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the CIST instance.

- `spantree msti path-cost`  
  Configures the Spanning Tree path cost value for a port or a link aggregate of ports for an MSTI.

**MIB Objects**

- `vStpInsPortTable`
  - `vStpInsPortNumber`
  - `vStpInsPortPathCost`
**spantree cist mode**

Configures manual mode (forwarding or blocking) or dynamic mode to manage the state of a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance. Dynamic mode defers the management of the port state to the Spanning Tree algorithm.

```
spantree cist {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} mode {forwarding | dynamic | blocking}
```

**Syntax Definitions**

- `chassis` The chassis identifier when running in virtual chassis mode.
- `slot/port[-port2]` The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
- `agg_id[-agg_id2]` The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `forwarding` Sets the port state to forwarding.
- `dynamic` Port state is determined by the Spanning Tree algorithm.
- `blocking` Sets the port state to blocking.

**Defaults**

By default, the port Spanning Tree mode is set to dynamic.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Usage Guidelines**

- This command only applies to the port Spanning Tree mode for the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the specified port mode is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Ports manually configured to operate in a forwarding or blocking state do not participate in the Spanning Tree algorithm.
- When port state is manually set to forwarding or blocking, the port remains in that state until it is changed using this command.
Examples

-> spantree cist port 4/1 mode forwarding
-> spantree cist port 4/2-5 mode forwarding
-> spantree cist linkagg 10 mode blocking
-> spantree cist linkagg 15-20 mode forwarding

Release History

Release 7.1.1; command introduced.

Related Commands

spantree mode

Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

spantree loop-guard

Configures the Spanning Tree mode for a port or a link aggregate of ports for the specified VLAN instance.

MIB Objects

vStpInsPortTable
  vStpInsPortNumber
  vStpInsPortManualMode
**spantree loop-guard**

Enables or disables the STP loop-guard on a port or link aggregate.

```
spantree {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} loop-guard {enable | disable}
```

### Syntax Definitions

- **chassis**
  
  The chassis identifier.

- **slot/port[-port2]**
  
  The slot number and port number of the physical port. Use a hyphen to specify a range of ports.

- **agg_id[-agg_id2]**
  
  The link aggregate ID number. Use a hyphen to specify a range of IDs (example 10-20).

- **enable**
  
  Enables STP loop-guard.

- **disable**
  
  Disables STP loop-guard.

### Defaults

STP loop-guard is disabled by default.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When you enable loop-guard on a port, it is automatically applied to all the active instances or VLANs associated to the port.

- Loop-guard cannot be enabled on a port if root-guard is already enabled on the port or link aggregate related to the port. Root-guard must be disabled before configuring loop-guard. Similarly, when loop-guard configuration is enabled on a port or chassis, root-guard cannot be configured on the port/s.

- Loop-guard can be enabled on all types of ports including designated (forwarding), non-designated (alternate, secondary, or root) ports. However, STP loop-guard configuration does not affect designated ports. Hence, loop-guard is not effective when applied on designated ports.

- When loop-guard is enabled on root ports, they change to blocking mode when a loop-guard error occurs. In such an instance, the alternate or secondary ports takeover until the root port recovers from the error state.

- If a set of ports that are already blocked by loop-guard are grouped together to form a link aggregate, the new link aggregate gets a new designated role. The link aggregate can also obtain a forwarding state depending on the STP state.
• If a spanning tree channel is blocked by loop-guard and the channel breaks, spanning tree loses all the state information. The individual physical ports obtain the designated role, even if one or more of the links that formed the channel are unidirectional. New link aggregate might obtain a forwarding state but new port state is defined.

• The ports that are configured as fast-forwarding or edge-ports do not receive BPDUs. Loop-guard is not effective on such ports.

• Loop-guard error state is recovered when the administrative state of the port is enabled or disabled.

• When a VLAN is disabled, all the VLAN port associations recover from the error state.

• The loop-guard feature can be enabled on the ports that have STP (RSTP, MRSTP or MSTP) enabled.

• STP loop-guard on link aggregate protects all ports that are members of the link aggregation group.

Examples

-> spantree port 1/1/2 loop-guard enable
-> spantree linkagg 1 loop-guard enable
-> spantree port 1/1/2 loop-guard disable
-> spantree linkagg 1 loop-guard disable

Release History

Release 8.2.1; command introduced.

Related Commands

show spantree ports Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance.

MIB Objects

**spantree vlan mode**

Configures Manual mode (forwarding or blocking) or Dynamic mode to manage the state of a port or a link aggregate of ports for the specified VLAN instance. Dynamic mode defers the management of the port state to the Spanning Tree algorithm.

```
spantree vlan vlan_id [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]] mode {dynamic | blocking | forwarding}
```

**Syntax Definitions**

- `vlan_id`: An existing VLAN ID number.
- `chassis`: The chassis identifier when running in virtual chassis mode.
- `slot/port[-port2]`: The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
- `agg_id[-agg_id2]`: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `dynamic`: Port state is determined by the Spanning Tree algorithm.
- `blocking`: Sets the port state to blocking.
- `forwarding`: Sets the port state to forwarding.

**Defaults**

By default, the port Spanning Tree mode is set to dynamic.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

**Usage Guidelines**

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified mode for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- Ports manually configured to operate in a forwarding or blocking state do not participate in the Spanning Tree algorithm.
- When port state is manually set to forwarding or blocking, the port remains in that state until it is changed using this command.
**Examples**

-> `spantree vlan 255 port 4/1-4 mode forwarding`
-> `spantree vlan 355 port 1/24 mode dynamic`
-> `spantree vlan 450 linkagg 1 mode dynamic`
-> `spantree vlan 450 linkagg 1-5 mode dynamic`

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `spantree mode` Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
- `spantree cist mode` Configures the Spanning Tree mode for a port or a link aggregate of ports for the CIST instance.

**MIB Objects**

- `vStpInsPortTable`
  - `vStpInsPortNumber`
  - `vStpInsPortManualMode`
**spantree cist connection**

Configures the connection type for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

```
spantree cist {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} connection {noptp | ptp | autoptp}
```

**Syntax Definitions**

- `chassis`: The chassis identifier.
- `slot/port[-port2]`: The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
- `agg_id[-agg_id2]`: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `noptp`: Defines port connection type as no point to point link.
- `ptp`: Defines port connection type as point to point link.
- `autoptp`: Specifies that switch software automatically defines connection type as point-to-point or no point-to-point.

**Defaults**

By default, the link connection type is set to auto point-to-point.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command only applies to the port connection type for the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.

- If the switch is running in per-VLAN mode when this command is used, the specified port connection type is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.

- A port is considered connected to a point-to-point LAN segment if the port belongs to a link aggregate of ports or if autonegotiation determines the port must run in full duplex mode or if full duplex mode was administratively set. Otherwise, the port is considered connected to a no point-to-point LAN segment.
• Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point-to-point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

**Examples**

`-> spantree cist port 7/24 connection noptp`
`-> spantree cist port 7/25-28 connection ptp`
`-> spantree cist linkagg 5-10 connection autoptp`
`-> spantree cist linkagg 5-10 connection autoptp`

**Release History**

Release 7.1.1; command introduced.

MIB Objects
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortAdminConnectionType
   vStpInsPortOperConnectionType
**spantree cist admin-edge**

Configures the administrative edge port status for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

```
spantree cist {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} admin-edge {enable | disable}
```

**Syntax Definitions**

- **chassis**
  - The chassis identifier.

- **slot/port[-port2]**
  - The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).

- **agg_id[-agg_id2]**
  - The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

- **enable**
  - Enables the administrative edge port status for the specified port-CIST instance.

- **disable**
  - Disables the administrative edge port status for the specified port-CIST instance.

**Defaults**

By default, the administrative edge port status is disabled (off).

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command only applies to the port connection type for the CIST instance regardless of which operating mode (flat or per-VLAN) is active on the switch.

- If the switch is running in the per-VLAN mode when this command is used, the specified edge port status is not active for the CIST instance until the switch is configured to run in the flat Spanning Tree mode.

- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (auto-edge) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.

- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
Configure ports that connect to a host (PC, workstation, server, and so on) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point-to-point connection type.

**Examples**

- `spantree cist linkagg 15 admin-edge enable`
- `spantree cist linkagg 4-10 admin-edge enable`
- `spantree cist port 8/25 admin-edge disable`
- `spantree cist port 2/2-5 admin-edge enable`

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

**spantree vlan admin-edge**

Configures the administrative edge port status for a port or a link aggregate of ports for a VLAN instance.

```
spantree vlan vlan_id {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} admin-edge {enable | disable}
```

### Syntax Definitions

- **vlan_id**
  
  An existing VLAN ID number.

- **chassis**
  
  The chassis identifier.

- **slot/port[-port2]**
  
  The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).

- **agg_id[-agg_id2]**
  
  The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

- **enable**
  
  Enables the administrative edge port status for the specified port-VLAN instance.

- **disable**
  
  Disables the administrative edge port status for the specified port-VLAN instance.

### Defaults

By default, the administrative edge port status is disabled (off).

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | V72/C32 | 6900 | 6900 | X48C6/T48C6/ |

  Configures the administrative edge port status for a port or aggregate of ports for a specific VLAN instance.

**MIB Objects**

- vStpInsPortTable
- vStpInsPortNumber
- vStpInsPortAutoEdge
spantree cist restricted-role

Configures the restricted role status for a port or a link aggregate of ports. Enabling this parameter blocks the port from becoming the Root Port, even if it is the most likely candidate for root. Once a root port is selected, the restricted port is selected as an Alternate Port.

```
spantree cist {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} {restricted-role | root-guard} {enable | disable}
```

### Syntax Definitions

- **chassis**
  
  The chassis identifier.

- **slot/port[-port2]**
  
  The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).

- **agg_id[-agg_id2]**
  
  The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

- **root-guard**
  
  Optional command syntax. Enter `root-guard` instead of restricted-role; both parameters specify the same functionality for this command.

- **enable**
  
  Enables the restricted role status for the specified port.

- **disable**
  
  Disables the restricted role status for the specified port.

### Defaults

By default, the restricted role status for the port is disabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When running in flat mode, this is a per-port setting and is applicable to any CIST or MSTI instances configured on that port.

- Enabling the restricted role status is used by network administrators to prevent bridges external to the core region of the network from influencing the Spanning Tree topology.

- Note that enabling the restricted role status for a port may impact connectivity within the network.

### Examples

- `-> spantree cist linkagg 15-20 restricted-role enable`
- `-> spantree cist linkagg 15-20 root-guard enable`
- `-> spantree cist port 8/23 restricted-role disable`
Distributed Spanning Tree Commands

spantree cist restricted-role

-> spantree cist port 1/1/4 root-guard enable
-> spantree cist port 8/24-27 restricted-role disable
-> spantree cist linkagg 10 restricted-role disable

Release History

Release 7.1.1; command introduced.

Related Commands

**Usage Guidelines**

- Enabling the restricted role status is used by network administrators to prevent bridges external to the core region of the network from influencing the Spanning Tree topology.
- Note that enabling the restricted role status for a port may impact connectivity within the network.
- This command only applies to the VLAN instance specified by the VLAN ID regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified restricted role status for the port is not active for the VLAN instance until the switch is running in the per-VLAN Spanning Tree mode.
**Examples**

-> spantree vlan 3 linkagg 15 restricted-role enable
-> spantree vlan 3 linkagg 15 root-guard enable
-> spantree vlan 255 port 8/23 restricted-role enable
-> spantree vlan 255 port 8/23 root-guard enable
-> spantree vlan 255 port 8/24-27 restricted-role enable
-> spantree vlan 255 linkagg 11-15 restricted-role enable

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

**spantree mode**

Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

**spantree cist restricted-role**

Configures the restricted role status for a port or aggregate of ports for the flat mode CIST instance.

**MIB Objects**

vStpInsPortTable

  vStpInsPortNumber
  vStpInsPortRestrictedRole
**spantree cist restricted-tcn**

Configures the restricted TCN status for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST). When this parameter is enabled, the port does not propagate topology changes and notifications to/from other ports.

```
spantree cist {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} restricted-tcn {enable | disable}
```

**Syntax Definitions**

- `chassis`  
  The chassis identifier.

- `slot/port[-port2]`  
  The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).

- `agg_id[-agg_id2]`  
  The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

- `enable`  
  Enables the restricted TCN status for the specified port-CIST instance.

- `disable`  
  Disables the restricted TCN status for the specified port-CIST instance.

**Defaults**

By default, the restricted TCN status for the port is disabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Enabling the restricted TCN status is used by network administrators to prevent bridges external to the core region of the network from causing unnecessary MAC address flushing in that region.

- Note that enabling the restricted TCN status for a port may impact Spanning Tree connectivity.

- This command only applies to the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.

- If the switch is running in the per-VLAN mode when this command is used, the specified restricted TCN status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.

**Examples**

- `-> spantree cist linkagg 15 restricted-tcn enable`
- `-> spantree cist port 8/23 restricted-tcn disable`
Distributed Spanning Tree Commands

-> spantree cist port 2/2-4 restricted-tcn enable
-> spantree cist linkagg 10-14 restricted-tcn disable

Release History
Release 7.1.1; command introduced.

Related Commands

spantree mode
Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

spantree vlan restricted-tcn
Configures the restricted TCN status for a port or aggregate of ports for the specified per-VLAN mode VLAN instance.

MIB Objects

vStpInsPortTable
  vStpInsPortNumber
  vStpInsPortRestrictedTcn
**spantree vlan restricted-tcn**

Configures the restricted TCN status for a port or a link aggregate of ports for the specified VLAN instance. When this parameter is enabled, the port does not propagate topology changes and notifications to/from other ports.

```
spantree vlan vlan_id {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} restricted-tcn {enable | disable}
```

**Syntax Definitions**

- `vlan_id`: An existing VLAN ID number.
- `chassis`: The chassis identifier.
- `slot/port[-port2]`: The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
- `agg_id[-agg_id2]`: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `enable`: Enables the restricted TCN status for the specified port-VLAN instance.
- `disable`: Disables the restricted TCN status for the specified port-VLAN instance.

**Defaults**

By default, the restricted TCN is set to disable.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>

### Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.

- If the switch is running in the flat mode when this command is used, the specified `txholdcount` status for the port is not active for the VLAN instance until the switch is running in the per-VLAN Spanning Tree mode.

### Examples

```
-> spantree vlan 3 txholdcount 6
```

### Release History

Release 7.1.1; command introduced.
**Related Commands**

**spantree mode**

Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

**spantree cist txholdcount**

Configures the BPDU transmission rate limit for the CIST instance.

**MIB Objects**

vStpInsTable

vStpInsBridgeTxHoldCount
show spantree

Displays Spanning Tree bridge information for the flat mode Common and Internal Spanning Tree (CIST) instance or the per-VLAN mode VLAN instances.

Syntax Definitions

N/A

Defaults

NA

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- If the switch is operating in the per-VLAN mode, this command displays a list of VLAN instances.
- If the switch is operating in the flat mode and the protocol is STP or RSTP, this command displays the single flat mode instance.
- If the switch is operating in the flat mode and the protocol is set to MSTP, this command displays a list of MSTIs, including MSTI 0 (also known as the CIST).

Examples

-> spantree mode flat
-> spantree protocol rstp
-> show spantree

**show spantree msti**

Displays Spanning Tree bridge information for a Multiple Spanning Tree Instance (MSTI).

`show spantree msti [msti_id]`

### Syntax Definitions

**msti_id**

An existing MSTI ID number.

### Defaults

By default, displays information for all MSTIs.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- If an **msti_id** number is not specified, this command displays the Spanning Tree status, protocol, and priority values for all MSTIs.
- This command displays Spanning Tree bridge information for an MSTI regardless of which mode (per-VLAN or flat) is active for the switch.
- Note that minimal information is displayed when this command is used in the per-VLAN mode, as MSTIs are not active in this mode. In addition, this command fails if MSTP is not the selected flat mode protocol.
- Note that MSTI 0 also represents the CIST instance that is always present on the switch. To view the CIST instance using this command, specify zero (0) for the **msti_id** number.

### Examples

```plaintext
-> spantree mode flat
-> spantree protocol mstp
-> show spantree msti
  Spanning Tree Path Cost Mode: AUTO
  Msti STP Status Protocol Priority (Prio:SysID)
  ------------------------------
  0    ON    MSTP    32768 (0x8000:0x0000)
  1    ON    MSTP    32769 (0x8000:0x0001)
-> show spantree msti 0

**Release History**

Release 7.1.1; command introduced.
Release 8.4.1; **Topology Change Port** field added.
Release 8.5R4; **Last TC Rcvd Bridge** field added.

**Related Commands**

- **show spantree**
  Displays the Spanning Tree bridge configuration for the flat mode CIST instance or a per-VLAN mode VLAN instance, depending on which mode is active for the switch.

- **show spantree cist**
  Displays the Spanning Tree bridge configuration for the CIST instance regardless of which mode (per-VLAN or flat) is active on the switch.

- **show spantree vlan**
  Displays the Spanning Tree bridge configuration for a VLAN instance regardless of which mode (per-VLAN or flat) is active on the switch.

**show spantree vlan**

Displays Spanning Tree bridge information for a per-VLAN mode VLAN instance.

**show spantree vlan [vlan_id]**

---

**Syntax Definitions**

*vlan_id*  
An existing VLAN ID number.

---

**Defaults**

By default, displays information for all VLAN instances.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- If a *vlan_id* number is *not* specified, this command displays the Spanning Tree status, protocol, and priority values for all VLAN instances.
- Specify a *vlan_id* number with this command to display Spanning Tree bridge information for a specific VLAN instance.
- This command displays Spanning Tree bridge information for a VLAN instance regardless of which mode (per-VLAN or flat) is active on the switch. Note that minimal information is displayed when this command is used in the flat mode, as VLAN instances are not active in this mode.

---

**Examples**

```
-> spantree mode per-vlan
-> show spantree vlan
  Spanning Tree Path Cost Mode : AUTO
  Vlan STP Status Protocol Priority
  +-------------------------------------------+
  |   vlan   STP  Status  Protocol   Priority |
  +-------------------------------------------+

output definitions

Spanning Tree Path Cost
Mode
  The Spanning Tree path cost mode for the switch (32 BIT or AUTO)
  Configured through the spantree path-cost-mode command.

Vlan
  The VLAN ID associated with the VLAN Spanning Tree instance.
  Configured through the vlan commands

STP Status
  The Spanning Tree state for the instance (ON or OFF).

Protocol
  The Spanning Tree protocol applied to the VLAN instance (STP or
  RSTP). Note that MSTP is not supported for a VLAN instance.
  Configured through the spantree protocol command.

Priority
  The Spanning Tree bridge priority for the instance. The lower the
  number, the higher the priority. Configured through the spantree
  priority command.

Spanning Tree Status
  The Spanning Tree state for the instance (ON or OFF).

Mode
  The Spanning Tree operating mode for the switch (per-vlan or flat).
  Configured through the spantree mode command.

Bridge ID
  The bridge identifier for this Spanning Tree instance. Consists of the
  bridge priority value (in hex) concatenated with the dedicated bridge
  MAC address.

Designated Root
  The bridge identifier for the root of the Spanning Tree for this instance.

Cost to Root Bridge
  The cost of the path to the root for this Spanning Tree instance.

show spantree ports

Displays Spanning Tree port information.

show spantree ports [forwarding | blocking | active | configured]

Syntax Definitions

forwarding Displays Spanning Tree operational port parameters for ports that are forwarding for the specified instance.

blocking Displays Spanning Tree operational port parameters for ports that are blocked for the specified instance.

active Displays a list of active ports associated with the specified instance.

configured Displays Spanning Tree administrative port parameters for all ports associated with the specified instance.

Defaults

<table>

output definitions

**Bridge, Msti, or Vlan**

The CIST instance, referred to as bridge 1 when either STP (802.1D) or RSTP (802.1W) is the active protocol in the flat mode. The MSTI number when MSTP is the active protocol in the flat mode. The VLAN ID number when STP or RSTP is the active protocol in the per-VLAN mode.

**Port**

The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
**Output Definitions (Continued)**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Oper Status</strong></td>
<td>The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, learning, and forwarding.</td>
</tr>
<tr>
<td><strong>Path Cost</strong></td>
<td>The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the <code>spantree msti path-cost</code> or <code>spantree vlan path-cost</code> command.</td>
</tr>
<tr>
<td><strong>Role</strong></td>
<td>The role of the port for this Spanning Tree instance. Possible port roles are: root, designated, alternate, and backup.</td>
</tr>
<tr>
<td><strong>loop-guard</strong></td>
<td>Displays if the loop-guard is enabled (ENA) or disabled (DIS) on the port. Configured through the <code>spantree loop-guard</code> command.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Displays a note if the port has entered the error violation state (ERR); then the port role of the port instance in that row becomes insignificant.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `show spantree cist ports` Displays Spanning Tree port information for the flat mode CIST instance when the switch is operating in the per-VLAN or flat Spanning Tree mode.
- `show spantree msti ports` Displays Spanning Tree port information for an MSTI when the switch is operating in the per-VLAN or flat Spanning Tree mode.
- `show spantree vlan ports` Displays Spanning Tree port information for VLAN instances when the switch is operating in the per-VLAN or flat Spanning Tree mode.

show spantree cist ports

Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance.

show spantree cist ports [forwarding | blocking | active | configured]

Syntax Definitions

forwarding Displays Spanning Tree operational port parameters for ports that are forwarding for the CIST instance.

blocking Displays Spanning Tree operational port parameters for ports that are blocked for the CIST instance.

active Displays a list of active ports associated with the CIST instance.

configured Displays Spanning Tree administrative port parameters for the CIST instance.

Defaults

<table>

output definitions

- **Port**: The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
- **Oper St**: The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, listening, learning, and forwarding.
- **Path Cost**: The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the `spantree vlan path-cost` command.
- **Desig Cost**: The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
- **Role**: The role of the port for this Spanning Tree instance. Possible port roles are: **root**, **designated**, **alternate**, and **backup**.
- **Prim. Port**: The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
- **Op Cnx**: Operational connection type: **PTP**, **NPT**, or **NS** (nonsignificant). Shows the current operational state of the port connection type. See the `spantree vlan connection` command for more information.

output definitions (continued)

- **Op Edg**: Operational connection type: **EDG**. Shows the current operational state of the port connection type. See the `spantree vlan connection` command for more information.

- **Desig Bridge ID**: The bridge identifier for the designated bridge for this port segment.

output definitions

- **Port**: The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).

- **Port Pri**: The Spanning Tree priority for the port. The lower the number, the higher the priority.

- **Adm St**: The Spanning Tree administrative status of the port: **enabled** or **disabled**.

- **Man. Mode**: The manual mode setting for the port: **yes** indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; **no** indicates that the Spanning Tree Algorithm is managing the port state. Configured through the `spantree vlan path-cost` command.

- **Config Cost**: The configured path cost value for this port. Configured through the `spantree vlan path-cost` command.

- **Adm Cnx**: The administrative connection type: **PTP**, **NPT**, or **AUT**. Configured through the `spantree vlan connection` command.

- **Adm Edg**: The edge port administrative status: **yes** indicates that the port is an admin edge port; **no** indicates that the port is not an admin edge port. Configured through the `spantree vlan connection` command.

- **Aut Edg**: The edge port automatic status: **yes** indicates that the port is an automatic edge port; **no** indicates that the port is not an automatic edge port. Configured through the `spantree cist auto-edge` or `spantree vlan auto-edge` command.

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- **show spantree ports**
  Implicit command for displaying Spanning Tree port information for the flat mode CIST instance or a per-VLAN mode VLAN instance.

- **show spantree msti ports**
  Displays Spanning Tree port information for an MSTI when the switch is operating in the per-VLAN or flat Spanning Tree mode.

**MIB Objects**

- `vStpInsPortTable`
  - `vStpInsPortNumber`
  - `vStpInsPortPriority`
  - `vStpInsPortState`
  - `vStpInsPortEnable`
  - `vStpInsPortPathCost`
  - `vStpInsPortDesignatedCost`
  - `vStpInsPortDesignatedBridge`
  - `vStpInsPortAdminEdge`
  - `vStpInsPortAutoEdge`
  - `vStpInsPortRestrictedRole`
  - `vStpInsPortRestrictedTcn`
  - `vStpInsPortManualMode`
  - `vStpInsPortRole`
  - `vStpInsPrimaryPortNumber`
  - `vStpInsPortAdminConnectionType`
  - `vStpInsPortOperConnectionType`
**show spantree msti ports**

Displays Spanning Tree port information for a flat mode Multiple Spanning Tree Instance (MSTI).

`show spantree msti [msti_id] ports [forwarding | blocking | active | configured]`

---

### Syntax Definitions

- **msti_id**
  - An existing MSTI ID number.

- **forwarding**
  - Displays Spanning Tree operational port parameters for ports that are forwarding for the MSTI instance.

- **blocking**
  - Displays Spanning Tree operational port parameters for ports that are blocked for the MSTI instance.

- **active**
  - Displays a list of active ports associated with the MSTI instance.

- **configured**
  - Displays Spanning Tree administrative port parameters for the MSTI instance.

---

### Defaults

<table>

</tr>
</tbody>
</table>

---

### Usage Guidelines

- If an `msti_id` number is not specified, this command displays the Spanning Tree port operational status, path cost, and role values for all associated MSTIs.

- This command displays Spanning Tree port information for an MSTI regardless of which mode (per-VLAN or flat) is active on the switch.

- Note that minimal information is displayed when this command is used in the per-VLAN mode, as MSTIs are not active in this mode. In addition, if MSTP is not the selected flat mode protocol, this command fails.

- The `configured` keyword is only available when an instance number is specified with this command. In addition, this keyword cannot be used in combination with either the `forwarding` or `blocking` keywords.
- Note that MSTI 0 also represents the CIST instance that is always present on the switch. To view the CIST instance using this command, specify zero (0) for the `msti_id` number.

## Examples

```
-> show spantree msti ports
Msti  Port  Oper Status  Path Cost  Role
-----+-----+------------+---------+-----
  0  1/1  FORW       200000   ROOT
  0  1/2  DIS           0    DIS
  0  1/3  DIS           0    DIS

**output definitions**

**Msti**
The Multiple Spanning Tree Instance (MSTI) number. MSTI 0 represents the CIST. Configured through the `spantree msti` command.

**Port**
The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).

**Oper St**
The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, listening, learning, and forwarding.

**Path Cost**
The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the `spantree msti path-cost` command.

**Desig Cost**
The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.

**RSTR Role/ Root Guard**
The role of the port for this Spanning Tree instance. Possible port roles are: root, designated, alternate, master, and backup.

**Prim. Port**
The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
**output definitions (continued)**

**Op Cnx**
Operational connection type: PTP, NPT, or NS (nonsignificant). Shows the current operational state of the port connection type. See the `spantree vlan connection` command for more information.

**Op Edg**
Operational connection type: EDG. Shows the current operational state of the port connection type. See the `spantree vlan connection` command for more information.

**Desig Bridge ID**
The bridge identifier for the designated bridge for this port segment.

**PVST+ Cfg**
Indicates the current PVST+ port configuration (auto, enable or disable).

**PVST+ Stat**
Indicates the current status of the PVST+ mode (On or Off).

```

**output definitions (continued)**

**Port**
The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).

**Port Pri**
The Spanning Tree priority for the port. It is a numeric value and the lower the number, the higher the priority. Configured through the `spantree priority` command.

**Adm St**
The Spanning Tree administrative status of the port: enabled - ENA or disabled - DIS.

**Man. Mode**
The manual mode setting for the port: yes indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; no indicates that the Spanning Tree Algorithm is managing the port state. Configured through the `spantree vlan path-cost` command.

**Config Cost**
The configured path cost value for this port. Configured through the `spantree msti path-cost` command.

**Adm Cnx**
The administrative connection type: PTP, NPT, or AUT. Configured through the `spantree vlan connection` command.

### Related Commands

- **show spantree ports**  
  Displays Spanning Tree port information for the flat mode CIST instance or a per-VLAN mode VLAN instance.
- **show spantree cist ports**  
  Displays Spanning Tree port information for a CIST instance when the switch is operating in the per-VLAN or flat Spanning Tree mode.
- **show spantree vlan ports**  
  Displays Spanning Tree port information for a VLAN when the switch is operating in the per-VLAN or flat Spanning Tree mode.

### MIB Objects

- `vStpInsPortTable`

  - `vStpInsPortOperConnectionType`
**show spantree vlan ports**

Displays Spanning Tree port information for a VLAN instance.

**Command Syntax**

```text
show spantree vlan [vlan_id|-vlan_id2] ports [forwarding | blocking | active | configured]
```

**Syntax Definitions**

- **vlan_id|-vlan_id2**: An existing VLAN ID number. Use a hyphen to specify a range of VLAN IDs (for example, `vlan 10-15`).
- **forwarding**: Displays Spanning Tree operational port parameters for ports that are forwarding for the VLAN instance.
- **blocking**: Displays Spanning Tree operational port parameters for ports that are blocked for the VLAN instance.
- **active**: Displays a list of active ports associated with the VLAN instance.
- **configured**: Displays Spanning Tree administrative port parameters for the VLAN instance.

**Defaults**

**Usage Guidelines**

- If a `vlan_id` number is not specified, this command displays the Spanning Tree port operational status, path cost, and role values for all VLAN instances.

- Specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (e.g., *show spantree vlan 10-15 ports*). Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs—is allowed with this command. Multiple entries are not accepted.

- This command displays Spanning Tree port information for a VLAN instance regardless of which mode (per-VLAN or flat) is active for the switch.

- Note that minimal information is displayed when this command is used in the flat mode, as VLAN instances are not active in this mode.
• The **configured** keyword is only available when a VLAN ID is specified with this command. In addition, this keyword cannot be used in combination with either the **forwarding** or **blocking** keywords.

**Examples**

```
-> show spantree vlan ports
Vlan  Port Oper Status  Path Cost  Role    Note
-----+-----+------------+---------+-------+---------
1   1/1       DIS           0    DIS

**output definitions**

**Port**

The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (e.g., 0/31).

**Port Pri**

The Spanning Tree priority for the port (0–15). The lower the number, the higher the priority. Configured through the `spantree priority` command.

**Adm St**

The Spanning Tree administrative status of the port: enabled or disabled. Configured through the `spantree vlan` command to enable or disable Spanning Tree on a port.
### Release History

Release 7.1.1; command was introduced.
**Related Commands**

- **show spantree ports**
  Displays Spanning Tree port information for the flat mode CIST instance or a per-VLAN mode VLAN instance.

- **show spantree cist ports**
  Displays Spanning Tree port information for a CIST instance when the switch is operating in the per-VLAN or flat Spanning Tree mode.

- **show spantree msti ports**
  Displays Spanning Tree port information for an MSTI when the switch is operating in the per-VLAN or flat Spanning Tree mode.

show spantree mode

Displays the current global Spanning Tree mode parameter values for the switch.

show spantree mode

Syntax Definition

N/A

Defaults

NA

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

The global parameters for spanning tree can be activated or configured using the related commands.

Examples

```plaintext
-> show spantree mode
```

Spanning Tree Global Parameters
- Current Running Mode: Per VLAN,
- Current Protocol: N/A (Per VLAN),
- Path Cost Mode: 32 BIT,
- Auto Vlan Containment: N/A
- Cisco PVST+ mode: Disabled
- Vlan Consistency check: Disabled

Output Definitions

- **Current Running Mode**: The spanning tree active on the switch. (Flat or Per VLAN)
- **Current Protocol**: The spanning tree protocol active on the switch.
- **Path Cost Mode**: The path cost mode value configured on the switch. (AUTO or 32 BIT)
- **Auto Vlan Containment**: The Auto VLAN containment mode configured on the switch (Enabled or Disabled).
- **Cisco PVST+ mode**: The PVST+ mode configured on the switch (Enabled or Disabled).
- **Vlan Consistency check**: Specifies if VLAN consistency check is Enabled or Disabled on the switch.
Related Commands

**spantree mode**
Assigns a flat Spanning Tree or per-VLAN Spanning Tree operating mode for the switch.

**spantree protocol**
Configures the Spanning Tree protocol for the flat mode Common and Internal Spanning Tree (CIST) instance or for an individual VLAN instance if the switch is running in the per-VLAN mode.

**spantree path-cost-mode**
Configures the automatic selection of a 16-bit path cost for STP/RSTP ports and a 32-bit path cost for MSTP ports or sets all path costs to use a 32-bit value.

**spantree pvst+compatibility**
Enables or disables PVST+ mode on the switch, port or link aggregate enabling them to operate with Cisco switches.

**spantree auto-vlan-containment**
Enables or disables Auto VLAN Containment (AVC).

Release History
Release 7.1.1; command introduced.

show spantree mst

Displays the Multiple Spanning Tree (MST) information for a MST region or the specified port or link aggregate on the switch.

```
show spantree mst {region | port chassis/slot/port | linkagg agg_id}
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot number and port number of the physical port.
- **agg_id[-agg_id2]**: The link aggregate ID number.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Three MST region attributes (configuration name, revision level, and configuration digest) define an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same values for these attributes are all considered part of the same region. Currently each switch can belong to one MST region at a time.

- This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.

- Specify the port number or link aggregate ID along with the **port** or **linkagg** keyword to get information related to the specified port or link aggregate.

### Examples

```
-> show spantree mst region
Configuration Name   = Region 1
Revision Level       = 0
Configuration Digest = 0xac36177f 50283cd4 b83821d8 ab26de62
Revision Max hops    = 20
Cist Instance Number = 0
```
show spantree mst port 1/2

```
MST  Role  State  Pth  Cst  Edge  Boundary  Op  Cnx  Vlans
---+-----+-----+----+--------+--------+-----+-----+--------------
 0  DIS  DIS  0  NO   YES     NS    1
12  DIS  DIS  0  NO    YES     NS
```

show spantree mst linkagg 4

```
MST  Role  State  Pth  Cst  Edge  Boundary  Op  Cnx  Vlans
---+-----+-----+----+--------+--------+-----+-----+--------------
 0  DESG  FORW  6000  NO    NO     NS    1
 1  DESG  FORW  0  NO    NO     NS
 2  DESG  FORW  0  NO    NO     NS
```

**Output Definitions**

- **Configuration Name**: An alphanumeric string that identifies the name of the MST region. Use the `spantree mst region name` command to define this value.
- **Revision Level**: A numeric value that identifies the MST region revision level for the switch.
- **Configuration Digest**: An MST region identifier consisting of a 16 octet hex value (as per the IEEE 802.1Q 2005 standard) that represents all defined MSTIs and their associated VLAN ranges. Use the `spantree msti` and `spantree msti vlan` commands to define VLAN to MSTI associations.
- **Revision Max hops**: The number of maximum hops authorized for region information. Configured through the `spantree mst region max-hops` command.
- **Cist Instance Number**: The number of the CIST instance, which is currently zero as there is only one region per switch. Therefore, only one CIST exists per switch. Note that this instance is also known as the flat mode instance and is known as bridge 1 when using STP or RSTP.

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `show spantree msti vlan-map`: Displays the range of VLANs associated to the specified MSTI.
- `show spantree cist vlan-map`: Displays the range of VLANs associated to the CIST instance.
- `show spantree map-msti`: Displays the MSTI that is associated to the specified VLAN.

**MIB Objects**

- `vStpMstRegionTable`
  - `vStpMstRegionNumber`
  - `vStpMstRegionConfigDigest`
  - `vStpMstRegionConfigName`
  - `vStpMstRegionConfigRevisionLevel`
  - `vStpMstRegionCistInstanceNumber`
  - `vStpMstRegionMaxHops`
show spantree msti vlan-map

Displays the range of VLANs associated with the specified Multiple Spanning Tree Instance (MSTI).

show spantree msti [msti_id] vlan-map

Syntax Definitions

msti_id

An existing MSTI ID number.

Defaults

By default, the VLAN to MSTI mapping is displayed for all MSTIs.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

Usage Guidelines

- If an msti_id is not specified, then the VLAN to MSTI mapping for all defined MSTIs is displayed.
- This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.
- Initially all VLANs are associated with the flat mode CIST instance.

Examples

-> show spantree msti vlan-map
   Cist
   Name               : 
   VLAN list          : 1-9,14-4094

</table>

Usage Guidelines

This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.

Examples

-> show spantree cist vlan-map

Cist
Name      : CIST1,
VLAN list : 1-9,14-4094

output definitions

<table>
<thead>
<tr>
<th>Name</th>
<th>An alphanumeric value that identifies the name of the CIST. Use the <code>spantree msti</code> command to define a name for this instance.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN list</td>
<td>The range of VLAN IDs that are associated with the CIST instance.</td>
</tr>
</tbody>
</table>

Release History

Release 7.1.1; command introduced.
Distributed Spanning Tree Commands

Related Commands

**show spantree mst**
Displays the MST region information for the switch.

**show spantree msti vlan-map**
Displays the range of VLANs associated to the specified MSTI.

**show spantree map-msti**
Displays the MSTI that is associated to the specified VLAN

MIB Objects

- `vStpMstInstanceNumber`
- `vStpMstInstanceName`
- `vStpMstInstanceVlanBitmapState`
show spantree map-msti

Displays the Multiple Spanning Tree Instance (MSTI) that is associated to the specified VLAN.

show spantree [vlan vlan_id] map-msti

Syntax Definitions

vlan_id An existing VLAN ID number.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.
- Initially all VLANs are associated with the flat mode CIST instance.

Examples

-> show spantree map-msti

Vlan Msti/Cist(0)
----------+------------------------
  200     1

9 Shortest Path Bridging Commands

The OmniSwitch supports Shortest Path Bridging MAC (SPBM), as defined in the IEEE 802.1aq standard. SPB-M uses the Provider Backbone Bridge (PBB) network model to encapsulate (using IEEE 802.1ah headers) and tunnel customer traffic through the network backbone. The shortest path trees (SPTs) upon which the PBB network infrastructure operates are determined using a version of the Intermediate System-to-Intermediate System (IS-IS) link state protocol that supports TLV extensions for SPB (ISIS-SPB).

The SPBM network topology consists of two layers: the backbone infrastructure (control plane) layer and the services (data plane) layer. ISIS-SPB builds the backbone layer by defining loop-free, SPTs through the backbone network. The service layer is based on the PBB framework as defined in the IEEE 802.1ah standard. SPBM supports the 802.1ah MAC-in-MAC method for data encapsulation. SPBM services transport the encapsulated traffic over the ISIS-SPB infrastructure.

This chapter documents the Command Line Interface (CLI) commands used to configure and verify the ISIS-SPB backbone. For commands used to configure and verify the SPBM services layer, see Chapter 10, “Service Manager Commands.”

MIB information for the SPB commands is as follows:

<table>
<thead>
<tr>

**spb bvlan**

Configures an SPB backbone VLAN (BVLAN).

```
spb bvlan {bvlan_id|-bvlan_id2}] [admin-state {enable | disable}] [name description]
```

```no spb bvlan bvlan_id```

**Syntax Definitions**

- `bvlan_id[-bvlan_id2]` A numeric value that uniquely identifies an individual BVLAN. The valid ID range is 1–4094. Use a hyphen to specify a range of BVLAN IDs (10-20).
- `enable` Enables the VLAN administrative status.
- `disable` Disables the VLAN administrative status.
- `description` An alphanumeric string. Optional name description for the VLAN ID.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>`enable</td>
<td>disable`</td>
</tr>
<tr>
<td><code>description</code></td>
<td>VLAN ID</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove a BVLAN from the switch configuration. All BVLAN ports are detached before the BVLAN is removed.
- The description can be any alphanumeric string. Enclose the description in double quotes if it contains more than one word with a space in between.
- The BVLAN configuration must be the same on each SPB bridge to ensure proper ISIS-SPB neighbor discovery and shortest path calculations throughout the provider backbone bridge (PBB) network.
- BVLANs differ from standard VLANs as follows:
  - No Spanning Tree control—the Spanning Tree protocol is automatically disabled on each BVLAN, and all ports associated with each BVLAN will remain in a forwarding state. However, Spanning Tree can remain operational on other types of VLANs.
  - No source MAC address learning—normal hardware learning is disabled on BVLANs. Instead, the
forwarding database (FDB) is populated by the ISIS-SPB protocol.

- There is no flooding of unknown destination or multicast frames.
- Ingress filtering based on the source MAC address—frames received on ports that do not have an incoming source MAC address pre-programmed by ISIS-SPB are discarded.

- All BVLANs are automatically associated with all ISIS-SPB interfaces. Adding or removing BVLANs from a specific SPB interface is not allowed.

- The recommended maximum number of BVLANs is four. Keeping the number of BVLANs at four or less reduces the number of address updates across the control plane and helps to improve scalability, stability, and convergence time in the SPB network.

- BVLANs and standard VLANs can co-exist on the same bridge ports.

**Examples**

- `-> spb bvlan 200 name BVLAN-200`
- `-> spb bvlan 720 admin-state disable`
- `-> spb bvlan 500 name BVLAN-500 admin-state enable`
- `-> no spb bvlan 1020`

**Release History**

Release 7.3.1; command introduced.

**Related Commands**

- `spb isis control-bvlan`        Configures a control BVLAN
- `spb isis bvlan ect-id`        Assigns an equal cost tree (ECT) algorithm ID to the specified BVLAN.
- `spb isis bvlan tandem-multicast-mode`        Configures the tandem multicast mode for the specified SPB backbone VLAN (BVLAN).
- `spb isis interface`        Configures ISIS-SPB network interfaces.
- `show spb isis bvlan`        Displays the BVLAN configuration for the switch.

**MIB Objects**

- `vlanTable`
  - `vlanNumber`
  - `vlanDescription`
  - `vlanAdmStatus`
  - `vlanOperStatus`
  - `vlanType`
**spb isis bvlan ect-id**

Configures the equal cost tree (ECT) identifier for the specified SPB backbone VLAN (BVLAN). The ECT ID assigns a tie-breaking algorithm to the BVLAN that is used for shortest path tree (SPT) calculations.

```
spb isis bvlan bvlan_id ect-id ect_id
```

**Syntax Definitions**

- **bvlan_id**
  
  An existing BVLAN ID.

- **ect_id**
  
  An ECT algorithm ID. The valid range is 1–16.

**Defaults**

By default, the next available ECT ID number is automatically assigned to a BVLAN when the BVLAN is created.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use this command to change the existing ECT ID number for the specified BVLAN on each SPB bridge, as necessary, to make sure the specified BVLAN uses the same ECT ID throughout the network.

- The BVLAN ID specified with this command must already exist in the switch configuration.

**Examples**

```
-> spb isis bvlan 200 ect-id 5
-> spb isis bvlan 720 ect-id 10
```

**Release History**

Release 7.3.1; command introduced.
Related Commands

spb bvlan
Creates a SPB backbone VLAN (BVLAN).

show spb isis bvlans
Displays the SPB BVLAN configuration for the switch.

MIB Objects

alcatelIND1IsisSpbEctStaticTable

alcatelIND1IsisSpbEctStaticEntryBaseVid
spb isis control-bvlan

Designates an existing BVLAN that will serve as the control BVLAN for the bridge. Only one BVLAN per bridge is designated as the control BVLAN, which is used to exchange ISIS-SPB control packets with neighboring SPB bridges on behalf of all the BVLANs configured for that bridge.

spb isis control-bvlan bvlan_id

**Syntax Definitions**

-bvlan_id An existing BVLAN ID.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The BVLAN ID specified with this command must already exist in the switch configuration.
- The control BVLAN ID is the VLAN tag that is applied to ISIS-SPB control frames.
- Configuring an existing BVLAN as the control BVLAN does not exclude that VLAN from carrying data traffic for the SPB domain. In other words, a single VLAN can serve as both a regular BVLAN and the control BVLAN at the same time.

**Examples**

- `> spb isis control-bvlan 200`
- `> spb isis control-bvlan 720`

**Release History**

Release 7.3.1; command introduced.
Related Commands

spb bvlan                          Configures an SPB BVLAN.
show spb isis bvlangs            Displays the BVLAN configuration for the bridge.

MIB Objects

alcatelIND1IsisSpbSys
  alcatelIND1IsisSpbSysControlBvlan
**spb isis bvlan tandem-multicast-mode**

Configures the tandem multicast mode for the specified SPB backbone VLAN (BVLAN). This mode is only applicable to associated SPB service instances that are configured to use the tandem replication mode for multicast traffic.

```
spb isis bvlan bvlan_id tandem-multicast-mode {sgmode | gmode}
```

### Syntax Definitions

- `bvlan_id`: An existing BVLAN ID.
- `sgmode`: Specifies the source and group (S,G) mode for the BVLAN.
- `gmode`: Specifies the any source and group (*,G).

### Defaults

By default, BVLANs are configured to use the (S,G) mode.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The BVLAN ID specified with this command must already exist in the switch configuration.
- The (S,G) mode identifies a source-specific multicast distribution tree.
- The (*,G) mode identifies a shared multicast distribution tree.

### Examples

- `-> spb isis bvlan 200 tandem-multicast-mode gmode`
- `-> spb isis bvlan 720 tandem-multicast-mode sgmode`

### Release History

Release 7.3.1; command introduced.
Related Commands

spb bvlan  Creates a SPB backbone VLAN (BVLAN).

MIB Objects

alcatelIND1IIsisSpbEctStaticTable
  alcatelIND1IIsisSpbEctStaticEntryBaseVid
  alcatelIND1IIsisSpbEctStaticEntryMulticastMode
**spb isis bridge-priority**

Configures the bridge priority value for the SPB bridge. This value is used to rank an SPB bridge in relation to other bridges.

**spb isis bridge-priority priority**

---

**Syntax Definitions**

*priority* A bridge priority value. The valid range is 0–65535.

**Defaults**

By default, the bridge priority value for the switch is set to 32768.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The lower the bridge priority number assigned, the higher the priority that is associated with the bridge.
- The bridge priority value makes up the upper two bytes of the eight-byte SPB bridge ID. The lower six bytes of the Bridge ID contain the system ID, which is the dedicated bridge MAC address of the SPB bridge.
- Setting a different bridge priority value on different SPB bridges will override the system identifier significance during the shortest path tree (SPT) calculation.

**Examples**

- `--> spb isis bridge-priority 15`
- `--> spb isis bridge-priority 32768`

**Release History**

Release 7.3.1; command introduced.
Related Commands

show spb isis info      Displays the status and configuration information for the SPB bridge.

MIB Objects

alcatelIND1IsisSpbSys
  alcatelIND1IsisSpbSysBridgePriority
spb isis interface

Configures the specified port or link aggregate as an ISIS-SPB interface on which protocol data units (PDUs) are sent and received to detect neighbors and form adjacencies with other SPB bridges in the network.

```
spb isis interface {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} [admin-state {enable | disable}] [hello-interval seconds] [hello-multiplier count] [metric metric] [type {p2p | multi-access}] [priority priority]
```

```
no spb isis interface {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

---

**Syntax Definitions**

- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[-agg_id2]**: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- **enable**: Administratively enables the SPB interface.
- **disable**: Administratively disables the SPB interface.
- **seconds**: The amount of time, in seconds, to wait between each transmission of a hello packet from this interface. The valid range is 1–20000.
- **count**: An integer value that is multiplied by the hello interval time to determine the amount of time, in seconds, a receiving bridge holds onto the hello packets transmitted from this interface. The valid range is 2–100.
- **metric**: An integer value that specifies the link cost to reach the destination BMAC. The valid range is 1–16777215.
- **p2p**: Configures the interface as an SPB point-to-point interface (P2P) on which one adjacency is allowed.
- **multi-access**: Configures the interface as an SPB multiple access LAN interface on which multiple adjacencies are allowed.
- **priority**: The priority value assigned to the ISIS-SPB interface. The valid range is 1–127. This value applies only when the interface is configured as an SPB multiple access LAN interface.
Defaults

<table>

<td>Yes</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to remove the ISIS-SPB interface.
- When configuring a link aggregate as an SPB interface, make sure the link aggregate ID number already exists in the switch configuration.
- All SPB interfaces are automatically assigned to all existing BVLANs. There is one ISIS-SPB instance per switch, and each BVLAN and SPB interface is associated with that instance.
- If the SPB interface metric value is set to a different value for each side of a link, the highest metric value is applied to the entire link.
- Administratively enabling ISIS-SPB on the switch, triggers IS-IS hello packet transmissions on all SPB interfaces.
- Configuring a port or link aggregate as an SPB multiple access (multi-access) LAN interface allows multiple adjacencies to form on that interface. This is particularly useful for extending an SPB backbone over a shared Ethernet domain, such as a shared service provider network or even connect to another ISIS-SPB domain.

Note. Software releases prior to AOS Release 8.7R1 do not process pseudo-node LSPs generated by multi-access interfaces. As a result, SPB nodes running such software may experience inconsistent connectivity to destinations beyond the shared Ethernet network segment. If such network reachability is desired, those SPB nodes must be upgraded to AOS Release 8.7R1.

- Consider the following when an interface is configured as an SPB multi-access interface:
  - LAN IS-IS Hello (IIH) packets containing a priority value and a LAN ID (System ID plus a unique local Circuit ID) are exchanged between multi-access LAN interfaces to discover neighbors and form adjacencies over a shared network.
A Designated Intermediate System (DIS) election process determines which multi-access LAN interface will serve as the DIS for the network. A DIS is elected based on which interface has the highest configurable priority value, with the highest backbone MAC address (BMAC) used as a tiebreaker.

All multi-access LAN interfaces report their adjacencies to the DIS. The DIS represents all of the multi-access links as a virtual SPB node (pseudo-node) to IS-IS by generating a pseudo-node LSP. This type of LSP contains a list all the multi-access links, including the DIS, that comprise the virtual SPB node.

The DIS is responsible for synchronizing the LSP database across a shared, multiple access network and calculating the shortest path through the shared network. All shortest paths calculated travel through the DIS.

The shared network (such as a service provider network) serves as the core over which an SPB multiple access domain is configured. Backbone Edge Bridges (BEBs) connect to the shared network instead of Backbone Core Bridges (BCB).

Configuring an SPB P2P interface and an SPB multi-access LAN interface on the same switch is supported.

- SPB interfaces are typically the Network Network Interface (NNI) ports that carry encapsulated customer data traffic through the Provider Backbone Bridge (PBB) network.
- Note that configuring a port or link aggregate as an SPB interface does not prevent configuration of other VLAN tagging on that port. In other words, the SPB interface can forward regular traffic for other VLAN types in addition to encapsulated SPBM traffic.

**Examples**

-> spb isis interface port 1/4/7
-> spb isis interface port 1/4/7 hello-interval 60
-> spb isis interface linkagg 3
-> spb isis interface linkagg 3 hello-multiplier 10
-> spb isis interface port 1/1/10 hello-interval 20 hello-multiplier 5 metric 2
-> no spb isis interface port 1/4/7
-> no spb isis interface linkagg 3

-> spb isis interface port 1/4/7 type multi-access
-> spb isis interface port 1/4/7 type p2p
-> spb isis interface linkagg 3 type multi-access
-> spb isis interface linkagg 3 type p2p

**Release History**

Release 7.3.1; command introduced.
Release 8.7R1; p2p, multi-access, and priority parameters added.

**Related Commands**

```
**spb ipvpn bind**

Binds a virtual routing and forwarding (VRF) instance, a Shortest Path Bridging (SPB) service instance identifier (ISID), and an IP gateway together to enable the bidirectional exchange of routes between the VRF and SPB ISID via the Global Route Manager (GRM).

```
spb ipvpn bind vrf {vrf_name | default} isid instance_id gateway ip_address {all-routes | import-route-map route_map_name}

no spb ipvpn bind vrf {vrf_name | default} isid instance_id gateway ip_address
```

### Syntax Definitions

- **vrf_name | default**
  
  The name of an existing VRF instance for which routes are imported from the Global Routing Table (GRT) to ISIS-SPB. Enter `default` to specify the default VRF instance.

- **instance_id**
  
  An existing ISID that identifies a Shortest Path Bridging (SPB) service in a provider backbone bridge (PBB) network.

- **ip_address**
  
  The IPv4 address of an IP interface that is associated with the specified VRF instance.

- **all-routes**
  
  Imports or exports all routes for this bind entry.

- **route_map_name**
  
  The name of an existing route map to use for filtering VRF routes that are imported from the GRT to ISIS-SPB for this bind entry. There is no filtering from ISIS-SPB to the GRT.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>No</td>
</tr>
<tr>
<td>6465</td>
<td>No</td>
</tr>
<tr>
<td>6560</td>
<td>No</td>
</tr>
<tr>
<td>6570M</td>
<td>No</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
</tr>
<tr>
<td>6860N</td>
<td>Yes</td>
</tr>
<tr>
<td>6865</td>
<td>Yes</td>
</tr>
<tr>
<td>6900</td>
<td>Yes</td>
</tr>
<tr>
<td>6900 V72/C32</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to remove the VRF-ISID bind entry. When the bind is deleted, all routes imported and exported for this binding are retracted.

- The specified VRF name, ISID, gateway IP address, and optional route map name must already exist in the local switch configuration. In addition, the specified route map must exist in the default VRF instance.

- Only one ISID can be bound to a single VRF/gateway IP instance.
The VRF-ISID binding is only active when the VRF exists, the ISID is configured on the local switch, and the gateway IP address is associated with an active IP interface that is associated with the VRF instance.

An active "bind" entry causes ISIS-SPB to export learned routes from the SPB network to the GRM and triggers the GRM to send IP routes from the corresponding VRF to ISIS-SPB using the ISID and gateway IP address as the next hop.

A VRF-ISID binding identifies an L3 VPN interface that will exchange routes between the VLAN domain (VRF instance) and the SPB service domain (I-SID). An L3 VPN interface is required when configuring IP routing over SPB. For more information and configuration examples, refer to the “IP over SPB” section of the “Configuring Shortest Path Bridging” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide*.

**Examples**

```plaintext
-> spb ipvpn bind vrf1 isid 1000 gateway 10.1.1.1 all-routes
-> spb ipvpn bind vrf2 isid 2000 gateway 20.2.2.1 import-route-map rm_vrf2
-> no spb ipvpn bind vrf1 isid 1000 gateway 10.1.1.1
```

**Release History**

Release 7.3.2; command introduced.

**Related Commands**

- `spb ipvpn redist`  
  Configures the redistribution of routes from a VRF to an ISID or from one ISID to another ISID.

- `show spb ipvpn bind`  
  Displays VRF-to-ISID bindings that enable the import and export of routes between VRFs and ISIDs.

**MIB Objects**

- `alcatelIND1IsisSpbIPVPNBindTable`
- `alcatelIND1IsisSpbIPVPNBindVrfName`
- `alcatelIND1IsisSpbIPVPNBindIsid`
- `alcatelIND1IsisSpbIPVPNBindGatewayType`
- `alcatelIND1IsisSpbIPVPNBindGateway`
- `alcatelIND1IsisSpbIPVPNBindImportRouteMap`
- `alcatelIND1IsisSpbIPVPNBindRowStatus`
**spb ipvpn redist**

Configures the redistribution of routes from a VRF to an ISID or from one ISID to another ISID.

```
spb ipvpn redist {source-vrf {vrf_name | default} | source-isid instance_id} destination-isid instance_id {all-routes | route-map route_map_name}
```

```
no spb ipvpn redist {source-vrf vrf_name | source-isid instance_id} destination-isid instance_id
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf_name</td>
<td>default</td>
</tr>
<tr>
<td>source-isid instance_id</td>
<td>The source ISID from which routes are redistributed.</td>
</tr>
<tr>
<td>destination-isid instance_id</td>
<td>The destination ISID to which routes from either the source VRF or source ISD are redistributed.</td>
</tr>
<tr>
<td>all-routes</td>
<td>route_map_name</td>
</tr>
<tr>
<td>route_map_name</td>
<td>The name of an existing route map to use for filtering routes that are redistributed.</td>
</tr>
</tbody>
</table>

** Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove the redistribution entry.
- The specified VRF name, ISID, and optional route map name must already exist in the local switch configuration.
- A redistribution entry is only active when the ISID belongs to an active bind entry. This applies to both ISIDs when redistributing between a source and destination ISID.
- An ISID cannot be bound and redistributed to the same VRF instance.
- The difference between a bind entry and a redistribution entry is as follows:
  - A bind entry binds only one I-SID to one VRF/gateway IP instance. IP VPN routes are then imported and exported bidirectionally between the VRF and I-SID.
  - A redistribution entry allows multiple VRFs to redistribute routes into one I-SID. However, IP VPN routes are only redistributed into the I-SID; there is no bidirectional exchange of routes between the
VRF and I-SID. Redistribution is mainly used when routing between I-SIDs is required.

**Examples**

-> spb ipvpn redist source-isid 1000 destination-isid 2000 all-routes
-> spb ipvpn redist source-isid 2000 destination-isid 1000 all-routes
-> spb ipvpn redist source-vrf vrf1 destination-isid 3000 route-map rm_isid2000
-> no spb ipvpn redist source-vrf vrf1 destination-isid 3000
-> no spb ipvpn redist source-isid 2000 destination isid 1000

**Release History**

Release 7.3.2; command introduced.

**Related Commands**

spb ipvpn bind

Binds a VRF instance, an ISID, and an IP gateway together to enable the bidirectional exchange of routes between the VRF and ISID via the GRM.

show spb ipvpn redist

Displays the SPB IPVPN redistribution configuration for the switch.

**show spb ipvpn bind**

Displays VRF-to-ISID bindings that enable the import and export of routes between VRFs and ISIDs.

```
show spb ipvpn bind [vrf {vrf_name | default}] [isid instance_id]
```

### Syntax Definitions

- **vrf_name | default**: The name of a VRF instance that is associated with an SPB IPVPN binding. Enter `default` to specify the default VRF instance.
- **instance_id**: An ISID number that is associated with an SPB IPVPN binding.

### Defaults

By default, all SPB IPVPN bindings are displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `vrf` and `isid` parameters to display the configuration for specific bindings.

### Examples

```
$ -> show spb ipvpn bind
Legend: * indicates bind entry is active
SPB IPVPN Bind Table:
+---------+---------+-----------+----------------+------------------+
| VRF     | ISID    | Gateway   | Route-Map      |
|---------+---------+-----------+----------------+------------------+
| * ospf  | 4001    | 1.1.1.2   |                |
| * ospf1 | 4003    | 2.2.2.2   |                |
```

Total Bind Entries: 2

### Output Definitions

- **VRF**: The name of the VRF instance associated with this binding.
- **ISID**: The ISID number associated with this binding.
- **Gateway**: The gateway IP address associated with this binding. This is the IP address specified for an IP interface that is associated with the VRF in this binding.
- **Route-Map**: The name of an IP route map or All Routes.
Release History

Release 7.3.2; command introduced.

Related Commands

spb ipvpn bind  Binds a VRF instance, an ISID, and an IP gateway together to enable the bidirectional exchange of routes between the VRF and ISID via the GRM.

show spb ipvpn redist  Displays the SPB IP VPN redistribution configuration for the switch.

show spb ipvpn route-table Displays the contents of the SPB IPVPN route table.

MIB Objects

alcatelIND1IsisSpbIPVPNBindTable
  alcatelIND1IsisSpbIPVPNBindVrfName

  alcatelIND1IsisSpbIPVPNBindGatewayType
  alcatelIND1IsisSpbIPVPNBindGateway
  alcatelIND1IsisSpbIPVPNBindRouteMap
show spb ipvpn redist

Displays the SPB IPVPN redistribution configuration for the switch. This configuration controls the redistribution of IP VPN routes from ISID to ISID or from VRF to ISID.

show spb ipvpn redist [vrf | [isid]]

Syntax Definitions

vrf Displays the VRF redistribution table.
isid Displays the ISID redistribution table.

Defaults

By default, both the VRF and ISID redistribution tables are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>

Routes: 30

**output definitions**

- **ISID**: The ISID number associated with this route.
- **Destination**: Destination IP address. Also includes the prefix length notation after the address to indicate the number of bits that are significant in the IPv6 address (mask).
- **Gateway**: IP address of the gateway from which this route was learned.
- **Source Bridge (Name : BMAC)**: The name and BMAC address of the SPB BEB switch that advertised the route.
- **Metric**: The metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.

**Release History**

Release 7.3.2; command introduced.

**Related Commands**

- `show spb ipvpn redist`: Displays the SPB IPVPN redistribution configuration for the switch.
- `show spb ipvpn bind`: Displays the VRF-ISID binding configuration.

**spb ipv6 bind**

Binds a virtual routing and forwarding (VRF) instance, a Shortest Path Bridging (SPB) service instance identifier (ISID), and an IPv6 gateway together to enable the bidirectional exchange of routes between the VRF and SPB ISID via the Global Route Manager (GRM).

```
spb ipv6 bind vrf {vrf_name | default} isid instance_id gateway ipv6_address {all-routes | import-route-map route_map_name}
```

```
no spb ipv6 bind vrf {vrf_name | default} isid instance_id gateway ipv6_address
```

**Syntax Definitions**

- `vrf_name | default`: The name of an existing VRF instance for which routes are imported from the Global Routing Table (GRT) to ISIS-SPB. Enter `default` to specify the default VRF instance.
- `instance_id`: An existing ISID that identifies a Shortest Path Bridging (SPB) service in a provider backbone bridge (PBB) network.
- `ipv6_address`: The IPv6 address of an IPv6 interface that is associated with the specified VRF instance.
- `all-routes`: Imports or exports all routes for this bind entry.
- `route_map_name`: The name of an existing route map to use for filtering VRF routes that are imported from the GRT to ISIS-SPB for this bind entry. There is no filtering from ISIS-SPB to the GRT.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove the VRF-ISID bind entry. When the bind is deleted, all routes imported and exported for this binding are retracted.

- The specified VRF name, ISID, gateway IPv6 address, and optional route map name must already exist in the local switch configuration. In addition, the specified route map must exist in the default VRF instance.

- Only one ISID can be bound to a single VRF/gateway IPv6 instance.
The VRF-ISID binding is only active when the VRF exists, the ISID is configured on the local switch, and the gateway IPv6 address is associated with an active IPv6 interface that is associated with the VRF instance.

An active "bind" entry causes ISIS-SPB to export learned routes from the SPB network to the GRM and triggers the GRM to send IPv6 routes from the corresponding VRF to ISIS-SPB using the ISID and gateway IPv6 address as the next hop.

A VRF-ISID binding identifies an L3 VPN interface that will exchange routes between the VLAN domain (VRF instance) and the SPB service domain (I-SID). An L3 VPN interface is required when configuring IPv6 routing over SPB. For more information and configuration examples, refer to the “IP over SPB” section of the “Configuring Shortest Path Bridging” chapter in the OmniSwitch AOS Release 8 Network Configuration Guide.

**Examples**

```bash
-> spb ipv6 bind vrf1 isid 1000 gateway 1000::1 all-routes
-> spb ipv6 bind vrf2 isid 2000 gateway 2000::1 import-route-map rm_vrf2
-> no spb ipv6 bind vrf1 isid 1000 gateway 1000::1
```

**Release History**

Release 8.5R2; command introduced.

**Related Commands**

- **spb ipv6 redist**  
  Configures the redistribution of routes from a VRF to an ISID or from one ISID to another ISID.

- **show spb ipv6 bind**  
  Displays VRF-to-ISID bindings that enable the import and export of routes between VRFs and ISIDs.

- alcatelIND1IsisSpbIPVPNBindRowStatus
**spb ipv6 redist**

Configures the redistribution of IPv6 routes from a VRF to an ISID or from one ISID to another ISID.

```
spb ipv6 redist {source-vrf {vrf_name | default} | source-isid instance_id} destination-isid instance_id {all-routes | route-map route_map_name}
```

```
no spb ipv6 redist {source-vrf vrf_name | source-isid instance_id} destination-isid instance_id
```

### Syntax Definitions

| **vrf_name | default** | The source VRF instance from which routes are redistributed. Enter default to specify the default VRF instance. |
| source-isid instance_id | The source ISID from which routes are redistributed. |
| destination-isid instance_id | The destination ISID to which routes from either the source VRF or source ISD are redistributed. |
| all-routes | Imports or exports all routes for this bind entry. |
| route_map_name | The name of an existing route map to use for filtering routes that are redistributed. |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **no** form of this command to remove the redistribution entry.
- The specified VRF name, ISID, and optional route map name must already exist in the local switch configuration.
- A redistribution entry is only active when the ISID belongs to an active bind entry. This applies to both ISIDs when redistributing between a source and destination ISID.
- An ISID cannot be bound and redistributed to the same VRF instance.
- The difference between a bind entry and a redistribution entry is as follows:
  - A bind entry binds only one I-SID to one VRF/IPv6 gateway instance. IPv6 VPN routes are then imported and exported bidirectionally between the VRF and I-SID.
  - A redistribution entry allows multiple VRFs to redistribute routes into one I-SID. However, IPv6 VPN routes are only redistributed into the I-SID; there is no bidirectional exchange of routes.
between the VRF and I-SID. Redistribution is mainly used when routing between I-SIDs is required.

**Examples**

- `-> spb ipv6 redist source-isid 1000 destination-isid 2000 all-routes`
- `-> spb ipv6 redist source-isid 2000 destination-isid 1000 all-routes`
- `-> spb ipv6 redist source-vrf vrf1 destination-isid 3000 route-map rm_isid2000`
- `-> no spb ipv6 redist source-vrf vrf1 destination-isid 3000`
- `-> no spb ipv6 redist source-isid 2000 destination-isid 1000`

**Release History**

Release 8.5R2; command introduced.

**Related Commands**

- **spb ipv6 bind**
  Binds a VRF instance, an ISID, and an IPv6 gateway together to enable the bidirectional exchange of routes between the VRF and ISID via the GRM.

- **show spb ipv6 redist**
  Displays the SPB IPv6 VPN redistribution configuration for the switch.

**show spb ipv6 bind**

Displays VRF-to-ISID bindings that enable the import and export of IPv6 routes between VRFs and ISIDs.

`show spb ipv6 bind [vrf {vrf_name | default}] [isid instance_id]`

---

**Syntax Definitions**

- **vrf_name | default**
The name of a VRF instance that is associated with an SPB IPv6 VPN binding. Enter `default` to specify the default VRF instance.

- **instance_id**
An ISID number that is associated with an SPB IPv6 VPN binding.

**Defaults**

By default, all SPB IPv6 VPN bindings are displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `vrf` and `isid` parameters to display the configuration for specific bindings.

**Examples**

```
-> show spb ipv6 bind
Legend: * indicates bind entry is active
SPB IPVPN Bind Table:

+---------------------+------------+---------------------+---------------------+
| VRF   | ISID      | Gateway             | Route-Map           |
+---------------------+------------+---------------------+---------------------+
| * ospf              | 4001       | 1000::1             |                     |
| * ospf1             | 4003       | 2000::1             |                     |
+---------------------+------------+---------------------+---------------------+

Total Bind Entries: 2
```

**Output definitions**

- **VRF**
The name of the VRF instance associated with this binding.

- **ISID**
The ISID number associated with this binding.

- **Gateway**
The gateway IPv6 address associated with this binding. This is the IPv6 address configured for an IPv6 interface that is associated with the VRF in this binding.

- **Route-Map**
The name of an IPv6 route map or All Routes.
**Release History**

Release 8.5R2; command introduced.

**Related Commands**

- **spb ipv6 bind**
  Binds a VRF instance, an ISID, and an IPv6 gateway together to enable the bidirectional exchange of routes between the VRF and ISID via the GRM.

- **show spb ipv6 redist**
  Displays the SPB IPv6 VPN redistribution configuration for the switch.

- **show spb ipv6 route-table**
  Displays the contents of the SPB IPv6 VPN route table.

**MIB Objects**

alcatelIND1IsisSpbIPVPNBindTable
  - alcatelIND1IsisSpbIPVPNBindVrfName

  - alcatelIND1IsisSpbIPVPNBindGateway
  - alcatelIND1IsisSpbIPVPNBindRouteMap
show spb ipv6 redist

Displays the SPB IPv6 VPN redistribution configuration for the switch. This configuration controls the redistribution of IPv6 VPN routes from ISID to ISID or from VRF to ISID.

show spb ipv6 redist [vrf | [isid]]

Syntax Definitions

vrf Displays the VRF redistribution table.

isid Displays the ISID redistribution table.

Defaults

By default, both the VRF and ISID redistribution tables are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>

<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the **isid** parameter to display the contents of the ISID redistribution table (ISID to ISID).
- Use the **vrf** parameter to display the contents of the VRF redistribution table (VRF to ISID).

Examples

```- show spb ipv6 redist
Legend: * indicates redist entry is active
SPB IPv6 Redist ISID Table:
Source-ISID Destination-ISID Route-Map
---------------------------------------------+
* 4001 4003
* 4003 4001

Total Redist ISID Entries: 2
Legend: * indicates redist entry is active
SPB IPv6 Redist VRF Table:
Source-VRF Destination-ISID Route-Map
---------------------------------------------+

Total Redist Vrf Entries: 0```

vrf Displays the VRF redistribution table.
isid Displays the ISID redistribution table.
-> show spb ipv6 redist isid
Legend: * indicates redist entry is active
SPB IPVPN Redist ISID Table:
Source-ISID    Destination-ISID     Route-Map
-----------------+--------------------+-----------------
* 4001          4003
* 4003          4001

Total Redist ISID Entries: 2
-> show spb ipv6 redist vrf
Legend: * indicates redist entry is active
SPB IPVPN Redist VRF Table:
Source-VRF            Destination-ISID     Route-Map
---------------------+--------------------+-----------------
Total Redist Vrf Entries: 0

- `alcatelIND1IsisSpbIPVPNRouteMetric`
spb isis admin-state

Enables or disables the administrative status of ISIS-SPB instance for the switch.

```
spb isis admin-state {enable | disable}
```

**Syntax Definitions**

- **enable**: Administratively enables ISIS-SPB for the switch.
- **disable**: Administratively disables ISIS-SPB for the switch.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When the ISIS-SPB status is disabled, the configuration settings and related statistics of the protocol remain unaffected.

**Examples**

```
-> spb isis admin-state enable
-> spb isis admin-state disable
```

**Release History**

Release 7.3.1; command was introduced.

**Related Commands**

- `show spb isis info`: Displays status and configuration information for the SPB instance.

**MIB Objects**

- `alcatelIND1IsisSpbSys`
- `alcatelIND1IsisSpbSysAdminState`
**spb isis area-address**

Configures the area address for the ISIS-SPB instance.

```
spb isis area-address area_address
```

### Syntax Definitions

- **area_address**: A 3-byte integer that specifies the ISIS-SPB area address to join.

### Defaults

By default, the area address is set to 0.0.0. for ISIS-SPB.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The area address is entered in decimal format with this command but is converted and sent out as a hex value on the wire. For example, if the decimal value entered is “73.00.00”, then the hex value actually sent out on the wire is “49.00.00”.
- The default setting of 0.0.0 is the area address typically used for ISIS-SPB.
- Changing the area address with this command is allowed, but make sure to configure each bridge that will participate in the ISIS-SPB instance with the same area address value.
- ISIS-SPB and ISIS-IP instances may co-exist on the same bridge.

### Examples

```
-> spb isis area-address 1.1.1
-> spb isis area-address 0.0.0
```

### Release History

Release 7.3.1; command was introduced.
**Related Commands**

`show spb isis info`  
Displays status and configuration information for the SPB instance.

**MIB Objects**

`alcatelIND1IsisSpbSys`  
`alcatelIND1IsisSpbSysAreaAddress`
**spb isis source-id**

Configures the shortest path (SP) source identifier value for the SPB bridge. This value identifies the source of multicast frames and is relevant only in multicast tandem replication mode.

```
spb isis source-id {source_id | auto}
```

---

**Syntax Definitions**

- **source_id**: A source identifier entered as xx-xx-xx, where xx is a hexadecimal value.
- **auto**: Changes the source ID back to the default value.

---

**Defaults**

By default, the last three least significant bytes of the system ID is used for the source ID.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

The source ID is the high order 3 bytes for the Group Address DA for the SPB bridge. Note that only 20 bits are used; the top 4 bits are not used.

---

**Examples**

- `-> spb isis source-id 00-2a-1d`
- `-> spb isis source-id 07-0b-d3`
- `-> spb isis source-id auto`

---

**Release History**

Release 7.3.1; command introduced.

---

**Related Commands**

- `show spb isis info`: Displays status and configuration information for the SPB instance.

---

**MIB Objects**

- `alcatelIND1IsisSpbSys`
- `alcatelIND1IsisSpbmSysSPSourceId`
**spb isis control-address**

Changes the ISIS-SPB control MAC address, which is used as the destination address for ISIS-SPB control packets.

```
spb isis control-address {alll1 | alll2 | allis}
```

### Syntax Definitions

- **alll1**: All Level 1 Intermediate Systems (01:80:C2:00:00:14).
- **alll2**: All Level 2 Intermediate Systems (01:80:C2:00:00:15).
- **allis**: All Intermediate Systems (09:00:2B:00:00:05).

### Defaults

By default, the control MAC address is set to AllL1.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

### Usage Guidelines

Changing the ISIS-SPB control MAC address on the OmniSwitch can enhance interoperability with third-party ISIS-SPB devices.

### Examples

```
-> spb isis control-address alll1
-> spb isis control-address alll2
-> spb isis control-address allis
```

### Release History

Release 7.3.2; command introduced.
**Related Commands**

*show spb isis info* Displays the status and configuration information for the SPB instance.

**MIB Objects**

- *alcatelIND1IsisSpbSys*
  - *alcatelIND1IsisSpbSysControlAddr*
**spb isis spf-wait**

Configures the time intervals between the first, second, and subsequent ISIS-SPB shortest path first (SPF) calculations.

```
spb isis spf-wait [initial-wait milliseconds | second-wait milliseconds] max-wait milliseconds]
```

**Syntax Definitions**

- **initial-wait milliseconds**
  Specifies the number of milliseconds to wait before triggering an initial SPF calculation after a topology change. The valid range is 10–100000 milliseconds. Specify a value that is the same or less than the maximum wait time value.

- **second-wait milliseconds**
  Specifies the minimum number of milliseconds to wait between the first and second SPF calculation. The valid range is 1–100000 milliseconds. Specify a value that is the same or less than the maximum wait time value.

- **max-wait milliseconds**
  Specifies the maximum number of milliseconds to wait between two consecutive SPF calculations. Enter a value that is the same or greater than the second wait time value. The valid range is 1000–120000 milliseconds.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>max-wait milliseconds</td>
<td>1000</td>
</tr>
<tr>
<td>initial-wait milliseconds</td>
<td>100</td>
</tr>
<tr>
<td>second-wait milliseconds</td>
<td>300</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- To reset all three of the SPF wait time intervals back to their default values, use the `spb isis spf-wait` command without specifying any parameters.

- Subsequent SPF calculations, if required, are generated at exponentially increasing intervals of the SPF `second-wait` parameter value until the `maximum-wait` parameter value is reached. For example, if the second-wait interval value is set to 1000 milliseconds, then the next SPF calculation is triggered after
2000 milliseconds and the next SPF calculation after that is triggered at 4000 milliseconds, and so on, until the maximum-wait interval value is reached.

- When the maximum interval value is reached, the SPF wait interval will stay at the maximum value until there are no more SPF calculations scheduled during that interval. After a full interval without any SPF calculations, the SPF wait interval will reset back to the initial-wait parameter interval value.

**Examples**
-> spb isis spf-wait max-wait 2500 initial-wait 1000 second-wait 1500
-> spb isis spf-wait max-wait 5000
-> spb isis spf-wait initial-wait 1000
-> spb isis spf-wait second-wait 2000
-> spb isis spf-wait

**Release History**
Release 7.3.1; command was introduced.

**Related Commands**
spb isis lsp-wait Configures the time intervals between the first, second, and subsequent generation of link state PDUs (LSPs).
show spb isis info Displays status and configuration information for the SPB instance.

**MIB Objects**
```plaintext
alcatelIND1IsisSpbProtocolConfig
  alcatelIND1IsisSpbProtocolSpfMaxWait
  alcatelIND1IsisSpbProtocolSpfInitialWait
  alcatelIND1IsisSpbProtocolSpfSecondWait
```
**spb isis lsp-wait**

Configures the time intervals between the first, second and subsequently generated link state PDU (LSP).

`spb isis lsp-wait {max-wait milliseconds | initial-wait milliseconds | second-wait milliseconds}`

### Syntax Definitions

**max-wait milliseconds**

Specifies the maximum number of seconds to wait between two consecutively generated LSPs. Enter a value that is the same or greater than the second wait time value. The valid range is 1000–120000 milliseconds.

**initial-wait milliseconds**

Specifies the number of seconds to wait before triggering an initial LSP generation after a topology change. The valid range is 0–100000 milliseconds. Specify a value that is the same or less than the maximum wait time value.

**second-wait milliseconds**

Specifies the minimum number of seconds to wait between the first and second generated LSPs. The valid range is 1000–100000 milliseconds. Specify a value that is the same or less than the maximum wait time value.

### Defaults

<table>
<thead>
<tr>

### Usage Guidelines

- To reset all three of the LSP wait time intervals back to their default values, use the `spb isis lsp-wait` command without specifying any parameters.

- Subsequent LSP, if required, are generated at exponentially increasing intervals of the LSP `second-wait` parameter value until the `maximum-wait` parameter value is reached. For example, if the second-wait interval value is set to 10 seconds, then the next LSP is generation is triggered after 20 seconds and the next LSP generated after that is triggered at 40 seconds, and so on, until the maximum-wait interval value is reached.
When the maximum interval value is reached, the LSP wait interval will stay at the maximum value until there are no more LSP generations during that interval. After a full interval without any LSP generations, the LSP wait interval will reset back to the initial-wait parameter interval value.

**Examples**

- `spb isis lsp-wait max-wait 2000 initial-wait 1000 second-wait 1500`
- `spb isis lsp-wait max-wait 5000`
- `spb isis lsp-wait initial-wait 2500`
- `spb isis lsp-wait second-wait 3000`
- `spb isis lsp-wait`

**Release History**

Release 7.3.1; command was introduced.

**Related Commands**

- `spb isis spf-wait` Configures the time intervals between the first, second, and subsequent shortest path first (SPF) calculations.
- `show spb isis info` Displays status and configuration information for the SPB instance.

**MIB Objects**

- `alcatelIND1IsisSpbProtocolConfig`

  - `alcatelIND1IsisSpbProtocolLspInitialWait`
  - `alcatelIND1IsisSpbProtocolLspSecondWait`
spb isis rapid-lsp-converge

Configures the status of ISIS-SPB rapid link state PDU (LSP) convergence and reserves an SPB I-SID to identify a multicast domain. When rapid LSP convergence is enabled (the default) and a topology event occurs, LSP frames are flooded on the multicast domain to all participating SPB bridges to expedite network notification and convergence time.

**spb isis rapid-lsp-converge {isid instance_id | admin-state {enable | disable}}**

**Syntax Definitions**

- **instance_id**: An SPB service instance identifier (I-SID). The valid range is 256–16777214 (or 0.1.0–255.255.254 in dot-decimal notation format).
- **enable**: Enables rapid LSP convergence.
- **disable**: Disables rapid LSP convergence.

**Defaults**

By default, rapid LSP convergence is enabled for the switch and the I-SID number is set to 16776961 or 255.255.1.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The reserved I-SID is always associated with the control BVLAN and is only modifiable when rapid LSP convergence is disabled.
- When changing the default I-SID value, make sure the new value specified is not associated with any SPB service. The specified I-SID will be reserved only for rapid LSP convergence.

**Examples**

- `-> spb isis rapid-lsp-convergence admin-state disable`
- `-> spb isis rapid-lsp-convergence isid 4001`
- `-> spb isis rapid-lsp-convergence isid 220.1.1`
- `-> spb isis rapid-lsp-convergence admin-state enable`

**Release History**

Release 8.5R2; command was introduced.
Related Commands

show spb isis rapid-lsp-converge-info
Displays the ISIS-SPB rapid LSP convergence information for the switch.

show spb isis rapid-lsp-converge-table
Displays the multicast forwarding information for all of the SPB bridges that are participating in rapid LSP convergence.

MIB Objects

alcatelIND1ISISSpbRapidLspConvergence
  alcatelIND1ISISSpbRapidLspConvergenceAdminStatus
  alcatelIND1ISISSpbRapidLspConvergenceIsid
**spb isis overload**

Configures the LSP database overload state for the local ISIS-SPB switch and optionally specifies the amount of time the switch remains in this state. When the overload state is enabled, the switch signals to other ISIS-SPB switches that it is not able to accept transit traffic.

**spb isis overload [timeout seconds]**

**no spb isis overload**

**Syntax Definitions**

*seconds* Specifies the timeout interval, in seconds. The valid range is 60–1800.

**Defaults**

By default, the IS-IS overload state is disabled.

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>0</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the *no* form of this command to make the router exit the overload state.
- If the time period is not specified, the router remains in the overload state for an infinite period.
- During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is used only if the destination route is directly reachable by the router (for example, it will not be used for other transit traffic).
- This command can be used when the router is overloaded or before executing a shutdown command to divert traffic around the router.

**Examples**

- `-> spb isis overload timeout 70`
- `-> no spb isis overload`
**Release History**

Release 7.3.1; command was introduced.

**Related Commands**

- **spb isis overload-on-boot**
  Configures the ISIS-SPB instance to operate in an overload state during bootup for a specified time period.

- **show spb isis info**
  Displays status and configuration information for the ISIS-SPB instance.

**MIB Objects**

- alcatelIND1IsisSpbSysSetOverload
- alcatelIND1IsisSpbSysOverloadTimeout
- alcatelIND1IsisSpbSysOverloadStatus
**spb isis overload-on-boot**

Configures the ISIS-SPB switch to operate in the overload state after a system bootup for the specified amount of time.

```
spb isis overload-on-boot [timeout seconds]
```

```
no spb isis overload-on-boot
```

**Syntax Definitions**

`seconds` Specifies the timeout interval, in seconds. The valid range is 60–1800.

**Defaults**

By default, the ISIS-SPB switch will not operate in the overload state after a bootup.

```
<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>0</td>
</tr>
</tbody>
</table>
```

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
<table>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

- Use the `no` form of this command to prevent the switch from entering the overload state after bootup.
- This command configures the switch to operate in the overload state after a bootup and until the timeout value expires or the `no` form of this command is used.
- The `no spb isis overload` command does not influence the overload-on-boot function.

**Examples**

```
-> spb isis overload-on-boot timeout 80
-> no spb isis overload-on-boot
```

**Release History**

Release 7.3.1; command was introduced.
**Related Commands**

- `spb isis overload`  
  Sets the ISIS-SPB switch to operate in the overload state.

- `show spb isis info`  
  Displays status and configuration information for the ISIS-SPB instance.

**MIB Objects**

- `vRtrIsisTable`
  - `alcatelIND1IsisSpbSysOverloadOnBoot`
  - `alcatelIND1IsisSpbSysOverloadOnBootTimeout`
  - `alcatelIND1IsisSpbSysOverloadStatus`
**spb isis graceful-restart**

Configures graceful restart of the bridge. It allows ISIS-SPB to reconverge faster, minimizing service interruption.

**spb isis graceful-restart**

**no spb isis graceful-restart**

**Syntax Definitions**

N/A

**Defaults**

By default, the graceful restart functionality is enabled.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to disable graceful restart and remove the graceful restart configuration from the SPB bridge.
- When graceful restart is enabled, the bridge can either be a helper (which helps a neighbor router to restart) or a restarting router, or both.

**Examples**

```
-> spb isis graceful-restart
-> no spb isis graceful-restart
```

**Release History**

Release 7.3.1; command was introduced.
Related Commands

spb isis graceful-restart helper  Configures the helper mode of routers for graceful restart.
show spb isis info  Displays status and configuration information for the SPB instance.

MIB Objects

alcatelIND1IsisSpbProtocolConfig
   alcatelIND1IsisSpbProtocolGracefulRestart
spb isis graceful-restart helper

Administratively enables and disables the ISIS-SPB bridge to operate in the helper mode in response to a bridge performing a graceful restart.

spb isis graceful-restart helper {enable | disable}

Syntax Definitions

enable

   Enables the helper mode on the bridge.

disable

   Disables the helper mode on the bridge.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

Release History

Release 7.3.1; command was introduced.

Related Commands

- `show spb isis info` Displays status and configuration information for the SPB instance
- `show spb isis interface` Displays the ISIS-SPB network interface configuration for the bridge.

MIB Objects

N/A
show spb isis interface

Displays the ISIS-SPB network interface configuration for the switch.

show spb isis interface [port chassis/slot/port | linkagg agg_id]

Syntax Definitions

chassis/slot/port The chassis, slot, and port number (3/1/1).
agg_id The link aggregate ID number.

Defaults

By default, a list of ISIS-SPB interfaces is displayed with summary information.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- This command also shows the operational and administrative status of the interface.
- Use the port or linkagg parameter to display additional information for a specific ISIS-SPB interface.
- When an SPB interface is created, the interface is automatically assigned to each SPB BVLAN in the switch configuration.

Examples

-> show spb isis interface

Release History

Release 7.3.1; command was introduced.

Related Commands

- **show spb isis database**: Displays ISIS-SPB topology information maintained in the link state database (LSDB).
- **show spb isis nodes**: Displays the discovered node-level parameter values for all of the ISIS-SPB bridges participating in the topology.

MIB Objects

N/A
**show spb isis database**

Displays ISIS-SPB topology information maintained in the link state database (LSDB).

`show ip isis database [lsp-id lsp_id]`

---

**Syntax Definitions**

`lsp_id` The LSP ID.

**Defaults**

By default, the entire LSDB is displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `lsp-id` parameter with this command to view database information for a specific link state packet (LSP).

- An additional LSP, referred to as a pseudo-node LSP, is transmitted by the Designated Intermediate Switch (DIS) in an SPB multiple access domain. The pseudo-node LSP contains a list of all SPB nodes.

- If the LSP ID specified is a pseudo-node LSP that is generated by a Designated Intermediate Switch (DIS) in an SPB multiple access domain, the contents displayed will differ from that of a regular LSP generated in a point-to-point domain.
  - A DIS pseudo-node LSP lists all the SPB nodes that are connected to multiple access links as neighbors.
  - A regular LSP lists only the neighboring SPB node adjacency.

**Examples**

```
-> show spb isis database
Legends:  P   = The Partition repair bit is set
          OV  = The overload bit is set
          ATT = The Attach bit is set
          L1  = Specifies a Level 1 IS type
          L2  = Specifies a Level 2 IS type

Release History

Release 7.3.1; command was introduced.
Release 8.5R2; display output updated to include SPB IPv6 VPN information.
Release 8.7R1; display output updated to include pseudo-node LSP information.

Related Commands

**show spb isis adjacency**
Displays information about the ISIS-SPB adjacencies created for the SPB bridge.

**show spb isis nodes**
Displays the discovered node-level parameter values for all of the ISIS-SPB bridges participating in the topology.

MIB Objects

N/A
show spb isis nodes

Displays the discovered node-level parameter values for all of the ISIS-SPB switches participating in the topology.

show spb isis nodes

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command displays the system name, system ID, SPsource ID, and bridge priority parameter values for the bridges discovered within the ISIS-SPB topology.

**Examples**

```bash
-> show spb isis nodes
SPB ISIS Nodes:
System Name          System Id      SourceID BridgePriority
--------------------+---------------+--------+---------------
Bridge-1 00e0.b1e7.0188  0x70188  32768 (0x8000)
Bridge-2 00e0.b1e7.0bd3  0x70bd3  32768 (0x8000)
Bridge-4 e8e7.3200.2ald 0x02a1d  32768 (0x8000)
Bridge-5 e8e7.3233.1891 0x31891  32768 (0x8000)
Bridge-6 e8e7.3233.199d 0x3199d  32768 (0x8000)
Bridge-7 e8e7.3233.1a29 0x31a29  32768 (0x8000)
Bridge-8 e8e7.3233.1c81 0x31c81  32768 (0x8000)
```

**output definitions**

- **System Name**
  - The system name assigned to the SPB bridge.

- **System Id**
  - The system ID of the SPB bridge. The system ID is the base chassis MAC address of the SPB bridge.
output definitions (continued)

<table>
<thead>
<tr>
<th>SourceID</th>
<th>The shortest path (SP) source ID value for the SPB bridge. This value identifies the source of multicast frames and is relevant only in the multicast tandem replication mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>BridgePriority</td>
<td>The bridge priority value assigned to the SPB bridge.</td>
</tr>

**Release History**

Release 7.3.1; command was introduced.

**Related Commands**

- **show spb isis adjacency** Displays information about the ISIS-SPB adjacencies created for the SPB bridge.
- **show spb isis info** Displays status and configuration information for the SPB instance

**MIB Objects**

N/A
**show spb isis unicast-table**

Displays the unicast forwarding information for the specified BVLANs. Use this command to verify unicast addresses were learned correctly on each SPB switch in the ISIS-SPB backbone topology.

**show spb isis unicast-table [bvlan bvlan_id]**

---

**Syntax Definitions**

**bvlan_id**

The VLAND ID of an existing BVLAN.

---

**Defaults**

By default, the forwarding information for all BVLANs in the SPB topology is displayed.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

Release History

Release 7.3.1; command was introduced.

Related Commands

- **show spb isis bvlans**: Displays status and configuration information for the SPB instance.
- **show spb isis multicast-table**: Displays the multicast forwarding information for the specified service instance identifier (I-SID).

MIB Objects

N/A
**show spb isis services**

Displays the service instance identifier (I-SID) mapping for bridges participating in the SPB topology. This command provides a network-wide view of existing services to help verify that SPB services are correctly advertised and learned by ISIS-SPB.

**show spb isis services [isid instance_id | bvlan bvlan_id]**

---

**Syntax Definitions**

- **instance_id**: An existing I-SID number.
- **bvlan_id**: The VLAND ID of an existing BVLAN.

---

**Defaults**

By default, the mapping for all I-SIDs in the SPB topology is displayed.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>

N/A
show spb isis spf

Displays the shortest path first (SPF) information to all known SPB bridges for a specific BVLAN.

show spb isis spf bvlan \texttt{bvlan\_id} [\texttt{bmac mac\_address}]

### Syntax Definitions

- **bvlan\_id**
  - The VLAND ID of an existing BVLAN.
- **mac\_address**
  - An SPB bridge BMAC address.

### Defaults

By default, the SPF information for all known BMAC addresses for the specified BVLAN.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

**Release History**

Release 7.3.1; command was introduced.

**Related Commands**

- **show spb isis multicast-sources**
  Displays all the known multicast sources across the SPB domain and BVLANs.

- **show spb isis multicast-sources-spf**
  Displays the shortest path first (SPF) reachability for a known multicast source bridge for a specific BVLAN.

**MIB Objects**

N/A
**show spb isis multicast-sources**

Displays all the known multicast sources across the SPB domain and BVLANs.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command also displays whether or not the source is reachable.

**Examples**

```
-> show spb isis multicast-sources
SPB ISIS Multicast Source Nodes:
  Multicast Source (Name : BMAC)       Reachable  (# ) BVIDS
  -----------------------------------+-------------------  +---------------+----+
  BRIDGE-8 : 00:d0:95:0a:fd:c2       YES         (2)  4001 4002

Total SPB Multicast Source Nodes: 1
```

**output definitions**

- **Multicast Source (Name : BMAC)**: The system name and BMAC address of the multicast source bridge.
- **Reachable**: Indicates whether the multicast source node is reachable (YES or NO).
- **(# ) BVIDS**: Indicates the number of BVLANs and the BVLAN IDs on which the bridge acts as a multicast source.

**Release History**

Release 7.3.1; command was introduced.
### Related Commands

- **show spb isis multicast-sources-spf**
  Displays the shortest path first (SPF) reachability for a known multicast source bridge for a specific BVLAN.

- **show spb isis multicast-table**
  Displays the multicast forwarding information for the specified service instance identifier (I-SID).

- **show spb isis info**
  Displays status and configuration information for the SPB instance

### MIB Objects

N/A
**show spb isis multicast-sources-spf**

Displays the shortest path first (SPF) reachability for a known multicast source bridge for a specific BVLAN.

**show spb isis multicast-sources-spf bvlan bvlan_id bmac mac_address [dest mac_address]**

---

### Syntax Definitions

- **bvlan_id**
  The VLAN ID of an existing BVLAN.
- **mac_address**
  An SPB bridge BMAC address.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the **dest mac_address** parameter to display information for a specific SPB bridge.

### Examples

```bash
-> show spb isis multicast-sources-spf bvlan 4001 bmac 00:d0:95:0a:fd:c2
SPB ISIS Path Table:
Destination (Name : BMAC)                      Outbound Interface (Name : BMAC) Next Hop SPB Num Metric Hops
----------------------------------------------------------+-------------------------------+-----------------------------+-----+----+-----+
BRIDGE-1 : 00:d0:95:03:19:12                   1/1  BRIDGE-7 : 00:d0:95:09:79:02      30   3
BRIDGE-2 : 00:d0:95:06:4c:62                   1/1  BRIDGE-7 : 00:d0:95:09:79:02      20   2
BRIDGE-3 : 00:d0:95:07:97:32                   1/1  BRIDGE-7 : 00:d0:95:09:79:02      20   2
BRIDGE-6 : 00:d0:95:08:f2:12                   1/2  BRIDGE-6 : 00:d0:95:08:f2:12      10   1
BRIDGE-7 : 00:d0:95:09:79:02                   1/1  BRIDGE-7 : 00:d0:95:09:79:02      10   1

SPF Path count: 5
```

```bash
-> show spb isis spf bvlan 4001 bmac 00:d0:95:0a:fd:c2 dest 00:d0:95:03:19:12
SPB ISIS Multicast Source Path Details:
Path Hop Name Path Hop BMAC
----------------------------------------
BRIDGE-1 00:d0:95:03:19:12
BRIDGE-3 00:d0:95:07:97:32
BRIDGE-7 00:d0:95:09:79:02
```
**output definitions**

<table>
<thead>
<tr>
<th>Destination (Name : BMAC)</th>
<th>The system name and BMAC address of the destination SPB bridge.</th>

### show spb isis ingress-mac-filter

Displays the ingress MAC filter for multicast traffic for a given BVLAN operating in the (*,G) mode.

```plaintext
show spb isis ingress-mac-filter [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2] | bvlan bvlan_id | bmac mac_address]
```

#### Syntax Definitions

- `chassis`  
  The chassis identifier.

- `slot/port[-port2]`  
  The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

- `agg_id[-agg_id2]`  
  The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

- `bvlan_id`  
  The VLAND ID of an existing BVLAN.

- `mac_address`  
  The source MAC address of the multicast traffic allowed on the specified BVLAN and physical port.

#### Defaults

N/A

#### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>

</tr>
</tbody>
</table>

#### Usage Guidelines

- Use the optional command parameters to display specific information with this command.
- Each of the optional command parameters can be combined with any of the other optional parameters within the same command line.

#### Examples

```plaintext
-> show spb isis ingress-mac-filter
SPB ISIS Ingress MAC Table (for GMODE bvlans only):
   Inbound   Multicast source MAC
   BVLAN   Interface  (Name : MAC Address)
-----------------------------------------------
   40   1/1   BRIDGE-1        : 00:d0:95:04:8d:92
MAC Addresses: 1
```
output definitions

<table>
<thead>
<tr>
<th>BVLAN</th>
<th>The VLAN ID number for the SPB BVLAN.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inbound Interface</td>
<td>The interface (port or link aggregate) on which the multicast source MAC was received.</td>
</tr>
<tr>
<td>System (Name : BMAC)</td>
<td>The system name and MAC address of the multicast traffic source.</td>
</tr>
</tbody>
</table>

**Release History**

MIB Objects

N/A
The OmniSwitch supports the following service types:

- **Shortest Path Bridging MAC (SPBM), as defined in the IEEE 802.1aq standard.** The SPBM network topology consists of two layers: the backbone infrastructure (control plane) layer and the services (data plane) layer. ISIS-SPB builds the backbone layer by defining loop-free paths through the backbone network. The service layer is based on the PBB framework as defined in the IEEE 802.1ah standard. SPBM supports the MAC-in-MAC method for data encapsulation. An SPBM service transports the encapsulated traffic over the ISIS-SPB infrastructure.

- **Virtual eXtensible LAN (VXLAN), as defined in the IETF “VXLAN: A Framework for Overlaying Layer 2 Virtualized Networks over Layer 3 Networks” standard.** VXLAN is a Layer 2 overlay network that is used to segment and tunnel device traffic. The backbone (control plane) layer is built through a flooding and learning process. A VXLAN service transports encapsulated traffic through the network. This allows Layer 2 communication between local and remote devices over a Layer 3 network.

- **Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel.** Similar to the OmniSwitch VXLAN implementation, L2 GRE provides a Layer 2 overlay network that is used to isolate and tunnel device traffic between tunnel end points over the underlying IP network.
  - L2 GRE assumes that the tunnel end points (IP addresses) are reachable for tunneling traffic; configuring static routes or routing protocols (such as RIP or OSPF) to ensure end point reachability is required. The BFD protocol can be used to learn the ARP of the next-hop gateway.
  - On switches that will operate as a tunnel aggregation switch, L2 GRE services and associated service objects are configured through Service Manager commands to create multiple tunnel end points.
  - On switches that will operate as a tunnel access switch, a single tunnel end point is created by configuring a UNP profile that defines L2 GRE service parameters. When qualifying traffic is assigned to the profile, the necessary L2 GRE service objects are dynamically created. See Chapter 40, “Access Guardian Commands,” for information about how to configure an L2 GRE UNP profile.

The OmniSwitch Service Manager application provides the ability to configure and manage a service-based architecture consisting of the following logical entities that are required to provision a service:

- **Access Port**—A port or link aggregate configured as a service access port. This type of port defines the point at which traffic from other provider networks or traffic directly from customer networks enters the network infrastructure. The access port is also associated with a Layer 2 profile that specifies how to process protocol control frames received on the port.

- **SPBM, VXLAN, or L2 GRE Service**—A flooding domain for network traffic. A service defines a Virtual Forwarding Instance (VFI) that is capable of learning device MAC addresses from the access side and from the network side and then switching the traffic based on this information.

- **Service Access Point (SAP)**—A SAP is a logical service entity (also referred to as a virtual port) that binds an access port to an SPB service ID, a VXLAN service ID, or an L2 GRE service ID and
specifies the type of customer traffic (untagged, single-tagged, double-tagged, or all) to encapsulate and tunnel through the network infrastructure.

- **Service Distribution Point (SDP)**—An SDP provides a logical point at which customer traffic is directed from one backbone edge switch to another. SDPs are used to set up distributed services, which consist of at least one SAP on a local node, one SAP on a remote node, and an SDP binding the service on both nodes.

- **Bind-SDP**—Represents the binding of a service instance to an SDP. The SDP then distributes the service connectivity to other backbone edge switches.

- **Service Instance Identifier (I-SID)**—An SPB backbone service instance that will tunnel the encapsulated data traffic through the network infrastructure. The I-SID is bound to an SPB backbone VLAN (BVLAN) ID and a Service Manager SPB service ID when the service is created.

- **Virtual Network Identifier (VNID)**—The VNID is a 24-bit segment ID (also referred to as a VXLAN segment ID) that is used to identify encapsulated VM frames. A VNID is bound to a Service Manager VXLAN service ID when the service is created.

- **Virtual Private Network ID (VPNID)**—An L2 GRE tunnel ID that identifies a segment of a tunnel service and is used in the GRE encapsulation header. A VPNID is bound to a Service Manager L2 GRE service ID when the service is created.

This chapter documents the Command Line Interface (CLI) commands used to configure and verify the service-based architecture. For commands used to configure and verify the ISIS-SPB backbone, see Chapter 9, “Shortest Path Bridging Commands.”

MIB information for the Service Manager commands is as follows:

- **Filename:** ALCATEL-IND1-SERVICE-MGR-MIB.mib
- **Module:** alcatelIND1ServiceMgrMIB

service spb

Configures a Shortest Path Bridging (SPB) service and associates that service with a backbone service instance identifier (I-SID) and BVLAN. An SPB service connects multiple customer sites together across a provider-managed core network by creating a virtual zero-hop, Layer 2 switched domain.

This section describes the base command along with the other optional command keywords that are used to configure SPB service parameter values. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a no form to remove the parameter or return it to its default value.

```
service service_id[-service_id2] spb isid instance_id[-instance_id2] bvlan bvlan_id[:x]
  [pseudo-wire {enable | disable}]
  [description desc_info]
  [multicast-mode {head-end | tandem | hybrid}]
  [stats {enable | disable}]
  [vlan-xlation {enable | disable}]
  [admin-state {enable | disable}]

no service service_id spb
```

**Syntax Definitions**

- `service_id[-service_id2]` A unique numerical value to identify a specific SPB service. The valid service ID range is 1–32767. Use a hyphen to configure a range of SPB service IDs (10-13).
- `instance_id[-instance_id2]` A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network. The valid range is 256–16777214. Use a hyphen to configure a range of I-SIDs (300-303).
- `bvlan_id[:x]` The VLAN ID number of an existing SPB BVLAN. To specify a range of BVLANs to assign to a range of services, append the “:x” syntax, where “x” is the number of BVLANs to assign in sequence (for example, 4000:4 would assign BVLANs 4000, 4001, 4002, and 4003).

**Defaults**

When an SPB service is created without specifying any of the optional parameter values, the service is created with the following default values:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>pseudo-wire {enable</td>
<td>disable}</td>
</tr>
<tr>
<td>description desc_info</td>
<td>no description added</td>
</tr>
<tr>
<td>tandem</td>
<td>head-end</td>
</tr>
<tr>
<td>stats {enable</td>
<td>disable}</td>
</tr>
<tr>
<td>vlan-xlation {enable</td>
<td>disable}</td>
</tr>
<tr>
<td>admin-state {enable</td>
<td>disable}</td>
</tr>
</tbody>
</table>
Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platforms</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860N</th>
<th>6860</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- To remove an SPB service, administratively disable the service (including any associated SAPs and SDPs) then use the `no` form of this command and specify the service ID of the disabled service.

- SPB services created with this command are considered static services, which are identified by a service ID number between 1 and 32767 (the valid range for this command). If the SPB service was dynamically created by another OmniSwitch feature, such as Universal Network Profiles (UNP), a service ID number between 32768 and 65534 is automatically assigned to the dynamic service.

- An SPB service provides E-LAN connectivity for customer traffic and is identified by an I-SID. Services are bound to service access ports (SAPs) on the access side. On the network side they are automatically bound to service distribution points by the ISIS-SPB protocol.

- Each SPB service is basically a Virtual Forwarding Instance (VFI) that is capable of learning customer MAC addresses from the access side (SAPs) and from the network side (Mesh SDP) and then switching the traffic based on this information.

- Use the `pseudo-wire` option to configure the SPB service to provide point-to-point E-LINE connectivity instead of multipoint-to-multipoint E-LAN connectivity. See the `service pseudo-wire` command on page page 10-7 for more information.

Examples

- `service 100 spb isid 1000 bvlan 4001`
- `service 200 spb isid 2000 bvlan 4001 vlan-xlation enable multicast-mode head-end description "SPB service for ISID 2000 in head-end mode"`
- `service 1-100 spb isid 1000-1100 bvlan 4000:4 multicast-mode tandem description "100 SPB Services with ISIDs from 1000-1100 and BVLANs from 4000-4003"`
- `no service 100 spb`

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; support for specifying a range of IDs, ISIDs, and BVLANs added.
Release 8.7R2; `pseudo-wire` parameter added.

**service pseudo-wire**

Configures the specified Shortest Path Bridging (SPB) service to operate as a point-to-point (E-LINE) service.

```
service service_id pseudo-wire {enable | disable}
```

**Syntax Definitions**

- **service_id**: An SPB service ID number.
- **pseudo-wire enable**: The SPB service will operate as a point-to-point (E-LINE) service. MAC address learning for the service is automatically turned off.
- **pseudo-wire disable**: The SPB service will operate as a multipoint-to-multipoint (E-LAN) service (the default). MAC addresses for the service are learned.

**Defaults**

By default, an SPB service provides multipoint-to-multipoint (E-LAN) connectivity between customer sites across an SPB network.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **disable** option to revert the SPB service back to operating in the default mode (multipoint-to-multipoint).
- With a pseudo-wire point-to-point connection, there is no forwarding decision to be made; packets simply enter one end of the connection and leave the other end of the connection unchanged. As a result, customer MAC addresses are not learned on the SAP attachment points. Packets are transparently forwarded, which simplifies traffic flow and reduces hardware usage.
- An SPB pseudo-wire service is used to define a virtual wire (E-LINE) connection between two local SAPs or between two SAPs across the SPB network. The SAP that the pseudo-wire service is associated with serves as an attachment point for one end of the point-to-point connection.
  - If the other end of the point-to-point connection is to a local SAP, make sure both SAPs are associated with the same service.
  - If the other end of the point-to-point connection is to a remote SAP, make sure both the local and remote SAP are associated with the same I-SID. This will ensure that there is only one virtual wire connection between the two SPB nodes.
  - Make sure there are no more than two SAP attachment points for the same pseudo-wire service.
Consider the following when configuring an SPB pseudo-wire service and associated SAP:

- Do not configure a pseudo-wire service with the same I-SID on more than two SPB nodes. Configuring the same pseudo-wire service on more than two nodes may cause unpredictable behavior with the connection.
- Configure the SPB pseudo-wire service to use the head-end multicast mode.
- VLAN translation is automatically disabled to ensure packets enter and leave the pseudo-wire connection with the original customer VLAN tag.
- Use the `all` option for the SAP encapsulation (1/1/2:all) to ensure all customer traffic flows through the pseudo-wire connection.
- Flooding and replication are not needed, as there are only two attachment points (SAP to SAP for a local service or SAP to a virtual network port for the same service instance across the SPB backbone network).
- IPv4 over SPB routing, IPv6 over SPB routing, and IGMP snooping are not supported on an SPB pseudo-wire service.
- When an access port that is associated with the Layer 2 profile `def-access-profile` is assigned to an SPB pseudo-wire SAP attachment point, the Layer 2 profile for that port is automatically changed to `pw-def-access-profile`. See the `service access l2profile` command on page page 10-46 for more information.

For more information and configuration examples, refer to the “SPBM Pseudo-Wire (E-LINE Transparent) Service” section of the “Configuring Shortest Path Bridging” chapter in the OmniSwitch AOS Release 8 Network Configuration Guide.

**Examples**

```bash
-> service 100 spb isid 1000 bvlan 4000 pseudo-wire enable description "Pseudo-wire for ISID 1000"
-> service 100 sap port 1/1/1:all

-> service 200 spb isid 2000 bvlan 4000
-> service 200 pseudo-wire enable
-> service 200 sap port 1/1/2:all

-> service 300 spb isid 3000 bvlan 4000
-> service 300 pseudo-wire enable description "Local Pseudo-wire"
-> service 300 sap port 1/1/3:all
-> service 300 sap port 1/1/4:all
```

**service vxlan**

Configures a Virtual eXtensible LAN (VXLAN) service. This section describes the base command along with the other optional command keywords that are used to configure VXLAN service parameter values. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a `no` form to remove the parameter or return it to its default value.

```
service service_id[-service_id2] vxlan vnid {vxlan_id[-vxlan_id2] | xxx.xxx.xxx[-xxx.xxx.xxx]}
  [description desc_info]
  [multicast-mode [tandem | head-end | hybrid]]
  [stats {enable | disable}]
  [vlan-xlation {enable | disable}]
  [admin-state {enable | disable}]
  [remove-ingress-tag {enable | disable}]
```

```
no service service_id vxlan
```

**Syntax Definitions**

- `service_id[-service_id2]` A unique numerical value to identify a specific VXLAN service. The valid service ID range is 1–32767. Use a hyphen to specify a range of VXLAN services.

- `vxlan_id[-vxlan_id2]` A 24-bit numerical value that identifies a VXLAN segment (a VXLAN network ID). The valid range is 1–16777215 (or 000.000.001–255.255.255 in dot-decimal notation format). Use a hyphen to specify a range of IDs (25001-25005).

**Defaults**

When a VXLAN service is created without specifying any of the optional parameter values, the service is created with the following default values:

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>description</code></td>
<td><code>no description added</code></td>
</tr>
<tr>
<td><code>tandem</code></td>
<td><code>hybrid</code></td>
</tr>
<tr>
<td><code>stats</code></td>
<td><code>disable</code></td>
</tr>
<tr>
<td><code>vlan-xlation</code></td>
<td><code>disable</code></td>
</tr>
<tr>
<td><code>admin-state</code></td>
<td><code>disable</code></td>
</tr>
</tbody>
</table>
Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>X72/Q32</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- To remove a VXLAN service, administratively disable the service then use the `no` form of this command and specify the service ID of the disabled service.

- Configuring a VXLAN service on an OmniSwitch 6900-V72/C32 is supported only when the service is configured to use the head-end multicast mode; tandem mode services are not supported.

- VXLAN services created with this command are considered static services, which are identified by a service ID number between 1 and 32767 (the valid range for this command). If the VXLAN service was dynamically created by another OmniSwitch feature, such as Universal Network Profiles (UNP), a service ID number between 32768 and 65534 is automatically assigned to the dynamic service.

- A VXLAN service provides E-LAN connectivity for customer traffic and is bound to a Service AccessPorts (SAP) on the access side. On the network side, the service is bound to a unicast or multicast Service Distribution Point (SDP).

- Each VXLAN service is basically a Virtual Forwarding Instance (VFI) that is capable of learning customer MAC addresses from the access side (SAPs) and from the network side (mesh SDP) and then switching the traffic based on this information.

Examples

```bash
-> service 10 vxlan vnid 1000 description "VxLAN service for VNID 1000 in hybrid multicast mode" admin-state enable
-> service 20 vxlan vnid 2000 multicast-mode head-end description "VxLAN Service for VNID 2000 in headend mode only" admin-state enable
-> service 30 vxlan vnid 3.173.104 multicast-mode tandem description "VxLAN Service for VNID 3000 in tandem mode only" admin-state enable
-> service 1-100 vxlan vnid 1000-1100 stats enable description "100 VxLAN Services with VNIDs from 1000-1100"
-> no service 20 vxlan
```

Release History

Release 7.3.4; command was introduced.
**Related Commands**

**service l2gre**

Configures a Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel service. This type of service is used to define an L2 GRE tunnel endpoint. The service is created and bound to a SAP on an OmniSwitch that will serve as a tunnel aggregation switch.

This section describes the base command along with the other optional command keywords that are used to configure L2 GRE tunnel service parameter values. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a `no` form to remove the parameter or return it to its default value.

```plaintext
service service_id l2gre vpnid {vpn_id}
    [description desc_info]
    [stats {enable | disable}]
    [vlan-xlation {enable | disable}]
    [admin-state {enable | disable}]
    [remove-ingress-tag {enable | disable}]

no service service_id l2gre
```

### Syntax Definitions

- **service_id**: A unique numerical value to identify a specific L2 GRE tunnel service. The valid service ID range is 1–32767. Use a hyphen to specify a range of services.

- **vpn_id**: A GRE tunnel Virtual Private Network (VPN) ID. This value should match the VPN ID value used to create the GRE tunnel endpoint on the Guest Tunneling access switch.

### Defaults

When an L2 GRE tunnel service is created without specifying any of the optional parameter values, the service is created with the following default values:

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>description desc_info</td>
<td>no description added</td>
</tr>
<tr>
<td>stats {enable</td>
<td>disable}</td>
</tr>
<tr>
<td>vlan-xlation {enable</td>
<td>disable}</td>
</tr>
<tr>
<td>admin-state {enable</td>
<td>disable}</td>
</tr>
<tr>
<td>remove-ingress-tag {enable</td>
<td>disable}</td>
</tr>
</tbody>
</table>
Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- To remove an L2 GRE tunnel service, administratively disable the service then use the no form of this command and specify the service ID of the disabled service.

- L2 GRE tunnel services created with this command are considered static services, which are identified by a service ID number between 1 and 32767 (the valid range for this command). If the L2 GRE service was dynamically created by another OmniSwitch feature, such as Universal Network Profiles (UNP), a service ID number between 32768 and 65534 is automatically assigned to the dynamic service.

- An L2 GRE tunnel service provides connectivity for customer traffic and is bound to a SAP on the access side. On the network side, the service is bound to a unicast Service Distribution Point (SDP).

- Each L2 GRE tunnel service is basically a Virtual Forwarding Instance (VFI) that is capable of encapsulating customer MAC addresses from the access side (SAPs) and from the network side (mesh SDP) and then tunneling the traffic through the network.

- L2 GRE tunneling services do not support multicast modes. All Broadcast, Unknown Unicast, and Multicast (BUM) traffic is replicated; a copy is sent to each far-end node over unicast SDPs (similar to the head-end multicast mode).

- On switches that will operate as a tunnel aggregation switch, L2 GRE services and associated service objects are configured through the service l2gre, service sap, service l2gre auto-discover, service sdp l2gre, and service bind-sdp commands.

- On switches that will operate as a tunnel access switch, the L2 GRE service objects are dynamically created based on the specified configuration for a UNP L2 GRE service profile when qualifying device traffic is assigned to that profile. Refer to Chapter 40, “Access Guardian Commands,” in this guide for information about how to configure a UNP L2 GRE service profile.

Examples

- `-> service 10 l2gre vpnid 1000 description "L2GRE service for VPNID 1000" admin-state disable`
- `-> service 20 l2gre vpnid 2000 description "L2GRE service for VPNID 2000" vlan-translation enable admin-state enable`
- `-> service 30 l2gre vpnid 3000 description "L2GRE service for VPNID 3000" remove-ingress-tag enable admin-state enable`
- `-> service 40 l2gre vpnid 4000 description "L2GRE service with VPNID 4000" stats enable admin-state enable`
- `-> service 40 l2gre vpnid 4000 admin-state disable`
- `-> no service 40`
**Release History**

Release 8.4.1.R02; command was introduced.

**Related Commands**

- **service description**
  Modifies the description information for the service.

- **service stats**
  Modifies the status of statistics collection for the service.

- **service vlan-xlation**
  Modifies the status of VLAN translation for the service.

- **service admin-state**
  Modifies the administrative status for the service.

- **service remove-ingress-tag**
  Configures whether or not the customer VLAN tag is removed from ingress packets for the specified service.

- **service l2gre auto-discover**
  Configures the status of L2 GRE automatic SDP discovery on a tunnel aggregation switch. When enabled, the switch discovers the SDPs of remote tunnel end points for a configured L2 GRE service.

- **service sdp l2gre**
  Manually configures an L2 GRE SDP.

- **service bind-sdp**
  Binds L2 GRE services to L2 GRE SDPs.

- **show service**
  Displays the service configuration for the bridge.

**MIB Objects**

- **alaSvcBaseInfoTable**
  - **alaSvcId**
  - **alaSvcType**
  - **alaSvcVpnId**
  - **alaSvcDescription**
  - **alaSvcAdminStatus**
  - **alaSvcAllocationType**
  - **alaSvcStatsAdminStatus**
  - **alaSvcSapVlanXlation**
service description

Configures a description for the specified service.

```
service service_id description desc_info

no service service_id description
```

**Syntax Definitions**

| service_id | An existing service ID number. |
| desc_info  | An ASCII text string up to 160 characters in length. |

**Defaults**

By default, a description is not added when the service is created.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove the description from the specified service ID.
- This command adds or modifies a description for an existing service. However, the `description` parameter is also used to specify a description at the time the service is created.
- Configuring a description for VXLAN services is supported only on the OmniSwitch 6900-X72/Q32 and OmniSwitch 6900-V72/C32.

**Examples**

Adding or modifying a description for an existing service:

- `service 100 description "SPB service for ISID 1234"`
- `service 200 description "VXLAN service for VNID 24000"`
- `service 300 description "L2GRE service for VPNID 30"`
- `no service 200 description`

Configuring a new service with a description:

- `service 100 isid 1234 bvlan 3000 description "SPB service for ISID 1234"`
- `service 200 vxlan vnid 24000 description "VXLAN service for VNID 24000"`
- `service 300 l2gre vpnid 30 description "L2GRE service for VPNID 30"`
Release History

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN service support added.
Release 8.4.1.R02; L2 GRE tunnel service support added.

Related Commands

- service stats: Configures the statistics collection status for the specified service.
- service vlan-xlation: Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified service.
- service admin-state: Configures the administrative status of the specified service.
- show service: Displays the service configuration for the bridge.

MIB Objects

alaSvcBaseInfoTable
  alaSvcId
  alaSvcDescription
service multicast-mode

Configures the multicast replication mode for the specified service.

```
service service_id multicast-mode {head-end | tandem | hybrid}
```

### Syntax Definitions

- **service_id**: An existing service ID number.
- **tandem**: Specifies the tandem replication mode for the service.
- **head-end**: Specifies the head-end replication mode for the service.
- **hybrid**: Specifies the hybrid replication mode for the service. This mode uses both the head-end and tandem methods.

### Defaults

By default, an SPB service is configured to use the head-end mode and a VXLAN service is configured to use the hybrid mode.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When an SPB service is configured to use the head-end mode, a non-unicast packet received on an SPB access port is replicated once for each receiver in the provider backbone bridge (PBB) network using its unicast base MAC (BMAC) address.
- When an SPB service is configured to use the tandem mode, a non-unicast packet received on an SPB access port is replicated once at each node using the multicast group address.
- When configuring IP Multicast Switching (IPMS) for an SPB service, make sure the service was configured to use the head-end multicast mode; IPMS is not supported on SPB services that are configured to use the tandem mode.
- Make sure that the same multicast mode is used across all nodes for a given SPB BVLAN. Tandem nodes and head-end nodes cannot communicate with each other.
- Configuring the multicast mode for VXLAN services is supported only on the OmniSwitch 6900-X72/Q32 and OmniSwitch 6900-V72/C32.
- Configuring a VXLAN service on an OmniSwitch 6900-V72/C32 is supported only when the service is configured to use the head-end multicast mode; tandem mode services are not supported. If the hybrid mode is selected, only the head-end mode is active.
The following multicast mode functionality is supported for VXLAN services:

- **Tandem**: In this mode, PIM multicast routing is required to discover the neighbor nodes and assign membership to VTEP nodes that desire to be in the same multicast group. This requires the manual configuration of a multicast SDP object (an SDP configured with a multicast group address) to tunnel traffic to the other VTEP nodes that belong to the same multicast group.

- **Head-end**: In this mode, unicast SDP objects (SDPs configured with a far-end IP address) are also manually configured to tunnel traffic to the far-end nodes. In this case, however, PIM multicast routing is not required. Any broadcast, unknown unicast, and multicast (BUM) traffic is replicated and one copy is sent to each VTEP node as specified by the unicast SDP object.

- **Hybrid**: In this mode, traffic is tunneled from this service instance to both a group of VTEPs that belong to the same multicast group address and to the VTEP nodes that are not associated with the same multicast group address.

L2 GRE tunneling services do not support multicast modes. All Broadcast, Unknown Unicast, and Multicast (BUM) traffic is replicated; a copy is sent to each far-end node over unicast SDPs (similar to the head-end multicast mode).

This command configures the multicast mode for an existing service. However, the `multicast-mode {head-end | tandem | hybrid}` parameter is also used to specify the status at the time the service is created.

**Examples**

Configuring the multicast mode for an existing service:

```
-> service 100 multicast-mode hybrid
-> service 150 multicast-mode head-end
```

Configuring the multicast mode for a new service:

```
-> service 100 spb isid 2345 bvlan 3000 multicast-mode tandem
-> service 150 vxlan vnid 24000 multicast-mode head-end
```

**Release History**

Release 7.3.1; command was introduced.

Release 7.3.4; VXLAN service support added.
### Related Commands

- **service spb**: Configures an SPB service.

- **service vlan-xlation**: Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified service.
- **service admin-state**: Configures the administrative status of the specified service.
- **show service**: Displays the service configuration for the bridge.

### MIB Objects

- **alaSvcBaseInfoTable**
  - **alaSvcId**
  - **alaSvcMulticastMode**
service stats

Configures ingress and egress statistics collection for packets flowing through the service access point (SAP) or service distribution point (SDP) bindings associated with the specified service.

```
 service service_id stats {enable | disable}
```

**Syntax Definitions**

- **service_id**: An existing service ID number.
- **enable**: Administratively enables statistics gathering for the service.
- **disable**: Administratively disables statistics gathering for the service.

**Defaults**

By default, statistics collection is disabled when the service is created.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command configures statistics collection for an existing service. However, the **stats {enable | disable}** parameter is also used to specify the status at the time the service is created.
- Configuring statistics collection for VXLAN services is supported only on the OmniSwitch 6900-X72/Q32 and OmniSwitch 6900-0V72/C32.

**Examples**

Configuring statistics collection for an existing service:
```
-> service 100 stats enable
-> service 100 stats disable
```

Configuring statistics collection for a new service:
```
-> service 200 isid 2345 bvlan 3000 stats enable
-> service 200 isid 3456 bvlan 2000 stats disable
-> service 300 vxlan vnid 24000 stats enable
-> service 300 vxlan vnid 24000 stats disable
-> service 400 l2gre vpnid 40 stats enable
-> service 400 l2gre vpnid 40 stats disable
```
Release History

- Release 7.3.1; command was introduced.
- Release 7.3.4; VXLAN service support added.
- Release 8.4.1.R02; L2 GRE tunnel service support added.

Related Commands

- **service spb**: Configures an SPB service.

- **service l2gre**: Configures an L2 GRE tunnel service.
- **service description**: Configures a description for the specified service.
- **service multicast-mode**: Configures the multicast replication mode for the specified service.
- **service vlan-xlation**: Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified service.
- **service admin-state**: Configures the administrative status of the specified service.
- **show service**: Displays the service configuration for the bridge.

MIB Objects

- `alaSvcBaseInfoTable`
  - `alaSvcId`
  - `alaSvcStatsAdminStatus`
service vlan-xlation

Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified service.

`service service_id vlan-xlation {enable | disable}`

**Syntax Definitions**

- `service_id` An existing service ID number.
- `enable` Enables VLAN translation for the service.
- `disable` Disables VLAN translation for the service.

**Defaults**

By default, VLAN translation is disabled when the service is created.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Enabling VLAN translation at the service level is only applicable if the corresponding access ports for the SAPs also have VLAN translation enabled. The exception to this is on the OmniSwitch 9900, where enabling VLAN translation is required only at the service level.

- Mixing switches with VLAN translation enabled on some and disabled on other switches in the same network is not recommended. When VLAN translation is enabled on a service, all the frames forwarded by the service are treated as untagged within the service domain; the tag is inserted only during egress. As a result, VLAN translation should be enabled for the service across all of the participating switches to prevent frames from egressing the service domain as untagged frames.

- This command configures the VLAN translation status for an existing service. However, the `vlan-xlation {enable | disable}` parameter is also used to specify the status at the time a service is created.

- Configuring VLAN translation for VXLAN services is supported only on the OmniSwitch 6900-X72/Q32 and OmniSwitch 6900-V72/C32.
**Examples**

Configuring the status for an existing service:

-> service 100 vlan-translation enable
-> service 100 vlan-translation disable

Configuring the status for a new service:

-> service 200 isid 2345 bvlan 3000 vlan-translation enable
-> service 200 isid 3456 bvlan 2000 vlan-translation disable
-> service 300 vxlan vnid 24000 vlan-translation enable
-> service 300 vxlan vnid 24000 vlan-translation disable
-> service 400 12gre vpnid 40 vlan-translation enable
-> service 400 12gre vpnid 40 vlan-translation disable

**Release History**

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN service support added.
Release 8.4.1.R02; L2 GRE tunnel service support added.

**Related Commands**

  - **alaSvcId**
  - **alaSvcSapVlanXlation**
service admin-state

Configures the administrative status of the specified service.

**service service_id admin-state {enable | disable}**

### Syntax Definitions

- **service_id**: An existing service ID number.
- **enable**: Administratively enables the service.
- **disable**: Administratively disables the service.

### Defaults

By default, the administrative status is disabled when the service is created.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Disable the administrative status of the service and any associated service access points (SAPs) and service distribution points (SDPs) before attempting to remove a service.
- Disabling the administrative status does not remove the service configuration from the bridge.
- This command configures the administrative status for an existing service. However, the `admin-state {enable | disable}` parameter is also used to specify the status at the time the service is created.
- Configuring the administrative status for VXLAN services is supported only on the OmniSwitch 6900-X72/Q32 and OmniSwitch 6900-V72/C32.

### Examples

Configuring the status for an existing service:

```
-> service 100 admin-state enable
-> service 100 admin-state disable
```

Configuring the status for a new service:

```
-> service 200 isid 2345 bvlan 3000 admin-state enable
-> service 200 isid 3456 bvlan 2000 admin-state disable
-> service 300 vxlan v nid 24000 admin-state enable
-> service 300 vxlan v nid 24000 admin-state disable
-> service 400 l2gre v nid 40 admin-state enable
-> service 400 l2gre v nid 40 admin-state disable
```
**Release History**

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN service support added.
Release 8.4.1.R02; L2 GRE tunnel service support added.

**Related Commands**

  - `alaSvcId`  
  - `alaSvcAdminStatus`
service remove-ingress-tag

Configures whether or not the customer VLAN tag is removed from ingress packets for the specified service.

`service service_id remove-ingress-tag {enable | disable}`

### Syntax Definitions

- **service_id**: An existing service ID number.
- **enable**: Customer VLAN tag is removed from ingress packets.
- **disable**: Customer VLAN tag is not removed from ingress packets.

### Defaults

By default, this functionality is disabled when the service is created.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Removing the customer VLAN tag from ingress packets is particularly useful for services that may forward packets to third-party devices that require untagged packets.

- When this function is enabled, the customer VLAN tag is removed before the packet is encapsulated with a header. The packet is then untagged when the header is removed. For example:
  - The remove ingress tag function is enabled for service 10.
  - Service 10 is associated with SAP 1/2:20 (port 1/2, VLAN tag 20) and SAP 9:30 (link aggregate 9, VLAN tag 30).
  - When a customer packet with VLAN tag 20 enters port 1/1/2, the packet is classified for service 10 and the VLAN 20 tag is removed before the header is added to the untagged packet.
  - When a customer packet with VLAN tag 30 enters link aggregate 9, the packet is classified for service 10 and the VLAN 30 tag is removed before the header is added to the untagged packet.

- This command configures the status of the remove ingress tag functionality for an existing service. However, the `remove-ingress-tag {enable | disable}` parameter is also used to specify the status at the time a service is created.

- Configuring the remove ingress tag status for VXLAN services is supported only on the OmniSwitch 6900-X72/Q32 and OmniSwitch 6900-V72/C32.
**Examples**

Configuring the status for an existing service:
```
-> service 100 remove-ingress-tag enable
-> service 100 remove-ingress-tag disable
```

Configuring the status for a new service:
```
-> service 200 vxlan vnid 24000 remove-ingress-tag enable
-> service 200 vxlan vnid 24000 remove-ingress-tag disable
-> service 300 l2gre vpnid 25000 remove-ingress-tag enable
-> service 300 l2gre vpnid 25000 remove-ingress-tag disable
```

**Release History**

Release 7.3.4; command was introduced.
Release 8.4.1.R02; L2 GRE tunnel service support added.

**Related Commands**

- `service vxlan` Configures a VXLAN service.
- `service l2gre` Configures an L2 GRE service.
- `show service` Displays the service configuration for the bridge.

**MIB Objects**

- `alaSvcBaseInfoTable`  
  - `alaSvcId`  
  - `alaSvcRemoveIngressTag`
**service vxlan udp-port**

Configures the UDP destination port for all encapsulated VXLAN frames on the gateway switch. Use this command to support previous implementations of the VXLAN functionality that did not use the well-known UDP port 4789. Note that only gateway devices using the same destination UDP port number can exchange encapsulated VXLAN frames.

```
service vxlan udp-port {udp_port_num | default}
```

**Syntax Definitions**

- `udp_port_num` The UDP destination port number to use for VXLAN traffic.
- `default` Use the well-known UDP destination port number (4789) for VXLAN traffic.

**Defaults**

By default, the well-known UDP port number 4789 is used in the default VRF instance.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>X72/Q32</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Avoid using the well-known UDP ports that are already reserved by IANA for other applications.
- Changing the UDP port number on the fly might stop the VXLAN traffic until the VXLAN Tunnel End Points (VTEPs) in the network are configured with the same destination UDP port.
- Configuring a VXLAN service on an OmniSwitch 6900-V72/C32 is supported only when the service is configured to use the head-end multicast mode; tandem mode services are not supported.

**Examples**

- `-> service vxlan udp-port 8472`
- `-> service vxlan udp-port default`

**Release History**

Release 7.3.4; command was introduced.
Related Commands

- `service vxlan vrf` Configures the VRF instance for the VXLAN segment.
- `service vxlan` Configures a VXLAN service.
- `show service info` Displays the destination UDP port value applied to VXLAN traffic.

MIB Objects

- `alaSvcMgrSysTable`
  - `alaSvcMgrVxlanDestUdpPort`
**service vxlan vrf**

Configures the current VRF instance for the VXLAN gateway.

```
service vxlan vrf {vrf_name | default}
```

### Syntax Definitions

- **vrf_name**
  - The name of an existing VRF instance.
- **default**
  - Use the default VRF instance.

### Defaults

By default, the default VRF instance is used.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>V72/C32</td>
<td>X48C6/T48C6/</td>
<td>X48C4E/V48C8/</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>C32E/T24C2/</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>X24C2</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>9900</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Administratively disable all configured SDPs first before changing the VRF instance for the VXLAN segment.
- If the VRF instance that is associated with a VXLAN segment is removed, the VXLAN segment is automatically assigned to the default VRF instance.
- Avoid configuring the same Loopback0 address in multiple VRF instances. Each VRF instance should have a unique Loopback0 address.
- Configuring a VXLAN service on an OmniSwitch 6900-V72/C32 is supported only when the service is configured to use the head-end multicast mode; tandem mode services are not supported.

### Examples

```
-> service vxlan vrf IpVxlan
-> service vxlan vrf default
```

### Release History

Release 7.3.4; command was introduced.
**Related Commands**

- **service vxlan**  
  Configures a VXLAN service.

- **show service info**  
  Displays the current VRF instance for the VXLAN network.

**MIB Objects**

- **alaSvcMgrSysTable**
  - **alaSvcMgrVxlanCurrentVrf**
service local-vrrp

Configures whether or not the customer VLAN tag is removed from VRRP packets received on SPB service access ports. When enabled, the VLAN tag is automatically removed from the VRRP packets. This is particularly useful when a switch is going to route VRRP packets using IP over SPB.

service local-vrrp {enable | disable}

Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the TCAM rule (VLAN tag is stripped from VRRP packets received on access ports).</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the TCAM rule (VLAN tag is not stripped from VRRP packets received on access ports).</td>
</tr>
</tbody>
</table>

Defaults

By default, the customer VLAN tag is removed from VRRP packets received on SPB service access ports.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>No</td>
</tr>
<tr>
<td>6465</td>
<td>No</td>
</tr>
<tr>
<td>6560</td>
<td>No</td>
</tr>
<tr>
<td>6570M</td>
<td>No</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
</tr>
<tr>
<td>6860N</td>
<td>No</td>
</tr>
<tr>
<td>6865</td>
<td>Yes</td>
</tr>
<tr>
<td>6900</td>
<td>Yes</td>
</tr>
<tr>
<td>6900 V72/C32</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>No</td>
</tr>
<tr>
<td>X48C8</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- This command is a global configuration command; the status applies to all access ports on the switch.

- This functionality is enabled to facilitate the processing of VRRP packets received on service access ports on a switch that participates in an IP over SPB routing configuration. When this function is disabled, the customer VLAN tag is not removed from VRRP packets are trapped to the switch for local VRRP processing and are not routed through the IP over SPB configuration.

- When this functionality is enabled (the default), one of the following actions is required based on the switch configuration:
  - If the switch is participating in an IP over SPB routing configuration, enable VLAN translation on all access ports and associated SPB services. This ensures that the VLAN tag is added back into the VRRP packets egressing the access ports.
  - If the switch serves as a transit switch that receives VRRP traffic from another OmniSwitch or a third-party device, use the service local-vrrp command with the disable option to prevent the switch from removing the customer VLAN tag. This helps to avoid having to enable VLAN translation on every single access port and SPB service on the switch.

- When VLAN translation is enabled, a Service Access Point (SAP) with the encapsulation value set to ":all" (all tagged and untagged packets not already assigned) will not work. The ":all" encapsulation value is treated as a ":0" encapsulation value (untagged packets only; tagged packets are dropped) for VLAN translation.
**Examples**

- `-> service local-vrrp disable`
- `-> service local-vrrp enable`

**Release History**

Release 8.3.1.R02; command was introduced.

**Related Commands**

- **service access**: Configures a switch port or link aggregate as an access port.
- **service access vlan-xlation**: Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified access port.
- **service vlan-xlation**: Configures the status of egress VLAN translation for the specified service.

**MIB Objects**

- `alaSvcMgrSysTable`
  - `alaSvcMgrVrrpMacTcamRuleAdminState`
service l2gre reserved-vlan

Configures a reserved VLAN to activate L2 GRE service domain learning on an L2 GRE tunnel access switch.

```
service l2gre reserved-vlan vlan_id[-vlan_id2]
```

```
no service l2gre reserved-vlan vlan_id[-vlan_id2]
```

**Syntax Definitions**

`vlan_id[-vlan_id2]` A VLAN ID number to configure as an L2 GRE reserved VLAN. Use a hyphen to specify a range of VLAN IDs. The valid range is 2–4092. Up to 8 reserved VLANs can be configured.

**Defaults**

By default, there is no L2 GRE reserved VLAN configured for the switch.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command is required only on an OmniSwitch 6560 that serves as an L2 GRE tunnel access switch. A reserved VLAN is not required for other supported OmniSwitch platforms.

- If there is no reserved VLAN configured, UNP does not learn users in the L2 GRE service domain. When a reserved VLAN is created, any blocked users are then learned.

- Use the `no` form of this command to remove an L2 GRE reserved VLAN from the switch configuration. Make sure there are no L2 GRE service objects (SAP, SDP, SDP bindings) configured before attempting to remove the reserved VLAN.

- Specify a VLAN ID that does not already exist in the switch configuration. Use the `show vlan` command to display the VLAN configuration and verify the L2 GRE reserved VLAN configuration.

- The reserved VLAN is used only for L2 GRE learning purposes; other VLAN management operations do not apply to this type of VLAN.

**Examples**

```
-> service l2gre reserved-vlan 4000
-> service l2gre reserved-vlan 4005-4008
-> no service l2gre reserved-vlan 4000
-> no service l2gre reserved-vlan 4005-4008
```
-> service l2gre reserved-vlan 4008-4020
ERROR: VLAN range should be less than or equal to 8.

-> service l2gre reserved-vlan 200
ERROR: Vlan 200 exists. Can not create the vlan!

-> show vlan

</tr>
</tbody>
</table>

Usage Guidelines

- By default, the OmniSwitch 6800N and OmniSwitch 6900-X48C6/T48C6/X48C4E/V48C8 operate in what is referred to as a "Basic" mode in which service-based inline routing is supported. While in the Basic mode, the availability of switch resources is reduced to provide the inline routing support.
- To disable inline routing support, use the no form of this command and then reboot the switch.
- When disabled, inline routing cannot be configured on the switch, however, more system resources are available for other non-inline routing functionality (such as an increase in the number of Layer 3 interfaces, ARPs, etc.).

Examples

-> no service l3vpn profile
WARNING: Reboot needed to change the mode to Disabled

-> service l3vpn profile
WARNING: Changing to current running mode Basic

Release History

Release 8.7R2; command was introduced.
Related Commands

show service l3vpn profile  Displays the status of IP over SPB inline routing support.

MIB Objects

alaCapManServicel3vpnConfig
alaCapManServicel3vpn
**service l2profile**

Configures a Layer 2 profile that is applied to an access (customer facing) port. This profile is used to specify how to process Layer 2 control frames ingressing on the access port.

```
service l2profile l2profile_name [stp | 802.1x | 802.3ad | 802.1ab | mvrp | gvrp | amap] [peer | drop | tunnel]
```

```
no service l2profile profile-name
```

**Syntax Definitions**

- **l2profile_name**
  - Alphanumeric string of up to 32 characters. Use quotes around string if the profile name contains multiple words with spaces between them (e.g., “ALE Engineering”).

- **stp**
  - Specifies how to process Spanning Tree BPDU.

- **802.1x**
  - Specifies how to process 802.1x control frames.

- **802.3ad**
  - Specifies how to process 802.3ad control frames.

- **802.1ab**
  - Specifies how to process 802.1AB control frames. To specify how to process tagged and untagged 802.1AB control frames separately, use the `service l2profile inbound 802.1ab` command.

- **mvrp**
  - Specifies how to process Multiple VLAN Registration Protocol packets.

- **gvrp**
  - Specifies how to process GARP VLAN Registration Protocol packets.

- **amap**
  - Specifies how to process Alcatel-Lucent Enterprise Management Adjacency Protocol packets.

- **peer**
  - Allows the access port to participate in the specified protocol. Control packets are not sent to the network side of the node.

- **drop**
  - Discards the specified PDU.

- **tunnel**
  - Tunnels the specified PDU across the provider network.

**Defaults**

If no parameters are specified with this command, the new profile inherits all the following control protocol settings from the default profile (def-access-profile for service access ports or unp-def-access-profile for UNP access ports):

<table>
<thead>
<tr>
<th>parameter</th>
<th>def-access-profile</th>
<th>unp-def-access-profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>stp</td>
<td>tunnel</td>
<td>drop</td>

</tr>
</tbody>
</table>

Usage Guidelines

- Use the **no** form of this command to delete a Layer 2 profile. Removing the **def-access-profile** or the **unp-def-access-profile** is not allowed.
- Remove any profile associations with access ports before attempting to modify or delete the profile.
- Not all of the control protocols are currently supported with the **peer**, **tunnel**, and **drop** parameters. Use the following table to determine the parameter combinations that are supported:

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Reserved MAC</th>
<th>peer</th>
<th>drop</th>
<th>tunnel</th>
</tr>
</thead>
<tbody>
<tr>
<td>STP</td>
<td>01-80-C2-00-00-00</td>

```
service l2profile inbound 802.1ab

Configures the treatment of Layer 2 tagged and untagged 802.1AB control frames that are received on access (customer facing) ports. Use this command to specify a different action (peer, drop, or tunnel) based on the tagged and untagged state of an 802.1AB control frame.

service l2profile l2profile_name inbound {tagged | untagged | both} 802.1ab {peer | drop | tunnel}

no service l2profile profile-name

Syntax Definitions

l2profile_name
The name of an existing or new Layer 2 profile.
tagged
The specified action is applied only to tagged 802.1AB control frames.
tagged
The specified action is applied only to untagged 802.1AB control frames.
both
The specified action is applied to both tagged and untagged 802.1AB control frames.
peer
Allows the access port to participate in the 802.1AB protocol. Control packets are not sent to the network side of the node.
drop
Discards 802.1AB PDUs.
tunnel
Tunnels 802.1AB PDUs across the provider network.

Defaults

By default, tagged and untagged 802.1AB control frames are dropped.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to delete the specified Layer 2 profile. Remove any profile associations with access ports before attempting to modify or delete the profile.
- When only the tagged keyword is used, the specified action is applied to tagged traffic and the default action (drop) is applied to untagged traffic.
- When only the untagged keyword is used, the specified action is applied to untagged traffic and the default action (drop) is applied to tagged traffic.
- Only the tunnel and drop actions can be configured for tagged control frames.
• Only the peer and drop actions can be configured for untagged control frames.

• The treatment of 802.1AB control frames received on access ports can either be mixed (different for tagged, different for untagged) or the same for both tagged and untagged control frames. To switch between mixed and the same, set the action for tagged and untagged frames back to the default (drop).

• Use the service l2profile command to configure the treatment for other protocol control frames. This command applies only to 801.1AB frames.

Examples

-> service l2profile lldp-tagged inbound tagged 802.1ab tunnel
-> service l2profile lldp-untagged inbound untagged 802.1ab peer
-> service l2profile lldp-diff inbound tagged 802.1ab tunnel inbound untagged 802.1ab peer
-> service l2profile lldp-both inbound both 802.1ab drop
-> no service l2profile lldp-tagged
-> no service l2profile lldp-untagged
-> no service l2profile lldp-diff
-> no service l2profile lldp-both

Release History

Release 8.6R2; command introduced.

**service access**

Configures a switch port or link aggregate as an access port on which device traffic enters or leaves a service domain.

```
service access {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} [description port_description]
```

```
no service access {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot/port[-port2]` The chassis number and the slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `agg_id[-agg_id2]` The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `port_description` An alphanumeric string (1–128 characters).

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>port_description</code></td>
<td>No description</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6</th>
<th>6900 X48C4E/V48C8</th>
<th>6900 C32E/T24C2</th>
<th>9900 X24C2</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to revert the port mode back to a regular switch port or link aggregate. Make sure the access port is not associated with any Service Access Points (SAPs) before attempting to change the port mode.

- Use the `no` form of the `description` parameter to remove only the description information from the access port. This option does not remove the access port designation, just the description text that was assigned to the port.

- Before configuring a port or link aggregate as an access port, make sure there is no IP interface configured for the default VLAN of the port. If there is, configuring the port as an access port is not allowed. For example, if VLAN 10 has an IP interface and is the default VLAN for port 1/1/1, then configuring port 1/1/1 as an access port is not supported.
• Access ports are required to configure a SAP. A SAP is the point at which customer traffic enters and exits the service. SAPs are not configurable on other port types.

Examples
-> service access port 1/1/3-10
-> service access linkagg 10-12
-> service access port 1/1/6 description "Voice Access Port"
-> service access port 2/1/6 description "L3 VPN Loopback Port"
-> service access linkagg 100 description "Server Access Port"
-> service access port 2/1/6 no description
-> no service access port 1/1/3
-> no service access linkagg 10

-> vlan 100
-> ip interface v100 address 10.10.10.1 vlan 100
-> vlan 100 members port 1/1/1 untagged
-> service access port 1/1/1
ERROR: A vlan with IP interface attached to this port is not supported!

Release History
Release 7.3.1; command was introduced.
Release 7.3.2; description parameter added.

alaServiceMgrPortMode
alaServiceMgrPortDescription
service access l2profile

Assigns an existing Layer 2 profile to the specified service access port. This profile determines how Layer 2 protocol frames received on the access port are processed.

service access {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} l2profile {default | profile-name}

Syntax Definitions

- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The chassis number and the slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[-agg_id2]**: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- **default**: Assigns the default profile to the specified port.
- **profile-name**: The name of an existing Layer 2 profile.

Defaults

By default, the default Layer 2 profile (**def-access-profile**) is assigned when a port is configured as a service access port.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>6900 X48C4E/V48C8/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the **default** parameter with this command to revert the associated profile back to the default profile settings.
- Specify only ports or link aggregates that are configured as service access ports. This command does not apply to network ports.
- Specify a profile name that already exists in the switch configuration.
- If a user-configured Layer 2 profile is not associated with a service access port, then the **def-access-profile** is used to process control packets that ingress on the service access port.
- If a user-configured Layer 2 profile is not associated with a UNP access port, then the **unp-def-access-profile** is used to process control packets that ingress on the UNP access port. To assign a Layer 2 profile to a UNP access port, use the **unp l2-profile** command.
When a service access port is configured with the **def-access-profile** and then assigned to an SPB pseudo-wire SAP, the Layer 2 profile for that port automatically changes to **pw-def-access-profile** and the following control protocol settings are used to process ingress control packets:

<table>
<thead>
<tr>
<th>parameter</th>
<th>def-access-profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>stp</td>
<td>tunnel</td>
</tr>
<tr>
<td>802.1x</td>
<td>tunnel</td>
</tr>
<tr>
<td>802.3ad</td>
<td>peer</td>
</tr>
<tr>
<td>mvrp</td>
<td>tunnel</td>
</tr>
<tr>
<td>gvrp</td>
<td>tunnel</td>
</tr>
<tr>
<td>amap</td>
<td>tunnel</td>
</tr>
<tr>
<td>802.1ab</td>
<td>tunnel</td>
</tr>
</tbody>
</table>

- If a user-configured Layer 2 profile is associated with a service access port that is then assigned to an SPB pseudo-wire SAP, the Layer 2 profile for that port is *not* changed. The user-configured profile is applied to control packets received on the port, not the **pw-def-access-profile**.
- When the **default** parameter is used, the Layer 2 profile assignment for the service access port reverts back to **def-access-profile**, regardless of whether the port was assigned to a user-configured profile or to **pw-def-access-profile**.
- Removing the **pw-def-access-profile** is not allowed.
- See the **service pseudo-wire** command on page page 10-7 for more information.

**Examples**

- `-> service access port 1/1/3 l2profile sap_1_profile`
- `-> service access linkagg 10 l2profile sap_1_profile`
- `-> service access port 1/1/3 l2profile default`
- `-> service access linkagg 10 l2profile default`

**Release History**

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN service support added.
Release 8.4.1.R02; L2 GRE tunnel service support added.
Release 8.7R2; **pw-def-access-profile** added for SPB pseudo-wire access ports.
Related Commands

  - alaServiceMgrPortPortProfileID
service access vlan-xlation

Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified access port.

`service access {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} vlan-xlation {enable | disable}`

**Syntax Definitions**

- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[-agg_id2]**: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- **enable**: Enables VLAN translation for the specified port.
- **disable**: Disables VLAN translation for the specified port.

**Defaults**

By default, VLAN translation is disabled when a port or link aggregate is configured as an access port.

</tr>
</tbody>
</table>

**Usage Guidelines**

- Specify only ports or link aggregates that are configured as service access ports. This command does not apply to interfaces configured as network ports.
- Enabling VLAN translation on an access port implicitly enables translation for all SAPs associated with that port. However, translation must also be enabled for the services associated with these SAPs. This ensures that all SAPs associated with a service will apply VLAN translation.
- On an OmniSwitch 9900, VLAN translation is configured only at the service level; configuring access port level VLAN translation is not required.
- Mixing switches with VLAN translation enabled on some and disabled on other switches in the same network is not recommended. When VLAN translation is enabled on a service, all the frames forwarded by the service are treated as untagged within the service domain; the tag is inserted only during egress. As a result, VLAN translation should be enabled for the service across all the participating switches to prevent frames from egressing the service domain as untagged frames.
**Examples**

-> service access port 1/3 vlan-xlation enable
-> service access linkagg 10 vlan-xlation enable
-> service access port 1/3-10 vlan-xlation disable
-> service access linkagg 10-15 vlan-xlation disable

**Release History**

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN service support added.

**MIB Objects**

`alaServiceMgrPortTable`
- `alaServiceMgrPortID`
- `alaServiceMgrPortMode`
- `alaServiceMgrPortVlanXlation`
service sap

Configures a Service Access Point (SAP) by associating a SAP ID with a Shortest Path Bridging (SPB) service, a Virtual eXtensible LAN (VXLAN) service, or a Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel service. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of network traffic to map to the associated service.

This section describes the base command along with the other optional command keywords that are used to configure SAP parameter values. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a no form to remove the parameter or return it to its default value.

```
service service_id sap {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} [sap_id]
[description desc_info]
[tcp-mss {overlay-profile {spb | ethernet} | num}]
[trusted | un-trusted [priority]]
[stats {enable | disable}]
[admin-state {enable | disable}]
```

```
no service service_id sap {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} [sap_id]
```

Syntax Definitions

- **service_id**: An existing SPB, VXLAN, or L2 GRE service ID number.
- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[-agg_id2]**: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- **sap_id**: The SAP ID (chassis/slot/port:encapsulation). Refer to the table in the “Usage Guidelines” section of this command page for a list of encapsulation values to select for the SAP ID.
- **spb | ethernet | num**: The TCP Maximum Segment Size (tcp-mss) size. **spb** (1380), **ethernet** (1402), **num** (500-1410)

## Defaults

When a SAP is created without specifying any optional parameter values, the SAP is created with the following defaults:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>:0</td>
<td>:all</td>
</tr>
<tr>
<td>description desc_info</td>
<td>No description added</td>
</tr>
<tr>
<td>trusted</td>
<td>un-trusted [priority]</td>
</tr>
<tr>
<td>stats enable</td>
<td>disable</td>
</tr>
<tr>
<td>admin-state enable</td>
<td>disable</td>
</tr>
</tbody>
</table>
Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>No</td>
</tr>
<tr>
<td>6465</td>
<td>No</td>
</tr>
<tr>
<td>6560</td>
<td>No</td>
</tr>
<tr>
<td>6570M</td>
<td>No</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
</tr>
<tr>
<td>6860N</td>
<td>Yes</td>
</tr>
<tr>
<td>6865</td>
<td>Yes</td>
</tr>
<tr>
<td>6900</td>
<td>Yes</td>
</tr>
<tr>
<td>6900V72/C32</td>
<td>Yes</td>
</tr>
<tr>
<td>6900X48C6/T48C6/V48C8/C32E/T24C2/X24C2</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the **no** form of this command to remove a SAP from the specified service.

- To define the SAP ID that will be associated with the SPB, VXLAN, or L2 GRE service, enter the access port or link aggregate number followed by one of the following encapsulation values (for example, service 10 sap port 1/1/23:10, where 1/1/23:10 is the SAP ID):

<table>
<thead>
<tr>
<th>SAP ID Encapsulation</th>
<th>Customer Traffic Forwarded by the SAP</th>
</tr>
</thead>
<tbody>
<tr>
<td>:0</td>
<td>Specifies a null encapsulation value for the SAP. All untagged traffic is mapped to the SAP; tagged traffic is dropped.</td>
</tr>
<tr>
<td>:all</td>
<td>Specifies a wildcard SAP. All tagged and untagged traffic that is not classified into another SAP is mapped to the wildcard SAP.</td>
</tr>
<tr>
<td>:qtag[-qtag2]</td>
<td>Specifies a VLAN ID tag for ingress traffic on the access port. Only traffic with this 802.1Q tag is mapped to the SAP. Use a hyphen to specify a range of VLAN IDs (21-30).</td>
</tr>
<tr>
<td>:outer_qtag.inner_qtag</td>
<td>Specifies an outer VLAN ID tag and an inner VLAN tag for ingress traffic on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.</td>
</tr>
</tbody>
</table>

- The **:all** (wild card) parameter is also configurable as the inner tag value for double-tagged packets (for example, “10:all” specifies double-tagged packets with an outer tag equal to VLAN 10 and an inner tag with any VLAN ID value).

- When VLAN translation is enabled, a Service Access Point (SAP) with the encapsulation value set to ":all" (all tagged and untagged packets not already assigned) will not work. The ":all" encapsulation value is treated as a ":0" encapsulation value (untagged packets only; tagged packets are dropped) for VLAN translation.

- Specify only ports or link aggregates that are configured as service access ports (see **service access**). This command does not apply to network ports.

- Configuring SAPs with different encapsulation types for the same access port is allowed.

- When specifying a range of VLAN IDs with this command on an OmniSwitch 6900-X72/Q32, consider the following guidelines:
  - Each service access port supports a maximum of 8 SAPs that are created with a range of VLANs.
  - A total of 255 service access ports can support a range of VLANs at any given time.
  - The range of VLANs specified for the SAPs of a service access port cannot overlap each other.
  - For double-tagged SAPs, separate range commands can be specified for both outer and inner VLAN tags.
– The outer VLAN range space is shared with the same space as QTAG SAP. The combined limit is 8 unique ranges per service access port. This is in addition to the 8 unique inner VLAN range per service access port.

- When configuring a SAP for a VXLAN service, consider the following:
  – Configuring a VXLAN SAP is supported only on the OmniSwitch 6900-X72/Q32 and OmniSwitch 6900-V72/C32.
  – Configuring a VXLAN service on an OmniSwitch 6900-V72/C32 is supported only when the service is configured to use the head-end multicast mode; tandem mode services are not supported. If the hybrid mode is selected, only the head-end mode is active.

- When configuring a SAP for an L2 GRE tunnel, consider the following:
  – A SAP is manually configured on a tunnel aggregation switch through the **service sap** command.
  – A SAP is dynamically created on a tunnel access switch based on the L2 GRE tunnel service parameters mapped to the UNP profile when qualifying device traffic is assigned to the profile. Refer to Chapter 40, “Access Guardian Commands,” for information about how to configure a UNP L2 GRE service profile.

- The TCP Maximum Segment Size (TCP-MSS) carried in the TCP SYN/SYN-ACK frames can be configured to set an MTU value supported by a VXLAN tunnel.

**Examples**

```
-> service 100 sap port 1/1/1:0
-> service 100 sap port 1/1/1:50 description “Server1 to VXLAN10 SAP”
-> service 100 sap port 1/2/10:100.200 admin-state enable
-> service 100 sap port 1/2/10:500.all untrusted stats enable
-> service 100 sap linkagg 5:10
-> service 200 sap linkagg 2:20:30
-> service 200 sap linkagg 9:all untrusted 3 stats enable admin-state enable
-> no service 100 sap port 1/1/1:50 description
-> no service 100 sap port 1/2/10:100.200
-> no service 200 sap linkagg 9:all

-> service 10 sap port 1/1/11-20:21-30 description “SAPs on ports 1/1/11 to 1/1/20 with tag 21 to 30”
-> service 20 sap linkagg 1-10:100 un-trusted description “Untrusted SAPs for lag 1-10 with tag 100”
-> service 30 sap port 1/1/2:10-20 description “SAP on port 1/1/2 with only one VP for tag 10-20”
-> service 30 sap linkagg 11:10-20 description “SAP on lag 11 with only one VP for tag 10-20”
-> service 1 sap port 1/1/7:all un-trusted 0 tcp-mss 1300 description “Untrusted SAPs on port 1/1/7 for all traffic and maximum segment size of 1300”
```

**Release History**

Release 7.3.1.; command was introduced.
Release 7.3.4.; support for entering a range of SAP ports, link aggregates, and VLAN ID tags added; VXLAN service support added).
Release 8.4.1.R02; support for L2 GRE tunnel services added.
**Related Commands**

- `service sap description`  
  Configures a description for the specified SAP ID.

- `service sap trusted`  
  Configures the trust mode for the specified SAP ID.

- `service sap stats`  
  Configures statistics collection for the specified SAP ID.

- `service sap admin-state`  
  Configures the administrative status for the specified SAP ID.

- `service spb`  
  Configures an SPB service.

- `service vxlan`  
  Configures a VXLAN service.

- `service l2gre`  
  Configures an L2 GRE tunnel service.

- `service access`  
  Configures a service access port.

- `show service ports`  
  Displays SAP configuration information for the specified service.

  `alaSapStatsAdminStatus`
  `alaSapAdminStatus`
**service sap description**

Configures a description for the specified Service Access Point (SAP) ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

```
service service_id sap {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} [:0 | :all | :qtag[-qtag2] | :outer_qtag.inner_qtag} description desc_info
```

```
no service service_id sap {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} [:0 | :all | :qtag[-qtag2] | :outer_qtag.inner_qtag} description
```

**Syntax Definitions**

- **service_id**
  - An existing SPB, VXLAN, or L2 GRE service ID number.

- **chassis**
  - The chassis identifier when running in virtual chassis mode.

- **slot/port[-port2]**
  - The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

- **agg_id[-agg_id2]**
  - The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

- **:0**
  - Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.

- **:all**
  - Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.

- **:qtag[-qtag2]**
  - Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP. Use a hyphen to specify a range of VLAN IDs (21-30).

- **:outer_qtag.inner_qtag**
  - Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.

- **desc_info**
  - An ASCII text string up to 160 characters in length.

**Defaults**

By default, a description is not added when the SAP is created.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

---

OmniSwitch AOS Release 8 CLI Reference Guide    April 2023    page 10-55
Usage Guidelines

- Use the `no` form of this command to remove the description from the specified SAP.
- Specify the service ID number associated with the specified SAP ID (access port/encapsulation).
- Configuring a description for a VXLAN SAP is supported only on the OmniSwitch 6900-X72/Q32 and OmniSwitch 6900-V72/C32.

Examples

```
-> service 10 sap port 1/2:10 description "CE1 to SPB10 SAP"
-> service 13 sap linkagg 20:100.200 description "CE2 to SPB13 SAP"
-> service 15 sap port 1/11-20:21-30 description "SAPs on ports 1/11 to 1/20 with tag 21 to 30"
-> service 30 sap port 1/2:10-20 description "SAP on port 1/2 with only one VP for tag 10-20"
-> service 10 sap port 1/2:10 no description
-> service 13 sap linkagg 20:100.200 no description
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; support for entering a range of SAP ports, linkaggs, and VLAN ID tags added; VXLAN service support added.
Release 8.4.1.R02; support for L2 GRE tunnel services added.

Related Commands

```

service sap trusted configures the trust mode for the specified SAP ID.
service sap stats configures statistics collection for the specified SAP ID.
service sap admin-state configures the administrative status for the specified SAP ID.
show service ports displays SAP configuration information for the specified service.
```

MIB Objects

```
alaSapBaseInfoTable
   alaSapPortId
   alaSapEncapValue
   alaSapDescription
   alaSapSvcId
```
**service sap trusted**

Configures the trust mode for the specified Service Access Port (SAP) ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

A trusted SAP can accept 802.1p values in incoming packets; an untrusted SAP will set any 802.1p values to zero in incoming packets, unless an 802.1p value is configured with this command.

```
service service_id sap {port chassis/slot/port | linkagg agg_num} [:0 | :all | :qtag |
:outer_qtag:inner_qtag] {trusted | un-trusted [priority]}
```

### Syntax Definitions

- **service_id**
  - An existing SPB, VXLAN, or L2 GRE service ID number.

- **chassis**
  - The chassis identifier.

- **slot/port[-port2]**
  - The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

- **agg_id[-agg_id2]**
  - The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

- **:0**
  - Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.

- **:all**
  - Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.

- **:qtag[-qtag2]**
  - Specifies a VLAN ID tag for traffic received on the access port. Only traffic with this tag is mapped to this SAP. Use a hyphen to specify a range of VLAN IDs (21-30).

- **:outer_qtag:inner_qtag**
  - Specifies an outer VLAN ID tag and an inner VLAN tag for traffic received on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.

- **trusted**
  - Allows the SAP to use the priority value obtained from tagged packets received on the SAP port. Untagged packets use the default port priority value.

- **un-trusted**
  - Sets the priority value to zero for tagged and untagged packets received on the SAP. This is the priority assigned to tagged and untagged packets received on an untrusted SAP.

- **priority**
  - The priority value to set for tagged and untagged packets received on an untrusted SAP. Values range from 0 (lowest priority) to 7 (highest priority).

### Defaults

By default, the SAP is trusted with the priority set to best effort (zero). These default values are set when a port is configured as an access port and then associated with the SAP.
Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

</tbody>
</table>

Usage Guidelines

- Use the `un-trusted` and the `priority` parameter options to assign an 802.1p priority value to ingress packets processed by the SAP. When the `un-trusted` parameter is used without specifying a priority value, a value of zero is automatically assigned to the ingress packets.

- Specify the service ID number associated with the specified SAP ID (access port/encapsulation).

- Administratively disabling the SAP is not required to change the trust mode for the SAP.

- When the trust mode is changed from untrusted to trusted, the priority value is automatically set to the default best effort priority value (zero).

- Note that untagged Layer 2 control packets (for example, BPDUs, GVRP, and AMAP) are always tunneled (if enabled) through the provider backbone bridge (PBB) network with the default EXP bits set to 7, so that they can arrive at the destination bridge at the highest COS queue of 7. As a result, trusted and untrusted SAPs configured on the access ports will not affect the Layer 2 control packets ingressing on the access ports.

- Configuring the trust mode on an access port is not allowed. These settings are configured for the SAP to which the access port is associated.

- Configuring the trust mode for a VXLAN SAP is supported only on the OmniSwitch 6900-X72/Q32 and OmniSwitch 6900-V72/C32.

Examples

```
-> service 10 sap port 1/1/2:10 trusted
-> service 13 sap linkagg 20 trusted
-> service 10 sap port 1/1/2:10 un-trusted
-> service 13 sap linkagg 20 un-trusted 5
-> service 20 sap linkagg 1-10:100 un-trusted
-> service 30 sap linkagg 11:10-20 trusted
```

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; support for entering a range of SAP ports, linkagg, and VLAN ID tags added; VXLAN service support added.
Release 8.4.1.R02; support for L2 GRE tunnel services added.
Related Commands

  - `alaSapPortId`
  - `alaSapEncapValue`
  - `alaSapTrusted`
  - `alaSapPriority`
  - `alaSapSvcId`
**service sap stats**

Configures ingress and egress statistics collection for packets flowing through the specified SAP ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

```
service service_id sap {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} {:0 | :all | :qtag[-qtag2] | :outer_qtag.inner_qtag} stats {enable | disable}
```

**Syntax Definitions**

- **service_id**: An existing SPB, VXLAN, or L2 GRE service ID number.
- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[-agg_id2]**: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- **:0**: Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
- **:all**: Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
- **:qtag[-qtag2]**: Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP. Use a hyphen to specify a range of VLAN IDs (21-30).
- **:outer_qtag.inner_qtag**: Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
- **enable**: Enables statistics collection for the SAP.
- **disable**: Disables statistics collection for the SAP.

**Defaults**

By default, statistics collection is disabled for the SAP.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Specify the service ID number associated with the specified SAP ID (access port/encapsulation).
Configuring statistics collection for a VXLAN SAP is supported only on the OmniSwitch 6900-X72/Q32 and OmniSwitch 6900-V72/C32.

**Examples**

-> service 100 sap port 1/1/2:10 stats enable
-> service 101 sap linkagg 20:all stats enable
-> service 100 sap port 1/1/2:10 stats disable
-> service 101 sap linkagg 20:all stats disable
-> service 10 sap port 1/11-20:21-30 stats enable
-> service 30 sap linkagg 11:10-20 stats disable

**Release History**

Release 7.3.1; command was introduced.
Release 7.3.4; support for entering a range of SAP ports, linkaggs, and VLAN ID tags added; VXLAN service support added.
Release 8.4.1.R02; support for L2 GRE tunnel services added.

**Related Commands**

- alaSapEncapValue
- alaSapStatsAdminStatus
- alaSapSvcId
### service sap admin-state

Configures the administrative status for the specified Service Access Point (SAP) ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

```
service service_id sap {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} {:0 | :all | :qtag[-qtag2] | :outer_qtag.inner_qtag} admin-state {enable | disable}
```

#### Syntax Definitions

- **service_id**: An existing SPB, VXLAN, or L2 GRE service ID number.
- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[-agg_id2]**: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- **:0**: Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
- **:all**: Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
- **:qtag[-qtag2]**: Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP. Use a hyphen to specify a range of VLAN IDs (21-30)
- **:outer_qtag.inner_qtag**: Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
- **enable**: Enables the administrative status for the SAP.
- **disable**: Disables the administrative status for the SAP.

#### Defaults

By default, the administrative status of the SAP is enabled.

#### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

- Specify the service ID number associated with the specified SAP ID (access port/encapsulation).
• Disabling the SAP administrative status does not remove the SAP configuration from the bridge.
• If an access port goes down, all SAPs associated with that port are operationally taken down as well.
• Configuring the administrative status for a VXLAN SAP is supported only on the OmniSwitch 6900-X72/Q32 and OmniSwitch 6900-V72/C32.

Examples
-> service 10 sap port 1/2:10 admin-state enable
-> service 13 sap linkagg 20 admin-state enable
-> service 10 sap port 1/2:10 admin-state disable
-> service 13 sap linkagg 20 admin-state disable
-> service 10 sap port 1/11-20:21-30 admin-state enable
-> service 30 sap linkagg 11:10-20 admin-state disable

Release History
Release 7.3.1; command was introduced.
Release 7.3.4; support for entering a range of SAP ports, linkaggs, and VLAN ID tags added; VXLAN service support added.
Release 8.4.1.R02; support for L2 GRE tunnel services added.

MIB Objects

alaSapBaseInfoTable
alaSapPortId
alaSapEncapValue
alaSapAdminStatus
alaSapSvcId
**service sdp vxlan**

Configures a Service Distribution Point (SDP) for Virtual eXtensible LAN (VXLAN) traffic. This type of SDP is used to tunnel unicast or multicast traffic between VXLAN Tunnel End Points (VTEPs). Configuring an SDP is automatically done for Shortest Path Bridging (SPB) services; this command is only for VXLAN services.

```
service sdp sdp_id vxlan {far-end ip_address | multicast-group mc_group_address} [ttl {ttl_num | default}] [description desc_info] [admin-state {enable | disable}]
```

```
no service sdp sdp_id [description]
```

**Syntax Definitions**

- **sdp_id**: The ID number to assign to the SDP object.
- **ip_address**: The IP address of the Loopback0 interface for the far-end VTEP node. The Loopback0 address is required on every VTEP node.
- **mc_group_address**: The multicast IP address of the group to which this service will join. This parameter is not supported on an OmniSwitch 6900-V72/C32.
- **ttl_num**: A Time-to-Live (TTL) value that is inserted into the TTL field of the IP header when the VXLAN encapsulated frames are sent from this node. The valid range is 1–255.
- **default**: Sets the TTL value to the default value of 64.
- **desc_info**: An ASCII text string up to 160 characters in length.
- **enable**: Enables the administrative status of the SDP.
- **disable**: Disables the administrative status of the SDP.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>

</tr>
</tbody>
</table>

OmniSwitch AOS Release 8 CLI Reference Guide April 2023 page 10-64
Usage Guidelines

- Use the **no** form of this command to delete the SDP object, only if the SDP is not bound to any services. If the **description** parameter is specified with the **no** form, then only the description information is removed from the SDP.

- When the **far-end** option is used, this command specifies a single destination unicast IP address that identifies the far-end VTEP node to which the SDP will tunnel traffic. This IP address is the Loopback0 address configured on every VTEP node. The SDP is then bound to a VXLAN service to direct one-way VXLAN encapsulated traffic to that single far-end node. This object is similar to the unicast SDP in SPB.

- When the **multicast-group** option is used, this command specifies the multicast group address to which all broadcast, unknown unicast, and multicast (BUM) traffic is sent to the VTEP nodes that subscribe to the PIM multicast group will receive this type of traffic. In this mode, the **ttl** parameter value is included in the IP header of the VXLAN encapsulation header:

- If the IP address of a VTEP node is learned, thus creating a dynamic unicast SDP through the discovery process, the unicast traffic is sent to the VTEP node that is associated with that learned IP address. This object is similar to multicast SDP in SPB.

- The administrative status of the VXLAN SDP affects all SDP bindings that are bound to this object.

- Configuring a VXLAN service on an OmniSwitch 6900-V72/C32 is supported only when the service is configured to use the head-end multicast mode; tandem mode services are not supported. As a result, creating an SDP with a multicast group address is also not supported (tandem mode services are bound to multicast SDPs).

Examples

```
-> service sdp 10 vxlan multicast-group 224.2.1.1 ttl 20 description "PIM Group 224.2.1.1"
-> service sdp 10 ttl 5
-> service sdp 20 far-end 10.10.10.2 description "Unicast to NodeB"
-> service sdp 20 admin-state disable
-> no service sdp 10 description
-> no service sdp 10
```

Release History

Release 7.3.4; command was introduced.

Related Commands

service sdp l2gre

Configures a Service Distribution Point (SDP) for Layer 2 Generic Routing Encapsulation (L2 GRE) traffic. This type of SDP is used to tunnel encapsulated GRE traffic between two L2 GRE tunnel end points. Manual configuration of an L2 GRE SDP is required on a switch serving as a tunnel aggregation switch.

```
service sdp sdp_id l2gre far-end ip_address [ttl {ttl_num | default}] [description desc_info] [admin-state {enable | disable}]
```

```
no service sdp sdp_id [description]
```

**Syntax Definitions**

- `sdp_id`  
  The ID number to assign to the SDP object.

- `ip_address`  
  The IP address of the Loopback0 interface for the far-end Guest Tunnel access switch. The Loopback0 address is required on every Guest Tunnel endpoint.

- `ttl_num`  
  A Time-to-Live (TTL) value that is inserted into the TTL field of the GRE header when the GRE encapsulated frames are sent from this node. The valid range is 1–255.

- `default`  
  Sets the TTL value to the default value of 64.

- `desc_info`  
  An ASCII text string up to 160 characters in length.

- `enable`  
  Enables the administrative status of the SDP.

- `disable`  
  Disables the administrative status of the SDP.

**Defaults**

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>X72/Q32</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>
Usage Guidelines

- Use the no form of this command to delete the SDP object, only if the SDP is not bound to any services. If the description parameter is specified with the no form, then only the description information is removed from the SDP.

- The far-end IP address value specifies a single destination unicast IP address that identifies the far-end L2 GRE tunnel access switch to which the SDP will tunnel traffic. This IP address is the Loopback0 interface address configured on every tunnel end point. The SDP is then bound to an L2 GRE service to direct one-way GRE encapsulated traffic to that single far-end tunnel access switch. This object is similar to the unicast SDP in SPB, however, multicast SDPs are not configurable for L2 GRE tunneling.

- The administrative status of the L2 GRE SDP affects all SDP bindings that are bound to this object.

- When L2 GRE automatic SDP discovery is enabled (the default), manual configuration of the SDP and SDP binding is not required on the L2 GRE tunnel aggregation switch (see the service l2gre auto-discover command for more information).

- Configuring L2 GRE tunneling on an OmniSwitch 6900-T20/T40 or OmniSwitch 6900-X20/X40 is recommended when these models are part of a mixed VC and the L2 GRE SDP is configured on one of the other switches in the mixed VC (for example, on an OmniSwitch 6900-X72/Q32 or OmniSwitch 6900-V72/C32). This ensures that all routing and multicast functionality required to support an L2 GRE tunnel service is limited to a switch that supports SDP configuration.

Examples

-> service sdp 20 l2gre far-end 192.168.0.10 admin-state enable description "Guest SDP to access switch 192.168.0.10"
-> service sdp 20 ttl 5
-> service sdp 20 admin-state disable
-> no service sdp 20 description
-> no service sdp 20

Release History

Release 8.4.1.R02; command was introduced.

**service bind-sdp**

Configures the binding of a Virtual eXtensible LAN (VXLAN) service or a Layer 2 Generic Encapsulation Routing (L2 GRE) tunnel service to a Service Distribution Point (SDP).

```
service service_id bind-sdp sdp_id1 [sdp_id2 sdp_id3 ...] [description desc_info]
service service_id[-service_id2] bind-sdp sdp_id [description desc_info]
no service service_id bind-sdp sdp_id [description]
```

**Syntax Definitions**

- `service_id[-service_id2]` An existing VXLAN service ID or an L2 GRE tunnel service ID to bind to the SDP. Use a hyphen to specify a range of services to bind to the SDP.
- `sdp_id` An existing SDP ID number to bind to the service. Use a space to specify additional SDP IDs to bind to the specified service (for example, 10 20 30 40 50).
- `desc_info` An ASCII text string up to 160 characters in length.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>desc_info</td>
</tr>
<tr>
<td>desc_info</td>
<td>No description.</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to delete the SDP binding. If the `description` parameter is specified with the `no` form, then only the description information is removed from the SDP binding.
- There is no control of the SDP administrative status; this type of service object is always enabled.
- Only static SDPs (created with an SDP ID between 1–32767) can be manually bound to a VXLAN service or an L2 GRE tunnel service; otherwise, an error message is returned.
- When configuring an SDP binding for a VXLAN service, consider the following:
  - VXLAN is only supported on the OmniSwitch 6900-X72/Q32 and OmniSwitch 6900-V72/C32.
  - An SDP binding is defined to allow VXLAN traffic to reach other nodes in the same group (multicast SDP) or reach a single node (unicast SDP).
A tandem mode VXLAN service can be bound only to one multicast SDP (not supported on an OmniSwitch 6900-V72/C32).

A head-end mode VXLAN service can be bound only to unicast SDPs.

A hybrid mode service can be bound with one multicast SDP for a group of member VTEPs and with many unicast SDPs for VTEPs that do not participate in a multicast group.

On an OmniSwitch 6900-V72/C32, only head-end mode VXLAN services are supported. As a result, creating an SDP bind for a tandem mode service is not supported on this platform. If the service is configured to use the hybrid multicast mode, then the service can only be bound to a unicast SDP.

- When configuring an SDP binding for an L2 GRE tunnel service, consider the following:
  - An SDP and SDP binding is defined on a tunnel aggregation switch to allow L2 GRE tunnel traffic to reach a single tunnel access switch (unicast SDP).
  - One SDP and SDP binding is configured for each tunnel access switch that will tunnel traffic to the tunnel aggregation switch.
  - When L2 GRE automatic discovery is enabled (the default), manual configuration of the SDP and SDP binding is not required on the L2 GRE tunnel aggregation switch (see the service l2gre autocDiscover command for more information).

Examples

```plaintext
-> service 1 bind-sdp 10 description "Bind to PIM Group 224.2.1.1"
-> service 2 bind-sdp 20 description "Unicast Bind to 1.1.1.20 VTEP"
-> service 4 bind-sdp 30 description "Unicast Bind to 10.2.2.1 Guest Access Switch:
-> service 5 bind-sdp 40 50 60 70 80 90
-> service 1-100 bind-sdp 10 description "Bind Services 1-100 to PIM Group 225.2.1.1"
-> service 200-250 bind-sdp 20 description "Bind Services 200-250 to 1.1.1.20 VTEP"
-> service 300-350 bind-sdp 30 description "Bind Services 300-350 to 10.2.2.1 Guest Access Switch"
-> no service 1 bind-sdp 10 description
-> no service 2 bind-sdp
```

Release History

Release 7.3.4; command was introduced.
Release 8.4.1.R02; support for binding L2 GRE tunnel services to unicast SDPs added.

Related Commands

**service l2gre auto-discover**

Configures the status of L2 GRE automatic SDP discovery on a tunnel aggregation switch. When enabled, the switch discovers the SDPs of remote tunnel end points for a configured L2 GRE service. Once discovered, the switch will dynamically create local SDP and SDP bindings for the remote tunnel end points of the L2 GRE service.

```
service l2gre auto-discover {enable | disable}
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables automatic discovery of L2 GRE edge switches.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables automatic discovery of L2 GRE edge switches.</td>
</tr>
</tbody>
</table>

**Defaults**

By default, automatic discovery is enabled on an L2 GRE tunnel aggregation switch.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>X72/Q32</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When L2 GRE automatic discovery is enabled (the default), the detection of SDPs for remote tunnel end points is based on the traffic received from these end points. If the destination IP address of the remote traffic is the IP address of the local Loopback0 interface and the VPNID of the traffic matches the VPNID of a local L2 GRE service, an SDP and SDP binding is dynamically created for the remote tunnel end point.

- When L2 GRE automatic discovery is disabled, manual configuration of an SDP and SDP binding for a remote tunnel end point is required using the `service sdp l2gre` and `service sdp-bind` commands.

- L2 GRE automatic discovery on the tunnel aggregation switch is similar to how tunnel access switches automatically define unicast SDPs to the aggregation switch.

- Configuring L2 GRE tunneling on an OmniSwitch 6900-T20/T40 or OmniSwitch 6900-X20/X40 is recommended when these models are part of a mixed VC and the L2 GRE SDP is configured on one of the other switches in the mixed VC (for example, on an OmniSwitch 6900-X72/Q32 or OmniSwitch 6900-V72/C32). This ensures that all routing and multicast functionality required to support an L2 GRE tunnel service is limited to a switch that supports SDP configuration.

**Examples**

```
-> service l2gre auto-discover disable
-> service l2gre auto-discover enable
```
Release History

Release 8.5R2; command was introduced.

MIB Objects

alaSvcMgrSysTable
  alaSvcMgrSdpAutoCreateAdminState
service rfp local-endpoint

Configures a local end point for an SPB Remote Fault Propagation (RFP) domain. Creating a local RFP end point identifies the local switch as a Maintenance End Point (MEP) in the RFP domain.

service rfp rfp_id local-endpoint lep_id [admin-state {enable | disable}] [ccm-interval {interval100ms | interval1s | interval10s | interval1m | interval10m | interval-invalid}] [level number] type spb

no service rfp rfp_id [local-endpoint lep_id]

Syntax Definitions

rfp_id  A unique numerical value to identify an RFP domain that maps to a reserved OAM domain. The valid RFP ID range is 1–32767.

lep_id  A numerical value to identify an end point of the specified RFP domain ID on the local switch. The valid range is 1–8191. This value serves as the virtual UP MEP ID for the RFP end point.

enable  Administratively enables the local end point.

disable  Administratively disables the local end point.

interval100ms  Send a Continuity Check Messages (CCM) every 100 milliseconds.

interval1s  Send a CCM every 1 second.

interval10s  Send a CCM every 10 seconds.

interval1m  Send a CCM every minute.

interval10m  Send a CCM every 10 minutes.

interval-invalid  Send a CCM by a MEP.

number  A unique numerical value to assign as the OAM domain level for the RFP domain. The valid range is 0-7.

Defaults

When a local end point is created for an RFP domain without specifying any of the optional parameter values, the end point is created with the following default values:

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
<tr>
<td>ccm-interval</td>
<td>interval1s</td>
</tr>
<tr>
<td>number</td>
<td>7</td>
</tr>
</tbody>
</table>
Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/C32E/T24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the `no` form of this command to remove the RFP domain configuration from the switch (for example, `no service rfp 1`). To remove the local end point ID only, use the `no` form of this command with the `local-endpoint` parameter (for example, `no service rfp local-endpoint`).

- An RFP domain consists of a local end point configured with this command and a remote end point list configured with the `service rfp remote-endpoint` command. An SPB service is bound to the remote end point list to identify the Service Access Point (SAP) to monitor.

- The local end point ID number identifies local BEB devices in the RFP domain; this is also the number used as the virtual UP MEP ID.

- Creating more than one RFP domain with the same domain level value is not allowed. Up to eight RFP domains are allowed as long as they each are created with a different level number. Each RFP domain created counts towards the maximum limit of Ethernet OAM domains allowed.

- When this command is used to create an RFP end point, the switch automatically creates the following reserved Ethernet OAM elements that are mapped to each RFP domain:
  - Maintenance Domain (MD) named “RFP_OVER_SPB_DOMAIN_LEVEL7”, where the level number is the value specified with this command. Each time an RFP end point is created, a new maintenance domain is created with the level number specified with this command.
  - Maintenance Association (MA) named “RFP_OVER_SPB_ASSOCIATION”. The same MA name is used for all RFP domains.
  - A primary VLAN, where the VLAN ID used is the SPB control BVLAN. This same VLAN is used as the primary VLAN for all RFP domains.
  - Virtual UP Maintenance End Point (MEP) that will advertise CCM to the network. Each CCM contains a proprietary OUI TLV that specifies I-SID information and the state of the port associated with the I-SID. CCM packets are sent using the CCM interval value specified with this command. The local end point ID specified with this command serves as the virtual UP MEP ID.

Examples

- `-> service rfp 1000 local-endpoint 1 ccm-interval INTERVAL1s type SPB`
- `-> service rfp 1000 local-endpoint 1 admin-status enable`
- `-> service rfp 2000 local-endpoint 1 admin-status enable ccm-interval INTERVAL1s level 6 type SPB`
- `-> service rfp 300 local-endpoint 40 ccm-interval INTERVAL1s type level 5 SPB`
- `-> service rfp 300 local-endpoint 40 admin-status enable`
- `-> no service rfp 1 local-endpoint 1000`

Release History

Release 7.3.4; command was introduced.
Related Commands

**service rfp remote-endpoint**  Configures a remote end point that is associated with the local end point through the RFP ID.

**show service rfp**  Displays the configuration and status of RFP for SPB domains.

**show service rfp configuration**  Displays the RFP OAM domain configuration for the bridge.

MIB Objects

alaRfpSpbLocalEndPointTable
  alaRfpSpbLocalEndPointRfp
  alaRfpSpbLocalEndPoint
  alaRfpSpbLocalEndPointCcmInterval

  alaRfpSpbLocalEndPointLevel
  alaRfpSpbLocalEndPointCBVlan
  alaRfpSpbLocalEndPointMaintDomain
  alaRfpSpbLocalEndPointMaintAssociation
**service rfp remote-endpoint**

Configures a remote end point list for an SPB Remote Fault Propagation (RFP) domain. The list consists of the MEP IDs on remote BEBs and local SPB service ID numbers. This command triggers the sending of a Continuity Check Message (CCM) to advertise the status of the specified local SPB services to the specified remote MEP IDs.

```
service rfp rfp_id remote-endpoint rep_id service-id [service_id[[-service_id2]]
```

```
no service rfp rfp_id remote-endpoint rep_id [service-id [service_id[[-service_id2]]]
```

### Syntax Definitions

- **rfp_id**: An existing RFP ID number.
- **rep_id**: A numerical value to identify the MEP ID of a remote BEB. The valid range is 1–8191.
- **service_id[[-service_id2]]**: An existing SPB service ID to bind to the RFP domain. Use a hyphen to specify a range of SPB services (for example, 10-12 specifies services 10, 11, and 12).

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to remove the RFP end point or an SPB service ID from the end point list.
- To identify a BEB as a participating member of an RFP domain, first configure a local RFP end point with the `service rfp local-endpoint` command to create the RFP domain ID then use this command to configure the remote end point. Both types of end points use the same RFP ID, but the RFP ID specified for the remote end point must already exist.
- The MEP ID specified with this command is the end-point ID configured on the remote BEB using the `service rfp local-endpoint` command.
- One or more SPB services are bound to the RFP remote end point to identify the Service Access Point (SAP) to monitor within the RFP domain. An SPB service is associated with an SPB service instance ID (I-SID); the service is then associated with a SAP. A SAP binds together the service and the access port on which device traffic enters the SPB service domain.
Each SPB service bound to an RFP domain identifies the SAP information (such as access port status and I-SID) that is advertised in the proprietary TLV of CCM packets. Each CCM may contain information for multiple SPB services.

Although binding multiple SPB services to an RFP domain is allowed, monitoring SAPs associated with only one SPB service is recommended.

**Examples**

```
-> service rfp 1000 remote-endpoint 2 service-id 10-14
-> service rfp 1000 remote-endpoint 3 service-id 20
-> no service rfp 1000 remote-endpoint 2 service-id 10
-> no service rfp 1000 remote-endpoint 2
-> no service rfp 1000
```

Example when the RFP ID does not exist because a local end point with that ID was not created:

```
-> service rfp 2000 remote-endpoint 2 service-id 10
ERROR: RFP Domain (2000) does not exist
```

**Release History**

Release 7.3.4; command was introduced.

**Related Commands**

- `service rfp local-endpoint` Configures a local end point that is associated with the remote end point through the RFP ID.
- `show service rfp` Displays the configuration and status of RFP for SPB domains.

show service l2profile

 Displays the Layer 2 profile configuration information for the bridge. This type of profile is applied to access (customer-facing) ports and specifies how to process Layer 2 protocol frames received on this type of port.

 show service l2profile [profile_name]

 Syntax Definitions

 profile_name

 An existing Layer 2 profile name. Use quotes around string if the profile name contains multiple words with spaces between them (for example, “ALE Engineering”).

 Defaults

 By default, all profiles are displayed if a profile name is not specified with this command.

 Platforms Supported

 This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

 Usage Guidelines

 • Use the profile-name parameter to display information for a specific profile. Entering a profile name is case sensitive.

 • If there are no profiles configured for the switch, this command will still display the information for the default profiles (def-access-profile, pw-def-access-profile, and unp-def-access-profile).
   – The def-access-profile is applied to service access ports that are not associated with a specific profile.
   – The pw-def-access-profile replaces the def-access-profile when the access port is assigned to an SPB pseudo-wire SAP.
   – The unp-def-access-profile is applied to UNP access ports.

 • An asterisk (*) appears after a profile name when the profile is assigned to UNP access ports.

show service access

Displays the access (customer-facing) port configuration for the bridge.

`show service access [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]] | sap]`

**Syntax Definitions**

- **chassis**
  - The chassis identifier.

- **slot/port[-port2]**
  - The chassis number and the slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

- **agg_id[-agg_id2]**
  - The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

- **sap**
  - Displays the Service Access Points (SAPs) associated with the specified access port.

**Defaults**

By default, all service access ports are displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `port` and `linkagg` parameters to display the configuration for a specific port or link aggregate.
- Use the `sap` parameter to display the SAPs associated with the specified port.

**Examples**

```
-> show service access
Port   Link   SAP   SAP   Vlan
Id     Status  Type  Count Xlation L2Profile              Description
-------+--------+-------+------+=---------------+----------------------------------
1/1/11  Up     Manual 100   N   def-access-profile
1/1/12  Up     Manual 100   N   def-access-profile
1/1/13  Down   Dynamic 100   N   unp-def-access-profile UNP Dynamic Access Port
1/1/14  Down   Manual 100   N   pw-def-access-profile

Total Access Ports: 4
```
-> show service access port 1/1/13
Port     Link  SAP     SAP   Vlan
Id       Status Type  Count Xlation L2Profile    Description
-------+------+-------+-=---+-------+------------------+-----------------------
1/1/13  Down   Dynamic 100   N       unp-def-access-profile UNP Dynamic Access Port
Total Access Ports: 1

output definitions
Port Id: The access port number or link aggregate ID number.
Link Status: The status of the link connection to the access port (Up or Down).
SAP Type: Whether or not the SAP associated with the access port was created statically or dynamically (Manual or Dynamic).
SAP Count: The number of service access points (SAPs) that are associated with the access port.
VLAN Xlation: Whether or not VLAN translation is enabled on the access port.
L2Profile: The name of the Layer 2 profile associated with the access port. Configured through the service l2profile command.
Description: An optional description configured for the access port. By default, the description is blank.

-> show service access port 1/1/23 sap
Legend: * denotes a dynamic object
Identifier       Adm  Oper Stats T:P  ServiceId   Isid/Vnid Xlation Sap Description
----------------+----+----+-----+----+-----------+---------+-------+---------------
sap:1/1/23:0     Down Down  N    Y:x  20          1500        N      -
sap:1/1/23:all   Up   Down  N    N:3  10          2300        N      VXLAN SAP
sap:1/1/23:9.10  Down Down  N    Y:x  20           200        N      L2GRE SAP
Total SAPs: 3

output definitions
Identifier: The SAP identifier, which consists of the access port and encapsulation value.
Adm: The administrative state of the SAP (Up or Down).
Oper: The operational state of the SAP (Up or Down).
Stats: Whether or not statistics collection is enabled for the SAP (Yes or No).
T:P: Whether or not the 802.1p priority value of traffic mapped to this SAP is trusted. (Y or N). If this value is set to untrusted (N), then the traffic is marked with the specified 802.1p priority value. For example, Y:x indicates traffic priority is trusted; N:3 indicates traffic priority is untrusted and should be marked with an 802.1p value of 3.
ServiceId: The ID number of the service associated with the SAP.
Isid/Vnid: An SPB service instance identifier (ISID), VXLAN network identifier (VNID), or an L2 GRE Virtual Private Network (VPN) identifier. The value of this field depends on whether an SPB service, a VXLAN service, or an L2 GRE tunnel service is associated with the SAP.

show service

Displays information about the services configured on the switch.

show service [spb | vxlan | l2gre | service_id [sap tcp-mss]]

Syntax Definitions

spb Displays only the Shortest Path Bridging (SPB) services.
vxlan Displays only the Virtual eXtensible LAN (VXLAN) services.
l2gre Displays only the Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel services.

service_id An existing service ID number. Displays additional details about the specified service.
sap tcp-mss Displays the TCP Maximum Segment Size (TCP-MSS) configuration.

Defaults

By default, a list of all services is displayed.

Usage Guidelines

- Use the spb parameter to display additional information about SPB services.
- Use the vxlan parameter to display additional information about VXLAN services.
- Use the l2gre parameter to display additional information about L2 GRE tunnel services.
- The service ID is a unique number that identifies a specific service. Information associated with the service ID is displayed.

output definitions

- **Isid**: The service instance identifier that identifies the SPB service instance within the provider backbone bridging (PBB) network. This field is displayed only for SPB services.

- **BVlan**: The VLAN ID number for the backbone VLAN to which the SPB service is mapped. This field is displayed only for SPB services.

- **MCast Mode**: The multicast replication mode (Headend, Tandem, or Hybrid) for the service.

- **T/R**: The number of packets transmitted and received for this service. This field is displayed only for SPB services.

Service Manager Commands

Related Commands

- **service spb**
  - Configures an SPB service.

- **service pseudo-wire**
  - Configures an SPB service to operate as a point-to-point (E-LINE) service.

- **service vxlan**
  - Configures a VXLAN service.

- **service l2gre**
  - Configures an L2 GRE tunnel service.

- **show service ports**
  - Displays the virtual ports (SAPs, SDPs) associated with the service.

- **show service sdp**
  - Displays the SDP configuration for the bridge.

- **show service bind-sdp**
  - Displays the Mesh SDP bindings for the bridge.

Release History

- Release 7.3.1; command was introduced.
- Release 7.3.4; **vxlan** parameter added.
- Release 8.4.1.R02; **l2gre** parameter added.
- Release 8.6R1; “Port Isolation” field added for L2 GRE tunnel services.
- Release 8.7R2; “Pseudo-wire” added to “Option” field for SPB services.

Option

- **Option**
  - The type of tunnel endpoint defined by the service (**pseudo-wire** or **None**). A pseudo-wire endpoint is configured to define a point-to-point connection that will provide a transparent E-LINE service. If this option is set to **None**, the service is operating in the default mode, where tunnel endpoints are automatically defined between all the SPB nodes with the same backbone service instance (I-SID).

IPv4 VRF Instance
IPv6 VRF Instance

- **IPv4 VRF Instance**
  - The name of the VRF instance in which an IP interface that is bound to the SPB service is configured. This field is displayed only when the SPB service is associated with an L3 VPN IP interface.

- **IPv6 VRF Instance**
  - The name of the VRF instance in which an IP interface that is bound to the SPB service is configured. This field is displayed only when the SPB service is associated with an L3 VPN IP interface.

IPv4 Interface
IPv6 Interface

- **IPv4 Interface**
  - The name of the IP interface that is bound to the SPB service. This field is displayed only when the SPB service is associate with an L3 VPN IP interface.

- **IPv6 Interface**
  - The name of the IP interface that is bound to the SPB service. This field is displayed only when the SPB service is associate with an L3 VPN IP interface.

Port Isolation

- **Port Isolation**
  - The status of port isolation for an L2 GRE tunnel service. When enabled, traffic between L2 GRE tunnel SAPs is dropped. Port isolation is implicitly enabled and is not configurable in this release.

Ingress Pkts
Ingress Bytes
Egress Pkts
Egress Bytes
Mgmt Change
Status Change

- **Ingress Pkts**
  - The number of packets that have ingressed on this SAP.

- **Ingress Bytes**
  - The number of bytes that have ingressed on this service.

- **Egress Pkts**
  - The number of packets that have egressed on this service.

- **Egress Bytes**
  - The number of bytes that have egressed on this service.

- **Mgmt Change**
  - The date and time of the last configuration change for this service.

- **Status Change**
  - The date and time of the last operational status change for this service.

show service ports

Displays the virtual ports associated with the specified Shortest Path Bridging (SPB) service, Virtual eXtensible LAN (VXLAN) service, or Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel service.

`show service {service_id | isid instance_id | vnid vxlan_id | vpnid vpn_id} ports`

Syntax Definitions

- **service_id**: An existing service ID number.
- **instance_id**: Displays the virtual ports associated with the specified SPB service instance identifier (I-SID) number. The valid range is 256–16777214.
- **vxlan_id**: Displays the virtual ports associated with the specified VXLAN network identifier (VNID). The valid range is 1–16777215 (or 000.000.001–255.255.255 in dot-decimal notation format).
- **vpn_id**: Displays the virtual ports associated with the specified L2 GRE tunnel Virtual Private Network (VPN) ID.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>

</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- A Service Access Point (SAP) and a Service Distribution Point (SDP) serve as virtual ports that carry traffic for the specified SPB service, VXLAN service, or L2 GRE tunnel service.
- In addition to the virtual port configuration, this command also provides the status and additional configuration information for the SPB service, VXLAN service, or L2 GRE tunnel service.

Examples

`-> show service 525 ports`

| Sdp FarEnd/Group    | - **VXLAN service**: The Loopback0 IP address or the multicast group IP address for the far-end VXLAN node associated with the service.  
                        - **L2 GRE service**: The Loopback0 IP address of the far-end Guest Tunnel access switch that is associated with the service. |
| Intf                | The bridge interface (port or link aggregate) of the virtual port (SAP or SDP) that is associated with the service. |
| Sap Description     | The description for the SAP that is associated with the service. |
| Sdp Systemname      | The system name for the SDP bridge that is associated with the SPB service. |
| Sdp Intf Name       | The description for the SDP interface that is associated with the VXLAN or L2 GRE service. |

#### Release History

- Release 7.3.1; command was introduced.
- Release 7.3.4; **vnid** parameter added for VXLAN services.
- Release 8.4.1.R02; **vpnid** parameter added for L2 GRE tunnel services.
- Release 8.7R2; “PW-Enb” field added only to the display output for SPB pseudo-wire services.

#### Related Commands

- **show service**  
  Displays the service configuration for the bridge.
- **show service spb sap**  
  Displays the service access point (SAP) configuration for a specific SAP associated with the specified SPB service.

#### MIB Objects

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td></td>
</tr>
</tbody>
</table>
show service spb sap

Displays the configuration information for the specified Service Access Point (SAP) ID associated with the specified service. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

show service spb service_id sap {port chassis/slot/port | linkagg agg_num} [:0 | :all | :qtag] [:outer_qtag.inner_qtag]

Syntax Definitions

- service_id: An existing service ID number.
- chassis/slot/port: The slot and port number of the Service Access Port.
- agg_num: The link aggregate ID number (0–31) of a service access link aggregate.
- :0: Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
- :all: Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
- :qtag: Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP.
- :outer_qtag.inner_qtag: Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>

</tr>
</tbody>
</table>

Usage Guidelines

- A SAP is a type of virtual port that is associated with the specified service.
- A SAP determines which traffic (untagged, single-tagged, or double-tagged) is mapped to the service associated with this SAP.
Examples

-> show service spb 525 sap port 1/11:2524

  - **alaSapLastStatusChange**

- **alaServiceMgrPortTable**
  - **alaServiceMgrPortID**
  - **alaServiceMgrPortVlanXlation**
**show service sdp**

Displays the Service Distribution Point (SDP) configuration for the bridge. An SDP is a logical service entity that tunnels traffic from one switch to another switch in the network.

```
show service sdp [sdp_id]
```

---

**Syntax Definitions**

*sdp_id*  
An existing SDP ID number.

**Defaults**

By default, all SDPs are displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the *sdp_id* parameter to display information about a specific SDP.
- Manual configuration of SDPs and SDP bindings is *not* required for SPB services. SDPs are automatically created and bound to ISIS-SPB services as needed throughout the Provider Backbone Bridge (PBB) network.
- Dynamic SDPs are not saved to the switch configuration file.
- Manual configuration of SDPs and SDP bindings is required for VXLAN services.
- The status of automatic discovery for Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel services determines whether or not manual configuration of SDPs and SDP bindings is required on an L2 GRE tunnel aggregation switch. See the *show service sdp l2gre* command for more information.
- Displaying the SDP configuration for VXLAN services is supported only on the OmniSwitch 6900-X72/Q32 and OmniSwitch 6900-V72/C32.

**Examples**

```
-> show service sdp
Legend: * denotes a dynamic object
All SDP Info
          FarEnd/Group Ip Addr
SdpId  FarEnd SysId:Bvlan  Adm  Oper  SvcType

Allocation Type : Dynamic,  SDP Bind Count : 1,

SDP-Id: A unique SDP identification number manually configured for VXLAN services.
Description: An optional ASCII text description for this SDP.
Service Type: The type of service traffic that this SDP will tunnel (SPB, VxLAN, or L2GRE).
FarEnd/Group: The IP address (Loopback0 interface) or multicast group IP address associated with the far-end VXLAN node or L2 GRE tunnel endpoint of this SDP. Note that L2 GRE SDPs only support far-end IP addresses.
Admin Status: The administrative state of the SDP (Up or Down).
Oper Status: The operational state of the SDP (Up or Down).
Service Manager Commands

**show service sdp**

<table>
<thead>
<tr>
<th><strong>TTL</strong></th>
<th>The time-to-live (TTL) value for this SDP.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Allocation Type</strong></td>
<td>Whether the SDP was statically or dynamically created. An SDP for an SPB service is generated dynamically; an SDP for a VXLAN or L2GRE tunnel service is generated statically or dynamically through the UNP feature.</td>
</tr>
<tr>
<td><strong>SDP Bind Count</strong></td>
<td>The number of services bound to this SDP.</td>
</tr>
<tr>
<td><strong>Mgmt Change</strong></td>
<td>The date and time of the last manual change to this SDP.</td>
</tr>
<tr>
<td><strong>Status Change</strong></td>
<td>The date and time of the last status change to this SDP.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN fields added.
Release 8.4.1.R02; L2 GRE fields added.

**Related Commands**

- `show service sdp spb` Displays SDP information specific to SPB services.
- `show service sdp vxlan` Displays SDP information specific to VXLAN services.
- `show service sdp l2gre` Displays SDP information specific to L2 GRE tunnel services.
- `show service` Displays the service configuration for the bridge.
- `show service bind-sdp` Displays the Mesh SDP configuration for the bridge.

**MIB Objects**

- `alaSdpInfoTable`<br>  
  - `alaSdpId`  
  - `alaSdpSvcType`  
  - `alaSdpDelivery`  
  - `alaSdpFarEndIpAddress`  
  - `alaSdpDescription`  
  - `alaSdpAdminStatus`

**show service sdp spb**

Displays the Service Distribution Point (SDP) configuration for SPB services.

```plaintext
show service sdp spb [sysid mac_address | bvlan bvlan_id]
```

### Syntax Definitions

- **mac_address**
  
  The System ID (BMAC) of the far-end SPB node of the service tunnel defined by this SDP.

- **bvlan_id**
  
  The VLAN ID number of an existing SPB BVLAN.

### Defaults

By default, all SDPs are displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **sysid** and **bvlan** parameters to display additional information about SPB SDPs.
- Manual configuration of SDPs and SDP bindings is *not* required for SPB services. SDPs are automatically created and bound to ISIS-SPB services as needed throughout the Provider Backbone Bridge (PBB) network.
- Dynamic SDPs are not saved to the switch configuration file.

**show service sdp vxlan**

Displays the Service Distribution Point (SDP) configuration for Virtual eXtensible LAN (VXLAN) services.

**show service sdp vxlan [far-end ip_address | multicast-group mc_group_address]**

---

**Syntax Definitions**

- **ip_address**
  
  The IP address of the Loopback0 interface for the far-end VXLAN Tunnel End Point (VTEP) node. The Loopback0 address is required on every VTEP node.

- **mc_group_address**
  
  The multicast IP address of the group to which the service will join. This parameter is not supported on an OmniSwitch 6900-V72/C32.

---

**Defaults**

By default, all SDPs are displayed.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

Total SDPs: 1

**SdpId**
A unique SDP identification number manually configured for VXLAN services.

**FarEnd/Group Addr**
The IP address (Loopback0) or multicast group IP address associated with the far-end VXLAN node of this SDP.

**Adm**
The administrative state of the SDP (**Up** or **Down**).

**Oper**
The operational state of the SDP (**Up** or **Down**).

**Intf**
The VXLAN interface on which the VXLAN node was discovered for a unicast SDP (this field is blank for a multicast SDP).

**Bind Count**
The number of services bound to this SDP.

**ttl**
The time-to-live (TTL) value for this SDP.

**Description**
An optional ASCII text description for this SDP.

**Release History**

Release 7.3.4; command was introduced.

**Related Commands**

- **service sdp vxlan**
  Configures an SDP for a VXLAN service.

- **show service sdp**
  Displays the SDP configuration for the switch.

- **show service sdp spb**
  Displays SDP information specific to SPB services.

- **show service sdp l2gre**
  Displays SDP information specific to L2 GRE tunnel services.

- **show service**
  Displays the service configuration for the bridge.

- **show service bind-sdp**
  Displays the Mesh SDP configuration for the bridge.
### MIB Objects

<tr>
<td>alaSdpAdminTTL</td>
</tr>
</tbody>
</table>
**show service sdp l2gre**

Displays the Service Distribution Point (SDP) configuration for Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel services.

**show service sdp l2gre [far-end ip_address]**

---

**Syntax Definitions**

*ip_address*  
The IP address of the Loopback0 interface for the far-end L2GRE tunnel endpoint. The Loopback0 address is required on every VTEP node.

---

**Defaults**

By default, all SDPs are displayed.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>X72/Q32</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Use the **far-end** parameter to display only L2 GRE SDPs associated with a specific far-end IP address; multicast group IP addresses are not supported.

- The status of automatic SDP discovery for L2 GRE tunnel services determines whether or not manual configuration of SDPs and SDP bindings is required on an L2 GRE tunnel aggregation switch. See the **service l2gre auto-discover** command for more information.
  - If L2 GRE automatic discovery is enabled (the default), then SDPs are automatically created and bound to L2 GRE services.
  - If L2 GRE automatic discovery is disabled, then manual configuration of SDPs and SDP bindings is required for L2 GRE services.

- This command is supported on an OmniSwitch 6560 to display dynamically configured L2 GRE service objects, such as SDPs.

---

**Examples**

```bash
-> show service sdp l2gre
Legend: (*) dyn unicast object
L2GRE SDP Info

<table>
<thead>
<tr>
<th>SdpId</th>
<th>FarEnd Addr</th>
<th>Adm</th>
<th>Oper</th>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>33001*</td>
<td>10.10.10.2</td>
<td>Up</td>
<td>Up</td>
<td>1/1/1</td>
<td>1</td>
<td>64</td>
<td>L2GRE VPNID 100</td>
</tr>
</tbody>
</table>

**SdpId**
A unique SDP identification number manually configured for L2 GRE services.

**FarEnd Addr**
The IP address (Loopback0 interface) associated with the far-end L2 GRE tunnel endpoint of this SDP.

**Adm**
The administrative state of the SDP (**Up** or **Down**).

**Oper**
The operational state of the SDP (**Up** or **Down**).

**Intf**
The interface on which the L2 GRE tunnel endpoint was discovered for a unicast SDP.

**Bind Count**
The number of services bound to this SDP.

**ttl**
The time-to-live (TTL) value for this SDP.

**Description**
An optional ASCII text description for this SDP.

**Release History**
Release 8.4.1.R02; command was introduced.

**Related Commands**
- `service sdp l2gre` Configures an SDP for an L2 GRE tunnel service.
- `show service sdp` Displays the SDP configuration for the switch.
- `show service sdp spb` Displays SDP information specific to SPB services.
- `show service sdp vxlan` Displays SDP information specific to VXLAN services.
- `show service` Displays the service configuration for the bridge.
- `show service bind-sdp` Displays the Mesh SDP configuration for the bridge.

show service bind-sdp

Displays the Service Distribution Point (SDP) binding configuration for the switch.

`show service bind-sdp [sdp_id[:service_id]]`

**Syntax Definitions**

- `sdp_id[:service_id]` Displays SDP bindings with the specified SDP ID and/or service ID number.

**Defaults**

By default, all SDP bindings are displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Manual configuration of SDPs and SDP bindings is **not** required for SPB services. SDPs are automatically created and bound to ISIS-SPB services as needed throughout the Provider Backbone Bridge (PBB) network.

- Dynamic SDP bindings are not saved to the switch configuration file.

- Manual configuration of SDPs and SDP bindings is required for VXLAN services.

- The status of automatic SDP discovery for Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel services determines whether or not manual configuration of SDPs and SDP bindings is required on an L2 GRE tunnel aggregation switch. See the `show service bind-sdp l2gre` command for more information.

- This command is also supported on an OmniSwitch 6560 to display dynamically configured L2 GRE service objects, such as SDP bindings.

- The `show service bind-sdp` command is the preferred command to use for displaying the SDP binding configuration, instead of the `show service mesh-sdp` command.

- Displaying the SDP binding configuration for VXLAN services is supported only on the OmniSwitch 6900-X72/Q32 and OmniSwitch 6900-V72/C32.

Total Bind-SDPs: 14

output definitions

SvcId
The ID number of the service that is bound to the SDP.

Bind-SDP
The unique SDP identification number that is bound to the service number.

FarEnd/Group Addr
The IP address (Loopback0 interface) or multicast group IP address associated with the far-end VXLAN node or L2 GRE tunnel endpoint of this SDP. Note that L2 GRE SDPs only support far-end IP addresses.

FarEnd SysId:BVlan
The System ID (bridge MAC address) and associated BVLAN of the far-end SPB node of the PBB tunnel defined by this SDP.

Oper
The operational state of the SDP binding (Up or Down).

Svc Type
The type of service bound to the SDP (SPB, VXLAN, or L2GRE).

show service bind-sdp spb

Displays the Service Distribution Point (SDP) binding configuration for Shortest Path Bridging (SPB) services.

show service bind-sdp [spb | isid instance_id]

Syntax Definitions

spb
Displays SPB SDP bindings.

instance_id
Displays SPB SDP bindings associated with the specified service instance identifier (I-SID) number. The valid range is 256–16777214.

Defaults

By default, all SDP bindings are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the spb parameter to display information for all SPB bindings.
- Use the isid parameter to display information for a specific SPB service instance.
- Manual configuration of SDPs and SDP bindings is not required for SPB services. SDPs are automatically created and bound to ISIS-SPB services as needed throughout the Provider Backbone Bridge (PBB) network.
- Dynamic SDP bindings are not saved to the switch configuration file.

Examples

-> show service bind-sdp spb
Legend: * denotes a dynamic object

Total Bind-SDPs: 10

output definitions

SvcId
The ID number of the SPB service that is bound to the SDP.

SdpId
The unique SDP identification number that is dynamically generated by ISIS-SPB and bound to the service number.

Iсид
The service instance identifier (I-SID) number for the SPB service.

FarEnd SysId:BVlan
The System ID (BMAC) and associated BVLAN of the far-end SPB node of the PBB tunnel defined by this SDP.

Oper
The operational state of the SDP binding (Up or Down).

Intf
The SPB interface (network port) on which ISIS-SPB discovered the neighbor BMAC and BVLAN.

FarEnd SystemName
The system name of the far-end SPB node.

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; isid parameter added.

Related Commands

show service bind-sdp

show service bind-sdp vxlan

Displays the Service Distribution Point (SDP) binding configuration for Virtual eXtensible LAN (VXLAN) services.

show service bind-sdp [vxlan | vnid vxlan_id]

**Syntax Definitions**

- **vxlan**: Displays VXLAN SDP bindings.
- **vxlan_id**: An existing VXLAN network identifier (VNID). The valid range is 1–16777215 (or 000.000.001–255.255.255 in dot-decimal notation format).

**Defaults**

By default, all SDP bindings are displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

Total Bind-SDPs: 4

SvcId
The ID number of the service that is bound to the SDP.

Bind-SDP
The unique SDP identification number that is bound to the service number. For example, 200:2 represents SDP 200 bound to service 2.

Vnid
A 24-bit numerical value that identifies a VXLAN segment.

FarEnd/Group Addr
The IP address (Loopback0) or multicast group IP address associated with the far-end VXLAN node of the SDP.

Oper
The operational state of the SDP binding (Up or Down).

Intf
The VXLAN interface on which the SDP binding was configured.

Intf Name
The name assigned to the VXLAN interface.

Release History
Release 7.3.4; command was introduced.

Related Commands
- show service bind-sdp: Displays the SDP binding configuration for the switch.
- show service bind-sdp spb: Displays SDP binding information for SPB services.
- show service bind-sdp l2gre: Displays SDP binding information for L2 GRE tunnel services.
- show service: Displays the service configuration for the bridge.
- show service sdp: Displays the SDP configuration for the bridge.

show service bind-sdp l2gre

Displays the Service Distribution Point (SDP) binding configuration for Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel services.

show service bind-sdp [l2gre | vpnid vpn_id]

Syntax Definitions

l2gre Displays L2 GRE SDP bindings.
vpnid An existing VPN ID for an L2 GRE tunnel segment.

Defaults

By default, all SDP bindings are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>X72/Q32</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the l2gre parameter to display information for all L2 GRE bindings.
- Use the vpnid parameter to display information for a specific L2 GRE VPN segment.
- The status of automatic SDP discovery for L2 GRE tunnel services determines whether or not manual configuration of SDPs and SDP bindings is required on an L2 GRE tunnel aggregation switch. See the service l2gre auto-discover command for more information.
  - If L2 GRE automatic discovery is enabled (the default), then SDPs are automatically created and bound to L2 GRE services.
  - If L2 GRE automatic discovery is disabled, then manual configuration of SDPs and SDP bindings is required for L2 GRE services.
- This command is supported on an OmniSwitch 6560 to display dynamically configured L2 GRE service objects, such as SDP bindings.

**output definitions**

- **SvcId**: The ID number of the service that is bound to the SDP.
- **SdpId**: The unique SDP identification number that is bound to the service number.
- **FarEnd/Group Addr**: The IP address (Loopback0 interface) or multicast group IP address associated with the far-end VXLAN node or L2 GRE tunnel endpoint of this SDP. Note that L2 GRE SDPs only support far-end IP addresses.
- **FarEnd SysId:BVlan**: The System ID (bridge MAC address) and associated BVLAN of the far-end SPB node of the PBB tunnel defined by this SDP.
- **Oper**: The operational state of the SDP binding (Up or Down).
- **Svc Type**: The type of service bound to the SDP (SPB, VXLAN, or L2GRE).

**Release History**

Release 7.3.1; command was introduced.
Release 7.3.4; VXLAN fields added.
Release 8.4.1.R02; L2 GRE fields added.

**Related Commands**

show service debug-info

Displays debug information for the virtual ports associated with the service.

```
show service {service_id | isid instance_id | vnid vxlan_id | vpnid vpn_id} debug-info
```

**Syntax Definitions**

- **service_id**: An existing service ID number.
- **instance_id**: Displays debug information for the SPB service associated with the specified service instance identifier (I-SID) number. The valid range is 256–16777214.
- **vxlan_id**: Displays debug information for the VXLAN service associated with the specified VXLAN network identifier (VNID). The valid range is 1–16777215 (or 000.000.001–255.255.255 in dot-decimal notation format).
- **vpnid**: Displays debug information for the L2 GRE tunnel service associated with the specified Virtual Private Network (VPN) ID.

**Defaults**

N/A

**Usage Guidelines**

- A virtual port represents a Service Access Point (SAP) or a Service Distribution Point (SDP) that is associated with the specified service.
- In addition to the virtual port configuration, this command also provides the status and additional configuration information for the service.
- Use the `isid` parameter to display debug information for the SPB service associated with the I-SID.
- Use the `vnid` parameter to display debug information for the VXLAN service associated with the VNID. This parameter is supported only on the OmniSwitch 6900-X72/Q32 and OmniSwitch 6900-V72/C32.
- Use the `vpnid` parameter to display debug information for the L2 GRE tunnel service associated with the VPNID.

Release History

Release 7.3.1; command was introduced.
Release 7.3.4; **vnid** parameter and display fields added for VXLAN.
Release 8.4.1.R02; **vpnid** parameter and display fields added for L2 GRE.

Related Commands

- **show service ports** Displays the virtual port (SAP and SDP) configuration for the specified service.
- **show service** Displays the service configuration for the bridge.
- **show service access** Displays the service access port configuration for the switch.

MIB Objects

N/A
show service info

Displays the Service Manager configuration for the local switch.

show service info

**Syntax Definitions**

N/A

**Defaults**

By default, the UDP port value is set to 4789.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The display output of this command also includes SPB and VXLAN information, such as the system MAC address and name used by SPB and the UDP port and VRF used by VXLAN.
- Layer 2 Generic Routing Encapsulation (L2 GRE) information is displayed based on the switch platform. For example, the status of automatic discovery and the reserved VLAN ID is displayed only on those switches that support that functionality.

**Examples**

-> show service info

Service Manager System Info

SPB System Id : 00e0.b1e7.09a3,       SPB System Name : OS6860,
Service Trap  : Disable,              SAP Trap        : Disable,
SDP Trap      : Disable,              Bind Trap        : Disable,
Trap Rate Per Min: 60,                  VRRP TCAM Rule   : Enable,
Stats Admin State: Enable,              Stats Owner      : SvcMgr,
VxLAN Udp Port : 4789,                  VxLAN Current VRF: Default,
SDP auto-create : Enable

Sample output on an OmniSwitch 6560:

-> show service info

Service Manager System Info

SPB System Id : 2cfa.a2a2.e93f,       SPB System Name : OS6560,
Service Trap  : Disable,              SAP Trap        : Disable,
SDP Trap      : Disable,              Bind Trap        : Disable,
Service Manager Commands

show service info

---

| Trap Rate Per Min: 60, | VRRP TCAM Rule : Enable, |
| Stats Admin State: Disable, | Stats Owner : Available, |
| VxLAN Udp Port : 4789, | VxLAN Current VRF: Default, |
| L2GRE Rsvd VLAN : 4000, 4005, 4006, 4007, 4008, 4015, 4016, 4017 |

output definitions

| SPB System Id | The base MAC address of the local switch. |
| SPB System Name | The system name associated with the local switch. |
| Service Trap | The status (Enable or Disable) of trap generation for service status changes. |
| SAP Trap | The status (Enable or Disable) of trap generation for SAP status changes. |
| SDP Trap | The status (Enable or Disable) of trap generation for SDP status changes. |
| Bind Trap | The status (Enable or Disable) of trap generation for service bind status changes. |
| Trap Rate Per Min | The maximum number of traps that can be sent per minute. |
| VRRP TCAM Rule | The status (Enable or Disable) of how the switch processes VRRP packets (destination VRRP MAC address) received on access ports. When enabled, the customer VLAN tag is removed from VRRP packets. When disabled, the customer VLAN tag is not removed from VRRP packets. Configured through the service local-vrrp command. |
| Stats Admin State | The administrative status (Enable or Disable) of the statistics collection function. Configured through the service stats command. |
| Stats Owner | The system application in control of statistics collection. |
| VxLAN Udp Port | The UDP destination port for the Virtual eXtensible Local Area Network (VXLAN) feature. Configured through the service vxlan udp-port command. |
| VxLAN Current VRF | The name of the VRF instance for the VXLAN feature. Configured through the service vxlan vrf command. |
| Mgmt Change | The date and time of the last administrative status change. |
| Status Change | The date and time of the last operational status change. |
| SDP auto-create | The status (Enable or Disable) of automatic edge switch discovery on an L2 GRE tunnel aggregation switch. Configured through the service l2gre auto-discover command. Supported only on the OmniSwitch 6860, OmniSwitch 6865, OmniSwitch 6900, and OmniSwitch 9900. |
| L2GRE Rsvd VLAN | The reserved VLAN IDs for L2 GRE tunnel services. Configured through the service l2gre reserved-vlan command Supported only on the OmniSwitch 6560. |

Release History

Release 7.3.4; command was introduced; VXLAN fields added.
Release 8.3.1.R02; VRRP TCAM Rule field added.
Release 8.5R2; L2GRE auto-disc and L2GRE Rsvd VLAN fields added for L2 GRE tunnel services.
Release 8.5R4; **L2GRE auto-disc** field name changed to **SDP auto-create**.
Release 8.6R1; **L2GRE Rsvd VLAN** field allows display of multiple L2 GRE reserved VLANs.

**Related Commands**

*show service*  
Displays information about the services configured on the switch.

**show service l3vpn profile**

Displays the status of IP over SPB inline routing support. For more information about inline routing, see the “IP over SPBM” section of the “Configuring Shortest Path Bridging” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide*.

**Syntax Definitions**

N/A

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>In-use</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>X48C6/T48C6/X48C4E</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Support for IP over SPB inline routing is enabled by default (Basic mode is active).
- When disabled (Basic mode is not active), inline routing cannot be configured on the switch, however, more system resources are available for other non-inline routing functionality (such as an increase in the number of Layer 3 interfaces, ARPs, etc.).

**Examples**

```
-> show service l3vpn profile
Legend: (*)In-use
Profile Name  L3 Intf  Next Hops  Ecmp Groups  Ecmp Members
-----------------------------------------------+
Basic*        1024     4096      256          1024
```

After inline routing support is disabled (no service l3vpn profile) and the switch is rebooted, the following is displayed:

```
-> show service l3vpn profile
Legend: (*)In-use
Profile Name  L3 Intf  Next Hops  Ecmp Groups  Ecmp Members
-----------------------------------------------+
Disabled*     0         0         0            0
```
**Release History**

Release 8.7R2; command was introduced.

**Related Commands**

- **service l3vpn profile**  
  Configures the status of IP over SPB inline routing support.

**MIB Objects**

- `alaCapManServiceL3vpnConfig`
- `alaCapManServiceL3vpn`
**show service counters**

Displays the traffic statistics for the specified service and associated virtual ports. A virtual port represents a Service Access Point (SAP) or a Service Distribution Point (SDP) that is bound to the specified service.

```
show service {service_id | spb service_id | vnid vxlan_id | vpnid vpn_id} counters
```

### Syntax Definitions

- **service_id**: An existing service ID number.
- **vxlan_id**: Displays statistics for the VXLAN service associated with the specified VXLAN network identifier (VNID). The valid range is 1–16777215 (or 000.000.001–255.255.255 in dot-decimal notation format).
- **vpn_id**: Displays statistics for the L2 GRE tunnel service associated with the specified Virtual Private Network (VPN) ID.

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- Enter an existing service ID number to display statistics for a specific service.
- Use the **vnid** parameter to display statistics for a specific VXLAN network identifier. A VNID identifies a specific VXLAN network segment. This parameter is supported only on the OmniSwitch 6900-X72/Q32 and OmniSwitch 6900-V72/C32.
- Use the **vpnid** parameter to display statistics for a specific L2 GRE VPN segment.

### Examples

```
-> show service 20 counters

<tr>
<td>sdp:200:20</td>
<td>60</td>
<td>5678</td>
<td>4321</td>
<td>12345678</td>
</tr>
</tbody>
</table>

**output definitions**

- **Identifier**: The virtual ports (SAPs or SDPs) associated with the service.
- **Ing Pkts**: The number of packets received on the virtual port.
- **Ing Byte Count**: The ingress packet byte count for the virtual port.
- **Egr Pkts**: The number of packets sent on the virtual port.
- **Egr Byte Count**: The egress packet byte count for the virtual port.

**Release History**

Release 7.3.1; command was introduced.
Release 7.3.4; vnid parameter added for VXLAN.
Release 8.4.1.R02; vpnid parameter added for L2 GRE.

**Related Commands**

- **show service**: Displays the service configuration for the bridge.
- **show service ports**: Displays the virtual ports associated with the specified service.
- **clear service counters**: Clears the traffic statistics for the specified service and associated virtual ports.

**MIB Objects**

alaSvcBaseInfoTable
  - alaSvcIngressPacketCount
  - alaSvcIngressByteCount
  - alaSvcEgressPacketCount
  - alaSvcEgressByteCount
clear service counters

Clears the traffic statistics for the specified service and associated virtual ports. A virtual port represents a Service Access Point (SAP) or a Service Distribution Point (SDP) that is bound to the specified service.

```
clear service [service_id] [sap {port chassis/slot/port | linkagg agg_id]} :0 | :all | :qtag | :outer_qtag.inner_qtag] [mesh-sdp sdp_id] counters
```

**Syntax Definitions**

- `service_id`: An existing SPB service ID number.
- `chassis`: The chassis identifier.
- `slot/port`: The slot and port number of the service access port.
- `agg_id`: The link aggregate ID number (0–31) of a service access link aggregate.
- `:0`: Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
- `:all`: Specifies a wild-card SAP. All tagged traffic that is not classified into another SAP is mapped to the wild-card SAP.
- `:qtag`: Specifies a VLAN ID tag for traffic that ingresses on the access port. Only traffic with this tag is mapped to this SAP.
- `:outer_qtag.inner_qtag`: Specifies an outer VLAN ID tag and an inner VLAN tag for traffic that ingresses on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
- `sdp_id`: An existing mesh SDP ID.

**Defaults**

By default, all statistics counters for the specified service are cleared.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `sap` parameter options with this command to clear the statistics for a specific SAP ID. A SAP ID is comprised of an access port (`slot/port or agg_id`) and an encapsulation value (`:0, :all, :qtag, or :outer_qtag.inner_qtag`) that is used to identify the type of customer traffic to map to the associated service.

- Use the `mesh-sdp sdp_id` parameter to clear the statistics for a specific mesh SDP.
Examples

-> clear service counters  
-> clear service 100 counters  
-> clear service sap 8/2:all counters  
-> clear service mesh-sdp counters

Release History

Release 7.3.1; command was introduced.  
Release 7.3.4; VXLAN service support added.

Related Commands

show service counters Displays the traffic statistics for the specified SPB service and associated virtual ports.

MIB Objects

alaSvcBaseInfoTable  
   alaSvcClearCounters  
alaSapBaseInfoTable  
   alaSapClearCounters
**show service rfp**

Displays the configuration and status of SPB Remote Fault Propagation (RFP) domains.

```
show service rfp [rfp_id [local-sap-status]]
```

### Syntax Definitions

- **rfp_id**
  - An existing RFP ID number.

- **local-sap-status**
  - Displays information about the local SPB service elements that are bound to the specified RFP ID.

### Defaults

By default, information for all RFP domains is displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Enter an existing RFP ID number to display statistics for a specific RFP domain.
- Use the **local-sap-status** parameter to display SPB service information for the specified RFP ID.

### Examples

```
-> show service rfp

Local system (Name: SystemId) = bridge1 : E8:E7:32:B8:9C:98

</tr>
</tbody>
</table>

**output definitions**

**RFP**
The RFP ID number. Configured through the `service rfp local-endpoint` command.

**Remote EndPoint**
The ID number for the RFP remote end point. Configured through the `service rfp remote-endpoint` command.

**RMEP Status**
The status of the remote Maintenance End Point (MEP).

**System (Name: SystemId)**
The name and bridge MAC address of the remote SPB switch.

**B-VLAN**
The SPB backbone VLAN that serves as the primary VLAN for the RFP domain. The SPB control BVLAN is automatically used for each RFP OAM domain.

**ISID**
The SPB service instance ID. The ISID is bound to an SPB service ID, which in turn is bound to an SPB access port. This binding creates a Service Access Point (SAP), which is configured through the `service sap` command.

**Service Id**
An SPB service ID number. Configured through the `service spb` command and associated with the RFP ID through the `service rfp remote-endpoint` command.

**Admin State**
The administrative status (Enable or Disable) of the SAP port on the local chassis.

```
-> show service rfp 1000 local-sap-status

Local endpoint ID = 10
Local system (Name: SystemId) = bridge1: E8:E7:32:B8:9C:98

```

**Local endpoint ID**
The ID number of the local RFP end point.

**Local system (Name: SystemId)**
The name and bridge MAC address of the local SPB switch.

**Service Id**
An SPB service ID number. Configured through the `service spb` command and associated with the RFP ID through the `service rfp remote-endpoint` command.
show service rfp

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sap</td>
<td>The Service Access Point to which the SPB service ID is associated through the configured through the <code>service sap</code> command.</td>
</tr>
<tr>
<td>Admin State</td>

<td>The ID number for the RFP remote end point. Configured through the <code>service rfp remote-endpoint</code> command.</td>
</tr>
<tr>
<td>R-Endpoint Status</td>
<td>The status of the remote Maintenance End Point (MEP).</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.3.4; command was introduced.

**Related Commands**

- `show service rfp configuration` Displays the RFP OAM domain configuration for the bridge.

**MIB Objects**

- **N/A**
**show service rfp configuration**

Displays the RFP OAM domain configuration for the bridge. When an RFP domain is created, an Ethernet OAM domain is automatically configured on the switch and mapped to the RFP domain.

**show service rfp configuration [rfp_id]**

---

**Syntax Definitions**

*rfp_id* 
An existing RFP ID number.

**Defaults**

By default, information for all RFP OAM domains is displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>V72/C32</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Enter an existing RFP ID number to display the OAM domain configuration for a specific RFM domain.
- For each RFP domain created, a separate OAM domain is also created and mapped to the RFP domain.

**Examples**

```
-> show service rfp configuration
Total Number of RFP domains - 2

RFP domain Number    : 1000
Admin status         : Enabled
Level                : 7
Type                 : SPB
Maintenance Domain   : RFP_OVER_SPB_DOMAIN_LEVEL7
Maintenance Association: RFP_OVER_SPB_ASSOCIATION
Control B-VLAN       : 1000
Virtual UP MEP ID    : 10
CCM interval         : 100 millisecond

1             10,11
2             20
3-9           40

output definitions

RFP domain number The RFP ID number, that is mapped to the OAM domain.
Admin State The administrative status (Enable or Disable) of the RFP domain.
Level The Maintenance Domain (MD) level.
Type The type of RFP domain (SPB is the only type currently supported).
Maintenance Domain The name of the reserved MD assigned to the RFP domain.
Maintenance Association The name of the Maintenance Association (MA) for the RFP (MD). The same MA name is used for all RFP domains.
Control B-VLAN The SPB control BVLAN that serves as the primary VLAN for the RFP OAM domain.
Virtual UP MEP ID The local end point ID for the RFP domain.
CCM interval The time interval at which a Continuity Check Message (CCM) is sent for this domain.
Remote Endpoint service ID The RFP ID number for the remote end point.

Release History

Release 7.3.4; command was introduced.
Related Commands

show service rfp

Displays the configuration and status of SPB Remote Fault Propagation (RFP) domains.

11 Loopback Detection Commands

Loopback Detection (LBD) automatically detects the loop and shutdown the port involved in the loop. This prevents forwarding loops on ports that have forwarded network traffic which has looped back to the originating switch. LBD detects and prevents Layer 2 forwarding loops on a port either in the absence of other loop detection mechanisms such as STP/RSTP/MSTP, or when these mechanisms cannot detect it (for example, a client's equipment may drop BPDUs, or the STP protocol may be restricted to the network edge). On a linkagg port, if one port of linkagg is getting shutdown due to LBD, then all the ports of linkagg will go to shutdown state.

Loopback Detection is enabled system wide and on a per-port basis. Once a loop is discovered, the port from which the loop originated is placed into an “Inactive” state and when the two ports of a switch is connected to each other through a hub, either the ports will be shutdown or it will be in normal state.

A provider network with a set of multiple switches interconnected together can be logically viewed as a large single switch. The large single switch provides service access points to customers' networks. Configuration faults in customer networks can result in loops spanning both provider and customer networks. This can result in broadcast storms. In order to protect provider's network from broadcast storms, loops that involve SAP ports need to be detected and broken.

The LBD can detect and break loops created on the service-access interface.

For a service-access interface, LBD can be enabled for a specific port or linkagg. LBD for service-access points allows shutting down only the specific interface of the link involved in the loop.

When loopback occurs, a trap is sent and the event is logged. The port which is shutdown due to LBD is automatically recovered if autorecovery-timer is set or the port can manually be enabled again when the problem is resolved.

MIB information for the Loopback Detection commands is as follows:

<table>
<thead>
<tr>
<th>Filename</th>
<th>ALCATEL-IND1-LBD-MIB</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module</td>
<td>alcatelIND1LBDMIB</td>
</tr>
</tbody>
</table>

A summary of available commands is listed here:

```
loopback-detection
loopback-detection port
loopback-detection service-access
loopback-detection transmission-timer
loopback-detection autorecovery-timer
show loopback-detection
show loopback-detection port
show loopback-detection linkagg
show loopback-detection statistics port
clear loopback-detection statistics port
```
loopback-detection

Enables or disables Loopback Detection (LBD) or remote origin LBD globally on the switch.

`loopback-detection [remote-origin] {enable | disable}`

**Syntax Definitions**

| enable | Disables LBD on the switch. |
| disable | Enables LBD on the switch. |

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- LBD can be enabled globally and per port without any dependency but `loopback-detection` will be operational only if LBD is enabled globally and also on the specific port.

- LBD can be configured for a port and the configuration can be applied and retained, whether or not LBD is enabled globally. However, LBD functionality on a port is available only when LBD is enabled globally on the switch.

- Enabling the `remote-origin` LBD option allows the switch to process the LBD frames originated from a remote system. The port from which the LBD frames originated will be shut down.

**Examples**

- `-> loopback-detection enable`
- `-> loopback-detection disable`
- `-> loopback-detection remote-origin enable`
- `-> loopback-detection remote-origin disable`

**Release History**

Release 7.3.4; command was introduced.
Release 8.2.1; `remote-origin` parameter added.
**Related Commands**

- `loopback-detection port` Enables or disables LBD on a specific port.
- `show loopback-detection` Displays LBD configuration information.

**MIB Objects**

- `alaLbdGlobalConfigStatus`
- `alaLbdGlobalRemoteConfigStatus`
**loopback-detection port**

Enables or disables LBD or remote-origin LBD on a specific bridge port.

`loopback-detection port chassis/slot/port[-port2] [remote-origin] {enable | disable}`

### Syntax Definitions

- **chassis**
  - The chassis identifier.

- **slot/port[-port2]**
  - The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

- **enable**
  - Enables LBD on the specified port.

- **disable**
  - Disables LBD on the specified port.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>chassis</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6/V48C8/C32E/T24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Loopback Detection must be enabled globally to enable LBD functionality on a specific port.
- For per-port remote origin LBD to work, both LBD and remote origin LBD must be enabled globally.
- LBD can be configured for a port and the configuration can be applied and retained, whether or not LBD is enabled globally. However, LBD functionality on a port is available only when LBD is enabled globally on the switch.
- When a LBD port joins a link aggregate, the LBD configuration on the joined port is removed.

### Examples

```
-> loopback-detection port 1/1/1 enable
-> loopback-detection port 1/1/1-8 enable
-> loopback-detection port 1/1/2 remote-origin enable
-> loopback-detection port 1/1/3-5 remote-origin enable
-> loopback-detection port 1/1/2 remote-origin disable
-> loopback-detection port 1/1/3-5 remote-origin disable
```
**Release History**

Release 7.3.4; command was introduced.
Release 8.2.1; `remote-origin` parameter added.

**Related Commands**

- `loopback-detection` Enables or disables LBD globally on the switch.
- `show loopback-detection` Displays LBD configuration information.
- `show loopback-detection port` Displays LBD port configuration information.

**MIB Objects**

  - `alaLbdPortConfigIndex`
  - `alaLbdPortConfigLbdAdminStatus`
  - `alaLbdPortConfigLbdOperStatus`
  - `alaLbdPortRemoteConfigAdminStatus`
**loopback-detection service-access**

Enables or disables LBD on a specific service access port or link aggregate or on a range of ports or link aggregates. When enabled, LBD can detect and break loops created on a service access interface.

`loopback-detection service-access {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} {enable | disable}`

### Syntax Definitions

- `chassis` The chassis identifier.
- `slot/port[-port2]` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `agg_id[-agg_id2]` The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `enable` Enables LBD on the specified port or linkagg.
- `disable` Disables LBD on the specified port or linkagg.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Before configuring LBD using the `service-access` option, the port or linkagg must be configured for service access. Use the `service access` command to configure the port or linkagg for service access.

- The `service-access` option allows shutting down only the specific interface of the link involved in the loop.

- The linkagg must be formed by ports with same path cost.

- LBD is applicable on a linkagg only if the linkagg is configured as a service access interface.

- LBD cannot be configured on a linkagg that has member ports running LBD configuration and vice versa.

- When a linkagg is in violation or shutdown state, the member ports cannot be deleted from the linkagg.
Examples

-> loopback-detection service-access port 1/1/1 enable
-> loopback-detection service-access port 1/1/1-8 enable
-> loopback-detection service-access linkagg 1 enable

Release History

Release 7.3.4; command was introduced.

Related Commands

- `loopback-detection` Enables or disables LBD globally on the switch.

Loopback Detection Commands

**loopback-detection transmission-timer**

Configures the LBD transmission timer on the switch. The transmission time is the time period between the consecutive LBD packet transmissions.

`loopback-detection transmission-timer seconds`

---

**Syntax Definitions**

- `seconds` The time period in seconds between LBD packet transmissions. The valid range is from 5 to 600 seconds.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>30</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

- If the timer value is not configured, the default value of 30 seconds is assigned to the transmission period.
- The timer can be modified at any time. However, the new timer value will come into effect only after the timer is restarted.

**Examples**

```
-> loopback-detection transmission-timer 200
```

**Release History**

Release 7.3.4; command was introduced.
Related Commands

- **loopback-detection**
  Enables or disables LBD globally on the switch.

- **show loopback-detection**
  Displays LBD configuration information.

MIB Objects

- **alaLbdGLocalConfigTransmissionTimer**
**loopback-detection autorecovery-timer**

Configures the LBD autorecovery timer on the switch. The autorecovery time is the time period in which the switch is recovered from the shutdown state.

**loopback-detection autorecovery-timer** seconds

---

**Syntax Definitions**

seconds The time period in seconds in which the switch is recovered from the shutdown state. The valid range is from 30 to 86400 seconds.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>300</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- If the timer value is not configured, the default value of 300 seconds is assigned to the autorecovery period.
- The timer can be modified at any time. However, the new timer value will come into effect only after the timer is restarted.

---

**Examples**

```
-> loopback-detection autorecovery-timer 200
```

---

**Release History**

Release 7.3.4; command was introduced.
Related Commands

- `loopback-detection` : Enables or disables LBD globally on the switch.

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To view information for a specific port or service access link aggregate, use the **show loopback-detection port** or **show loopback-detection linkagg** command.

**Examples**

```
-> show loopback-detection
Global LBD Status : enabled,
Global Remote-origin LBD Status : disabled,
Global LBD Transmission Timer : 30 sec,
Global LBD Auto-recovery Timer : 300 sec,
```

**output definitions**

- **Global LBD Status**: The current status of LBD of the switch (enabled or disabled).
- **Global Remote-origin LBD Status**: The current status of remote-origin LBD of the switch (enabled or disabled).
- **Global LBD Transmission Timer**: Displays the time interval in seconds between LBD packet transmissions.
- **Global LBD Auto-recovery Timer**: Displays the time in which the switch recovered from the shutdown state.
**Release History**

Release 7.3.4; command was introduced.
Release 8.2.1; “Global Remote-origin LBD Status” field added.

**Related Commands**

- `loopback-detection` Enables or disables LBD globally on the switch.
- `show loopback-detection port` Displays LBD configuration information for bridge and service access ports on the switch.
- `show loopback-detection linkagg` Displays LBD configuration information for a service access link aggregate.
- `show violation` Displays the administrative status, link status, violations, recovery time, maximum recovery attempts and the value of the wait-to-restore timer for the specified port or ports.

**MIB Objects**

- `alaLbdGlobalConfigStatus`
- `alaLbdGlobalRemoteConfigStatus`
- `alaLbdGlobalConfigTransmissionTimer`
- `alaLbdGlobalConfigAutorecoveryTimer`
show loopback-detection port

Displays the LBD configuration information for the specified bridge or service access port.

```
show loopback-detection port [chassis/slot/port]
```

**Syntax Definitions**

- **chassis**: The chassis identifier.
- **slot/port**: The slot and port number (3/1).

**Defaults**

By default, the LBD configuration for all ports is displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900V72/C32</th>
<th>6900X48C6/T48C6</th>
<th>6900X48C4E/V48C8C32E/T24C2</th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The command can be used only on an LBD enabled port.

- Use the `loopback-detection port` command to enable LBD on a bridge port.
- Use the `loopback-detection service-access` command to enable LBD on a service access port or link aggregate.

**Examples**

```
-> show loopback-detection port
Slot/Port  Admin State  Remote-origin Status  OperState     Time-to-recovery (sec)
---------------------------------------------------------------------------------------------------------
1/1/1      enabled     enabled       Remote ShutDown             -
1/1/2      enabled     -             Normal                      -
```

**output definitions**

- **Slot/Port**: The slot/port number of the LBD port.
- **Admin State**: The administrative state of the port (enabled or disabled).
- **Remote-origin Status**: The remote-origin LBD status of the port (enabled or disabled). This field does not apply to LBD service access ports.
- **OperState**: The operational state of the port (Normal or Inactive).
- **Time-to-recovery (sec)**: The amount of time to recovery during an LBD shutdown.
-> show loopback-detection port 1/1/1
Global LBD Status          : enabled,
Global Remote-origin LBD Status : enabled,
Global LBD Transmission Timer : 30 sec,
Global LBD Auto-recovery Timer : 300 sec,
Port LBD Status            : enabled,
Port Remote-origin LBD Status : enabled,
Port LBD State             : Remote ShutDown,
Remote Src Mac             : E8:E7:32:9A:5A:4E,
Remote BridgeId            : E8:E7:32:9A:5A:3F,
Port LBD Type              : normal-edge,

-> show loopback-detection port 1/1/2
Global LBD Status          : enabled,
Global Remote-origin LBD Status : disabled,
Global LBD Transmission Timer : 30 sec,
Global LBD Auto-recovery Timer : 300 sec,
Port LBD Status            : enabled,
Port Remote-origin LBD Status : -,
Port LBD State             : Inactive,
Port LBD Type              : service-edge,

</tr>
</tbody>
</table>

**Usage Guidelines**

The command can be used only on an LBD enabled link aggregate. Use the `loopback-detection service-access` command to enable LBD on a service access link aggregate.

**Examples**

```
--> show loopback-detection linkagg 10
Global LBD Status : enabled,
Global Remote-origin LBD Status : disabled,
Global LBD Transmission Timer : 30 sec,
Global LBD Auto-recovery Timer : 300 sec,
Linkagg LBD Status : disabled,
Linkagg LBD State : Inactive,
Linkagg LBD Type : service-access
```

**output definitions**

- **Global LBD Status** The current LBD status for the switch (enabled or disabled).
- **Global Remote-origin LBD Status** The current status of remote-origin LBD on the switch (enabled or disabled). This field does not apply to LBD link aggregates.
- **Global LBD Transmission Timer** Displays the time interval in seconds between LBD packet transmissions.
- **Global LBD Auto-recovery Timer** Displays the time interval in seconds in which the switch is recovered from the shut down state.
- **Linkagg LBD Status** Displays the administrative status of the link aggregate.

**show loopback-detection statistics port**

Displays LBD statistics information for a specific port on the switch.

**Syntax Definitions**

- **chassis**  
  The chassis identifier.

- **slot/port**  
  The slot and port number (3/1).

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>

<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The link aggregate ID is not displayed if the link aggregate is operationally down.

**Examples**

```
-> show loopback-detection statistics port 1/1/1
LBD Port Statistics
LBD Packet Send    : 1,
Invalid LBD Packet Received : 0,
Member of Link Aggregation : -
```

```
-> show loopback-detection statistics port 1/1/3
LBD Port Statistics
LBD Packet Send    : 1,
Invalid LBD Packet Received : 0,
Member of Aggregation : 2
```

**output definitions**

- **LBD Packet Send**  
  The number of LBD packet sent from the port.

- **Invalid LBD Packet Received**  
  The number of invalid LBD packets received on the port.

- **Member of Aggregation**  
  The linkagg ID in which the port is a member.

**MIB Objects**

alaLbdPortStatsTable
alaLbdPortStatsClear
Link aggregation combines multiple physical links between two switches into one logical link. The aggregate group operates within Spanning Tree as one virtual port and can provide more bandwidth than a single link. It also provides redundancy. If one physical link in the aggregate group goes down, link integrity is maintained.

There are two types of aggregate groups: static and dynamic. Static aggregate groups are manually configured on the switch with static links. Dynamic groups are set up on the switch but they aggregate links as necessary according to the Link Aggregation Control Protocol (LACP).

The dynamic aggregation software is compatible only with the following IEEE standard:

802.3ad — Aggregation of Multiple Link Segments

MIB information for the link aggregation commands is as follows:

Filename: ALCATEL-IND1-LAG-MIB.mib
Module: alcatelIND1LAGMIB
A summary of available commands is listed here:

| Static link aggregates                      | linkagg static agg size  |
|                                            | linkagg static agg name  |
|                                            | linkagg static agg wait-to-restore-time |
|                                            | linkagg static agg loopback |
|                                            | linkagg static agg loopback internal |
|                                            | linkagg static agg admin-state |
|                                            | linkagg static agg port agg |

| Dynamic link aggregates                     | linkagg lacp agg size     |
|                                            | linkagg lacp agg name      |
|                                            | linkagg lacp agg wait-to-restore-time |
|                                            | linkagg lacp agg admin-state |

**linkagg static agg size**

Creates a static aggregate group between two switches. A static aggregate group contains static links.

```
linkagg static agg agg_id[-agg_id2] size size [name name] [admin-state {enable | disable}] [multi-chassis active] [hash {source-mac | destination-mac | source-and-destination-mac | source-ip | destination-ip | source-and-destination-ip | tunnel-protocol}]
```

```
no linkagg static agg agg_id[-agg_id2]
```

**Syntax Definitions**

- `agg_id[-agg_id2]` The link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).
- `size` The maximum number of links allowed in the aggregate group.
- `name` The name of the static aggregate group. Can be any alphanumeric string. A group name with spaces must be contained within quotes (for example, “Static Group 1”).
- `enable` Specifies that the static aggregate group is active and is able to aggregate links.
- `disable` Specifies that the static aggregate group is inactive and not able to aggregate links.
- `multi-chassis active` This parameter is not supported.
- `source-mac` Selects the source MAC address hashing option.
- `destination-mac` Selects the destination MAC address hashing option.
- `source-and-destination-mac` Selects the source MAC address and destination MAC address hashing option.
- `source-ip` Selects the source IP hashing option.
- `destination-ip` Selects the destination IP hashing option.
- `source-and-destination-ip` Selects the source IP and destination IP hashing option.
- `tunnel-protocol` Selects the tunnel protocol (payload based) hashing option.
### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
<tr>
<td><em>hash_option</em></td>
<td>source-and-destination-IP (Layer 3 traffic)</td>
</tr>
<tr>
<td></td>
<td>source-and-destination-mac (Layer 2 traffic)</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to remove a static aggregate group or a range of static aggregate groups from the configuration.

- Link aggregation cannot be configured on an AppMon enabled port.

- If the static aggregate has any attached ports, delete the attached ports with the `no` form of the `linkagg static port agg` command then remove the static link aggregate ID. Delete the attached ports using the `no linkagg static port` command.

- Specify the `hash` parameter option when the link aggregate is first created. The hashing algorithm options apply to unicast traffic and are not modifiable once the aggregate is created. If different options are required:
  - Disassociate all ports currently associated with the aggregate.
  - Delete the aggregate from the switch configuration.
  - Create the aggregate again with the new hashing options.

- It is not necessary to administratively down the linkagg ports before changing the hashing algorithm, but doing so is recommended to avoid any loss of traffic.

- The hashing algorithm does not take into consideration the speed of the ports to distribute the traffic. In other words, the same number of flows is distributed evenly on each port without consideration of the line speed.

- Aggregate load balancing is performed at the ingress side.

- Per-aggregate hashing is local to the switch, so each side of the aggregation can use different configurations for the hashing algorithms.

- Link aggregation follows the global hash control settings configured through the `hash-control brief` or `hash-control extended` commands.
For example, when the **source-mac** option is specified for L2 hashing:
- If the global hash-control is in brief mode, hashing is based on source MAC address only.
- If the global hash-control is in extended mode, hashing is based on source MAC address, VLAN, Ethertype, and source module ID/port.

For example, when the **source-ip** option is specified for L3 hashing:
- If the global hash-control is in brief mode, hashing is based on source IP address only.
- If the global hash-control is in extended mode, hashing is based on source IP address and source UDP-TCP Port.

To load balance Unknown Destination/Broadcast/Multicast traffic on all the ports of the aggregate, use the **hash-control** command to enable load balancing of DFL traffic.

Use the **linkagg lacp agg size** command to create a dynamic aggregation (LACP) group.

### Examples

```
-> linkagg static agg 3-10 size 8
-> linkagg static agg 4 size 2 admin-state disable
-> linkagg static agg 4 size 2 hash source-and-destination-ip
-> no linkagg static agg 3-10
```

### Release History

- Release 7.1.1; command introduced.
- Release 7.3.1; **tunnel-protocol** parameter added.

### Related Commands

**show linkagg**

Displays information about static and dynamic (LACP) link aggregate groups.

### MIB Objects

**alclnkaggAggTable**

- **alclnkaggAggNumber**
- **alclnkaggAggSize**
- **alclnkaggAggLacpType**
- **alclnkaggAggName**
- **alclnkaggAggAdminState**
- **alclnkaggAggPortSelectionHash**
**linkagg static agg name**

Configures a name for an existing static aggregate group.

```
linkagg static agg agg_id[{-agg_id2}] name name
no linkagg static agg agg_id[{-agg_id2}] name
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>agg_id[{-agg_id2}]</code></td>
<td>The link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).</td>
</tr>
<tr>
<td><code>name</code></td>
<td>The name of the static aggregation group, can be an alphanumeric string. A group name with spaces must be contained within quotes (for example, “Static Group 1”)</td>
</tr>
</tbody>
</table>

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to remove a name from a static aggregate or from a range of static aggregates.
- You must assign names to static link aggregate IDs individually.
- To specify a range of link aggregates, use hyphen between the first and last link aggregate IDs of the range. A range of link aggregate IDs can be used only with the **no** form of this command.

**Examples**

```
-> linkagg static agg 2 name accounting
-> no linkagg static agg 2-10 name
```

**Release History**

Release 7.1.1; command introduced.
Related Commands

**linkagg static agg size**
Creates a static aggregate group.

**show linkagg**
Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
    alclnkaggAggNumber
    alclnkaggAggName
```
linkagg static agg wait-to-restore-time

Configures the number of minutes to wait before bringing up a link aggregate that is attached to other link aggregates.

linkagg static agg agg_id[-agg_id2] wait-to-restore-time wtr_minutes

no linkagg static agg agg_id[-agg_id2] wait-to-restore-time

Syntax Definitions

agg_id[-agg_id2] The link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).

wtr_minutes The number of minutes the switch waits to bring a link aggregate up. The range is 0–12 minutes.

Defaults

By default, the wait-to-restore timer is set to 0 (disabled).

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to disable the wait-to-restore timer for the specified link aggregate or aggregates.

- If a link aggregate is not attached to other links, this timer value is ignored and the aggregate is immediately brought up.

Examples

- `-> linkagg static agg 2 wait-to-restore-time 10`
- `-> linkagg static agg 2 wait-to-restore-time 0`
- `-> linkagg static agg 4 wait-to-restore-time 5`
- `-> no linkagg static agg 4 wait-to-restore-time`

Release History

Release 7.1.1; command introduced.
Related Commands

- `linkagg static agg size`  Creates a static aggregate group.
- `show linkagg`  Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

- `alclnkaggAggTable`
  - `alclnkaggAggNumber`
  - `alclnkaggAggWTRTimer`
**linkagg static agg loopback**

Configures the specified link aggregate group to run in loopback mode. This is required if the link aggregate is going to provide loopback functionality to support L3 VPN in-line routing for an IP over Shortest Path Bridging (SPB) configuration.

**Syntax Definitions**

`agg_id[agg_id2]` An existing link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>

<td></td>
<td></td>
<td></td>
<td></td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Only front-panel ports that are also configured to run in loopback mode can be assigned to this type of link aggregate.

- Once the loopback mode is enabled for a link aggregate, the link aggregate is dedicated to providing loopback functionality for an SPB L3 VPN in-line routing configuration. The loopback mode is disabled only when the link aggregate is deleted.

- For more information about SPB L3 VPN, see the “IP over SPBM” section of the “Configuring Shortest Path Bridging” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide*.

**Examples**

- `-> linkagg static agg 2 loopback`
- `-> linkagg static agg 10 loopback`

**Release History**

Release 8.6R2; command introduced.
**Related Commands**

- `linkagg static agg size` Creates a static aggregate group.
- `interfaces loopback` Configures a front-panel port to run in the loopback mode.

  - `alclnkaggAggLoopbackState`
linkagg static agg loopback internal

Configures the specified link aggregate group to run in internal loopback mode. This is required if the link aggregate is going to provide loopback functionality to support L3 VPN inline routing for an IP over Shortest Path Bridging (SPB) configuration.

**linkagg static agg **agg_id[-agg_id2] loopback

**Syntax Definitions**

agg_id[-agg_id2] An existing link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).

**Defaults**

N/A

**Platforms Supported**

Not supported in this release.

**Usage Guidelines**

- When the internal loopback mode is enabled, internal ports are assigned to the link aggregate group. These ports are dedicated for this purpose; front-panel ports are not assigned to this type of link aggregate.
- No external cable is required and no front-panel ports are used up to provide the L3 VPN loopback functionality when internal loopback is used to define an L3 VPN gateway interface.
- Only one link aggregate per switch can be configured to run in the internal loopback mode.
- Once the internal loopback mode is enabled for a link aggregate, the link aggregate is dedicated to providing loopback functionality for an SPB L3 VPN inline routing configuration. The internal loopback mode is disabled only when the link aggregate is deleted.
- For more information about SPB L3 VPN, see the “IP over SPBM” section of the “Configuring Shortest Path Bridging” chapter in the OmniSwitch AOS Release 8 Network Configuration Guide.

**Examples**

-> linkagg static agg 2 loopback internal
-> linkagg static agg 10 loopback internal
ERROR: Internal Loopback aggregate already exists

**Release History**

Release 8.6R2; command introduced.
Related Commands

**linkagg static agg size**

Creates a static aggregate group.

**show linkagg**

Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

alclnkaggAggTable
  alclnkaggAggNumber
  alclnkaggAggLoopbackState
**linkagg static agg admin-state**

Enables or disables the administrative state of a static link aggregation group.

```
linkagg static agg agg_id[-agg_id2] admin-state {enable | disable}
```

**Syntax Definitions**

- **agg_id[-agg_id2]**: The link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).
- **enable**: Specifies that the static aggregate group is active and is able to aggregate links.
- **disable**: Specifies that the static aggregate group is inactive and not able to aggregate links.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When the administrative state is set to **disable**, the static aggregate group is disabled.

**Examples**

```
→ linkagg static agg 2 admin-state disable
```

**Release History**

Release 7.1.1; command introduced.
Related Commands

`linkagg static agg size`  Creates a static aggregate group.
`show linkagg`  Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

`alclnkaggAggTable`
- `alclnkaggAggNumber`
- `alclnkaggAggAdminState`
**linkagg static port agg**

Configures a slot and port for a static aggregate group.

```
linkagg static port chassis/slot/port[-port2] agg agg_id
no linkagg static port chassis/slot/port[-port2]
```

**Syntax Definitions**

- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).
- **agg_id**: The ID number corresponding to the static aggregate group.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove one or more ports from a static aggregate group.
- A port can belong to only one aggregate group.
- Ports that belong to the same static aggregate group need not be configured sequentially and can be on any Network Interface (NI).
- To specify a range of link aggregates, use hyphen between the first and last link aggregate IDs of the range. A range of link aggregate IDs can be used only with the `no` form of this command.

**Examples**

```
-> linkagg static port 2/1-5 agg 4
-> no linkagg static port 2/1-5
```

**Release History**

Release 7.1.1; command introduced.
Related Commands

`linkagg static agg size`  Creates a static aggregate group.
`show linkagg port`  Displays information about link aggregation ports.

MIB Objects

`alclnkaggAggPortTable`  
- `alclnkaggAggPortGlobalPortNumber`
- `alclnkaggAggPortLacpType`
- `alclnkaggAggPortSelectedAggNumber`
**linkagg lACP agg size**

Creates a dynamic aggregate group that uses the Link Aggregation Control Protocol (LACP) to establish and maintain link aggregation. The **size** parameter is required to create the link aggregate group.

```
linkagg lACP agg agg_id[-agg_id2] size size
   [name name]  
   [admin-state {enable | disable}]  
   [actor admin-key actor_admin_key]  
   [actor system-priority actor_system_priority]  
   [actor system-id actor_system_id]  
   [partner system-id partner_system_id]  
   [partner system-priority partner_system_priority]  
   [partner admin-key partner_admin_key]  
   [multi-chassis active]  
   [hash {source-mac | destination-mac | source-and-destination-mac | source-ip | destination-ip | source-and-destination-ip | tunnel-protocol}]
```

```
no linkagg lACP agg agg_id[-agg_id2] size size
```

**Syntax Definitions**

- **agg_id[-agg_id2]** The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
- **size** The maximum number of links that can belong to the aggregate.
- **name** The name of the dynamic aggregate group. Can be an alphanumeric string. A group name with spaces must be contained within quotes (for example, “Dynamic Group 1”).
- **enable** Specifies that the dynamic aggregate group is active and is able to aggregate links.
- **disable** Specifies that the dynamic aggregate group is inactive and not able to aggregate links.
- **actor_admin_key** The administrative key value associated with the dynamic aggregate group.
- **actor_system_priority** The priority of the dynamic aggregate group.
- **actor_system_id** The MAC address of the dynamic aggregate group on the switch.
- **partner_system_id** The MAC address of the aggregate group of the remote system which is attached to the aggregate group of the switch.
- **partner_system_priority** The priority of the remote system to which the aggregation group is attached.
- **partner_admin_key** The administrative key for the remote partner of the aggregation group.
- **multi-chassis active** This parameter is not supported.
- **source-mac** Selects the source MAC address hashing option.
- **destination-mac** Selects the destination MAC address hashing option.
- **source-and-destination-mac** Selects the source MAC address and destination MAC address hashing option.
source-ip

Selects the source IP hashing option.

destination-ip

Selects the destination IP hashing option.

source-and-destination-ip

Selects the source IP and destination IP hashing option.

tunnel-protocol

Selects the tunnel protocol hashing option.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>enable</td>
</tr>
<tr>
<td>hash_option</td>
<td>source-and-destination-ip (Layer 3 traffic)</td>
</tr>
<tr>
<td></td>
<td>source-and-destination-mac (Layer 2 traffic)</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to remove a dynamic aggregate group from the configuration.
- Link aggregation cannot be configured on an AppMon enabled port.
- You must disable the group with the **linkagg lacp agg admin-state** command before you can delete a dynamic link aggregate group.
- Optional parameters for the dynamic aggregate group can be configured when the aggregate is created. The dynamic aggregate group can be modified after the optional parameters are assigned.
- Specify the **hash** parameter option when the link aggregate is first created. The hashing algorithm options apply to unicast traffic and are not modifiable once the aggregate is created. If different options are required:
  - Disassociate all ports currently associated with the aggregate.
  - Delete the aggregate from the switch configuration.
  - Create the aggregate again with the new hashing options.
- It is not necessary to administratively down the linkagg ports before changing the hashing algorithm, but doing so is recommended.
- The hashing algorithm does not take into consideration the speed of the ports to distribute the traffic. In other words, the same number of flows is distributed evenly on each port without consideration of the line speed.
- Aggregate load balancing is performed at the ingress side.
- Per-aggregate hashing is local to the switch, so each side of the aggregation can use different configurations for the hashing algorithms.

- Link aggregation follows the global hash control settings configured through the `hash-control brief` or `hash-control extended` commands.

- For example, if the `source-mac` option is specified for L2 hashing:
  - If the global hash-control is in brief mode, hashing is based on source MAC address only.
  - If the global hash-control is in extended mode, hashing is based on source MAC address, VLAN, Ethertype, and source module ID/port.

- For example, if the `source-ip` option is specified for L3 hashing:
  - If the global hash-control is in brief mode, hashing is based on source IP address only.
  - If the global hash-control is in extended mode, hashing is based on source IP address and source UDP-TCP Port.

- To load balance Unknown Destination/Broadcast/Multicast traffic on all the ports of the aggregate, use the `hash-control` command to enable load balancing of DFL traffic.

- Use the `linkagg static agg size` command to create static aggregate groups. See page 12-3 for more information about this command.

**Examples**

```
-> linkagg lacp agg 2-5 size 4
-> linkagg lacp agg 3 size 2 admin-state disable actor system-priority 65535
-> no linkagg lacp agg 2-5 size 4
```

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `show linkagg` Displays information about static and dynamic (LACP) aggregate groups.

**MIB Objects**

  - `alclnkaggAggActorAdminKey`
  - `alclnkaggAggActorSystemPriority`
  - `alclnkaggAggActorSystemID`
  - `alclnkaggAggPartnerSystemID`
  - `alclnkaggAggPartnerSystemPriority`
  - `alclnkaggAggPartnerAdminKey`
  - `alclnkaggAggPortSelectionHash`
linkagg lacp agg name

Configures a name for a dynamic aggregate group.

`linkagg lacp agg agg_id name name`

`no linkagg lacp agg agg_id[agg_id2] name`

**Syntax Definitions**

- `agg_id[agg_id2]`: The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
- `name`: The name of the dynamic aggregate group. Can be an alphanumeric string. A group name with spaces must be contained within quotes (for example, “Dynamic Group 1”).

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove a name from a single or a range of dynamic aggregate groups simultaneously.
- Assign names to individual dynamic link aggregate groups separately.

**Examples**

`-> linkagg lacp agg 2 name finance`

`-> no linkagg lacp agg 2-5 name`

**Release History**

Release 7.1.1; command introduced.
Related Commands

- `linkagg lacp agg size` Creates a dynamic aggregate group.

  - `alclnkaggAggNumber`
  - `alclnkaggAggName`
**linkagg lacp agg wait-to-restore-time**

Configures the number of minutes to wait before bringing up a dynamic link aggregate that is attached to other link aggregates.

```
linkagg lacp agg [agg_id1[-agg_id2]] wait-to-restore-time wtr_minutes

no linkagg lacp agg [agg_id1[-agg_id2]] wait-to-restore-time
```

**Syntax Definitions**

- `agg_id1[-agg_id2]` The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
- `wtr_minutes` The number of minutes the switch waits to bring a link aggregate up. The range is 0–12 minutes.

**Defaults**

By default, the wait-to-restore timer is set to 0 (disabled).

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to disable the wait-to-restore timer for the specified link aggregate or aggregates.
- If a link aggregate is not attached to other links, this timer value is ignored and the aggregate is immediately brought up.

**Examples**

```
-> linkagg lacp agg 2 wait-to-restore-time 10
-> linkagg lacp agg 2 wait-to-restore-time 0
-> linkagg lacp agg 4 wait-to-restore-time 5
-> no linkagg lacp agg 4 wait-to-restore-time
```

**Release History**

Release 7.1.1; command introduced.
Related Commands

MIB Objects

- **alclnkaggAggTable**
  - **alclnkaggAggNumber**
  - **alclnkaggAggWTRTimer**
linkagg lacp agg admin-state

Configures the administrative state of a dynamic aggregate group or a range of dynamic aggregate groups.

linkagg lacp agg agg_id[-agg_id2] admin-state {enable | disable}

**Syntax Definitions**

- `agg_id[-agg_id2]`: The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
- `enable`: Specifies that the dynamic aggregate group is active and is able to aggregate links.
- `disable`: Specifies that the operation of a dynamic aggregate group cannot be performed.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- When the administrative state is set to `disable`, the operation of a dynamic aggregation (LACP) group cannot be performed.
- You can also enable or disable the admin-state for a range of link aggregate IDs simultaneously, using this command.

**Examples**

```bash
-> linkagg lacp agg 2 admin-state disable
-> linkagg lacp agg 2-10 admin-state disable
```

**Release History**

Release 7.1.1; command introduced.
Related Commands

- **linkagg lACP agg size**
  - Creates a dynamic aggregate group.

- **show linkagg**
  - Displays information about static and dynamic (LACP) aggregate groups.

- **show linkagg port**
  - Displays information about ports associated with a particular aggregate group or all aggregates.

MIB Objects

- **alclnkaggAggTable**
  - **alclnkaggAggNumber**
  - **alclnkaggAggAdminState**
**linkagg lACP agg actor admin-key**

Configures the administrative key associated with a dynamic aggregate group.

```
linkagg lACP agg agg_id[agg_id2] actor admin-key actor_admin_key
```

```
no linkagg lACP agg agg_id[agg_id2] actor admin-key
```

### Syntax Definitions

- `agg_id[agg_id2]` The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
- `actor_admin_key` The administrative key value associated with the dynamic aggregate group.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>actor_admin_key</code></td>
<td>0</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `no` form of this command to remove an actor admin key from a dynamic aggregate group.

### Examples

```
-> linkagg lACP agg 3-5 actor admin-key 2
```

```
-> no linkagg lACP agg 3-5 actor admin-key
```

### Release History

Release 7.1.1; command introduced.
Related Commands

**linkagg lacp agg size**
Creates a dynamic aggregate group.

**show linkagg**
Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

alclnkaggAggTable

- alclnkaggAggNumber
- alclnkaggAggActorAdminKey
**linkagg lacp agg actor system-priority**

Configures the priority of the dynamic aggregate group.

```
linkagg lacp agg [agg_id|-agg_id2] actor system-priority actor_system_priority
no linkagg lacp agg [agg_id|-agg_id2] actor system-priority
```

**Syntax Definitions**

- `agg_id|-agg_id2` The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
- `actor_system_priority` The priority of the dynamic aggregate group of the switch in relation to other aggregate groups.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>actor_system_priority</code></td>
<td>0</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to return the value to its default.
- Ports with the same system priority value can join the same dynamic aggregate group.
- To assign or remove the actor system-priority for a series of link aggregate IDs, specify the range of link aggregate IDs with the `agg` keyword. Use a hyphen to separate the first and last link aggregate IDs of a range.

**Examples**

```
-> lacp linkagg 3 actor system-priority 100
-> no lacp linkagg 3 actor system-priority
```

**Release History**

Release 7.1.1; command introduced.
Related Commands

  - **alclnkaggAggActorSystemPriority**
linkagg lacp agg actor system-id

Configures the MAC address of a dynamic aggregate group on the switch.

**Syntax**

```
linkagg lacp agg [agg_id][agg_id2] actor system-id actor_system_id
```

**no linkagg lacp agg [agg_id][agg_id2] actor system-id**

**Syntax Definitions**

- `agg_id[agg_id2]` The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>actor_system_id</td>
<td>0</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove the MAC address assignment (actor system ID) from a dynamic link aggregate or a range of dynamic link aggregates simultaneously.

- You can configure the MAC address for a range of dynamic link aggregate IDs simultaneously. Use a hyphen to separate the first and last link aggregate IDs of a range along with this command.

**Examples**

```
-> linkagg lacp agg 2 actor system-id 00:20:da:81:d5:b0
-> no linkagg lacp agg 3-10 actor system-id
-> no linkagg lacp agg 11 actor system-id
```

**Release History**

Release 7.1.1; command introduced.
Related Commands

**linkagg lacp agg size**

Creates a dynamic aggregate group.

**show linkagg**

Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

alclnkaggAggTable

- **alclnkaggAggNumber**
- **alclnkaggAggActorSystemID**
**linkagg lacp agg partner system-id**

Configures the MAC address of the dynamic aggregate group of the remote system that is attached to the dynamic aggregate group of the local switch.

```plaintext
linkagg lacp agg agg_id[-agg_id2] partner system-id partner_system_id
no linkagg lacp agg agg_id[-agg_id2] partner system-id
```

### Syntax Definitions

- `agg_id[-agg_id2]` The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>partner_system_id</td>
<td>0</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `no` form of this command to remove a partner system ID from a dynamic aggregate group or a range of groups assigned with the same partner system IDs together.
- The `partner_system_id` and the `partner_system_priority` together specify the priority of the remote system.
- You can configure a partner system ID for a range of dynamic link aggregate IDs simultaneously. Use a hyphen to separate the first and last link aggregate IDs of a range along with this command.

### Examples

- `-> linkagg lacp agg 2 partner system-id 00:20:da4:32:81`
- `-> linkagg lacp agg 2-10 partner system-id 00:20:da4:32:82`
- `-> no linkagg lacp agg 2-10 partner system-id`
**Release History**

Release 7.1.1; command introduced.

**Related Commands**

- `linkagg lacp agg size`  Creates a dynamic aggregate group.

<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to return to the priority value to its default.
- The `partner_system_id` and the `partner_system_priority` together specify the priority of the remote system.
- You can apply the partner system-priority to a range of link aggregate IDs simultaneously. Use a hyphen to separate the first and last link aggregate IDs of a range after the `agg` keyword.

**Examples**

```
-> linkagg lacp agg 3 partner system-priority 65535
-> linkagg lacp agg 3-6 partner system-priority 65535
-> no linkagg lacp agg 3-6 partner system-priority
```

**Release History**

Release 7.1.1; command introduced.
**Related Commands**

- `linkagg lacp agg size`  Creates a dynamic aggregate group.
- `show linkagg`  Displays information about static and dynamic (LACP) aggregate groups.

**MIB Objects**

- `alclnkaggAggTable`
  - `alclnkaggAggNumber`
  - `alclnkaggAggPartnerSystemPriority`
**linkagg lacp agg partner admin-key**

Configures the administrative key for the remote partner of the dynamic aggregation group.

```
linkagg lacp agg agg_id[{-agg_id2}] partner admin-key partner_admin_key
no linkagg lacp agg agg_id[{-agg_id2}] partner admin-key
```

**Syntax Definitions**

- `agg_id[{-agg_id2}]` The link aggregate ID number corresponding to the dynamic aggregate group. Use a hyphen to specify a range of IDs (10-20).
- `partner_admin_key` The administrative key for the remote partner of the dynamic aggregation group.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>partner_admin_key</td>
<td>0</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove a partner admin-key from a dynamic aggregate group.
- The partner admin-key can be assigned for a range of dynamic link aggregate IDs simultaneously.

**Examples**

```
-> linkagg lacp agg 3-5 partner admin-key 3
-> no linkagg lacp agg 3-10 partner admin-key
```

**Release History**

Release 7.1.1; command introduced.
**Related Commands**

- `linkagg lACP agg size`  
  Creates a dynamic aggregate group.

- `show linkagg`  
  Displays information about static and dynamic (LACP) aggregate groups.

**MIB Objects**

- `alclnkaggAggTable`  
  - `alclnkaggAggNumber`  
  - `alclnkaggAggPartnerAdminKey`
**linkagg lacp port actor admin-key**

Configures an actor administrative key for a port, which allows the port to join a dynamic aggregate group.

```
linkagg lacp port chassis/slot/port[-port2] actor admin-key actor_admin_key
  [actor admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default]
   [expire] | none}]
  [actor system id actor_system_id]
  [actor system priority actor_system_priority]
  [partner admin system id partner_admin_system_id]
  [partner admin-key partner_admin_key]
  [partner admin system priority partner_admin_system_priority]
  [partner admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default]
   [expire] | none}]
  [actor port priority actor_port_priority]
  [partner admin port partner_admin_port]
  [partner admin port priority partner_admin_port_priority]
```

```
no linkagg lacp port chassis/slot/port[-port2] [actor admin-state {[active] [timeout] [aggregate]
  [synchronize] [collect] [distribute] [default] [expire] | none}]
  [actor system id actor_system_id]
  [actor system priority actor_system_priority]
  [partner admin system id partner_admin_system_id]
  [partner admin-key partner_admin_key]
  [partner admin system priority partner_admin_system_priority]
  [partner admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default]
   [expire] | none}]
  [actor port priority actor_port_priority]
  [partner admin port partner_admin_port]
  [partner admin port priority partner_admin_port_priority]
```

**Syntax Definitions**

- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).
- **actor admin-key**: The administrative key associated with this dynamic aggregate group.
- **actor admin-state**: See the linkagg lacp port actor admin-state command.
- **actor system id**: The MAC address of this dynamic aggregate group on the switch.
- **actor system priority**: The priority of the dynamic aggregate group.
- **partner admin system id**: The MAC address of the dynamic aggregate group of the remote switch.
- **partner admin-key**: The administrative key for the remote partner of the dynamic aggregation group.
**Partner admin system priority**  The priority of the remote system to which the dynamic aggregation group is attached.

**Partner admin state**  See the linkagg lacp agg partner admin-state command.

**Actor port priority**  The priority of the actor port.

**Partner admin port**  The administrative state of the partner port.

**Partner admin port priority**  The priority of the partner port.

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>active</td>
<td>active, timeout, aggregate</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the no form of this command to remove a slot and port from a dynamic aggregate group.
- A port can belong to only one aggregate group.
- Ports that belong to a dynamic link aggregate must be configured to the same link speed.
- Ports that belong to the same dynamic aggregate group need not be configured sequentially and can be on any Network Interface (NI).
- Key modification is not allowed without deleting and re-adding the lacp port.

### Examples

- `-> linkagg lacp port 2/1/7 actor admin-key 1`
- `-> no linkagg lacp port 2/1/7`

### Release History

Release 7.1.1; command introduced.

### Related Commands

- **linkagg lacp agg size**  Creates a dynamic aggregate group.
- **show linkagg port**  Displays information about ports associated with a particular aggregate group or all aggregates.
**MIB Objects**

`alclnkaggAggPortTable`

`alclnkaggAggPortGlobalPortNumber`
`alclnkaggAggActorAdminKey`
`alclnkaggAggPortLacpType`
`alclnkaggAggPortActorAdminState`
`alclnkaggAggPortActorSystemID`
`alclnkaggAggPortActorSystemPriority`
`alclnkaggAggPortPartnerAdminSystemID`

`alclnkaggAggPortActorPortPriority`
`alclnkaggAggPortPartnerAdminPort`
`alclnkaggAggPortPartnerAdminPortPriority`
**linkagg lACP port actor admin-state**

Configures the system administrative state of the slot and port for the dynamic aggregate group on the local switch. The state values correspond to bits in the actor state octet in the LACPDU frame.

```
linkagg lACP port chassis/slot/port[-port2] actor admin-state { [active] [timeout] [aggregate]
[synchronize] [collect] [distribute] [default] [expire] | none }
```

```
no linkagg lACP port chassis/slot/port[-port2] actor admin-state { [active] [timeout] [aggregate]
[synchronize] [collect] [distribute] [default] [expire] | none }
```

### Syntax Definitions

- **chassis**
  - The chassis identifier.

- **slot/port[-port2]**
  - The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).

- **active**
  - Specifies that bit 0 in the actor state octet is enabled. When this bit is set, the dynamic aggregate group is able to exchange LACPDU frames. By default, this value is set.

- **timeout**
  - Specifies that bit 1 in the actor state octet is enabled. When this bit is set, a short timeout is used for LACPDU frames. When this bit is disabled, a long timeout is used for LACPDU frames. By default, this value is set.

- **aggregate**
  - Specifies that bit 2 in the actor state octet is enabled. When this bit is set, the system considers this port to be a potential candidate for aggregation. If this bit is not enabled, the system considers the port to be individual (it can only operate as a single link). By default, this value is set.

- **synchronize**
  - Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 3) is set by the system, the port is allocated to the correct dynamic aggregation group. If this bit is not set by the system, the port is not allocated to the correct dynamic aggregation group.

- **collect**
  - Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 4) is set by the system, incoming LACPDU frames are collected from the individual ports that make up the dynamic aggregate group.

- **distribute**
  - Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 5) is set by the system, distributing outgoing frames on the port is disabled.

- **default**
  - Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 6) is set by the system, it indicates that the actor is using the defaulted partner information administratively configured for the partner.

- **expire**
  - Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 7) is set by the system, the actor cannot receive LACPDU frames.

- **none**
  - Resets all administrative states to their default configurations.
### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>[active] [timeout]....</td>
<td>active, timeout, aggregate</td>
</tr>
<tr>
<td>timeout enable</td>
<td>Disabled (OmniSwitch 9900)</td>
</tr>
<tr>
<td></td>
<td>Enabled (All other platforms)</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the **no** form of this command to restore the LACPDU bit settings to their default configuration.
- When the actor admin-state is set to **none**, all bit values are restored to their default configurations.
- Enabling the **timeout** parameter configures a 1 second interval (short timeout / fast transmit rate). Disabling the **timeout** parameter configures a 30 second interval (long timeout / slow transmit rate).
- **timeout** option when used sets only the transmit rate. The remote side timeout is 3X the configured transmit rate. For example, if the transmit rate is set to 1 packet per second, the remote side will timeout if it misses 3 packets. In this case, it will timeout in 3 seconds. If the transmit rate is set to 30 packets per second, then the remote side will take 90 seconds to timeout.
- ‘no linkagg lacp port actor admin-state timeout’ disables the **timeout** parameter, which results in a long timeout, that is, 30 second transmission rate.

### Examples

```
-> linkagg lacp port 4/2 actor admin-state synchronize collect distribute
-> no linkagg lacp port 4/2 actor admin-state synchronize collect
-> linkagg lacp port 4/2 actor admin-state none
```

### Release History

Release 7.1.1; command introduced.
Related Commands

- **linkagg lacp agg size**  
  Creates a dynamic aggregate group.

- **show linkagg port**  
  Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

- **alclnkaggAggPortTable**
- **alclnkaggAggPortGlobalPortNumber**
- **alclnkaggAggPortActorAdminState**
linkagg lacp port actor system-id

Configures the system ID (i.e., MAC address) for the local port associated with a dynamic aggregate group.

linkagg lacp port chassis/slot/port[-port2] actor system-id actor_system_id

no linkagg lacp port chassis/slot/port[-port2] actor system-id

**Syntax Definitions**

- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>actor_system_id</td>
<td>0</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the no form of this command to remove the actor system ID from a slot and port or a range of slot and ports associated with a dynamic aggregate group.
- Configure the system ID for a range of local ports simultaneously. Use a hyphen to separate the first and last port IDs of a range after the port keyword.

**Examples**

- `-> linkagg lacp port 3/1-10 actor system-id 00:20:da:06:ba:d3`
- `-> no linkagg lacp port 3/1-10 actor system-id`

**Release History**

**linkagg lacp agg partner admin-state**

Configures the system administrative state of the slot and port for the dynamic aggregate group on the remote switch. The state values correspond to bits in the actor state octet in the LACPDU frame.

```
linkagg lacp port chassis/slot/port[-port2] partner admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}
```

```
no linkagg lacp port chassis/slot/port[-port2] partner admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}
```

**Syntax Definitions**

- **chassis**
  - The chassis identifier.

- **slot/port[-port2]**
  - The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).

- **active**
  - Specifies that bit 0 in the partner state octet is enabled. When this bit is set, the dynamic aggregate group is able to exchange LACPDU frames. By default, this value is set.

- **timeout**
  - Specifies that bit 1 in the partner state octet is enabled. When this bit is set, a short timeout is used for LACPDU frames. When this bit is disabled, a long timeout is used for LACPDU frames. By default, this value is set.

- **aggregate**
  - Specifies that bit 2 in the partner state octet is enabled. When this bit is set, the system considers this port to be a potential candidate for aggregation. If this bit is not enabled, the system considers the port to be individual (it can only operate as a single link). By default, this value is set.

- **synchronize**
  - Specifies that bit 3 in the partner state octet is enabled. When this bit is set, the port is allocated to the correct dynamic aggregation group. If this bit is not enabled, the port is not allocated to the correct aggregation group. By default, this value is disabled.

- **collect**
  - Specifying this keyword has no effect because the system always determines its value. When this bit (bit 4) is set by the system, incoming LACPDU frames are collected from the individual ports that make up the dynamic aggregate group.

- **distribute**
  - Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 5) is set by the system, distributing outgoing frames on the port is disabled.

- **default**
  - Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 6) is set by the system, it indicates that the partner is using the defaulted actor information administratively configured for the actor.

- **expire**
  - Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 7) is set by the system, the partner cannot receive LACPDU frames.

- **none**
  - Resets all administrative states to their default configurations.
**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>

```

**Syntax Definitions**

- `chassis`  
  The chassis identifier.

- `slot/port[-port2]`  
  The slot number for this aggregate and the port that the switch initially uses as the Spanning Tree virtual port for this aggregate. Use a hyphen to specify a range of ports (2/1-5).

- `actor_port_priority`  
  The priority of the actor port.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>actor_port_priority</code></td>
<td>0</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

  Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

- **AlcLnkAggAggPortTable**
  - **alcLnkaggAggPortGlobalPortNumber**
  - **alcLnkaggAggPortPartnerAdminPortPriority**
**dhl name**

Configures a Dual-homed Link (DHL) session associated with the specified session ID number.

`dhl dhl_num [name name]`

`no dhl dhl_num`

---

**Syntax Definitions**

- `dhl_num` The DHL session ID number. Valid range is 1–1000.
- `name` The name of the DHL session.

**Defaults**

By default, if a name is not assigned to a DHL session, the session is configured as DHL-1.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6450</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to remove a DHL session ID from the switch configuration.
- Use the optional `name` parameter to specify a name for the DHL session.
- Only one DHL session can be configured on a switch.
- Once the DHL session ID is created, assign a link A port and a link B port to the session. This is required before administratively enabling the DHL session is allowed.

**Examples**

- `dhl 1 name dhl_session1`
- `no dhl 1`

**Release History**

Release 8.2.1; command was introduced.

<td>Displays information about a specific DHL session.</td>
</tr>
</tbody>
</table>

### MIB Objects

- `alaDHLSessionTable`
  - `alaDHLSessionIndex`
  - `alaDHLSessionDescr`
**dhl linka linkb**

Configures two ports or two link aggregates or a combination of both as linkA and linkB for the specified DHL session. Only two links are allowed per DHL session; only one DHL session per switch is allowed.

```
dhl num linka {port chassis/slot/port | linkagg agg_id} linkb {port chassis/slot/port | linkagg agg_id}
```

```
no dhl num linka {port chassis/slot/port | linkagg agg_id} linkb {port chassis/slot/port | linkagg agg_id}
```

**Syntax Definitions**

- **dhl_num**: An existing DHL session ID number.
- **chassis**: The chassis ID number.
- **slot**: The slot number to designate as a link for the DHL session.
- **port**: The physical port number to designate as a link for the DHL session.
- **agg_id**: The link aggregate ID number to designate as a link for the DHL session.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Support</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to remove the linkA and linkB ports from the specified session ID. Before attempting to remove the links, administratively disable the DHL session.
- Make sure that DHL linkA and linkB are associated with each of the VLAN that the DHL session will protect. Any VLAN not associated with both the links or only associated with one of the links is unprotected.
- DHL linkA and linkB should belong to the same default VLAN. In addition, select a default VLAN that is one of the VLANs that the DHL session will protect. For example, if the session is going to protect VLANs 10-20, then assign one of those VLANs as the default VLAN for linkA and linkB.
- Only one DHL session per switch is allowed. Each session can have only two links (linkA and linkB). Specify a physical switch port or a link aggregate (linkagg) ID as a DHL link. The same port or link aggregate is not configurable as both linkA or linkB.
- DHL is not supported on mobile, 802.1x-enabled, GVRP, or UNI ports. DHL is also not supported on a port that is a member of a link aggregate or a port that is enabled for transparent bridging.

- The administrative state of a DHL session is not configurable until a linkA port and a linkB port are associated with the specified DHL session ID number.

- Changing the port designations for linkA and linkB is not recommended while the DHL session is enabled.

- Removing a link aggregate from the switch configuration is not allowed if the aggregate is configured as a link for a DHL session.

**Examples**

- `dhl 1 linka port 1/1 linkb port 1/2`
- `dhl 1 linka  linkagg 1  linkb port 1/2`
- `dhl 1 linka port 1/1 linkb linkagg 1`
- `dhl 1 linka  linkagg 1  linkb linkagg 2`
- `no dhl 1 linka port 1/1 linkb port 1/2`

**Release History**

Release 8.2.1; command was introduced.

**Related Commands**

- `dhl name` Configures a session ID for the DHL session.
- `dhl admin-state` Configures the administrative status for the DHL session.
- `show dhl` Displays the global status of the DHL configuration.
- `show dhl` Displays information about a specific DHL session.

**dhl admin-state**

Enables or disables the administrative state of a DHL session.

```
dhl dhl_num admin-state {enable | disable}
```

---

### Syntax Definitions

- **dhl_num**: An existing DHL session ID number.
- **enable**: Enables the DHL session.
- **disable**: Disables the DHL session.

---

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

---

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

---

### Usage Guidelines

- The DHL session ID specified with this command must already exist in the switch configuration.
- The administrative state cannot be enabled until a linkA port and a linkB port are associated with the specified DHL session ID number.

---

### Examples

```
-> dhl 1 admin-state enable
-> dhl 1 admin-state disable
```

---

### Release History

Release 8.2.1; command was introduced.
Related Commands

Configures the administrative status for the DHL session.

**show dhl**
Displays the global status of the DHL configuration or information about a specific DHL session.

MIB Objects

alaDHLSessionTable

alaDHLSessionAdminStatus
**dhl vlan-map linkb**

Configures a VLAN-MAP (a single VLAN or a range of VLANs) from a common pool of VLANs to operate on DHL link B.

```
dhl dhl_num vlan-map linkb {vlan_id[-vlan_id]}
no dhl dhl_num vlan-map linkb {vlan_id[-vlan_id]}
```

**Syntax Definitions**

- **dhl_num**
  - A DHL session ID number.

- **vlan_id[-vlan_id]**
  - A VLAN ID number or a range of VLAN IDs to map to linkB. The valid range is 1–4094.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- A DHL session has to be created before a VLAN-MAP can be configured.

- When the DHL session is active, the common VLAN that both the dual homed links belong to is treated as a protected VLAN. The VLAN containing only one dual homed link is treated as an unprotected VLAN. Traffic is forwarded only on the dual homed links belonging to the protected VLAN.

- If a VLAN is removed globally and if the VLAN belongs to a particular dual homed link, then the VLAN will automatically be removed from the dual homed link.

- If one dual homed link, for example linkA, is moved out of a protected VLAN, then the VLAN becomes unprotected and the VPA is removed from the second dual homed link, for example linkB.

- If the admin state of a VLAN is changed to disabled, and if the VLAN is part of a protected VLAN, then the disabled VLAN is removed from the operational DHL VLAN list but will be present in the protected VLAN list.

- If the admin state of a dual homed link, for example linkA, is changed to disabled, then the protected VLANs of the disabled linkA are moved to the other link, for example linkB. When linkA is re-enabled, then the VLANs are moved back to linkA.
If the VLAN-MAP of linkB is removed, then the VPAs for the linkB will also be removed and the VLANs configured on linkB are moved to linkA.

If a VLAN is configured as default on one dual homed link, for example linkA, then the same VLAN cannot be configured as tagged on the other link, for example linkB.

Examples

```
-> vlan 10-30
-> vlan 10-20 802.1q 1/1
-> vlan 4
-> vlan port default 1/1-2
-> dhl 1 name dhl_session1
-> dhl 1 linka port 1/1 linkb port 1/2
-> dhl 1 vlan-map linkb 18-20
-> no dhl 1 vlan-map linkb 18-20
```

  - `alaDHLVlanMapRowStatus`
**dhl pre-emption-time**

Configures the pre-emption timer for the DHL session. A pre-emption timer is a recovery-delay timer that is used to delay the switchover of VLANs to their primary links. It is the delay in the resumption of traffic when a link that is down is brought up.

**dhl dhl_num pre-emption-time seconds**

---

**Syntax Definitions**

* dhl_num
  A DHL session ID number.

* seconds
  The number of seconds for the delay in the switchover of VLANs to their primary links. The valid range is 0–600.

---

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- Pre-emption timer is applicable only when a failed port is brought up. If both ports are down, the pre-emption timer is activated only when the second port is brought up.

- If the pre-emption timer value is set to 0, then there will be no delay in the VLANs being moved back to their primary link.

- If a link fails when the pre-emption timer is active, that is when the remaining pre-emption time value is not equal to 0, then the timer will be halted.

- When the pre-emption timer is active for a particular link and if the other link goes down, then the VLANs of the link that is down are automatically moved to the port for which the pre-emption timer is active.

- When DHL ports spanned across the NIs or DHC ports are on the same NI but data port is on different NI, it is advised to configure mac-flush mechanism (either Raw/MVRP) for faster convergence.

---

**Examples**

-> dhl 1 pre-emption-time 40sec
Release History

Release 8.2.1; command was introduced.

Related Commands

- **dhl name**: Configures a session ID for the DHL session.

- **show dhl link**: Displays information about a specific link.

MIB Objects

- **alaDHLSessionTable**
  - **alaDHLSessionPreemptionTime**
dhl mac-flushing

Configures the MAC-flushing technique for the DHL session. The MAC-flushing technique is used to correct any stale MAC entries that are caused when a dual homed link goes down.

```
dhl dhl_num mac-flushing {none | raw | mvrp}
```

**Syntax Definitions**

- **dhl_num**  
  A DHL session ID number.

- **none**  
  Flushing of the MAC address tables does not occur.

- **raw**  
  Method of flushing when VPAs of the links moved across them due to link up/down or configuration change (VLAN-map). The switch determines the MAC addresses within the affected VLANs.

- **mvrp**  
  Method of flushing when one link fails and the other link issues 'join' declarations to establish connectivity. These new joins are flagged as 'new' and they are forwarded by the core devices causing flushing on the core network for the active VLANs.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>raw</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Before enabling MVRP on dual homed links, the Registrar Mode should be set to 'forbidden', failing which an error message is displayed when configuring DHL. If the Registrar Mode is set to 'not forbidden', then changes cannot be made to the MVRP configuration on the dual homed links.

- If the MAC-flushing technique is set to MVRP and if MVRP is not enabled on the dual homed links, then the `show dhl` command displays the active MAC-flushing technique as **none**. When MVRP is enabled on the dual homed links, then the MAC-flushing technique changes to **MVRP** and the Registrar Mode of the links is automatically set to ‘forbidden’.

- If VLANs are moved across the dual homed links as a result of configuration changes, then MAC-flushing is automatically enabled, if configured, excepting dual homed links that are changed on the fly.
**Examples**

-> dhl 1 mac-flushing none  
-> dhl 1 mac-flushing raw

**Release History**

Release 8.2.1; command was introduced.

**Related Commands**

- **dhl name**
  Configures a session ID for the DHL session.

show dhl link

Displays information about a specific DHL link, for example linkA or linkB and the VLAN details of the specified link.

show dhl dhl_num [linkA | linkB]

---

**Syntax Definitions**

dhl_num

A DHL session ID number.

linkA

The dual homed link that is part of a pair of DHL links that can be configured per switch.

linkB

The dual homed link that is part of a pair of DHL links that can be configured per switch.

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

show linkagg

Displays information about static and dynamic (LACP) aggregate groups.

show linkagg [agg agg_id1[-agg_id2]]

Syntax Definitions

agg_id1[-agg_id2] The link aggregate ID number corresponding to the aggregate group. Configured through the linkagg static agg size or linkagg lacp agg size command. Use a hyphen to specify a range of IDs (10-20).

Defaults

By default, information for all aggregate groups is displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- If an aggregate number is specified, only the information about the relevant aggregate group is displayed. The fields included in the display depend on whether the aggregate group is static or dynamic.

- Use the show linkagg port command to display information about aggregate group ports.

Examples

No aggregate group is specified:

-> show linkagg

<table>
<thead>
<tr>

show linkagg port

Displays information about link aggregation ports.

```plaintext
show linkagg [agg agg_id[-agg_id2]] port [chassis/slot/port]
```

### Syntax Definitions

- `agg_id[-agg_id2]` The link aggregate ID number corresponding to the aggregate group. Use a hyphen to specify a range of IDs (10-20).
- `chassis` The chassis identifier.
- `slot/port` The slot and port number of the link aggregation port.

### Defaults

By default, all link aggregation ports are displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- If a particular slot or port is specified, the fields displayed depend upon whether the port belongs to a static aggregate group or a dynamic (LACP) aggregate group.

- If only a link aggregate or a range of link aggregates is specified along with the `agg` keyword, the ports and related information for only the specified link aggregate IDs are displayed.

### Examples

```plaintext
-> show linkagg port

Slot/Port Aggregate  SNMP Id   Status   Agg  Oper Link Prim
--------------------+----------+--------+----------+----+----+----+----+----
  2/1    Static        2001  ATTACHED     1  UP   UP   YES

-> show linkagg agg 1-5 port

Slot/Port Aggregate  SNMP Id   Status   Agg  Oper Link Prim
--------------------+----------+--------+----------+----+----+----+----+----
  1/16  Static  2016     CONFIGURED       1    UP   UP   YES
  1/17  Static  2017     CONFIGURED       2    UP   UP   NO
  3/1   Static  3001     CONFIGURED      3     UP   UP   NO
  3/2   Static  3045     CONFIGURED       4    UP   UP   NO
```

OmniSwitch AOS Release 8 CLI Reference Guide   April 2023   page 12-86
A port that belongs to a static aggregate is specified:

`-> show linkagg port 4/1`

**Static Aggregable Port**
- **SNMP Id**: 4001,
- **Slot/Port**: 4/1,
- **Administrative State**: ENABLED,
- **Operational State**: DOWN,
- **Port State**: CONFIGURED,
- **Link State**: DOWN,
- **Selected Agg Number**: 2,
- **Port position in the aggregate**: 0,
- **Primary port**: NONE

**output definitions**

show linkagg accounting

Displays statistics collected for packets transmitted and received on link aggregate ports.

show linkagg accounting

Syntax Definitions
N/A

Defaults
N/A

Platforms Supported
This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines
- Statistics are displayed for all link aggregate IDs configured on the switch.
- Statistics are collected for undersized and oversized packets, packets of a certain size, and Jabber frames.

Examples

-> show linkagg accounting

Link Agg 10
rx undersize packets = 0
tx undersize packets = 0
rx oversize packets = 0
tx oversize packets = 0
rx packets 64 = 3073753
rx packets 65_127 = 678698
rx packets 128_255 = 21616
rx packets 256_511 = 21062
rx packets 512_1023 = 2
rx packets 1024_1518 = 84
rx packets 1519_4095 = 0
rx packets 4096_9216 = 0
rx jabber frames = 0

Release History
Release 8.3.1; command introduced.
Related Commands

**show linkagg counters**
Displays statistics collected for the type and number of packets transmitted and received on link aggregate ports.

**show linkagg traffic**
Displays the total number of packets and bytes that are received and transmitted on link aggregate ports.

**clear linkagg-statistics**
Clears statistics for all link aggregates or for specific aggregate IDs.

show linkagg counters

Displays statistics collected for the type and number of packet frames transmitted and received on link aggregate ports.

show linkagg counters [errors]

Syntax Definitions

errors Display the number of errors received on the link aggregate member ports.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Statistics are displayed (in bytes or frame count) for all link aggregate IDs configured on the switch.
- Error statistics include the number of alignment, frame check (FCS), received, and transmitted errors.

Examples

```
-> show linkagg counters
Link Agg 10
InOctets    = 54367578586897979
OutOctets   = 5.78E19
InUcastPkts = 55654265276
OutUcastPkts= 5.78E20
InMcastPkts = 58767867868768777
OutMcastPkts= 5465758756856

OutBcastPkts= 786876
InPause frames = 567798768768767
OutPause frames= 786876

-> show linkagg counters errors
Link Agg 10
Alignments Errors = 6.45E13
FCS Errors        = 7.65E12
```
IfInErrors = 6435346
IfOutErrors = 5543

**Release History**

clear linkagg-statistics

Clears statistics for all link aggregates or for a specific aggregate ID or range of IDs.

clear linkagg-statistics [agg agg_id[-agg_id2]]

**Syntax Definitions**

`agg_id[-agg_id2]`  
The link aggregate ID number corresponding to the static aggregate group. Use a hyphen to specify a range of IDs (10-20).

**Defaults**

By default, statistics are cleared for all link aggregates.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

13 Virtual Chassis Commands

A Virtual Chassis is a group of switches managed through a single management IP address and that behave as a single bridge or router. It provides both node level and link level redundancy for devices connecting to the aggregation layer via dual-homed standard 802.3ad link aggregation mechanisms. The use of Virtual Chassis provides node level redundancy without the need to use redundancy protocols such as STP and VRRP between the edge and the aggregation/core layer.

MIB information for the Virtual Chassis commands is as follows:

- **Filename**: ALCATEL-IND1-VIRTUAL-CHASSIS-MIB.mib
  - **Module**: alcatelIND1VirtualChassisMIB

- **Filename**: ALCATEL-IND1-VC-SPLIT-PROTECTION-MIB.mib
  - **Module**: alaVCSPMIB

</tbody>
</table>
**virtual-chassis configured-chassis-id**

Assigns a globally unique chassis identifier to the switch and enables the switch to operate in virtual-chassis mode.

```
virtual-chassis [chassis-id oper_chassis] configured-chassis-id config_chassis
no virtual-chassis [chassis-id oper_chassis] configured-chassis-id config_chassis
```

**Syntax Definitions**

- `oper_chassis`  
  The operational/current chassis ID number.

- `config_chassis`  
  The configured/next chassis ID number.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>oper_chassis</code></td>
<td>0 (standalone mode; no virtual chassis operation is allowed)</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The OS6900-X48C4E does not support a Virtual Chassis configuration.
- Use the `no` form of this command to change the chassis ID back to “0” (the default). When the chassis ID is set to “0”, the switch operates in standalone mode and all virtual chassis related configuration commands are no longer active for the switch.
- The operational chassis identifier parameter is only optional when the switch is running in standalone mode or at start up time, within the `vcsetup.cfg`, when the switch is coming up in virtual chassis mode. The same restrictions apply to the no form of the command.
- The operational chassis identifier is a mandatory parameter whenever the system is running in virtual chassis mode. This prevents modifying the chassis identifier of all switches at the same time and causing a duplicate chassis identifier.
- Two switches that have the same chassis identifier are not allowed to operate in virtual chassis mode. If a duplicate chassis identifier is detected one of the switches will be in an inconsistent role and its status will be set to Duplicate-Chassis-ID.
- The configured chassis identifier will only take effect after the next reboot of the target chassis.
• Virtual chassis is only supported between two switches of the same type. For example, virtual chassis is not supported between an OmniSwitch 6860 and an OmniSwitch 6900.

• The no form of this command can only be used if there are no VFLs configured on the switch.

• Snapshots produced through the show configuration vcm-snapshot, show configuration snapshot virtual chassis or write memory commands always include the operational chassis identifier.

Examples
-> virtual-chassis configured-chassis-id 1 //Standalone mode
-> virtual-chassis chassis-id 0 configured-chassis-id 1
-> no virtual-chassis chassis-id 0 configured-chassis-id
-> no virtual-chassis configured-chassis-id

Release History
Release 7.3.1; command introduced.

Related Commands
vc-takeover Converts an existing standalone configuration to a virtual chassis configuration.

show virtual-chassis consistency Displays the system level mandatory consistency parameters of both the local and peer switches.

show virtual-chassis topology Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

virtualChassisGlobalTable
  virtualChassisOperChasId
  virtualChassisConfigChassisId
virtual-chassis chassis-group

Assigns a globally unique chassis group identifier to a chassis. Each peer switch in a virtual chassis domain must use the same group ID number. The group ID number uniquely identifies switches operating in the same virtual chassis.

`virtual-chassis [chassis-id oper_chassis] chassis-group group`

**Syntax Definitions**

- `oper_chassis`: The operational/current chassis ID number.
- `group`: Virtual chassis group identifier (0-255), which is used to identify a group of chassis belonging to the same virtual chassis.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>group</td>
<td>Derived from last byte of Master chassis MAC address</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The OS6900-X48C4E does not support a Virtual Chassis configuration.
- Each virtual chassis domain must use a different group ID number to differentiate the domain within the network environment.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches is running in virtual chassis mode the chassis group can only be configured with exactly the same value as the master chassis when the configuration applies to a single and specific switch.
- When a set of switches is running in virtual chassis mode the chassis group can be configured with any value within the valid range as long as the configuration applies to all switches at the same time.
- It is strongly recommended that the same chassis group value is set for all switches that will participate on the same virtual chassis group. Failure to adhere to this recommendation followed by a system reset will prevent the switches whose values are different from joining the same virtual chassis group.
• When determining the chassis group ID the last byte of the Master chassis MAC address is used. For example, if the Master's MAC address is xx:xx:xx:xx:xx:7e, the chassis group will be 126 (equivalent to hex 7e).

**Examples**

- virtual-chassis chassis-id 1 chassis-group 10
- virtual-chassis chassid-id 0 chassis-group 10
- virtual-chassis chassis-group 10 // All switches

**Release History**

Release 7.3.1; command introduced.
Release 7.3.4; Chassis group ID based on Master MAC address introduced.

**Related Commands**

<table>
<thead>

</tr>
</tbody>
</table>

**MIB Objects**

virtualChassisGlobalTable
  virtualChassisOperChasID
  virtualChassisGroup
**virtual-chassis configured-chassis-priority**

Sets the configured chassis priority for a chassis specified by its operational chassis identifier.

```
virtual-chassis [chassis-id oper_chassis] configured-chassis-priority priority
```

**Syntax Definitions**

- **oper_chassis**: The operational/current chassis ID number.
- **priority**: Configured chassis priority (0-255) which defines the user preference above all other election criteria, for the target chassis to become the master of the virtual chassis.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>OS6900-Q32 - 120</td>
</tr>
<tr>
<td></td>
<td>All others - 100</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>Yes</td>
</tr>
<tr>
<td>6465</td>
<td>Yes</td>
</tr>
<tr>
<td>6560</td>
<td>Yes</td>
</tr>
<tr>
<td>6570M</td>
<td>Yes</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
</tr>
<tr>
<td>6860N</td>
<td>Yes</td>
</tr>
<tr>
<td>6865</td>
<td>Yes</td>
</tr>
<tr>
<td>6900</td>
<td>Yes</td>
</tr>
<tr>
<td>6900 V72/C32</td>
<td>Yes</td>
</tr>
<tr>
<td>6900 X48C6/T48C6/V48C8/C32E/T24C2/X24C2</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The OS6900-X48C4E does not support a Virtual Chassis configuration.
- The greatest configured-chassis-priority will become the Master chassis. Without setting this value the smallest chassis identifier becomes the key parameter used to determine which switch will become the Master.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- The configured chassis priority will only take effect after the next reboot of the target switch.

**Examples**

**Standalone mode:**
- `-> virtual-chassis chassis-priority 50`
- `-> virtual-chassis chassis-id 0 chassis-priority 50`

**All switches:**
- `-> virtual-chassis configured-chassis-priority 50`
- `-> virtual-chassis chassid-id 0 configured-chassis-priority 50`
Chassis 2 only:

`virtual-chassis chassis-id 2 configured-chassis-priority 75` //Chassis 2 only

**Release History**

Release 7.3.1.R01; command introduced.

**Related Commands**

- **vc-takeover**: Converts an existing standalone configuration to a virtual chassis configuration.

- **show virtual-chassis topology**: Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

**MIB Objects**

- `virtualChassisGlobalTable`
  - `virtualChassisOperChasID`
  - `virtualChassisConfigPriority`
**virtual-chassis configured-control-vlan**

Sets the configured control VLAN for a chassis specified by its operational chassis identifier.

```
virtual-chassis [chassis-id oper_chassis] configured-control-vlan vlan
```

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>oper_chassis</code></td>
<td>The operational/current chassis ID number.</td>
</tr>
<tr>
<td><code>vlan</code></td>
<td>Configured/next virtual chassis control VLAN (2-4094), which is used for all internal control communication between switches over the VFL.</td>
</tr>
</tbody>
</table>

**Defaults**

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan</code></td>
<td>4094</td>
</tr>
</tbody>
</table>
```

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The OS6900-X48C4E does not support a Virtual Chassis configuration.
- This configured control VLAN will only take effect after the next reboot of the target switch.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches in running in virtual chassis mode, the configured control VLAN can only be configured with exactly the same value as the master chassis when the configuration applies to a single and specific switch.
- When a set of switches in running in virtual chassis mode, the configured control VLAN can be configured with any value within the valid range as long as the configuration applies to all switches at the same time.
- It is strongly recommended that the value is for all switches that will participate in the same virtual chassis topology.
Examples

Standalone mode:
-> virtual-chassis configured-control-vlan 10
-> virtual-chassis chassis-id 0 configured-control-vlan 10

All switches:
-> virtual-chassis configured-control-vlan 10
-> virtual-chassis chassis-id 0 configured-control-vlan 10

Release History

Release 7.3.1; command introduced.

Related Commands

vc-takeover
Converts an existing standalone configuration to a virtual chassis configuration.

show virtual-chassis consistency
Displays the system level mandatory consistency parameters of both the local and peer switches.

show virtual-chassis topology
Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

virtualChassisGlobalTable
  virtualChassisOperChasID
  virtualChassisConfigControlVlan
virtual-chassis configured-hello-interval

Sets the virtual chassis configured hello interval parameter on the switch. Hello packets are sent periodically on the virtual fabric link (VFL) interfaces to establish a relationship and bidirectional communication between virtual chassis switches. The hello interval value determines how often these packets are sent.

```
virtual-chassis [chassis-id oper_chassis] configured-hello-interval hello
```

</table>

Defaults

```
<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>hello</td>
<td>5</td>
</tr>
</tbody>
</table>
```

Platforms Supported

Not supported in this release.

Usage Guidelines

- The configured value will only take effect after the next reboot of the target switch.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches is running in virtual chassis mode, the configured hello interval can only be configured with exactly the same value as the master chassis when the configuration applies to a single and specific switch.
- When a set of switches is running in virtual chassis mode, the configured hello interval can be configured with any value within the valid range as long as the configuration applies to all switches at the same time.
- The hello timeout is a fixed value and defined as 120 seconds. This is the minimum time interval that a switch will wait without receiving any hello packets from a peer switch before declaring that the adjacency towards that switch was lost.
- It is strongly recommended that the hello interval be the same for all switches that will participate in the same virtual chassis topology.

Examples

Standalone mode:

```
-> virtual-chassis configured-hello-interval 10
-> virtual-chassis chassis-id 0 configured-hello-interval 10
```
All switches:

-> virtual-chassis configured-hello-interval 10
-> virtual-chassis chassis-id 0 configured-hello-interval 10

**Release History**

Release 7.3.1; command introduced.
Release 7.3.3; command deprecated.

**Related Commands**

- **vc-taking** Converts an existing standalone configuration to a virtual chassis configuration.
- **show virtual-chassis consistency** Displays the system level mandatory consistency parameters of both the local and peer switches.
- **show virtual-chassis topology** Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

**MIB Objects**

virtualChassisGlobalTable
  virtualChassisOperChasID
  virtualChassisConfigHelloInterval
**virtual-chassis vf-link create**

Configures a virtual fabric link (VFL) between two peer switches. A VFL is required to enable the virtual chassis operation between the two switches.

```
virtual-chassis [chassis-id oper_chassis] vf-link vfl_id create
```

```
no virtual-chassis [chassis-id oper_chassis] vf-link vfl_id
```

---

**Syntax Definitions**

- `oper_chassis`: The operational/current chassis ID number.
- `vfl_id`: The VFL link identifier (0).

---

**Defaults**

N/A

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- The OS6900-X48C4E does not support a Virtual Chassis configuration.

- Although a virtual fabric link can be configured while the switch is running either in standalone or virtual chassis mode, a VFL can only become operational when the chassis operates in virtual chassis mode.

- Use the no form of this command to remove the VFL configuration from the switch.

- Although the switch supports runtime configuration of the VFL and its member ports, configuring the VFL at the same time as the chassis identifier is configured and before rebooting the switch is recommended.

- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.

- This command is valid only when the VFL mode is set to static.

- Platforms that do not support static VFLs do not support this command.

---

**Examples**

```
-> virtual-chassis vf-link 0 create
-> virtual-chassis chassis-id 0 vf-link 0 create
-> no virtual-chassis vf-link 0
```
Virtual Chassis Commands

virtual-chassis vf-link create

- no virtual-chassis chassis-id 0 vf-link 0
- virtual-chassis chassis-id 1 vf-link 0 create
- virtual-chassis chassis-id 2 vf-link 0 create
- no virtual-chassis chassis-id 1 vf-link 0
- no virtual-chassis chassis-id 2 vf-link 0

Release History

Release 7.3.1; command introduced.

Related Commands

vc-takeover
Converts an existing standalone configuration to a virtual chassis configuration.

show virtual-chassis consistency
Displays the system level mandatory consistency parameters of both the local and peer switches.

show virtual-chassis vf-link
Displays a summary of the configured and operational parameters related to the virtual fabric link on the switch.

**virtual-chassis vf-link member-port**

Adds member ports to a given virtual fabric link (VFL).

```plaintext
virtual-chassis [chassis-id oper_chassis] vf-link vfl_id member-port [oper_chassis/slot/port]
no virtual-chassis [chassis-id oper_chassis] vf-link vfl_id member-port [oper_chassis/slot/port]
```

**Syntax Definitions**

- `oper_chassis` The operational/current chassis ID number.
- `vfl_id` The VFL link identifier (0).
- `oper_chassis/slot/port` The operational chassis identifier, slot, and port.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Supported</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The OS6900-X48C4E does not support a Virtual Chassis configuration.
- Although virtual-fabric link (VFL) member ports can be configured while the switch is running either in standalone or virtual chassis mode, a configured virtual-fabric link (VFL) member port can only become operational when the chassis operates in virtual chassis mode.
- Use the no form of this command to remove a member port from the virtual-fabric link (VFL).
- When a switch is running in virtual chassis mode, a virtual-fabric link member port must be fully specified including `oper_chassis/slot/port`.
- Although the switch supports runtime configuration of the virtual-fabric link (VFL) and its member ports, configuring the virtual-fabric link (VFL) at the same time as the chassis identifier is configured and before rebooting the switch is recommended.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches in running in virtual chassis mode, a virtual-fabric link (VFL) member ports can only be created or removed exactly in one switch at a time. In other words, we are not allowed to create or remove a virtual chassis link member port with a system operating in virtual chassis mode if no operational chassis identifier is provided or if the value zero is specified.
- A maximum of 16 member ports can be added or assigned to each virtual-fabric link (VFL).
• All virtual-fabric link (VFL) member ports must operate at the same speed.

• Only interfaces that operate at 10G speed or above can be added or assigned to a virtual-fabric link. (Note: 10GBaseT ports cannot be assigned to a VFL).

• Only interfaces operating in full-duplex mode can be added or assigned to a virtual-fabric link.

• It is recommended to configure virtual-fabric link (VFL) member ports across multiple network interface modules (NI) for resilience reasons.

• Virtual-fabric link (VFL) member ports can only be configured on interfaces that are fixed ports, network ports or priority flow control enabled ports. For instance, interfaces configured as Q-tag ports or ERP ports cannot be configured as virtual-fabric link member ports.

• When a switch is running in virtual chassis mode, the interface related to the last active virtual-fabric link member port cannot be administratively disabled.

• When a switch is running in virtual chassis mode, the last active virtual-fabric link member port cannot be deleted using the no form of the present command.

• When a switch is running in virtual chassis mode, the network interface module (NI) that hosts the last active virtual-fabric link member port cannot be administratively reset or powered off.

• This command is valid only when the VFL mode is set to static.

• Platforms that do not support static VFLs do not support this command.

Examples

-> virtual-chassis chassis-id 0 vf-link 1 member-port 0/1/1
-> virtual-chassis chassis-id 0 vf-link 1 member-port 0/2/1
-> virtual-chassis chassis-id 1 vf-link 1 member-port 1/1/1
-> no virtual-chassis chassis-id 0 vf-link 1 member-port 0/1/1
-> no virtual-chassis chassis-id 0 vf-link 1 member-port 0/2/1
-> no virtual-chassis chassis-id 1 vf-link 1 member-port 1/1/1

MIB Objects

virtualChassisLinkTable
virtualChassisOperChasID
virtualChassisLinkId
virtualChassisVflMemberPortIfindex
virtualChassisVflMemberPortRowStatus
**virtual-chassis vf-link default-vlan**

Configures the default VLAN for the virtual fabric link (VFL).

```
virtual-chassis [chassis-id oper_chassis] vf-link vfl_id default-vlan vlan
```

```
no virtual-chassis [chassis-id oper_chassis] vf-link vfl_id default-vlan
```

### Syntax Definitions

- **oper_chassis**: The operational/current chassis ID number.
- **vfl_id**: The VFL link identifier (0).
- **vlan**: The default VLAN (1-4094) for the specified VFL.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan</td>
<td>1</td>
</tr>
</tbody>
</table>

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- This configured VLAN will become the default untagged VLAN for the VFL.

- Although the switch supports runtime configuration of the virtual-fabric link (VFL) and its member ports, configuring the virtual-fabric link (VFL) at the same time as the chassis identifier is configured and before rebooting the switch is recommended.

- Use the `no` form of this command to set the default VLAN back to 1.

- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.

- When a set of switches is running in virtual chassis mode, a virtual-fabric link (VFL) default VLAN can only be configured exactly in one switch at a time. In other words, we are not allowed to configured the virtual chassis link default VLAN with a system operating in virtual chassis mode if no operational chassis identifier is provided or if the value zero is specified.

- It is strongly recommended that the user set the same value of default VLAN for all virtual-fabric links on all switches that will participate on the same virtual chassis topology. Failure to adhere to this recommendation may cause end to end connectivity problems in the network.
Examples

Standalone mode:
-> virtual-chassis vf-link 0 default-vlan 5
-> virtual-chassis chassis-id 0 vf-link 0 default-vlan 5
-> no virtual-chassis vf-link 0 default-vlan
-> no virtual-chassis chassis-id 0 vf-link 0 default-vlan

Chassis 1:
-> virtual-chassis chassis-id 1 vf-link 0 default-vlan 5
-> no virtual-chassis chassis-id 1 vf-link 0 default-vlan

**virtual-chassis hello-interval**

Sets the virtual chassis configured hello interval parameter on the chassis. Hello packets are sent periodically on the virtual fabric link (VFL) interfaces to establish a relationship and bidirectional communication between virtual chassis switches. The hello interval value determines how often these packets are sent.

```
virtual-chassis [chassis-id oper_chassis] hello-interval hello
```

**Syntax Definitions**

- **oper_chassis**: The operational/current chassis ID number
- **hello**: The operational/current virtual chassis hello interval in seconds (1–2000), which defines how frequently the keep-alives related to the virtual chassis hello protocol are exchanged over the VFL links.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>hello</td>
<td>10 (6900 all models) 15 (6360, 6560, 6570M, 6860, 6860N) 60 (9900)</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>

MIB Objects

virtualChassisGlobalTable
  virtualChassisOperChasID
  virtualChassisOperHelloInterval
virtual-chassis shutdown

Disables all front-panel port including the user ports and all the VFL member ports on a chassis isolating the chassis from the rest of the virtual chassis topology.

virtual-chassis shutdown [chassis-id oper_chassis]

Syntax Definitions

oper_chassis The operational/current chassis ID number.

Defaults
N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

• The OS6900-X48C4E does not support a Virtual Chassis configuration.

• This command will disable all front panel ports, including the user ports and all virtual-fabric link (VFL) member ports on the specified switch.

• After running this command remote access to the target switch is only possible through the local EMP port on that switch.

• The target switch must be reloaded to bring its ports back to an operational state.

• This command is only functional when executed through the master chassis of a system operating in virtual chassis mode.

• After the shutdown command is executed, the target switch assumes the role of master and remains isolated from all other switches in the virtual chassis topology.

Examples

→ virtual-chassis shutdown chassis-id 2

Release History

Release 7.3.1; command introduced.
Related Commands

**show virtual-chassis consistency**
Displays the system level mandatory consistency parameters of both the local and peer switches.

MIB Objects

N/A
**virtual-chassis vf-link-mode**

Configures the Virtual Chassis mode. Virtual Chassis mode determines whether the VFLs are created automatically or statically.

```
virtual-chassis vf-link-mode {static | auto}
```

**Syntax Definitions**

N/A

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>vf-link-mode</td>
<td><strong>auto</strong> (if no vcsetup.cfg file exists).</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The OS6900-X48C4E does not support a Virtual Chassis configuration.
- If the chassis boots without a `vcsetup.cfg` file the mode defaults to auto.
- If the chassis boots with a `vcsetup.cfg` file and the ‘virtual-chassis vf-link-mode’ CLI does not exist, the mode will be set to static. Otherwise, the mode will be set as configured in the `vcsetup.cfg` file.
- Changing the mode is only allowed for all chassis or the local chassis. Specific chassis configuration is not allowed.
- Platforms that do not support static VFLs do not support this command.

**Examples**

```
-> virtual-chassis vf-link-mode auto
-> virtual-chassis vf-link-mode static
```

**Release History**

Release 7.3.4; command introduced.
Related Commands

**show virtual-chassis vf-link**  
Displays a summary of the configured and operational parameters related to the virtual fabric link on the switch.

MIB Objects

Usage Guidelines

- The OS6900-X48C4E does not support a Virtual Chassis configuration.
- This command is allowed only if VFL mode is auto.
- Refer to the defaults table above for information on which ports are default automatic VFL ports.
- Transceiver does not have to be present for port to be eligible as a default port.
- The OS6860N only supports a VFL link on the dedicated VFL ports.

Examples

-> virtual-chassis auto-vf-link-port 1/1/1
-> no virtual-chassis auto-vf-link-port 1/1/1

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The OS6900-X48C4E does not support a Virtual Chassis configuration.

- For a dual-CMM Master chassis configuration, this command triggers a local CMM takeover on the Master if both the primary and secondary CMMs are up. This will cause the secondary CMM to become the primary CMM and the NIs will remain up. The original Master chassis will remain the Master and the Slave chassis will remain the Slave.

- For a single-CMM Master chassis configuration, this command will reboot the entire Master chassis including the NIs and result in the Slave chassis becoming the Master.

Examples

-> vc-takeover
WARNING - Working Changes Will Be Lost, Confirm VC takeover (Y/N) :

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The OS6900-X48C4E does not support a Virtual Chassis configuration.

- This command will automatically create the new configuration files `vcsetup.cfg` and `vcboot.cfg` within the specified directory. The `vcsetup.cfg` file contains the virtual chassis manager configuration, which is specific to each individual switch. The contents of the `vcsetup.cfg` files are unique to each switch and distinct between switches. The `vcboot.cfg` file contains the generic application configuration, which is global to the entire virtual chassis topology. As a result, the `vcboot.cfg` files should have the same contents between distinct switches.

- This command will automatically copy the image files of the current running directory into the specified dir directory.

- This command is only accepted in standalone mode after a valid chassis identifier (1-6) has been configured on the switch. The command is rejected when executed in a switch already running in virtual chassis mode.

- The directory will be automatically created if it does not exist.

- The current standalone configuration files (e.g. `boot.cfg`) that may exist in the directory will remain intact. When the switches come up in virtual chassis mode following a conversion using this command, the `vcboot.cfg` files present on distinct switches may be different. However, the `vcboot.cfg` files must be the same on all switches running in virtual chassis mode. As a result, the `vcboot.cfg` file of the master will overwrite the `vcboot.cfg` file on the slave chassis and the slave will automatically reboot.
Examples

-> convert configuration to vc_dir

Release History

Release 7.3.1; command introduced.

Related Commands

show configuration snapshot  Displays the configured and operational parameters related to the virtual chassis feature on the switch.

MIB Objects

N/A
show virtual-chassis topology

This command is used to provide a detailed status of the virtual chassis topology.

show virtual-chassis [chassis-id \{oper_chassis\}] topology

Syntax Definitions

oper_chassis
The operational/current chassis ID number.

Defaults
N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

• The OS6900-X48C4E does not support a Virtual Chassis configuration.
• This command can be executed on any CMM within any switch of the system.
• When no operational chassis identifier is specified the command will show data related to the entire virtual chassis system.
• A chassis-id of 100 or 101 is used to indicate a duplicate chassis-id.

output definitions

Oper-Chassis-ID (Chas) Operational/current virtual chassis chassis identifier.
Config Chas ID The configured/next chassis identifier for the switch specified by operational chassis identifier.
Chassis-Role (Role) Chassis Role
Unassigned: Role undefined as election has not completed yet.
Master: Chassis is central point of management and control.
Slave: Chassis is an active or functional participant of the virtual chassis topology, but it is not the main entry point for management and control purposes.
Inconsis: Chassis is not an active or functional participant of the virtual chassis topology due to some inconsistent parameter, which does not match the master chassis' settings.
Startup-Err: Chassis is in start up error mode because it was unable to come up in virtual chassis mode. When a chassis assumes the Startup-Err role, its chassis status will be equal to either Invalid-Chassis-Id or Invalid-License, which are described later in this section.
Previous-Chassis-Role Previous chassis role before the last transition.
output definitions

<table>
<thead>
<tr>
<th>Chassis-Status (Status)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Init</td>
<td>Status undefined as the chassis has not completed its initialization.</td>
</tr>
<tr>
<td>Running</td>
<td>The chassis is fully operational.</td>
</tr>
<tr>
<td>Invalid-Chassis-Id</td>
<td>The chassis is not operational in virtual chassis mode because no valid chassis identifier has been found in the configuration. Typically this means that the vcsetup.cfg file is corrupted, empty or contains an invalid (e.g. out of range) chassis ID identifier.</td>
</tr>
<tr>
<td>Invalid-License</td>
<td>The chassis is not operational in virtual chassis mode because no valid advanced license has been found.</td>
</tr>
<tr>
<td>Hello-Down</td>
<td>The chassis is isolated from the rest of the virtual chassis topology participants because hello packets have not been received for a period of time greater than the hello timeout.</td>
</tr>
<tr>
<td>Duplicate-Chassis</td>
<td>This chassis is not fully operational because its operational chassis identifier matches the chassis ID of another chassis within the virtual chassis topology. As a result, a new operational chassis identifier from the range (101-102) will be allocated to this chassis.</td>
</tr>
<tr>
<td>Mis-Image</td>
<td>The chassis is not fully operational because its image versions are not consistent with the master chassis' images. In other words, the image version are not compatible and some of the software components running on this chassis are unable to interface with the software operating in the master chassis.</td>
</tr>
<tr>
<td>Mis-Chassis-Type</td>
<td>The chassis is not fully operational because its chassis type (i.e. OS6900, OS6860) is not consistent with the master chassis' type. Different chassis types cannot be mixed in the same virtual chassis topology.</td>
</tr>
<tr>
<td>Mis-Hello-Interval</td>
<td>The chassis is not fully operational because its operational hello interval is not consistent with the master chassis' operational hello interval.</td>
</tr>
<tr>
<td>Mis-Control-Vlan</td>
<td>The chassis is not fully operational because its operational control VLAN is not consistent with the master chassis' operational control VLAN.</td>
</tr>
<tr>
<td>Mis-Chassis-Group</td>
<td>The chassis is not fully operational because its chassis group does not match the master chassis' chassis group and the chassis is connected directly or indirectly to the master chassis through virtual-fabric links. This chassis is unable to join the active virtual chassis topology whose master chassis is part of.</td>
</tr>
<tr>
<td>Mis-License-Config</td>
<td>The chassis is not fully operational because its license settings do not match the master chassis' license configuration. An exact match is required to allow successful operation within the same virtual chassis topology.</td>
</tr>
<tr>
<td>Split-Topology</td>
<td>The chassis is not fully operational and all of its front panel user ports (excluding the virtual-fabric link member ports) are operationally down because a topology split has occurred. This chassis became isolated from the master chassis after all of its active virtual-fabric member ports went down or the virtual chassis manager hello timeout has expired.</td>
</tr>
<tr>
<td>Running+</td>
<td>Element added after last saved topology.</td>

</tbody>
</table>

Release History

Release 7.3.1; command introduced.
Release 7.3.4; VFLink mode introduced.
Related Commands

- **virtual-chassis configured-chassis-id**: Assigns a globally unique chassis identifier to the switch and enables the switch to operate in virtual chassis mode.

- **virtual-chassis chassis-group**: Assigns a globally unique chassis group identifier to a switch. Each peer switch in a virtual chassis domain must use the same group ID number.

- **virtual-chassis configured-chassis-priority**: Sets the configured chassis priority for a switch specified by its operational chassis identifier.

- **virtual-chassis configured-control-vlan**: Sets the configured control VLAN for a switch specified by its operational chassis identifier.

- **virtual-chassis configured-hello-interval**: Configures the virtual chassis hello interval parameter on the switch.

show virtual-chassis consistency

This command is used to provide a detailed status of the parameters taken into account to determine the consistency of a group of switches participating in the virtual chassis topology.

show virtual-chassis [chassis-id oper_chassis] consistency

Syntax Definitions

oper_chassis

The operational/current chassis ID number.

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

• The OS6900-X48C4E does not support a Virtual Chassis configuration.

• This command provides a list of parameters that must be configured consistently on all switches that will participate on the virtual chassis topology to allow correct system operation.

• In order to determine the consistency of a given parameter, the switch will compare the value of such parameters on a given switch with the settings of the master chassis. Therefore consistency is always defined as a comparison with the master chassis.

• The following parameters are considered consistent if they match the settings of the master chassis: chassis type, license, chassis group, operational control VLAN, configured control VLAN, operational hello interval and configured hello interval.

• The configured chassis identifier parameter is considered consistent if it is different than the settings of the master chassis.

Examples

-> show virtual-chassis consistency
Legend: * - denotes mandatory consistency which will affect chassis status
Licenses - A: Advanced; B: Data Center

**Legend:**

- * - denotes mandatory consistency which will affect chassis status
- Licenses - A: Advanced; B: Data Center

**output definitions**

- **Chassis-ID (Chas)**: Operational/current virtual chassis chassis identifier. The operational chassis identifier when a switch operates in standalone mode is zero (0).
- **Config-Chassis-ID (Conf Chas ID)**: The configured/next chassis identifier for the switch specified by operational chassis identifier.
- **Chassis-Type (Chas Type)**: The switch chassis type (OS6900 or OS6860).
- **License**: The licenses installed on the chassis.
- **Chassis-Group (Chas Group)**: Virtual chassis group identifier. Used to identify a group of chassis belonging to the same active virtual chassis topology.
- **Hello-Interval**: Operational/current hello-interval.
- **Oper-Control-VLAN**: Operational/current virtual chassis control VLAN.
- **Config-Control-VLAN**: Configured/next virtual chassis control VLAN, which will take effect after reset thereby becoming the next operational control VLAN.

**Status**

- **OK**: The switch is operating in virtual chassis mode and the given switch's parameter value is consistent with the settings of the master chassis.
- **NOK**: The switch is operating in virtual chassis mode and the given switch's parameter value is inconsistent with the settings of the master chassis.
- **N/A**: The switch is operating in virtual chassis mode, but the virtual chassis topology has not converged and therefore a master chassis is not yet known.
- **Disabled**: The switch is operating in standalone mode, in which there can be no virtual chassis master and hence the concept of consistency does not apply.
Release History

Release 7.3.1; command introduced.

Related Commands

- **virtual-chassis configured-chassis-id**: Assigns a globally unique chassis identifier to the switch and enables the switch to operate in virtual chassis mode.

</tr>
</tbody>
</table>

**output definitions**

- **Chassis/VFLink ID**: Pair operational/current virtual chassis chassis identifier and virtual-fabric link (VFL) identifier.
- **Oper**: Virtual-fabric link (VFL) operational status (Up or Down).
- **Primary Port**: Primary port of the virtual-fabric link (VFL) trunk, which is the port where non-unicast packets destined a remote chassis are sent out.
- **Config Port**: Number of ports configured to operate as virtual-fabric link (VFL) member ports, i.e. ports that potentially may join a VFL.
- **Active Port**: Number of virtual-fabric link (VFL) member ports that are operational, i.e. the LACP protocol is fully operational for those ports.
- **Def Vlan**: Operational default VLAN on the virtual-fabric link (VFL).
- **Chassis/Slot/Port**: The operational chassis/slot/port tuple identifying a particular virtual-fabric link (VFL) member port.
- **Is Primary**: Indicates if this port is the primary port of the VFL.

**Release History**

- Release 7.3.1: command introduced.
- Release 7.3.4: VFLink mode introduced.

**Related Commands**

- **virtual-chassis configured-chassis-id**: Assigns a globally unique chassis identifier to the switch and enables the switch to operate in virtual chassis mode.
- **virtual-chassis vf-link create**: Configures a virtual fabric link (VFL) between two peer switches. A VFL is required to enable the Virtual Chassis operation between the two switches.
- **virtual-chassis vf-link member-port**: Configures member ports for the virtual fabric link (VFL).
- **virtual-chassis vf-link default-vlan**: Configures the default VLAN for the VFL.

**MIB Objects**

</tr>
</tbody>
</table>

**Usage Guidelines**

- The OS6900-X48C4E does not support a Virtual Chassis configuration.
- When no operational chassis identifier is specified the command will show data related to the entire virtual chassis system.
- On the OmniSwitch 6900, the slot number depicted in this command always refers to the main board of the switch (i.e. slot number 1). In other words, this command does not present the status related to expansion boards.

**Examples**

```
-> show virtual-chassis slot-reset-list
Chas  Slot  Reset status
---------+---------+--------------
  1      1      Split
  2      1      Split

-> show virtual-chassis chassis-id 1 slot-reset-list
Chas  Slot  Reset status
---------+---------+--------------
  1      1      Split
```
### output definitions

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Chas</strong></td>
<td>Operational/current virtual chassis identifier. The operational chassis identifier when a switch operates in standalone mode is zero (0).</td>
</tr>
<tr>
<td><strong>Slot</strong></td>
<td>Slot number identifying a particular network interface module (NI). For OmniSwitch 6900 switches, the slot number is always equal to 1.</td>
</tr>
</tbody>
</table>
| **Reset Status** | For the network interface module (NI) identified by the pair (Chas, Slot), this command displays status information specifying whether bringing down or extracting such network interface module (NI) will lead to a virtual chassis topology split according to the following definitions.  
**Supported**: The network interface module can be reset without splitting the virtual chassis topology.  
**Split**: Resetting this network interface module will cause a virtual chassis topology split. |

### Release History

Release 7.3.1; command introduced.

### Related Commands

**show virtual-chassis topology** Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

### MIB Objects

- virtualChassisSlotResetStatusTable
- virtualChassisOperChasID
- virtualChassisSlotResetStatus
**show virtual-chassis neighbors**

This command displays a list of which neighbors are connected via which VFL for a virtual chassis.

```
show virtual-chassis [chassis-id oper_chassis] neighbors
```

**Syntax Definitions**

- `oper_chassis` The operational/current chassis ID number.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>

show configuration vcm-snapshot chassis-id

Displays a snapshot of the switch specific virtual chassis configuration for a switch running in virtual chassis mode.

**show configuration vcm-snapshot chassis-id oper_chassis**

---

### Syntax Definitions

*oper_chassis*  
The operational/current chassis ID number.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The OS6900-X48C4E does not support a Virtual Chassis configuration.
- When a switch operates in standalone mode, this command is not supported. In this case, we must use the `show configuration snapshot virtual chassis` to obtain a snapshot of the switch specific virtual chassis configuration.

### Examples

```
-> show configuration vcm-snapshot chassis-id 1
! Virtual Chassis Manager:
  virtual-chassis chassis-id 1 configured-chassis-id 1
  virtual-chassis chassis-id 1 vf-link 0 create
  virtual-chassis chassis-id 1 vf-link 0 member-port 1/8/1
  virtual-chassis chassis-id 1 configured-control-vlan 4091
  virtual-chassis chassis-id 1 chassis-group 1

! IP:
  ip interface local chassis-id 1 emp address 10.255.76.21 mask 255.255.255.0
```

### Release History

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The OS6900-X48C4E does not support a Virtual Chassis configuration.
- VCSP cannot be enabled before assigning a link aggregate.
- VCSP and the helper functionality can be enabled on the same link aggregate.
- The virtual chassis and its helper cannot have the same Group ID.

Examples

- `virtual-chassis split-protection admin-state enable`
- `virtual-chassis split-protection admin-state disable`

Release History

Release 7.3.4.R02; command was introduced.
Related Commands

- **show virtual-chassis split-protection status**
  Displays all the information related to VCSP when enabled.

- **virtual-chassis split-protection linkagg**
  Assigns a link aggregate for use with VCSP.

MIB Objects

- `alaVCSPConfigInfo`
- `alaVCSPAdminState`
**virtual-chassis split-protection linkagg**

Assigns a link aggregate for use with VCSP.

```
virtual-chassis split-protection linkagg agg_id
```

```
no virtual-chassis split-protection linkagg
```

**Syntax Definitions**

```
agg_id
```
The link aggregate ID number to associate with the helper for VCSP support. The valid range is 0–255.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The OS6900-X48C4E does not support a Virtual Chassis configuration.
- Use the `no` form of this command to remove the link aggregate assignment.
- This command must be used to configure VC split protection `linkagg` before enabling VC split protection.

**Examples**

```
-> virtual-chassis split-protection linkagg 1
```

**Release History**

Release 7.3.4.R02; command was introduced.
Related Commands

show virtual-chassis split-protection status

virtual-chassis split-protection guard-timer

Configures the timer value for how long the master will wait to receive VCSP PDUs before beginning transmission of VCSP PDUs.

virtual-chassis split-protection guard-timer \texttt{time}

\textbf{Syntax Definitions}

\texttt{time} \hspace{2cm} Time interval to wait on boot up before choosing any state. The valid range is 30–100 seconds.

\textbf{Defaults}

\begin{tabular}{|c|c|}
\hline
\texttt{parameter} & \texttt{default} \\
\hline
\texttt{time} & 30 seconds \\
\hline
\end{tabular}

\textbf{Platforms Supported}

This command is supported on the following OmniSwitch platforms:

\begin{tabular}{|c|c|c|c|c|c|c|c|c|c|}
\hline
\hline
Yes & Yes & Yes & Yes & Yes & Yes & Yes & Yes & Yes & Yes \\
\hline
\end{tabular}

\textbf{Usage Guidelines}

\begin{itemize}
\item The OS6900-X48C4E does not support a Virtual Chassis configuration.
\item Changes to the Guard timer only take affect after reboot or by disabling and re-enabling VC split protection.
\end{itemize}

\textbf{Examples}

\texttt{\rightarrow virtual-chassis split-protection guard-timer 60}

\textbf{Release History}

Release 7.3.4.R02; command was introduced.
Related Commands

Virtual Chassis Commands

show virtual-chassis split-protection helper status
14  Ethernet Ring Protection Commands

Ethernet Ring Protection (ERP) is a protection switching mechanism for Ethernet ring topologies, such as multi-ring and ladder networks. The implementation of ERP on the OmniSwitch is based on ERP Version 2 (ITU-T G.8032/Y.1344 to 2010) using the Ring Automatic Protection Switching (R-APS) protocol to coordinate and prevent network loops within a bridged Ethernet ring.

ERPv2 supports multi-rings and ladder to ladder networks. ERPv2 functionalities allow configuration of Sub-Rings within a Master Ethernet Ring, interconnected nodes and shared links between the rings.

MIB information for Ethernet Ring Protection commands is as follows:

Filename:  ALCATEL-IND1-ERP-MIB.mib
Module:    alcatelIND1ERPMIB

A summary of available commands is listed here:

```
  erp-ring
  erp-ring rpl-node
  erp-ring wait-to-restore
  erp-ring enable
  erp-ring guard-timer
  erp-ring sub-ring
  erp-ring virtual-channel
  erp-ring revertive
  erp-ring clear
  erp-ring ethoam-event
  erp-ring sap-neighbor
  clear erp statistics
  show erp
  show erp statistics
```
**erp-ring**

Creates an Ethernet Ring Protection (ERP) using the specified ports and service VLAN ID. The service VLAN transmits ERP control traffic, such as Ring Automatic Protection Switching (R-APS) messages, through the ring. The specified level number identifies an APS Management Entity Group (MEG) to which the service VLAN belongs.

```
```

**Syntax Definitions**

- `ring_id`: The ERP ring ID number. The valid range is 1 to 2147483647.
- `chassis`: The chassis identifier.
- `slot/port`: The slot number for the module and the physical port number on that module.
- `agg_id`: The link aggregate ID number.
- `access-[tagged | untagged]`: Specifies the ERP Control (Service) VLAN mapping to tagged or untagged port or linkagg on the access port1 or port 2.
  - If the ERP control VLAN is mapped to tagged SAP, then configure ERP ring as access-tagged.
  - If the ERP control VLAN is mapped to untagged SAP, configure the ERP ring as access-untagged.
  
  *This parameter is supported only on the OmniSwitch 9900, OmniSwitch 6900, OmniSwitch 6860, and OmniSwitch 6860N.*

- `mac_address`: MAC address of the remote system of the BEB where the other end of the ERP ring is connected as the access port.
  
  Only either of port2 or remote system can be configured.

  *This parameter is supported only on the OmniSwitch 9900, OmniSwitch 6900, OmniSwitch 6860, and OmniSwitch 6860N.*

- `vlan_id`: The service VLAN ID number. The valid range is 1 to 4094.
- `level`: The MEG level number for the service VLAN. The valid range is 0 to 7.
- `guard-timer`: The guard timer value, in centi seconds, for the ring node.
- `wrt-timer`: The wait-to-restore timer value, in minutes, for the Ring Protection Link (RPL) node.
- `enable`: Administratively enables the ERP ring.
- `disable`: Administratively disables the ERP ring.
Defaults

<table>
<thead>
<tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to remove a ring from the switch configuration. Administratively disable the ring ports before deleting the ring to avoid creating any network loops. Once the ring is deleted, ensure that the same ports are administratively enabled under Spanning Tree control.

- The specified ring identification number must be unique within a switch.

- ERP is not supported on mobile ports, mirroring ports, link aggregate member ports, high availability ports, Multicast VLAN receiver ports (ERP is supported on Multicast VLAN sender ports only), VLAN Stacking user network interface (UNI) ports, or RRSTP ring ports.

- BEB cannot be a RPL node. Hence, RPL port shall not be configured on SPB network. The RPL port cannot be configured as a SAP neighbor.

- Each ERP ring can have only two access port connections into the underlay network.

- For the SPB service associated with the ERP service VLAN, it has to be configured in the Control bridge VLAN (BVLAN) of the SPB network. This will ensure reachability to all nodes of the SPB network.

- In case where the underlay network needs to support more than one ERP ring, then
  - Ensure there is no overlap in the VLAN range supported within the ERP rings. That is, each ERP ring must have an exclusive range of VLANs including the service VLAN relative to the other ERP rings.
  - In the underlay network, the services association with the ERP VLANS is exclusive to each ring. That is, the service IDs (for example, ISID, VNID) cannot extend across/into the other ERP rings.

- If a port is tagged with the service VLAN ID or the service VLAN is the default VLAN for the port, then the port is not eligible to become an ERP ring port.

- Specify an existing VLAN ID for the service VLAN ID. Use the same VLAN ID and level number for the service VLAN on each switch that participates in the ERP ring.
- If the ERP switch participates in an Ethernet OAM Maintenance Domain (MD), configure the ERP service VLAN to use the same level number that is used for the Ethernet OAM MD.

- Specify a static VLAN ID for the ERP service VLAN; dynamic VLANs are not configurable as service VLANs.

- The service VLAN can belong to only one ERP ring at a time. A maximum of 64 rings are allowed per switch.

- The specified service VLAN ID must not participate in a Spanning Tree instance that is associated with non-ERP VLANs. Ideally, change the Spanning Tree configuration for the VLAN ID prior to using this command.

- An ERP ring port can belong to only one ERP ring at a time.

- Create an ERP type NNI-SVLAN binding before establishing an ERP ring on that SVLAN-NNI binding.

**Examples**

```
-> erp-ring 1 port1 1/1/1 port2 2/4/1 service-vlan 10 level 2 enable
-> erp-ring 2 port1 linkagg 1 port2 2/10/1 service-vlan 20 level 2
-> erp-ring 3 port1 linkagg 2 port2 linkagg 4 service-vlan 30 level 7
-> no erp-ring 2
-> erp-ring 1 port1 access-tagged 1/1/1 port2 access-tagged 1/1/2 service-vlan 10 level 1
-> erp-ring 1 port1 access-untagged 1/1/1 port2 access-untagged 1/1/2 service-vlan 10 level 1
-> erp-ring 1 port1 access-untagged 1/1/1 spb remote-system 00:11:22:33:44:55 service-vlan 100 level 1
-> erp-ring 1 port1 access-untagged linkagg 1 spb remote-system 00:11:22:33:44:55 service-vlan 100 level 1
-> no erp-ring 2
```

**Release History**

Configures a switch as a Ring Protection Link (RPL) node. This command also identifies the ERP port as an RPL connection port. The RPL remains blocked to prevent loops within the ERP ring.

```
erp-ring ring_id rpl-node {port chassis/slot/port | linkagg agg_id}
no erp-ring ring_id rpl-node
```

**Syntax Definitions**

- **ring_id**
  An existing ERP ring ID number. The valid range is 1 to 2147483647.
- **chassis**
  The chassis identifier.
- **slot/port**
  The slot number for the module and the physical port number on that module.
- **agg_id**
  The link aggregate ID number.

**Defaults**

NA

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to remove the RPL designation for the specified ring.
- The RPL node can be configured only when the ring is disabled. RPL configuration applied to the Ethernet ring while it is enabled is rejected.
- The specified ERP ring ID must exist in the switch configuration.
- This command applies only to ERP ring ports; ports not configured as ERP ring ports are not eligible to become RPL ports.
- Only one of the two ring ports configured for the switch can be designated as an RPL node port.

**Examples**

```
-> erp-ring 1 rpl-node port 2/1
-> erp-ring 2 rpl-node linkagg 2
-> no erp-ring 2 rpl-node
```
**Release History**
Release 7.1.1; command introduced.

**Related Commands**

</tr>
</tbody>
</table>

**MIB Objects**

alaErpRingPortEntry
- alaErpRingPortIfIndex
- alaErpRingPortType
**erp-ring wait-to-restore**

Configures the wait-to-restore timer value for the Ring Protection Link (RPL) switch. This timer determines the number of minutes the RPL switch waits before returning the RPL ports to a blocked state after the ERP ring has recovered from a link failure.

**Syntax**

```
erp-ring ring_id wait-to-restore wtr_timer
```

**no erp-ring ring_id wait-to-restore**

**Syntax Definitions**

- **ring_id**
  - An existing ERP ring ID number. The valid range is 1 to 2147483647.

- **wtr_timer**
  - The number of minutes to wait before restoring the RPL to a blocked state. The valid range is 1 to 12.

**Defaults**

By default, the wait-to-restore timer value is set to 5 minutes.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to set the timer back to the default setting of 5 minutes.
- The specified ERP ring ID must exist in the switch configuration.
- This command applies only on a switch that serves as the RPL node for the ERP ring.

**Examples**

```
-> erp-ring 1 wait-to-restore 6
-> no erp-ring 1 wait-to-restore
```

**Release History**

Release 7.1.1; command introduced.
**Related Commands**

- **erp-ring**
  - Configures an ERP ring.

- **erp-ring rpl-node**
  - Configures a Ring Protection Link (RPL) port connection.

- **show erp**
  - Displays the ERP ring configuration for the switch.

**MIB Objects**

- **alaErpRingId**
- **alaErpRingWaitToRestoreTimer**
**erp-ring enable**

Enables or disables an ERP ring identified by the specified ring ID. This command applies to enabling or disabling existing ERP rings.

```
erp-ring ring_id {enable | disable}
```

### Syntax Definitions

- **ring_id**
  
  An existing ERP ring ID number. The valid range is 1 to 2147483647.

- **enable**
  
  Enables the specified ring ID.

- **disable**
  
  Disables the specified ring ID.

### Defaults

By default, ERP rings are disabled when they are created.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The specified ring ID must exist in the switch configuration.
- Enabling a ring is also allowed at the time the ring is created.

### Examples

```
-> erp-ring 1 enable
-> erp-ring 1 disable
```

### Release History

Release 7.1.1; command introduced.
**Related Commands**

- **erp-ring**
  - Configures an ERP ring.
- **show erp**
  - Displays the ERP ring configuration for the switch.

**MIB Objects**

- **alaErpRingId**
- **alaErpRingStatus**
**erp-ring guard-timer**

Configures the guard timer value for the specified ERP ring node. The guard timer is used to prevent ring nodes from receiving outdated Ring Automatic Protection Switching (R-APS) messages. During the amount of time determined by this timer, all received R-APS messages are ignored by the ring protection control process.

```
erp-ring ring_id guard-timer guard_timer
no erp-ring ring_id guard-timer
```

**Syntax Definitions**

- **ring_id**: An existing ERP ring ID number. The valid range is 1 to 2147483647.
- **guard_timer**: The guard timer value. The valid range is 1–200 centi-secs.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>guard_timer</td>
<td>50</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to set the timer back to the default value of 50 centi-secs.
- The specified ring ID must exist in the switch configuration.

**Examples**

```
-> erp-ring 1 guard-timer 10
-> no erp-ring 1 guard-timer
```

**Release History**

Release 7.1.1; command introduced.
**Related Commands**

- **erp-ring**
  Configures an ERP ring.

- **show erp**
  Displays the ERP ring configuration for the switch.

**MIB Objects**

- **alaErpRingId**
  - **alaErpRingGuardTimer**
**erp-ring sub-ring**

Creates an Ethernet Ring Protection (ERP) sub-ring.

```
erp-ring ring_id sub-ring-port {chassis/slot/port | linkagg agg_id} service-vlan vlan_id level level_num [guard-timer guard_timer] [wait-to-restore-timer wtr_timer] [enable | disable]
```

**Syntax Definitions**

- `ring_id`: The ERP ring ID number. The valid range is 1 to 2147483647.
- `chassis`: The chassis identifier.
- `slot/port`: The slot number for the module and the physical port number on that module.
- `agg_id`: The link aggregate ID number.
- `vlan_id`: The service VLAN ID number. The valid range is 1 to 4094.
- `level_num`: The MEG level number for the service VLAN. The valid range is 0 to 7.
- `guard_timer`: The guard timer value, in centi-secs, for the ring node.
- `wtr_timer`: The wait-to-restore timer value, in minutes, for the Ring Protection Link (RPL) node.
- `enable`: Administratively enables the ERP sub-ring.
- `disable`: Administratively disables the ERP sub-ring.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>guard_timer</td>
<td>50</td>
</tr>
<tr>
<td>wtr_timer</td>
<td>5</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the **no** form of this command to remove a sub-ring from the switch configuration.
- Administratively disable ring ports before deleting the ring to avoid creating any network loops. Once the ring is deleted, ensure that the same ports are administratively enabled under Spanning Tree control.
The specified ring identification number must be unique within a switch.

ERP is not supported on mobile ports, mirroring ports, link aggregate member ports, high availability ports, Multicast VLAN receiver ports (ERP is supported on Multicast VLAN sender ports only), VLAN Stacking user network interface (UNI) ports, or RRSTP ring ports.

If a port is tagged with the service VLAN ID or the service VLAN is the default VLAN for the port, the port is not eligible to become an ERP ring port.

Specify an existing VLAN ID for the service VLAN ID. Use the same VLAN ID and level number for the service VLAN on each switch that participates in the ERP ring.

If the ERP switch participates in an Ethernet OAM Maintenance Domain (MD), configure the ERP service VLAN to use the same level number that is used for the Ethernet OAM MD.

Specify a static VLAN ID for the ERP service VLAN; dynamic VLANs are not configurable as service VLANs.

The service VLAN can belong to only one ERP ring at a time. A maximum of four rings are allowed per switch.

The specified service VLAN ID must not participate in a Spanning Tree instance that is associated with non-ERP VLANs. Ideally, change the Spanning Tree configuration for the VLAN ID prior to using this command.

An ERP ring port can belong to only one ERP ring at a time.

An ERP type NNI-SVLAN binding must be created before establishing an ERP ring on that SVLAN-NNI binding.

Examples

- `-> erp-ring 1 sub-ring-port 1/1 service-vlan 10 level 2 enable`
- `-> erp-ring 2 sub-ring-port linkagg 1 port2 2/10 service-vlan 20 level 2`
- `-> no erp-ring 2`

Release History

Release 7.3.1; command introduced.

Related Commands

- `erp-ring` Creates an Ethernet Ring Protection (ERP) ring.
- `show erp` Displays the ERP ring configuration for the switch.
- `show erp statistics` Displays ERP ring statistics.

**erp-ring virtual-channel**

Enables or disables an Ethernet Ring Protection (ERP) Ring Virtual Channel.

`erp-ring ring_id virtual-channel [enable | disable]`

---

**Syntax Definitions**

- **ring_id**
  - The ERP ring ID number. The valid range is 1 to 2147483647.

- **enable**
  - Administratively enables the ERP virtual channel. If enabled, Ring Automatic Protection Switching (R-APS) protocol messages are encapsulated and transmitted over a virtual channel configured on the major ring.

- **disable**
  - Administratively disables the ERP virtual channel. If disabled, R-APS messages are terminated at the interconnection nodes between the rings but not blocked at the Ring Protection Link (RPL) of the sub-ring.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>

erp-ring revertive

Enables or disables revertive mode on the specified node.

\texttt{erp-ring} \textit{ring\_id} revertive \{enable | disable\}

\textbf{Syntax Definitions}

- \textit{ring\_id} \quad The ERP ring ID number. The valid range is 1 to 2147483647.
- \textit{enable} \quad Administratively enables Revertive Mode. Now, if the RPL is unblocked due to a failure within the ring, the RPL automatically reverts to the “Blocked” state when the failed link recovers.
- \textit{disable} \quad Administratively disables Revertive Mode. Now, If the RPL is unblocked due to a failure within the ring, the RPL does not automatically revert to “Blocked” state when the failed link recovers.

\textbf{Defaults}

\begin{tabular}{ll}
\hline
parameter & default \\
\hline
\texttt{enable | disable} & \texttt{enable} \\
\hline
\end{tabular}

\textbf{Platforms Supported}

This command is supported on the following OmniSwitch platforms:

**show erp statistics**

Displays the ERP statistics for all rings, a specific ring, or a specific ring port.

```plaintext
show erp statistics [ring ring_id [port chassis/slot/port | linkagg agg_id]]
```

### Syntax Definitions

- **ring_id**: An existing ERP ring ID number. The valid range is 1 to 2147483647.
- **chassis**: The chassis identifier.
- **slot/port**: The slot number for the module and the physical port number on that module.
- **agg_id**: The link aggregate ID number.

### Defaults

By default, statistics are displayed for all ERP rings in the switch configuration.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860M</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>

</tr>
</tbody>
</table>

### Usage Guidelines

- Enter a ring ID to display the statistics for a specific ring.
- Enter a ring ID and a ring port number or link aggregate ID to display the statistics for a specific port or link aggregate.
- The specified ring ID must exist in the switch configuration.
- The specified port must belong to the ring identified by the ring ID.

### Examples

15 Media Redundancy Protocol Commands

Media Redundancy Protocol (MRP) is an IEC standard that specifies a recovery protocol for use in high availability ring topology networks used in industrial automation networks. It is described in the IEC 62439-2. The protocol is designed to react to a single link or switch failure in the network and provide deterministic recovery time, which is important in ensuring real time data communication needs of industrial networks. During the failure of a connection, the media redundancy reconfigures the network so that the nodes can be accessed again through a substitute path.

MIB information for MRP commands is as follows:

Filename: IEC-62439-2-MIB.mib, ALCATEL-IND1-MRP-MIB.mib
Module: IEC62439, alcatelIND1MRPMIB

A summary of the available commands is listed here:

<table>
<thead>
<tr>

mrp

Configures a Domain or Interconnection with VLAN ID for the MRP ring.

mrp {domain domain_index | interconnect interconnect_id} vlan vlan_id

no mrp {domain domain_index | interconnect interconnect_id}

Syntax Definitions

domain_index
The domain identifier unique in the switch. The range is 1-3.
This key attribute defines the redundancy domain representing the MRP ring.

interconnect_id
Specifies the interconnection identifier unique in the switch. This is a
mandatory parameter to create a MRP interconnection. Allowed values are 1 to 65535.

vlan_id
The service VLAN ID number of the MRP ring. The valid range is 2 to 4094. Control traffic will flow with this VLAN tag in the ring.

Defaults
None.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Usage Guidelines

- MRP is packaged into a Debian package, which can be installed on the switch. To configure MRP in AoS, it is required to install the MRP package using Package Manager commands. For more information on the Package Manager, see “Chassis Management and Monitoring Commands” chapter in the OmniSwitch AOS Release 8 CLI Reference Guide.

- MRP is supported in a standalone mode (virtual chassis of one) on OmniSwitch 6465. MRP is supported on virtual chassis of one or more on OmniSwitch 6865.

- Use the no form of this command to remove a ring from the switch configuration.

- A maximum of three MRP rings (domain) will be supported at a time in a node. Also, a node can have MRM/MRA (Media Redundancy Manager/Media Redundancy Auto-manager) role for only one ring among the allowed three rings.

- MRP domain configuration is mandatory to enable MRP interconnect on a switch.
• Specify a static VLAN ID for the MRP service VLAN; dynamic VLANs are not configurable as service VLANs.

• The service VLAN can belong to only one MRP ring at a time. The specified service VLAN ID must not participate in a Spanning Tree instance that is associated with non-MRP VLANs. Ideally, change the Spanning Tree configuration for the VLAN ID prior to using this command.

• VLAN used to create MRP must not be deleted till the MRP configuration is removed.

• STP will be disabled on MRP ring ports.

• MRP or ERP, any one of the redundancy protocol work at a time.

• MRP is not supported on mobile ports, mirroring ports, VFL port, UNI port, LPS port, UNP port, DHL port, or Openflow ports.

Examples

-> mrp domain 1 vlan 10

-> mrp interconnect 1 vlan 10

-> no mrp domain 1

Release History

Release 8.7R2; command introduced.
Release 8.9R1; mrp interconnect support added.

Related Commands

mrp domain
Configures the MRP ring parameters like domain index, ring ports, admin-role, priority, react on link change, and recovery. Use this command to administratively enable or disable an MRP ring.

mrp inter connect
Configures the MRP interconnection parameters like interconnection index, interconnection ports, admin-role, mode, and recovery time.

show mrp
Displays the MRP configuration information.

MIB Objects

mrpDomainTable
    mrpDomainIndex
    mrpDomainVlanId
    mrpDomainState
**mrp domain**

Configures the MRP ring parameters, such as domain index, ring ports, admin-role, priority, react on link change, and recovery. Use this command to administratively enable or disable an MRP ring.

```
mrp domain domain_index [name domain_name] [uuid uuid] port1 {linkagg agg_id | chassis/slot/port | slot/port} port2 {linkagg agg_id | chassis/slot/port | slot/port} [admin-role {client | manager | auto-manager}] [manager {priority priority | linkchange-react {enable | disable} | test-default [{interval interval | count repeat_count}] | [rt-delay-reset] [recovery-time {500ms | 200ms | 30ms | 10ms}]]
mrp domain domain_index admin-state {enable | disable}
```

**Syntax Definitions**

- **domain_index**
  Specifies the domain identifier unique in the switch. The range is 1–3.

- **domain_name**
  Specifies a logical name for the MRP domain to ease the management of MRP domains. The maximum length is up to 18 characters.

- **uuid**
  Specifies the unique 16 hexadecimal domain ID.

- **port1**
  The interface ID of the first ring port, which is either a bridge port, or an aggregated link within a bridge on which the ring is configured. There can be only two ring ports per ring in a bridge.

- **agg_id**
  A link aggregate ID number.

- **chassis**
  The chassis identifier.

- **slot/port**
  The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

- **port2**
  The interface ID of the second ring port, which is either a bridge port, or an aggregated link within a bridge on which the ring is configured. There can be only two ring ports per ring in a bridge.

- **client | manager | auto-manager**
  Specifies the role of the node redundancy domain.
  - By choosing the admin-role Manager, the device becomes the redundancy manager, MRM (Media Redundancy Manager).
  - By choosing the admin-role Client, the device becomes the redundancy client, MRC Media Redundancy Client).
  - By choosing the admin-role Auto-manager, the device becomes the redundancy auto-manager, MRA (Media Redundancy Auto-manager).

- **priority**
  The priority of the MRP entity. Lesser the value, higher the priority. The valid range is 0–65535.

- **linkchange-react enable**
  Specifies the MRM/MRA to react immediately on link-down MRP link change frames from MRC.

- **linkchange-react disable**
  Specifies the MRM/MRA to not react on link-down MRP link change frames from MRC.

- **interval**
  Specifies the test default timer for sending the MRP test frames to MRM/MRA in milliseconds. The range is 20–125.

  Test default interval range for 200ms recovery time is 20–50, and for 500ms recovery time is 50–125.
**repeat_count**
- Specifies the test default repeat count for MRM/MRA. The valid range is 1–15.

**rt-delay-reset**
- Resets the values of maximum round-trip-delay and minimum and round-trip-delay to zero at the same time.

**recovery-time**
- Specifies the maximum recovery time of a ring in milliseconds. Only 200ms and 500ms recovery time is supported.

**enable**
- Enables the administrative state of the MRP ring.

**disable**
- Disables the administrative state of the MRP ring.

</tr>
</tbody>
</table>
Usage Guidelines

- All devices in a ring which are configured with MRP must be part of the same redundancy domain. The domain is identified by domain identifier or domain name.
- Each specified ring port can only be part of a single ring.
- The maximum number of nodes in a ring is 50.
- A maximum of three MRP rings (domain) will be supported at a time in a node. Also, a node can have MRM/MRA role for only one ring among the allowed three rings.
- To configure Manager parameters (like priority, linkchange-react, test-default interval and so on), admin-role Manager or Auto-Manager must be configured first.
- Test default interval, repeat count, and recovery time must be same for all the switches in the domain.
- MRP ring supports multicast L2 and L3 flows; and the flows are converged within the configured recovery time and static multicast convergence time of a ring with static multicast querier and static multicast neighbor configuration.
- In MRP closed domain, blocking ports on MRM will go in STP blocking for all the VLANs configured on this port. VLANs which are not part of ring will also be affected due to this.
- MRAs select one MRM among each other by using a voting protocol. The remaining MRAs transition to the role MRC.
- If any of the node in the ring is configured as MRM, then all the nodes in ring that are configured with auto-manager moves to client role, MRC.
- The MRP priority value is used in the voting process to decide which of the nodes will finally become the MRM, while the other nodes take over the MRC role.
- STP will be disabled on the configured MRP ring ports once MRP ring is administratively enabled.

Examples

-> mrp domain 1 uuid 0xffffffff-ffff-ffff-ffff-ffffffffffe
-> mrp domain 1 port1 linkagg 1 port2 1/1/1 admin-role client recovery-time 200ms
-> mrp domain 1 name domain-2 port1 linkagg 1 port2 1/1/1 admin-role manager rt-delay-reset recovery-time 200ms
-> mrp domain 1 manager priority 10 linkchange-react enable test-default interval 50
-> mrp domain 1 admin-state enable
-> no mrp domain 1

Release History

Release 8.7R2; command introduced.
**Related Commands**

- **mrp**
  Configures a domain with VLAN ID for the MRP ring.

- **show mrp domain**
  Displays the MRP domain configuration information for a specific ID, domain name, or UUID.

- **show mrp**
  Displays the MRP configuration information.

**MIB Objects**

- `mrpDomainTable, alaMrpDomainTable`
- `mrpDomainIndex`
- `mrpDomainName`
- `mrpDomainID`
- `mrpDomainRingPort1`
- `mrpDomainRingPort2`
- `mrpDomainAdminRole`

- `alaMRPDomainMRMTestDefaultInterval`
- `alaMRPDomainMRMTestNRMax`
- `mrpDomainResetRoundTripDelays`
- `alaMrpDomainRecoveryTime`
**mrp interconnect**

Configures the MRP interconnection parameters like interconnection index, interconnection ports, admin-role, mode, and recovery time.

Use this command to administratively enable or disable an MRP interconnection ring.

```
mrp interconnect interconnect_id [name name] port {linkagg agg_id | chassis/slot/port | slot/port} [admin-role {client | manager}] [manager {test-default [{interval interval | count repeat_count}] | [mode {link-check | ring-check}] [recovery-time {500ms | 200ms | 30ms | 10ms}]]
mrp interconnect interconnect_id admin-state {enable | disable}
```

### Syntax Definitions

- **interconnect_id**: Specifies the interconnection identifier unique in the switch. This is a mandatory parameter to create a MRP interconnection. Allowed values are 1 to 65535.
- **name**: Specifies an unique name for the redundant interconnection domain of MRP rings. The maximum length is up to 240 characters.
- **port**: The interface index of the interconnection port, which is either a bridge port, or an aggregated link within a bridge.
- **agg_id**: A link aggregate ID number.
- **chassis**: The chassis identifier.
- **slot/port**: The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
- **client | manager**: Specifies the role of the node.
  - By choosing the admin-role Manager, the device becomes the redundancy manager, MIM (Media Redundancy Interconnection Manager).
  - By choosing the admin-role Client, the device becomes the redundancy client, MIC (Media Redundancy Interconnection Client).
- **interval**: Specifies the test default timer for sending the MRP interconnect test frames to MIM in milliseconds. The range is 20–125.
  - Test default interval range for 200ms recovery time is 20–50, and for 500ms recovery time is 50–125.
- **repeat_count**: Specifies the test default repeat count for MIM. The valid range is 1–15.
- **link-check | ring-check**: Specifies the mode.
  - The MIM can observe the interconnection topology by either reacting directly on interconnection port link change notification messages (LC-mode) or by sending test frames on the interconnection port over the connected rings and receiving them over its ring ports, and vice versa in the other direction (RC mode).
- **recovery-time**: Specifies the maximum recovery time of a ring in milliseconds.
  - Only 200ms and 500ms recovery time is supported.
- **enable**: Enables the administrative state of the MRP ring.
- **disable**: Disables the administrative state of the MRP ring.

**Usage Guidelines**

- Each specified ring port can only be part of a single ring.
- MRP domain configuration is mandatory to enable MRP interconnect on a switch.
- VLAN used to configure MRP interconnection should not be deleted until MRP Interconnect configuration is removed. MRP interconnect will be disabled if VLAN or VPA for service VLAN is removed.
- Test default interval, repeat count, and recovery time must be same for all the switches in the domain.
- MRP interconnect ring will consist of four nodes. Among these nodes, one node will be MIM, and the remaining will be MIC.
- On both OmniSwitch 6465 and OmniSwitch 6865, only one Domain and two Interconnects (or one Interconnect) is supported.
- On OmniSwitch 6465,
  - with MRM as Base Domain, RC mode is not allowed. In LC mode, only one Interconnect is supported (MIM/MIC).
  - with MRC as Base Domain, both LC and RC modes are allowed but only one Interconnect is supported (MIM/MIC).
- On OmniSwitch 6865,
  - with MRM as Base Domain, RC mode is not allowed with MIM configuration. MIM + MIM
configuration is not allowed in both LC and RC mode.
- with MRC as Base Domain, both LC and RC modes are allowed. MIM + MIM configuration is not allowed in both LC and RC mode.

- Use **no** command to delete an existing MRP interconnection.

### Examples

```
-> mrp interconnect 1 port1 linkagg 1 admin-role manager manager test-default
   interval 50 mode link-check recovery-time 200ms

-> mrp interconnect 1 vlan 10 admin-state enable

-> no mrp interconnect 1
```

### Release History

Release 8.9R1; command introduced.

### Related Commands

- **mrp**
  - Configures a domain with VLAN ID for the MRP ring.

- **show mrp interconnect**
  - Displays the MRP domain configuration information for a specific interconnection ID or name.

- **show mrp**
  - Displays the MRP configuration information.

**show mrp**

Displays the MRP configuration information.

**show mrp [domain [\{id | name name | uuid uuid\}]]**

### Syntax Definitions

- **id**
  The domain identifier unique in the switch. When specified, displays the MRP domain configuration for a MRP domain.

- **name**
  The domain name. When specified, displays the MRP domain configuration for a specific MRP domain name.

- **uuid**
  The 16 hexadecimal domain ID. When specified, displays the MRP domain configuration for a specific UUID.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Support for show mrp</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>No</td>
</tr>
<tr>

output definitions

**Domain Id**
A unique ID that represents the MRP ring.

**Port1**
Port ID that serves as the first ring port:

**Port2**
Port ID that serves as the second ring port:

**Status**
Administrative status of the MRP ring.

**State**
The MRP ring state: open, close, undefined

**Config Role**
The role of the node redundancy domain.

**Operational Role**
The operational role of the node.

**VLAN**
The VLAN for sending MRP frames.

**Recovery time (ms)**
The maximum recovery time of a ring in milliseconds.

**Domain UUID**
The UUID of the MRP redundancy domain.

**Domain Name**
The the domain name of the configured MRP ring.

**Interconnection ID**
A unique interconnection ID that represents the MRP ring.

**Name**
An unique name for the redundant interconnection of MRP rings.

**Last State Change**
Timeticks since last change of mrpInterconnectionState to interconnOpen.
### Release History

Release 8.7R2; command introduced.

### Related Commands

- **show mrp domain**
  
  Displays the MRP domain configuration information for a specific ID, domain name, or UUID.

- **show mrp interconnect**
  
  Displays the MRP interconnection configuration information for a specific interconnection ID or name.

- **show mrp port**
  
  Displays the packet counters for an MRP domain for a specific port or a linkagg.

show mrp domain

Displays the MRP domain configuration information for a specific ID, domain name, or UUID.

show mrp domain [{domain_index | name name} | uuid uuid] [counters] [detail] [elected-manager] [ring-port] [rt-delay]

Syntax Definitions

domain_index
The domain identifier unique in the switch. When specified, displays the MRP domain configuration for a MRP domain.

name
The domain name. When specified, displays the MRP domain configuration for a MRP domain name.

uuid
The 16 hexadecimal domain ID. When specified, displays the MRP domain configuration for a specific UUID.

counters
Display the counters for a specific domain ID, domain name, or UUID.

detail
Display the MRP domain configuration in detail for a specific domain.

elected-manager
Display the elected-manager source MAC and priority.

ring-port
Display the ring ports belonging to a specific domain.

rt-delay
Display the round-trip-delay for a specific domain. This is applicable only for MRM/MRA.

Media Redundancy Protocol Commands

show mrp domain

- mrpDomainOperRole
- mrpDomainVlanId
- alaMRPDomanRecoveryTime
**show mrp port**

Displays the packet counters for an MRP domain for a specific port or a linkagg.

`show mrp port {linkagg agg_id | chassis/slot/port} counters`

### Syntax Definitions

- **agg_id**: A link aggregate ID number.
- **chassis**: The chassis identifier.
- **slot/port**: The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
- **counters**: Display the counters for a port.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>

**show mrp interconnect**

Displays the MRP interconnection configuration information for a specific interconnection ID or name.

```plaintext
show mrp [interconnect [{interconnect_id | name name}]] [detail] [ring-port] [counters]
```

### Syntax Definitions

- **interconnect_id**: The interconnection identifier unique in the switch. When specified, displays the MRP interconnection configuration for a MRP interconnect ID.
- **name**: An unique name for the redundant interconnection of MRP rings. When specified, displays the MRP interconnection configuration for a MRP interconnect name.
- **counters**: Display the counters for a specific interconnection ID or name.
- **detail**: Display the MRP interconnection configuration in detail for a specific interconnection ID or name.
- **ring-port**: Display the ring ports belonging to a specific interconnection ID or name.

output definitions

ID
A unique interconnection ID that represents the MRP ring.

Port
The port number.

Port State
Operational state of the interconnection port.
Disabled - indicates that all frames are dropped.
Blocked - indicates that all frames are dropped except
- MRP Interconnection topology change frames,
- MRP Interconnection test frames,
- MRP Interconnection link change frames,
- MRP Interconnection link status poll frames,
- frames from other protocols that also define to pass blocked
  ports.
Forwarding- indicates that all frames are passed through according to
the forwarding behavior of IEEE 802.1D.
NotConnected - indicates that the port has no link.

Mode
Specifies the role of the node.
Undefined- signals that the interconnection mode is neither set to LC
mode nor to RC mode.
LC - indicates that the interconnection mode is set to LC mode.
RC - indicates that the interconnection mode is set to RC mode.

Status
Administrative status of the MRP ring.

Config State
Operational status of the MRP interconnection entity.

Operational Role
The operational role of an MRP interconnection entity per media
redundancy interconnection domain.

Recovery Role
The recovery role of an MRP interconnection entity per media
redundancy interconnection domain.

VLAN
The service VLAN for sending MRP Interconnection frames.

Time (ms)
The maximum recovery time of a ring in milliseconds.

STM State
The protocol machine state.

Last State Change
Timeticks since last change of mrpInterconnectionState to
interconnOpen.

System Up Time
The time of MRP configuration since the last system reboot.

Interconnection Open Count
Counter for MRP Interconnection state changes to interconnOpen.

Interconnection own MRM MAC
The device MAC address of the devices ring manager (MRM).

Elected MIM MAC
The switch MAC address of the elected MIM.

Interconnection NAME
A unique interconnection name that represents the MRP ring.
Release History

Release 8.9R1; command introduced.

Related Commands

**mrp inter connect**

Configures the MRP ring parameters like interconnection index, interconnection ports, admin-role, mode, and recovery time.

**show mrp**

Displays the MRP configuration information.

MIB Objects

**Interconnection peer UUID**
The domain UUID of the ring the interconnection peer's, connected to the devices interlink port, ring.

**Error**
Displays the reason when the switch cannot reach to the desired administrative state.
clear mrp

Clears the counters for a ring or all the rings in the system.

clear mrp [domain [{id | name name | uuid uuid}] [counters]

Syntax Definitions

id The domain identifier unique in the switch.
name The domain name.
uuid The unique 16 hexadecimal domain ID.

Defaults

This command can be used to clear the counters for a particular domain ID, domain name, UUID.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

16 MVRP Commands

MVRP (Multiple VLAN Registration Protocol) provides a mechanism for maintaining the contents of Dynamic VLAN Registration Entries for each VLAN, and for propagating the information they contain to other Bridges. MVRP uses MRP (Multiple Registration Protocol) as the underlying mechanism, for the maintenance and propagation of the VLAN information.

MVRP acts as an MRP application, sending and receiving MVRP information encapsulated in an Ethernet frame on a specific MAC address. MVRP allows both end stations and Bridges in a Bridged Local Area Network to issue and revoke declarations relating to membership of VLANs.

Filename: ALCATEL-IND1-MVRP-MIB.mib
Module: alcatelIND1MVRPMIB

A summary of the available commands is listed here:

```
mvrp
mvrp port
mvrp linkagg
mvrp maximum-vlan
mvrp registration
mvrp applicant
mvrp timer join
mvrp timer leave
mvrp timer leaveall
mvrp timer periodic-timer
mvrp periodic-transmission
mvrp restrict-vlan-registration
mvrp restrict-vlan-advertisement
mvrp static-vlan-restrict
show mvrp configuration
show mvrp port
show mvrp linkagg
show mvrp timer
show mvrp statistics
show mvrp last-pdu-origin
show mvrp vlan-restrictions
mvrp clear-statistics
```
mvrp

Enables or disables MVRP globally on the switch.

mvrp {enable | disable}

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables MVRP globally on the switch.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables MVRP globally on the switch.</td>
</tr>
</tbody>
</table>

**Defaults**

By default, MVRP is disabled on the switch.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>Yes</td>
</tr>
<tr>
<td>6465</td>
<td>Yes</td>
</tr>
<tr>
<td>6560</td>
<td>Yes</td>
</tr>
<tr>
<td>6570M</td>
<td>Yes</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
</tr>
<tr>
<td>6860N</td>
<td>Yes</td>
</tr>
<tr>
<td>6865</td>
<td>Yes</td>
</tr>
<tr>
<td>6900</td>
<td>Yes</td>
</tr>
<tr>
<td>V72/C32</td>
<td>Yes</td>
</tr>
<tr>
<td>6900</td>
<td>Yes</td>
</tr>
<tr>
<td>X48C6/T48C6/V48C8C32E/T24C2/X24C2</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Disabling MVRP globally deletes all the MVRP learned VLANs.
- MVRP is supported only when the switch is operating in the flat Spanning Tree mode and it is not supported in the per-VLAN mode.

**Examples**

- `-> mvrp enable`
- `-> mvrp disable`

**Release History**

Release 7.2.1; command introduced.

**Related Commands**

- `show mvrp configuration` Displays the global configuration for MVRP.

**MIB Objects**

- `alaMvrpGlobalStatus`
**mvrp port**

Enables or disables MVRP on specific ports on the switch.

```
mvrp port chassis/slot/port{–port2} {enable | disable}
```

---

**Syntax Definitions**

- **chassis**: The chassis identifier when running in virtual chassis mode.
- **slot/port**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8)
- **enable**: Enables MVRP on a port.
- **disable**: Disables MVRP on a port.

**Defaults**

By default, MVRP is disabled on all the ports.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- MVRP can be enabled on switch ports regardless of whether it is globally enabled on the switch. However, for the port to become an active participant in the MVRP operation, MVRP must be enabled globally on the switch.
- When MVRP is globally enabled on the switch and is not enabled on the port, that port is excluded from the MVRP protocol operation.
- MVRP can be enabled only on fixed ports, 802.1 Q ports, aggregate ports, and VLAN Stacking Network ports. Other ports (mirroring ports, aggregable ports, VLAN Stacking User ports) do not support MVRP.

**Examples**

```
-> mvrp port 1/2 enable
-> mvrp port 1/2 disable
-> mvrp port 1/1-10 enable
-> mvrp port 1/1-10 disable
```

**Release History**

Release 7.2.1; command introduced.
Related Commands

**show mvrp port**
Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

**show mvrp statistics**
Displays the MVRP statistics for all the ports, aggregates, or specific ports.

MIB Objects

alaMvrpPortConfigTable
alaMvrpPortStatus
**mvrp linkagg**

Enables or disables MVRP on specific aggregates on the switch.

```
mvrp linkagg agg_id[-agg_id2] {enable | disable}
```

**Syntax Definitions**

- `agg_id[-agg_id2]` The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `enable` Enables MVRP for the specified link aggregate ID.
- `disable` Disables MVRP for the specified link aggregate ID.

**Defaults**

By default, MVRP is disabled on all the ports.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- MVRP can be enabled on switch ports regardless of whether it is globally enabled on the switch. However, for the port to become an active participant in the MVRP operation, MVRP must be enabled globally on the switch.
- When MVRP is globally enabled on the switch and is not enabled on the port, that port is excluded from the MVRP protocol operation.
- MVRP can be enabled only on fixed ports, 802.1 Q ports, aggregate ports, and VLAN Stacking Network ports. Other ports (mirroring ports, aggregable ports, mobile ports, VPLS Access ports, VLAN Stacking User ports) do not support MVRP.
- To use the `agg_id` parameter, the link aggregate group must be created.

**Examples**

- `-> mvrp linkagg 10 enable`
- `-> mvrp linkagg 10 disable`
- `-> mvrp linkagg 2-5 enable`
- `-> mvrp linkagg 1-5 disable`
**Release History**

Release 7.2.1; command introduced.

**Related Commands**

- **show mvrp port**
  Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

- **show mvrp statistics**
  Displays the MVRP statistics for all the ports, aggregates, or specific ports.

**MIB Objects**

alaMvrpPortConfigTable
alaMvrpPortStatus
**mvrp maximum-vlan**

Configures the maximum number of dynamic VLANs that can be created by MVRP.

```
mvrp maximum-vlan vlan_limit
```

### Syntax Definitions

- `vlan_limit` - The maximum number of VLANs to be created by MVRP. The valid range is 32–4094.

### Defaults

The default value is 256.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command can be used even when MVRP is not enabled on the switch. However, MVRP must be enabled on the switch for creating dynamic VLANs.
- If the VLAN limit to be set is less than the current number of dynamically learned VLANs, then the new configuration takes effect only after the MVRP is disabled and re-enabled on the switch. The VLANs learned earlier are retained if this operation is not performed.

### Examples

```
-> mvrp maximum-vlan 100
```

### Release History

Release 7.2.1; command introduced.

### Related Commands

- `show mvrp configuration` - Displays the global configuration for MVRP.
- `show mvrp vlan-restrictions` - Displays the list of VLANs learned through MVRP and their details.

### MIB Objects

- `alaMvrpMaxVlanLimit`
**mvrp registration**

Configures the MVRP registration mode for specific ports or aggregates.

```
mvrp {port chassis/slot/port[- port2] | linkagg agg_id[-agg_id2]} registration {normal | fixed | forbidden}
```

### Syntax Definitions

- **chassis**
  - The chassis identifier.
- **slot/port**
  - The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[agg_id2]**
  - The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- **normal**
  - Specifies that both registration and de-registration of VLANs are allowed. VLANs can be mapped either dynamically (through MVRP) or statically (through management application) on such a port.
- **fixed**
  - Specifies that only static mapping of VLANs is allowed on the port but de-registration of previously created dynamic or static VLANs is not allowed.
- **forbidden**
  - Specifies that dynamic VLAN registration or de-registration is not allowed on the port. Any dynamic VLANs created earlier is de-registered.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal</td>
<td>fixed</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
```

### Usage Guidelines

To use the `agg_id` parameter, the link aggregate group must be created and enabled.

### Examples

- `mvrp port 1/2 registration forbidden`
- `mvrp port 1/5 registration normal`
- `mvrp linkagg 10 registration fixed`
-> mvrp linkagg 20 registration forbidden
-> mvrp port 2/5-10 registration normal

**Release History**

Release 7.2.1; command introduced.

**Related Commands**

- **show mvrp port** Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
- **show mvrp linkagg** Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

**MIB Objects**

- **alaMvrpPortConfigTable**
- **alaMvrpPortConfigRegistrarMode**
mvrp applicant

Configures the applicant mode of specific ports on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.

```
mvrp {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} applicant {participant | non-participant | active}
```

Syntax Definitions

- `chassis` The chassis identifier.
- `slot/port` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `agg_id[-agg_id2]` The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `participant` Specifies that MVRP PDU exchanges are only allowed when the port is in the STP forwarding state.
- `non-participant` Specifies that MVRP PDU’s are not sent in this mode and PDU’s received are processed and learning happens as expected.
- `active` Specifies that MVRP PDU exchanges are allowed when the port is in the STP forwarding state or STP blocking state. This is applicable for both advertisement and registration.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>non-participant</td>
</tr>
<tr>
<td>active</td>
<td>active</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

To use the `agg_id` parameter, the link aggregate group must be created and enabled.

Examples

- `mvrp port 1/2 applicant active`
- `mvrp port 1/3 applicant participant`
- `mvrp port 1/4 applicant non-participant`
-> mvrp linkagg 10 applicant active
-> mvrp linkagg 15 applicant participant
-> mvrp linkagg 20 applicant non-participant

**Release History**

Release 7.2.1; command introduced.

**Related Commands**

- **show mvrp port**
  Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

- **show mvrp linkagg**
  Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

**MIB Objects**

- **alaMvrpPortConfigTable**
  - **alaMvrpPortConfigApplicantMode**
mvrp timer join

Specifies the join time interval between transmit opportunities for the dynamically registering VLANs on the switch.

\[\text{mvrp} \{\text{port chassis/slot/port[–port2]} | \text{linkagg agg_id[–agg_id2]}\} \text{ timer join timer_value}\]

**Syntax Definitions**

- **chassis**
  - The chassis identifier.
- **slot/port**
  - The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[–agg_id2]**
  - The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- **timer_value**
  - Specifies the value of the join timer in milliseconds. The valid range is 250 milliseconds to 1073741773 milliseconds.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>timer-value</td>
<td>600 milliseconds</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- To use the `agg_id` parameter, the link aggregate group must be created and enabled.

**Examples**

- `mvrp port 1/2 timer join 600`
- `mvrp port 1/2-12 timer join 600`
- `mvrp linkagg 3 timer join 600`
- `mvrp linkagg 3-6 timer join 600`

**Release History**

Release 7.2.1; command introduced.
Related Commands

- **show mvrp timer**
  Displays the timer values configured for all the ports or a specific port.

- **show mvrp port**
  Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

- `alaMvrpPortConfigTable`
  - `alaMvrpPortConfigJoinTimer`
  - `alaMvrpPortConfigLeaveTimer`
  - `alaMvrpPortConfigLeaveAllTimer`
  - `alaMvrpPortConfigPeriodicTimer`
**mvrp timer leave**

Specifies the period of time that the switch has to wait in the Leave state before changing to the unregistered state.

```
/mvrp {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} timer leave timer_value
```

### Syntax Definitions

- **chassis**
  - The chassis identifier.

- **slot/port**
  - The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

- **agg_id[-agg_id2]**
  - The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

- **timer-value**
  - Specifies the value of the Leave Timer in milliseconds. The valid range is 750 milliseconds to 2147483647 milliseconds.

### Defaults

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>timer_value</td>
<td>1800</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>Yes</td>
</tr>
<tr>
<td>6465</td>
<td>Yes</td>
</tr>
<tr>
<td>6560</td>
<td>Yes</td>
</tr>
<tr>
<td>6570M</td>
<td>Yes</td>
</tr>
<tr>
<td>6860</td>
<td>Yes</td>
</tr>
<tr>
<td>6860N</td>
<td>Yes</td>
</tr>
<tr>
<td>6865</td>
<td>Yes</td>
</tr>
<tr>
<td>6900</td>
<td>Yes</td>
</tr>
<tr>
<td>6900 V72/C32</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.

- Leave timer value must be greater than or equal to twice the Join timer value, plus six times the timer resolution (16.66 milliseconds). Leave timer must be at least be greater than twice the join timer plus100 milliseconds.

- To use the `agg_id` parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 timer leave 1800
-> mvrp port 1/2-12 timer leave 1800
-> mvrp linkagg 3 timer leave 1800
-> mvrp linkagg 3-6 timer leave 1800
```
**Release History**

Release 7.2.1; command introduced.

**Related Commands**

- `show mvrp timer` Displays the timer values configured for all the ports or a specific port.
- `show mvrp port` Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

**MIB Objects**

alaMvrpPortConfigTable
  - `alaMvrpPortConfigJoinTimer`
  - `alaMvrpPortConfigLeaveTimer`
  - `alaMvrpPortConfigLeaveAllTimer`
  - `alaMvrpPortConfigPeriodicTime`
**mvrp timer leaveall**

Specifies the frequency with which the LeaveAll messages are communicated.

```
mvrp {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} timer leaveall timer_value
```

**Syntax Definitions**

- **chassis**: The chassis identifier.
- **slot/port**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[-agg_id2]**: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- **timer_value**: Specifies the value of the LeaveAll Timer in milliseconds. The valid range is 750 milliseconds to 2147483647 milliseconds.

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>timer-value</td>
<td>30000 milliseconds</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- LeaveAll timer value must be greater than or equal to the Leave timer value. It is recommended to have the leaveall timer 15 times greater than the leave timer.
- To use the `agg_id` parameter, the link aggregate group must be created and enabled.

**Examples**

- `-> mvrp port 1/2 timer leaveall 30000`
- `-> mvrp port 1/2-12 timer leaveall 30000`
- `-> mvrp linkagg 3 timer leaveall 30000`
- `-> mvrp linkagg 3-6 timer leaveall 30000`

**Release History**
Release 7.2.1; command introduced.

**Related Commands**

mvrp periodic-transmission

Enables the periodic transmission status on a port or aggregate of ports.

```
mvrp {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} periodic-transmission {enable | disable}
```

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot/port` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `agg_id[-agg_id2]` The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `enable` Enables periodic transmission status on a port.
- `disable` Disables periodic transmission status on a port.

**Defaults**

By default, periodic-transmission status is disabled on all the ports.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use the `agg_id` parameter, the link aggregate group must be created and enabled.

**Examples**

- `-> mvrp port 1/2 periodic-transmission enable`
- `-> mvrp port 1/2 periodic-transmission disable`
- `-> mvrp linkagg 10 periodic-transmission enable`
- `-> mvrp linkagg 10 periodic-transmission disable`

**Release History**

Release 7.2.1; command introduced.
Related Commands

**show mvrp port**
Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

**show mvrp linkagg**
Displays the MVRP configurations for all link aggregates, including timer values, registration and applicant modes.

MIB Objects

alaMvrpPortConfigTable

alaMvrpPortConfigPeriodicTransmissionStatus
mv rp restrict-vlan-registration

Restricts MVRP processing from dynamically registering the specified VLAN or VLANs on the switch.

```plaintext
mv rp [port chassis/slot/port [-port2] | linkagg agg_id[-agg_id2]] restrict-vlan-registration vlan vlan_list
```

```plaintext
no mv rp [port chassis/slot/port [-port2] | linkagg agg_id[-agg_id2]] restrict-vlan-registration vlan vlan_list
```

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot/port` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `agg_id[-agg_id2]` The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `vlan_list` The VLAN ID or the VLAN ID range (for example, 1-10).

**Defaults**

By default, MVRP dynamic VLAN registrations are not restricted.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `no` form of this command to allow registration of dynamic VLAN IDs through MVRP processing.
- If the specified VLAN exists on the switch, the VLAN is mapped to the receiving port.
- To use the `agg_id` parameter, the link aggregate group must be created and enabled.

**Examples**

- `mv rp port 1/2 restrict-vlan-registration vlan 5`
- `no mv rp port 1/2 restrict-vlan-registration vlan 5`
- `mv rp linkagg 10 restrict-vlan-registration vlan 6-10`
- `no mv rp port 3/1 restrict-vlan-registration vlan 6-10`
**Release History**

Release 7.2.1; command introduced.

**Related Commands**

*show mvrp port* Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

*show mvrp linkagg* Displays the MVRP configurations for all link aggregates, including timer values, registration and applicant modes.

**MIB Objects**

alaMvrpPortRestrictVlanConfigTable

alaMvrpPortRestrictRowStatus

alaMvrpPortRestrictVlanAttributeType

alaMvrpPortRestrictVlanID
mvrp restrict-vlan-advertisement

Restricts the advertisement of VLANs on a specific port or an aggregate of ports.

```
mvrp [port chassis/slot/port|linkagg agg_id]-agg_id2] restrict-vlan-advertisement vlan vlan_list

no mvrp [port chassis/slot/port|linkagg agg_id]-agg_id2] restrict-vlan-advertisement vlan vlan_list
```

**Syntax Definitions**

- `chassis` The chassis identifier.
- `slot/port` The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `agg_id|agg_id2` The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `vlan_list` The list of VLAN IDs or the VLAN ID range (for example, 1-10).

**Defaults**

By default, MVRP VLAN advertisement is not restricted.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command affects the MVRP processing only if the applicant mode is set to participant or active.
- Use the `no` form of this command to allow the propagation of VLANs.
- To use the `agg_id` parameter, the link aggregate group must be created and enabled.

**Examples**

```
-> mvrp port 1/2 restrict-vlan-advertisement vlan 5
-> no mvrp port 1/2 restrict-vlan-advertisement vlan 5
-> mvrp linkagg 10 restrict-vlan-advertisement vlan 6-10
-> no mvrp port 1/2 restrict-vlan-advertisement vlan 6-10
-> no mvrp port 1/1-2 restrict-vlan-advertisement vlan 6-10
```

**Release History**
Release 7.2.1; command introduced.

**Related Commands**

- **mvrp applicant** Configures the applicant mode of specific ports on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.

- **mvrp timer join** Configures the applicant mode of specific link aggregates on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.

- **show mvrp port** Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

- **show mvrp linkagg** Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

**MIB Objects**

alaMvrpPortRestrictVlanConfigTable
- alaMvrpPortRestrictRowStatus
- alaMvrpPortRestrictVlanAttributeType
- alaMvrpPortRestrictVlanID
mvrp static-vlan-restrict

Restricts a port from becoming a member of a statically created VLAN or a range of VLANs.

```
mvrp {linkagg agg_id[-agg_id2] | port chassis/slot/port[-port2]} static-vlan-restrict vlan vlan_list
```

```
no mvrp {linkagg agg_id[-agg_id2] | port chassis/slot/port[-port2]} static-vlan-restrict vlan vlan_list
```

### Syntax Definitions

- `chassis`  
The chassis identifier.
- `slot/port`  
The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `agg_id[-agg_id2]`  
The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- `vlan_list`  
The list of VLAN IDs or the VLAN ID range (for example, 1-10).

### Defaults

By default, ports are assigned to the static VLAN based on MVRP PDU processing.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command applies only to static VLANs and does not apply to dynamic VLANs.
- Use the `no` form of this command to set the specified port and VLAN to the default value.

### Examples

- `-> mvrp port 1/2 static-vlan-restrict vlan 5`
- `-> no mvrp port 1/2 static-vlan-restrict vlan 5`
- `-> mvrp port 1/2 static-vlan-restrict vlan 6-9`
- `-> no mvrp port 1/2 static-vlan-restrict vlan 6-9`
- `-> mvrp linkagg 3 static-vlan-restrict vlan 4-5`
- `-> no mvrp linkagg 3 static-vlan-restrict aggregate vlan 4-5`

### Release History

Release 7.2.1; command introduced.
**Related Commands**

- `show mvrp port`  
  Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

- `show mvrp linkagg`  
  Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

**MIB Objects**

- `alaMvrpPortRestrictVlanConfigTable`
  - `alaMvrpPortRestrictRowStatus`
  - `alaMvrpPortRestrictVlanAttributeType`
  - `alaMvrpPortRestrictVlanID`
  - `alaMvrpPortConfigRegistrationToStaticVlan`
  - `alaMvrpPortConfigRegistrationToStaticVlanLearn`
  - `alaMvrpPortConfigRegistrationToStaticVlanRestrict`
show mvrp configuration

Displays the global configuration for MVRP.

**show mvrp configuration**

<tbody>
<tr>
<td>Maximum VLAN Limit</td>
<td>The maximum number of VLANs that can be learned by MVRP in the system.</td>
</tr>
</tbody>
</table>

**Release History**

Release 7.2.1; command introduced.
Related Commands

**mvrp**
Enables or disables MVRP globally on the switch.

**mvrp maximum-vlan**
Configures the maximum number of dynamic VLANs that can be created by MVRP.

MIB Objects

- alaMvrpGlobalStatus
- alaMvrpMaxVlanLimit
**show mvrp port**

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

`show mvrp port [chassis/slot/port[-port2]] [enable | disable]`

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot/port**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **enable**: To display only the enabled ports.
- **disable**: To display only the disabled ports.

### Defaults

show mvrp linkagg

Displays the MVRP configurations for linkaggs, including timer values, registration and applicant modes.

\texttt{show mvrp linkagg [agg_id]-[agg_id2]} \texttt{[enabled | disabled]}

\textbf{Syntax Definitions}

- \texttt{agg_id} - The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
- \texttt{enabled} - To display only the enabled ports.
- \texttt{disabled} - To display only the disabled ports.

\textbf{Defaults}

N/A

\textbf{Platforms Supported}

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

show mvrp timer

Displays the timer values configured for all the ports or a specific port.

`show mvrp [port chassis/slot/port|–port2] | linkagg agg_id[-agg_id2]] timer {join | leave | leaveall | periodic-timer}`

### Syntax Definitions

- **chassis**
  The chassis identifier when running in virtual chassis mode.

- **slot/port**
  The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

- **agg_id[-agg_id2]**
  The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

- **join**
  To display only the join timer.

- **leave**
  To display only the leave timer.

- **leaveall**
  To display only the leaveall timer.

- **periodic-timer**
  To display only the periodic-timer.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `join`, `leave`, `leaveall`, or `periodic-timer` parameter with this command to view the specific timer values configured on all the ports.

- Use the `agg_id` or `slot/port` parameter with this command to display the timer values configured for a specific port.

### Examples

```
-> show mvrp timer
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Join Timer (msec)</th>
<th>Leave Timer (msec)</th>
<th>LeaveAll Timer (sec)</th>
<th>Periodic Timer (msec)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/1</td>
<td>600</td>
<td>1800</td>
<td>30000</td>
<td>2</td>
</tr>
<tr>
<td>1/2</td>
<td>600</td>
<td>1800</td>
<td>30000</td>
<td>5</td>
</tr>
</tbody>
</table>
show mvrp timer

<table>
<thead>
<tr>
<th>Port</th>
<th>Join Timer</th>
<th>Leave Timer</th>
<th>LeaveAll Timer</th>

</table>

Release History

Release 7.2.1; command introduced.

Related Commands

- **mvrp timer join**: Specifies the join time interval between transmit opportunities for the dynamically registering VLANs on the switch.
- **mvrp timer leave**: Specifies the period of time that the switch has to wait in the Leave state before changing to the unregistered state.
- **mvrp timer leaveall**: Specifies the frequency with which the LeaveAll messages are communicated.
- **mvrp timer periodic-timer**: Specifies the MVRP periodic-timer time interval for the dynamically registering VLANs on the switch.
- **show mvrp port**: Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

alaMvrpPortConfigTable
  - alaMvrpPortConfigJoinTimer
  - alaMvrpPortConfigLeaveTimer
  - alaMvrpPortConfigLeaveAllTimer
  - alaMvrpPortConfigPeriodicTimer
show mvrp statistics

Displays the MVRP statistics for all the ports, aggregates, or specific ports.

show mvrp {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} statistics

Syntax Definitions

- **chassis**: The chassis identifier.
- **slot/port**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[-agg_id2]**: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

show mvrp last-pdu-origin

Displays the source MAC address of the last MVRP message received on specific ports or aggregates.

show mvrp {port chassis/slot/port|-- port2 | link agg_id[-agg_id2]} last-pdu-origin

Syntax Definitions

- **chassis**: The chassis identifier.
- **slot/port**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[-agg_id2]**: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>

<tr>
<th>Port</th>
<th>Displays the slot and port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last PDU origin</td>
<td>The source MAC address of the last PDU message received on the specific port.</td>
</tr>
</tbody>
</table>

Release History

Release 7.2.1; command introduced.

Related Commands

show mvrp linkagg
Displays the MVRP configuration for a specific port or an aggregate of ports.

show mvrp port
Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

alaMvrpPortStatsTable
alaMvrpPortLastPduOrigin
show mvrp vlan-restrictions

Displays the VLAN MVRP configuration on a specific port or an aggregate of ports.

`show mvrp {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} vlan-restrictions`

**Syntax Definitions**

- `chassis` : The chassis identifier.
- `slot/port` : The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `agg_id[-agg_id2]` : The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>

</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `agg_id` or `slot/port` parameter with this command to display the MVRP statistics for a specific port.

**Examples**

`-> show mvrp port 1/21 vlan-restrictions`

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>Static Registration</th>
<th>Restricted Registration</th>
<th>Restricted Applicant</th>
</tr>

</tr>
</tbody>
</table>

**Release History**

Release 7.2.1; command introduced.

**Related Commands**

- `show mvrp port` Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
- `show mvrp linkagg` Displays the MVRP configuration for a specific port or an aggregate of ports.

**MIB Objects**

- `alaMvrpPortConfigTable`
  - `alaMvrpPortConfigRestrictedRegistrationBitmap`
  - `alaMvrpPortConfigRestrictedApplicantBitmap`
  - `alaMvrpPortConfigRegistrationToStaticVlan`
**mvrp clear-statistics**

Clears MVRP statistics for all the ports, an aggregate of ports, or a specific port.

```
mvrp [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]] clear-statistics
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot/port**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **agg_id[-agg_id2]**: The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

### Defaults

If no ports are specified, the MVRP statistics are deleted for all the ports.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `agg_id` or `slot/port` parameter with this command to clear MVRP statistics for a specific port.

### Examples

- `-> mvrp clear-statistics`
- `-> mvrp port 1/2 clear-statistics`
- `-> mvrp linkagg 10 clear-statistics`

### Release History

Release 7.2.1; command introduced.
Related Commands

show mvrp statistics  Displays the MVRP statistics for all the ports, aggregates, or specific ports.

17 802.1AB Commands

802.1AB is an IEEE standard for exchanging information with neighboring devices and maintaining a database of it. The information is exchanged as an LLDPDU (Link Layer Discovery Protocol Data Unit) in TLV (Time, Length, Value) format. This chapter details configuring and monitoring 802.1AB on a switch.

The OmniSwitch version of 802.1AB complies with the following:

- IEEE 802.1AB-2009 Station and Media Access Control Discovery

MIB information for the 802.1AB commands is as follows:

- **MIB Filename**: LLDP-MIB.mib, LLDP-TC-MIB.mib, LLDP-EXT-DOT1-MIB.mib, LLDP-EXT-DOT3-MIB.mib, LLDP-EXT-MED-MIB.mib
- **MIB V2 Filenames**: LLDP-V2-MIB.mib, LLDP-V2-TC-MIB.mib, LLDP-EXT-DOT1-V2-MIB.mib, LLDP-EXT-DOT3-V2-MIB.mib, LLDP-EXT-MED-MIB.mib

- **Filename**: ALCATEL-IND1-LLDP-MED-MIB.mib
- **Module**: alcatelIND1LLDPMEDMIB
- **Filename**: ALCATEL-IND1-LLDP-TRUST-MIB.mib
- **Module**: alcatelIND1LLDPTRUSTMIB
A summary of available commands is listed here:

- lldp nearest-edge mode
- lldp transmit interval
- lldp transmit hold-multiplier
- lldp reinit delay
- lldp notification interval
- lldp lldpdu
- lldp notification
- lldp network-policy
- lldp med network-policy
- lldp tlv management
- lldp tlv dot1
- lldp tlv dot3
- lldp tlv med
- lldp tlv proprietary
- lldp tlv application
- lldp tlv application priority
- lldp port-id sub-type
- lldp port med-device
- lldp chassis-mac-delimiter
- show lldp statistics
- show lldp local-system
- show lldp local-port
- show lldp local-management-address
- show lldp config
- show lldp network-policy
- show lldp med network-policy
- show lldp remote-system
- show lldp remote-system med
- show lldp remote-system application-tlv
- show lldp remote-system power-via-mdi
- show lldp remote-system power-via-mdi-measurements
- show lldp local-port power-via-mdi
- show lldp local-port power-via-mdi-measurements
- lldp trust-agent
- lldp trust-agent violation-action
- show lldp trusted remote-agent
- show lldp trust-agent

Configuration procedures for 802.1AB are explained in “Configuring 802.1AB,” *OmniSwitch AOS Release 8 Network Configuration Guide.*
**lldp nearest-edge mode**

Enables or disables the nearest-edge mode for the switch. When enabled, the switch will use the LLDP destination MAC address (01:20: DA: 02:01:73) to send LLDPDUs.

```
lldp nearest-edge mode {enable | disable}
```

### Syntax Definitions

- **enable**
  - Enables the nearest-edge mode.
- **disable**
  - Disables the nearest-edge mode.

### Defaults

NA

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The **nearest-edge** MAC address is used in conjunction with the Auto Download Configuration feature to advertise the management VLAN.
- This mode is used to learn the Management VLAN ID from a centralized Remote Configuration management switch.

### Examples

```
-> lldp nearest-edge mode enable
```

### Release History

Release 7.3.4; command introduced.

### Related Commands

- **show lldp local-system**
  - Displays local system information.

### MIB Objects

- **lldpDestMac**
lldp transmit interval

Sets the transmit time interval for LLDPDUs.

**lldp transmit interval seconds**

---

**Syntax Definitions**

```
seconds          The transmit interval between LLDPDUs, in seconds. The valid range is 5 - 32768.
```

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>30</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The LLDP protocol must be enabled before using this command.

**Examples**

```
-> lldp transmit interval 40
```

**Release History**

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.
Related Commands

**lldp transmit hold-multiplier**  
Sets the transmit hold multiplier value, which is used to calculate the Time To Live TLV.

**show lldp local-system**  
Displays local system information.

MIB Objects

lldpConfiguration

  lldpV2MessageTxInterval
illdp transmit hold-multiplier

Sets the transmit hold multiplier value, which is used to calculate the Time To Live TLV.

illdp transmit hold-multiplier num

Syntax Definitions

num The transmit hold multiplier value. The valid range is 2-10.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>num</td>
<td>4</td>
</tr>
</tbody>
</table>

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- The LLDP protocol must be enabled before using this command.
- The Time To Live is a multiple of transmit interval and transmit hold multiplier.

Examples

-> illdp transmit hold-multiplier 6

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.
**Related Commands**

- **lldp transmit interval**
  Sets the transmit time interval for LLDPDUs.

- **show lldp local-system**
  Displays local system information.

**MIB Objects**

```plaintext
lldpConfiguration
  lldpV2MessageTxHoldMultiplier
```
**lldp reinit delay**

Sets the time interval that must elapse before the current status of a port is reinitialized after a status change.

`lldp reinit delay seconds`

---

**Syntax Definitions**

`seconds`  The number of seconds to reinitialize the ports status after a status change. The valid range is 1-10.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>2</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

The LLDP protocol must be enabled before using this command.

---

**Examples**

`-> lldp reinit delay 4`

---

**Release History**

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.
Related Commands

- **lldp transmit interval**
  - Sets the minimum time interval between successive LLDPDUs transmitted.

- **show lldp local-system**
  - Displays local system information.

MIB Objects

- **lldpConfiguration**
  - **lldpV2ReinitDelay**
**lldp notification interval**

Sets the time interval that must elapse before a notification about the local system MIB change is generated.

`lldp notification interval seconds`

---

**Syntax Definitions**

`seconds`

The minimum number of seconds for generating a notification-event. The valid range is 5-3600.

---

**Defaults**

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>5</td>
</tr>
</tbody>
</table>

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- The LLDP protocol and notification must be enabled before using this command.
- In a specified interval, it is not possible to generate more than one notification-event.

---

**Examples**

```
-> lldp notification interval 25
```

---

**Release History**

- Release 7.1.1; command introduced.
- Release 7.3.1; Version 2 (2009) updates implemented.
**Related Commands**

**lldp notification**  Specifies the switch to control per port notification status about the remote device change.

**show lldp local-system**  Displays local system information.

**MIB Objects**

lldpConfiguration

  lldpV2NotificationInterval
**lldp lldpdu**

Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.

```plaintext
lldp [non-tpmr | nearest-customer | nearest-bridge | all] {port chassis/slot/port[-port2] | slot chassis/slot | chassis} lldpdu {tx | rx | tx-and-rx | disable}
```

### Syntax Definitions

- **non-tpmr**: The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
- **nearest-customer**: The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
- **nearest-bridge**: The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
- **all**: All LLDP agents.
- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **slot**: The slot number for a specific module.
- **chassis**: Specifies the whole chassis.
- **tx**: Transmits LLDPDUs.
- **rx**: Receives LLDPDUs.
- **tx-and-rx**: Transmits and receives LLDPDUs.
- **disable**: Disables LLDPDUs transmission and reception.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>tx</td>
<td>rx</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

- The port can be set to receive, transmit, or transmit and receive LLDPDUs using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.
- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.
- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

**Examples**

```
-> lldp port 1/2 lldpdu tx-and-rx
-> lldp slot 3 lldpdu tx
-> lldp chassis lldpdu disable
```

**Release History**

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

**Related Commands**

- `lldp lldpdu` Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.
- `lldp notification` Specifies the switch to control per port notification status about the remote device change.

**MIB Objects**

- `lldpV2PortConfigTable`
  - `lldpV2PortConfigIfIndex`
  - `lldpV2PortConfigDestAddressIndex`
  - `lldpV2PortConfigAdminStatus`
**lldp notification**

Specifies the switch to control per port notification status about the remote device change.

```
lldp [non-tpmr | nearest-customer | nearest-bridge | all] {port chassis/slot/port[-port2] | slot chassis/slot | chassis} notification {enable | disable}
```

### Syntax Definitions

- **non-tpmr**: The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
- **nearest-customer**: The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
- **nearest-bridge**: The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
- **all**: All LLDP agents.
- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **slot**: The slot number for a specific module.
- **chassis**: Specifies the whole chassis.
- **enable**: Enables the notification of local system MIB changes.
- **disable**: Disables the notification.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The LLDPDU administrative status must be in the receive state before using this command.
• If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.

• Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.

• Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.

• Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples
- `lldp port 1/2 notification enable`
- `lldp slot 1 notification disable`

Release History
Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands
- `lldp notification interval`  Sets the time interval that must elapse before a notification about the local system MIB change is generated.
- `lldp lldpdu`  Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.

MIB Objects
- `lldpPortConfigTable`
- `lldpV2PortConfigPortNum`
- `lldpV2PortConfigDestAddressIndex`
- `lldpV2PortConfigNotificationEnable`
lldp network-policy

Configures a local Network Policy on the switch for a specific application type.

```
  lldp network-policy policy_id  application {voice | voice-signaling | guest-voice | guest-voice-signaling | softphone-voice | video-conferencing | streaming-video | video-signaling} vlan {untagged | priority-tag | vlan_id} [l2-priority 802.1p_value] [dscp dscp_value]
  no lldp network-policy policy_id[-policy_id2]
```

Syntax Definitions

- `policy_id[-policy_id2]` A network policy identifier (0–31) which is associated to a port. Supported only with the `no` form of the command
- `voice` Specifies a voice application type.
- `voice-signaling` Specifies a voice-signaling application type.
- `guest-voice` Specifies a guest-voice application type.
- `guest-voice-signaling` Specifies a guest-voice-signaling application type.
- `softphone-voice` Specifies a softphone-voice application type.
- `video-conferencing` Specifies a video-conferencing application type.
- `streaming-video` Specifies a streaming-video application type.
- `video-signaling` Specifies a video-signaling application type.
- `untagged` Specifies that a VLAN port is untagged.
- `priority-tag` Specifies the internal priority that would be assigned to the VLAN.
- `vlan_id` VLAN identifier. Valid range is 1–4094.
- `802.1p_value` The Layer-2 priority value assigned to the VLAN. Valid range is 0–7.
- `dscp_value` Priority value assigned to the DSCP (Differentiated Service Code Point) header. Valid range is 0–63.

Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.1p_value for voice application</td>
<td>5</td>
</tr>
<tr>
<td>802.1p_value for other applications</td>
<td>0</td>
</tr>
<tr>
<td>dscp_value</td>
<td>0</td>
</tr>
</tbody>
</table>

By default, the VLAN ID is configured in the voice network profile.
Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Support</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the no form of this command to remove the configured network policy from the system.
- When a network policy is deleted, all the associated values and port bindings are also deleted.
- A maximum of 32 network policies can be configured on a single VLAN.
- Once a policy is created, the application type, VLAN ID, 802.1p, and DSCP values can be modified.
- If a network policy ID is bound to a port, it cannot be modified.
- Use a hyphen to specify a range of Policy IDs and a space to separate multiple Policy IDs in the command.
- The range for Policy IDs is supported only with the no form of this command.

Examples

-> lldp network-policy 10 application voice vlan 20
-> lldp network-policy 11 application guest-voice-signaling vlan untagged l2-priority 3
-> lldp network-policy 20 application voice vlan priority-tag dscp 39
-> lldp network-policy 20 application voice-signaling vlan 23 l2-priority 2 dscp 43

**lldp med network-policy**

 Associates an existing network policy per LLDP agent per port, slot, or chassis. Also specifies the LLDP destination MAC address sent in LLDPDUs.

```
[lldp] [nearest-bridge | nearest-customer | non-tpmr | all] {port chassis/slot/port | slot chassis/slot | chassis} med network-policy policy_id[-policy_id2]

no lldp {port chassis/slot/port | slot chassis/slot | chassis} med network-policy policy_id[-policy_id2]
```

### Syntax Definition

- **nearest-bridge** Specifies the destination MAC address as 01:80:C2:00:00:0E.
- **nearest-customer** Specifies the destination MAC address as 01:80:C2:00:00:00.
- **non-tpmr** Specifies the destination MAC address as 01:80:C2:00:00:03.
- **all** Specifies that all three LLDP agents must be supported.
- **chassis/slot/port[-port2]** The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1-8).
- **chassis/slot** The chassis ID and slot number for a specific module (3/1).
- **chassis** Specifies all switch ports.
- **policy_id[-policy_id2]** A network policy identifier (0–31).

### Defaults

NA

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>9900</th>
<th>9900 X48C4E/V48C8/</th>
</tr>
</thead>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the no form of this command to disassociate a network policy from a port.
- The network policy must already be configured in the system before associating it with a port.
- A maximum of 8 network policies can be associated to a port.
- Two or more network policy IDs with the same application type cannot be associated to a port.

### Examples

```
-> lldp chassis med network-policy 22
-> lldp slot 1/1 med network-policy 1-4 5 6
```
- lldp por 2/1/3 med network-policy 12
- no lldp slot 2/3 med network-policy 12

**Release History**

Release 8.1.1; command introduced.

**Related Commands**

lldp tlv management

Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.

`lldp [non-tpmr | nearest-customer | nearest-bridge | all] {port chassis/slot/port[-port2] | slot chassis/slot | chassis} tlv management {port-description | system-name | system-description | system-capabilities | management-address} {enable | disable}`

### Syntax Definitions

- **non-tpmr**: The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
- **nearest-customer**: The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
- **nearest-bridge**: The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
- **all**: All LLDP agents.
- **chassis**: The chassis identifier.
- **slot/port1[-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **slot**: The slot number for a specific module.
- **chassis**: Specifies the whole chassis.
- **port-description**: Enables or disables the transmission of port description TLV in LLDPDU.
- **system-name**: Enables or disables the transmission of system name TLV in LLDPDU.
- **system-description**: Enables or disables transmission of system description TLV in LLDPDU.
- **system-capabilities**: Enables or disables transmission of system capabilities TLV in LLDPDU.
- **management-address**: Enables or disables transmission of management address on per port.
- **enable**: Enables management TLV LLDPDU transmission.
- **disable**: Disables management TLV LLDPDU transmission.

### Defaults

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.
- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.
- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

- `lldp port 1/2 tlv management port-description enable`
- `lldp slot 2 tlv management management-address enable`
- `lldp slot 3 tlv management system-name disable`
- `lldp chassis tlv management system-capabilities enable`

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.

Related Commands

  - `lldpV2PortConfigPortNum`
- `lldpV2XMedPortConfigTable`
  - `lldpV2XMedPortConfigTLVStxEnable`
**lldp tlv proprietary**

Allows the switch to advertise the Access Point location through the proprietary TLVs.

```
lldp {port chassis/slot/port|-port2]| slot chassis/slot | chassis} tlv proprietary {enable | disable}
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot/port**: Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
- **slot**: The slot number for a specific module.
- **chassis**: All switch ports.
- **enable**: Enables proprietary TLVs to advertise AP location.
- **disable**: Disables proprietary TLVs to advertise AP location.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>disable</td>
</tr>
</tbody>
</table>

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>6360</td>
<td>Yes</td>
</tr>
<tr>
<td>6465</td>
<td>Yes</td>

<td>Yes</td>
</tr>
<tr>
<td>6900V72/C32</td>
<td>Yes</td>
</tr>
<tr>
<td>9900</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The VLAN information is advertised through 802.1x TLV (i.e, Management VLAN is advertised if the port is a 802.1x port else default VLAN of the port is advertised). The AP location is advertised through proprietary TLV.

- If an AP is detected and authenticated on a 802.1x port, LLDP TLVs are triggered to advertise management VLAN and AP location despite CLI configuration being disabled.

- If an AP is removed from 802.1x port, LLDP receives message from 802.1x port after which LLDP stops advertising of management VLAN and AP location, only if the configuration is disabled explicitly on the port.

### Examples

```
-> lldp port 5/1 tlv proprietary enable
-> lldp port 5/1 tlv proprietary disable
-> lldp slot 2 tlv proprietary enable
```
-> lldp slot 2 tlv proprietary disable
-> lldp chassis tlv proprietary enable
-> lldp chassis tlv proprietary disable

</tbody>
</table>
Usage Guidelines

- The LLDPDU must be enabled and set to transmit and receive before using this command.
- The Application Priority TLV must be enabled for transmission.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- Nearest bridge propagation is constrained to a single physical link, packets are stopped by all types of bridges.
- Non-tpmr propagation is constrained by all bridges other than TPMRs, intended for use within provider bridged networks.
- Nearest customer bridge propagation is constrained by customer bridges, this gives the same coverage as a customer-customer MACSec connection.

Examples

- `lldp port 1/1/3 tlv application fcoe priority 3`
- `lldp port 1/1/3 tlv application tcp-sctp-port 3192 priority 5`

Release History

Release 7.3.2; command introduced.

Related Commands

- `lldp tlv application` Enables or disables Application Priority TLV in LLDPDUs.
- `show lldp config` Displays the LLDP port configuration.

MIB Objects

- `alaXdot1dcbxAdminApplicationPriorityAppTable`
- `alaXdot1dcbxAdminApplicationPriorityAEPriority`
**lldp port-id sub-type**

Globally configures the LLDP port to send the interface index or interface name or MAC address in the LLDP Port ID TLV sent in the LLDP packet.

`lldp port-id sub-type {disable | mac-address | name | index}`

**Syntax Definitions**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>disable</td>
</tr>
<tr>
<td>mac-address</td>
<td>mac-address</td>
</tr>
<tr>
<td>name</td>
<td>name</td>
</tr>
<tr>
<td>index</td>
<td>index</td>
</tr>
</tbody>
</table>

**Defaults**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>disable</td>
</tr>
<tr>
<td>mac-address</td>
<td>mac-address</td>
</tr>
<tr>
<td>name</td>
<td>name</td>
</tr>
<tr>
<td>index</td>
<td>index</td>
</tr>
</tbody>
</table>

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The configuration is applied to all the ports in the switch irrespective of the device connected at the other end of the switch.
- The configuration can be applied to a specific chassis, slot and port using the `lldp port med-device` CLI.
- The global configuration will over ride the port level configuration.

**Examples**

- `-> lldp port-id sub-type mac-address`
- `-> lldp port-id sub-type name`
- `-> lldp port-id sub-type index`
- `-> lldp port-id sub-type disable`
Release History
Release 8.8R2; command introduced.

Related Commands

- **lldp port med-device**: Configures a specific chassis, slot and port to send the interface index or interface name or MAC address in the LLDP Port ID TLV sent in the LLDP packet.

- **show lldp config**: Displays the general LLDP configuration information for LLDP ports.

MIB Objects

- **alaLldpV2PropConfigTable**
- **alaLLDPConfigPortIdSubType**
**lldp port med-device**

Configures a specific chassis, slot and port to send the interface index or interface name or MAC address in the LLDP Port ID TLV sent in the LLDP packet.

    lldp port chassis/slot/port med-device port-id sub-type {mac-address | name | index}

show lldp statistics

Displays per port statistics.

show lldp [non-tpmr | nearest-customer | nearest-bridge] [port chassis/slot/port[-port2] slot chassis/slot] statistics

Syntax Definitions

non-tpmr The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.

nearest-customer The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.

nearest-bridge The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.

chassis The chassis identifier.

slot/port[-port2] The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

slot The slot number for a specific module.

Defaults

By default, statistics for all LLDP ports are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- If the slot/port option is not specified, statistics for the chassis are displayed.
- If the statistics are zero they are not displayed.

Examples

`-> show lldp statistics

Displays per-port information.

```plaintext
show lldp [non-tpmr | nearest-customer | nearest-bridge] [port chassis/slot/port[-port2]] slot chassis/slot] local-port
```

### Syntax Definitions

- **non-tpmr**  
  The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.

- **nearest-customer**  
  The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.

- **nearest-bridge**  
  The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.

- **chassis**  
  The chassis identifier.

- **slot/port[-port2]**  
  The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

- **slot**  
  The slot number for a specific module.

### Defaults

By default, a list of all LLDP ports is displayed.

Local LLDP Agent Management Address:
  Management Address Type = 1 (IPv4),
  Management IP Address = 10.255.11.100

output definitions

<table>
<thead>
<tr>
<th>Management Address Type</th>
<th>The address type used to define the interface number (IPv4 or IPv6).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Management IP Address</td>
<td>The management IP address. The loopback0 IP address is configured for the management IP address to be transmitted.</td>
</tr>
</tbody>
</table>

Release History

Release 7.1.1; command introduced.
Release 7.3.1; Version 2 (2009) updates implemented.
**Related Commands**

- `lldp tlv management` Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.
- `show lldp local-system` Displays local system information.

**MIB Objects**

- `lldpV2LocManAddrTable`
- `lldpV2LocManAddrLen`
- `lldpV2LocManAddrIfSubtype`
- `lldpV2LocManAddrIfId`
show lldp config

Displays the general LLDP configuration information for LLDP ports.

```
show lldp [non-tpmr | nearest-customer | nearest-bridge] [port chassis[/slot[/port[/[-port2]]]] [slot chassis/slot] config [application-tlv]
```

### Syntax Definitions

- **non-tpmr**: The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.
- **nearest-customer**: The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.
- **nearest-bridge**: The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.
- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **slot**: The slot number for a specific module.
- **application-tlv**: Displays Application Priority TLV parameters.

### Defaults

By default, a list of all LLDP ports with their configuration parameters is displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `slot/port` or `slot` parameter to display information for a specific port or for all ports on a specific module.

### Examples

```
-> show lldp config
Chas/ Slot/Port Status  Admin  Notify  Std TLV  Mgmt  802.1  802.3 MED  App-Prio  Trust  Proprietary  Port-Id
      Admin  Notify  Std TLV  Mgmt  802.1  802.3 MED  App-Prio  Trust  Proprietary  Port-Id

**Release History**

Release 7.1.1; command introduced.
Release 7.3.2; **App-Prio TLV** field added, **application-tlv** parameter added.
Release 7.3.1; Version 2 (2009) updates implemented.
Release 8.4.1.R02; **Proprietary TLV** output field added.
Release 8.8R2; **Port-Id TLV** output field added.
**Related Commands**

**lldp lldpdu**
Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.

**lldp notification**
Specifies the switch to control per port notification status about the remote device change.

**lldp tlv management**
Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.

**lldp tlv dot3**
Specifies the switch to control per port 802.3 TLVs to be incorporated in the LLDPDUs.

**lldp tlv application**
Configures the switch to include the LLDP-DCBx Application Priority TLV in the LLDPDUs for the specified port.

**lldp tlv application priority**
Configures the LLDP-DCBx Application Priority TLV to advertise an 802.1p priority value for specific protocols on the specified port.

**lldp port-id sub-type**
Globally configures the LLDP port to send the interface index or interface name or MAC address in the LLDP Port ID TLV sent in the LLDP packet.

**lldp port med-device**
Configures a specific chassis, slot and port to send the interface index or interface name or MAC address in the LLDP Port ID TLV sent in the LLDP packet.

show lldp network-policy

Displays the MED Network Policy details for a given policy ID.

show lldp network-policy [policy_id]

Syntax Definitions

policy_id

Policy identifier for a network policy definition. Valid range is between 0 and 31.

Defaults

By default, all configured policies are displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Platform</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6/</th>
<th>6900 X48C4E/V48C8/</th>

## show lldp network-policy

### Command Description

Configures a local network policy on a switch for an application type.

### Output Definitions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Network Policy ID</strong></td>
<td>Policy identifier for a network policy definition.</td>
</tr>
<tr>
<td><strong>Application Type</strong></td>
<td>Indicates the type of application configured on the port or VLAN.</td>
</tr>
<tr>
<td><strong>VLAN ID</strong></td>
<td>The VLAN ID assigned to the port on which the network policy is configured.</td>
</tr>
<tr>
<td><strong>Layer2 Priority</strong></td>
<td>Layer 2 priority to be used for the specified application type.</td>
</tr>
<tr>
<td><strong>DSCP Value</strong></td>
<td>DSCP value to be used to provide Diffserv node behavior for the specified application type.</td>
</tr>
</tbody>
</table>

### Release History

Release 8.1.1 command introduced.

### Related Commands

show lldp med network-policy

Displays the network policy configured on a slot or port. If no option is specified, network policies configured on all ports of the chassis are displayed.

show lldp [nearest-bridge | nearest-customer | non-tpmr | all] [slot chassis/slot | port chassis/slot/port] med network-policy

**Syntax Definitions**

**nearest-bridge** The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.

**nearest-customer** The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.

**non-tpmr** The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.

**all** Specifies that all three LLDP agents must be supported.

**chassis/slot** The chassis ID and slot number for a specific module (3/1).

**chassis/slot/port[-port2]** The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).

**Defaults**

By default, all ports with associated policies are displayed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>

lldpV2RemManAddrIfId
show lldp remote-system med

Displays remote system MED information for a single port or all ports on a slot.

show lldp [non-tpmr | nearest-customer | nearest-bridge] [port chassis/slot/port[-port2] | slot chassis/slot] remote-system med {network-policy | inventory}

Syntax Definitions

**non-tpmr**
The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.

**nearest-customer**
The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.

**nearest-bridge**
The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.

**chassis**
The chassis identifier.

**slot/port[-port2]**
The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

**slot**
The slot number for a specific module.

**network-policy**
Display network-policy TLVs from remote Endpoint Devices.

**inventory**
Display inventory management TLVs from remote Endpoint Devices.

Defaults

By default, a list of all LLDP ports is displayed.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

**show lldp remote-system application-tlv**

Displays remote system Application Priority TLV information for a single port or all ports on a slot.

```
show lldp [non-tpmr | nearest-customer | nearest-bridge] [port chassis/slot/port|-port2] | slot chassis/slot] remote-system application-tlv
```

### Syntax Definitions

**non-tpmr**  
The non-TPMR agent using destination MAC address 01-80-C2-00-00-03.

**nearest-customer**  
The nearest customer bridge agent using destination MAC address 01-80-C2-00-00-00.

**nearest-bridge**  
The nearest bridge agent using destination MAC address 01-80-C2-00-00-0E.

**chassis**  
The chassis identifier.

**slot/port[-port2]**  
The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

**slot**  
The slot number for a specific module.

### Defaults

By default, a list of all LLDP ports is displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `slot/port` or `slot` parameter to display information for a specific port or for all ports on a specific module.

### Examples

```
-> show lldp remote-system application-tlv
Slot/ Port     Remote ID Selector  Protocol  Priority
-------------+-------+----------+-----------+------------+--------+----------+-----------+----------+----------------+
1/2          1     Ethertype  35078      3 [fcce]  
1/2          1     Tcp/Sctp  3260       4 [iscsi]  
1/20         1     Tcp/Sctp  3190       3        
1/20         1     Udp/Dccp  300        4        
1/20         1     Tcp/Udp/Sctp/Dccp 300      4        
```
output definitions

<table>
<thead>
<tr>
<th>Slot/Port</th>
<th>The Slot number to which the remote system entry is associated and the physical port number on that module.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote ID</td>
<td>The Index of the Remote Device.</td>
</tr>
<tr>
<td>Selector</td>
<td>The protocol selector.</td>

### show lldp remote-system power-via-mdi

Displays the information of remote system which includes the information received in the power via MDI TLV.

```plaintext
show lldp [port chassis/slot/port[-port2] | slot chassis/slot] remote-system power-via-mdi
```

#### Syntax Definitions

- `chassis`  
  The chassis identifier.
- `slot/port[-port2]`  
  The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- `slot`  
  The slot number for a specific module.

#### Defaults

N/A.

#### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

  - **alaLldpXdot3LocPSEAutoClassSupport**

### Maximum Available Power

Indicates the highest power the PSE can grant. The PSE sets the value of this field taking available power budget and hardware capabilities into account. When connected to a dual-signature PD this value refers to the total amount of power available at the PI, even though power is allocated separately on a per pairset basis. A PD shall set this field to 0. Power expressed in units of 0.1 W. Valid values for these bits are 1 through 999.

### Auto Class

Indicates if the PSE supports or not supports auto class.

### Auto Class Completion Status

Indicates the status of the auto class measurement.
show lldp local-port power-via-mdi

alaLldpXdot3LocPowerDownRequest
alaLldpXdot3LocPowerDownTime
show lldp local-port power-via-mdi-measurements

Displays the information of the local system which includes the information transmitted in the power via MDI measurements. The measurements are electrical measurements.

show lldp [port chassis/slot/port[-port2] | slot chassis/slot] local-port power-via-mdi-measurements

Syntax Definitions

chassis
The chassis identifier.

slot/port[-port2]
The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

slot
The slot number for a specific module.

Defaults
N/A.

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

Power Measurement = 3600 mW,
Energy Measurement = 3 kJ,
Power Price Index = 0
802.1AB Commands

show lldp local-port power-via-mdi-measurements

**output definitions**

<table>
<thead>
<tr>
<th>Supported</th>
<th>Indicates the supported measurement (Voltage, Current, Power, Energy) by the device.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Valid</td>
<td>Indicates which measurement field contains valid data.</td>
</tr>
<tr>
<td>Request</td>
<td>Indicates the type of measurement for request.</td>
</tr>
<tr>
<td>Voltage Uncertainty</td>
<td>Indicates the unit of expanded uncertainty for the voltage measurement. The units are measured in 1 mV. The valid range is 1 through 65000.</td>
</tr>
<tr>
<td>Current Uncertainty</td>
<td>Indicates the unit of expanded uncertainty for the current measurement. The units are measured in 0.1 mA. The valid range is 1 through 65000.</td>
</tr>
<tr>
<td>Power Uncertainty</td>
<td>Indicates the unit of expanded uncertainty for the power measurement. The units are measured in 10 mW. The valid range is 1 through 65000.</td>
</tr>
<tr>
<td>Energy Uncertainty</td>
<td>Indicates the unit of expanded uncertainty for the energy measurement. The units are measured in 0.1 kJ. The valid range is 1 through 65000.</td>
</tr>
<tr>
<td>Voltage Measurement</td>
<td>Indicates the measurement of the pairset with the highest voltage. Measured in units of 1 mV.</td>
</tr>
<tr>
<td>Current Measurement</td>
<td>Indicates the current measurement. Expressed in units of 0.1 mA. The valid units are 0 through 20000.</td>
</tr>
<tr>
<td>Power Measurement</td>
<td>Indicates the power measurement. Expressed in units of 10 mW. The valid units are 0 through 10000.</td>
</tr>
<tr>
<td>Energy Measurement</td>
<td>Indicates the energy measurement. Expressed in units of 0.1 kJ since power on. The valid units are 0 through 4294967295.</td>
</tr>
<tr>
<td>Power Price Index</td>
<td>Indicates the current price of electricity compared to what the PSE considers the nominal electricity price. The determination of the nominal electricity price is implementation dependent. The PSE sets the value of this field taking the availability of power from any external and internal resources, and the relative supply and demand balance, into account. A value of 0xFFFF means that no power price index is available.</td>
</tr>
</tbody>
</table>

The valid values for these bits are decimal 0 through 65000, and hexadecimal value 0xFFFF.

**Release History**

Release 7.3.2; command introduced.

</tr>
</tbody>
</table>

**Usage Guidelines**

N/A

**Examples**

```
-> show lldp agent-destination-address
Lldp Agent                Name                     MAC address
-------------------------+----------------+------------------------
1  Nearest-Bridge         00-80-C2-00-00-0E
2  Non-TPMR-Bridge        Tcp/Sctp                  00-80-C2-00-00-03
3  Nearest-Customer-Bridge 00-80-C2-00-00-00
```

**output definitions**

- **Lldp Agent**
  - The LLDP agent identifier.
- **Name**
  - The name of the LLDP agent.
- **Destination MAC address**
  - The destination MAC address of the LLDP agent.

**Release History**

Release 7.3.1; command introduced.
**Related Commands**

**lldp lldpdu**

Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, slot, or port.

**MIB Objects**

- `lldpV2DestAddressTable`
  - `lldpV2AddressTableIndex`
  - `lldpV2DestMacAddress`
**lldp trust-agent**

Enables or disables the security mechanism globally (chassis level) or for a slot or a single port. By enabling LLDP security mechanism on a port, LLDP CMM task brings the LLDP status of the port as trusted and monitors the port for any LLDP security violation.

```
lldp {chassis/slot/port | chassis/slot | chassis} trust-agent [admin-state] {enable | disable} [chassis-id-subtype {chassis-component | interface-alias | port-component | mac-address | network-address | interface-name | locally-assigned | any}]
```

**Syntax Definitions**

- `chassis/slot/port`: The chassis ID, slot, and port number for the module and the physical port number on that module (for example, 1/2/4 specifies chassis 1, port 4 on slot 2).
- `chassis/slot`: The chassis ID and slot number for the module (for example, 1/2 specifies chassis 1, slot 2).
- `chassis`: Specifies all the ports in the chassis.
- `enable`: Enables LLDP security mechanism.
- `disable`: Disables LLDP security mechanism.
- `chassis-component`: The chassis component is used for validating the remote agent.
- `interface-alias`: The alias configured for the interface is used for validating the remote agent.
- `port-component`: The port component is used for validating the remote agent.
- `mac-address`: The MAC address is used for validating the remote agent.
- `network-address`: The network address is used for validating the remote agent.
- `interface-name`: The interface name is used for validating the remote agent.
- `locally-assigned`: The locally assigned component is used for validating the remote agent, that is the chassis information, which can be locally assigned (the local configuration).
- `any`: The remote agent with any chassis ID sub type is accepted as a trust agent.

**Defaults**

- `'any'`: If the chassis ID sub type is not configured for validating the remote agent, by default, the first remote agent is accepted as a trust agent considering any of the chassis ID sub types.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

- By enabling security on chassis/slot level, the ports that come under the respective level are monitored for any LLDP security violation.

- If the chassis ID sub type is not configured for validating the remote agent, then the LLDP learns the first remote agent with available chassis ID TLV (Time, Length, Value) received in the PDU.

- After a link up is received on a LLDP security enabled port, LLDP CMM waits for three times the LLDP timer interval (30 seconds). If no LLDP PDU is received after link up that has no remote agent, the port is moved to a violation state.

- If a trusted remote agent already exists, and if no LLDP remote agent is learned even after three times the LLDP timer interval (30 seconds), the port is moved to a violation state. If a new LLDP remote agent is learned after the link toggle, then the port is moved to a violation state.

- If the same chassis ID and port ID already exist in the trusted remote agent database but on a different port, then the port remote agent is learned and the port is moved to a violation state. If a new LLDP remote agent is learned on a port that has a trusted LLDP remote agent, then the port is moved to a violation state.

**Examples**

- `lldp chassis trust-agent admin-state enable`
- `lldp chassis trust-agent chassis-id-subtype chassis-component`

**Release History**

Release 8.3.1; command introduced.

**Related Commands**

- `lldp trust-agent violation-action` Sets the action to be performed when a violation is detected.
- `show lldp trusted remote-agent` Displays information on trusted remote-agents.
- `show lldp trust-agent` Displays information on local LLDP agent or port.

**MIB Objects**

- `alaLldpTrustAdminStatus`  
- `alaLldpTrustChassisIdSubType`
lldp trust-agent violation-action

Sets the action to be performed when a violation is detected.

```
lldp {chassis/slot/port | chassis/slot | chassis} trust-agent violation-action {trap-and-shutdown | trap | shutdown}
```

**Syntax Definitions**

- `chassis/slot/port`  
  The chassis ID, slot, and port number for the module and the physical port number on that module (for example, 1/2/4 specifies chassis 1, port 4 on slot 2).

- `chassis/slot`  
  The chassis ID and slot number for the module (for example, 1/2 specifies chassis 1, slot 2).

- `chassis`  
  All switch ports.

- `trap-and-shutdown`  
  Shuts down the port and sends a trap notification when a violation is detected.

- `trap`  
  Sends a trap notification when a violation is detected.

- `shutdown`  
  Shuts down the port when a violation is detected.

**Defaults**

By default, trust agent violation action is set to ‘trap’.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If the port is in a shutdown state, clear the violation on the port by using the command “`interfaces chassis/slot/port1-port2] clear-violation-all`”

- Clearing the violation on a port does not clear the trusted remote agent existing on that port. To clear the trusted remote agent, disable the LLDP security mechanism on the port.

- If the port is in a shutdown state due to violation and the port link is toggled, only the link goes up. The port still remains in the violation state and the trusted remote agent existing on that port is not cleared.

**Examples**

- `lldp chassis trust-agent violation-action trap`
- `lldp slot 3 trust-agent violation-action shutdown`
Release History

Release 8.3.1; command introduced.

Related Commands

lldp trust-agent
Sets the status of trust admin status for a port.

show lldp trusted remote-agent
Displays information on trusted remote-agents.

show lldp trust-agent
Displays information on local LLDP agent or port.

MIB Objects

alaLldpTrustAction
show lldp trusted remote-agent

Displays information on trusted remote-agents.

```
show lldp [chassis/slot | chassis/slot/port] trusted remote-agent
```

**Syntax Definitions**

- `chassis/slot`: The chassis ID and slot number for the module (for example, 1/2 specifies chassis 1, slot 2).
- `chassis/slot/port`: The chassis ID, slot, and port number for the module and the physical port number on that module (for example, 1/2/4 specifies chassis 1, port 4 on slot 2).

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the slot/port or slot parameter to display information for a specific port or for all ports on a specific module.
- LLDP trust agent must be enabled globally on the chassis or individually on a port in order to get the `show lldp trusted remote-agent` command output.

**Examples**

```
-> lldp chassis trust-agent enable
-> lldp chassis trust-agent chassis-id-subtype mac-address

-> show lldp trusted remote-agent
```

```
Trusted Remote LLDP Agents on Local Slot/Port: 1/7
Chassis ID Subtype = 4 (MAC Address),
Chassis ID = 00:e0:b1:7a:e6:3c,
Port ID Subtype = 7 (Locally assigned),
Port ID = 1017
```
output definitions

<table>
<thead>
<tr>
<th>Trusted Remote LLDP Agents on Local Slot/Port</th>
<th>The slot number to which the remote trusted agent is associated and the physical port number on that module.</th>

Release History

Release 8.3.1; command introduced.

Related Commands

- `lldp trust-agent`             Sets the status of trust admin status for a port.
- `lldp trust-agent violation-action` Sets the action to be performed when a violation is detected.
- `show lldp trust-agent`        Displays information on local LLDP agent/port.

MIB Objects

- N/A
show lldp trust-agent

Displays information of the local LLDP agent or port.

show lldp [chassis/slot | chassis/slot/port] trust-agent

Syntax Definitions

chassis/slot
The chassis ID and slot number for the module (for example, 1/2 specifies chassis 1, slot 2).

chassis/slot/port
The chassis ID, slot, and port number for the module and the physical port number on that module (for example, 1/2/4 specifies chassis 1, port 4 on slot 2).

Defaults

N/A

Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- Use the slot/port or num (slot number) values to display information for a specific port or for all ports on a specific module.
- LLDP trust agent must be enabled globally on the chassis or individually on a port in order to get the show lldp trust-agent command output correctly.
- If LLDP security is disabled this command correctly displays the ‘Admin Status’ as ‘Disabled’; however the other output parameters will display their default values.

Examples

-> lldp chassis trust-agent enable
-> lldp chassis trust-agent chassis-id-subtype chassis-component

-> show lldp trust-agent

MIB Objects

N/A
SIP Snooping feature address the key challenge of real time delivery and monitoring requirements for media streams from SIP devices. SIP snooping feature provides plug and play support to the device, where it automatically identifies the ports used. It also enhances the security of device.

SIP Snooping prioritizes voice and video traffic over non-voice traffic. To summarize, SIP Snooping:

- Identifies and marks the SIP and its corresponding media streams. Each media stream contains Real Time Protocol (RTP) and Real Time Control Protocol (RTCP) flows. Marking is done using the DSCP field in the IP header.
- Provides user configured QOS treatment for SIP/RTP/RTCP traffic flows based on its marking.
- Also snoops voice quality metrics of media streams from their RTCP packets and displays them to the user with knowledge of media reception quality in real time and helps to diagnose the problems on their quality. Also in addition, trap will be generated when voice quality parameters like Jitter, Round trip time, Packet-lost, R-factor and MOS values of media streams crosses user configured threshold.

This chapter includes SIP commands and their descriptions.

MIB information for SIP commands is as follows:

- **Filename**: ALCATEL-IND1-SIP-SNOOPING-MIB.mib
- **Module**: aluSIPSnoopingMIB

A summary of the available commands is listed here:

- sip-snooping admin-state
- sip-snooping port admin-state
- sip-snooping mode
- sip-snooping trusted server
- sip-snooping sip-control
- sip-snooping sos-call number
- sip-snooping sos-call dscp
- sip-snooping udp port
- sip-snooping tcp port
- sip-snooping threshold
- sip-snooping logging-threshold num-of-calls
- show sip-snooping call-records
- clear sip-snooping statistics
- show sip-snooping config
- show sip-snooping ports
- show sip-snooping statistics
- show sip-snooping registered-clients
sip-snooping admin-state

Enables or disables the SIP snooping on the switch.

`sip-snooping admin-state {enable | disable}`

### Syntax Definitions

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables SIP snooping</td>
</tr>
<tr>
<td>disable</td>
<td>Disables SIP snooping</td>
</tr>
</tbody>
</table>

### Defaults

By default, SIP-snooping is disabled on the switch.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Feature</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- If SIP snooping is disabled at the port level, enabling SIP snooping globally will not override the configuration of that port.
- If SIP snooping is disabled and enabled, it is mandatory that the phones re-register for successful DSCP marking.

### Examples

- `-> sip-snooping admin-state enable`
- `-> sip-snooping admin-state disable`

### Release History

Release 8.1.1; command was introduced.
**Related Commands**

- **sip-snooping port admin-state**  
  Configures the status of SIP snooping on a single port, a range of ports, or on a link aggregate of ports.

- **show sip-snooping ports**  
  Shows the SIP snooping port level data.

- **show sip-snooping config**  
  Shows the configuration done for SIP snooping.

**MIB Objects**

- **aluSIPSnoopingStatus**
**sip-snooping port admin-state**

Configures the status of SIP snooping on a single port, a range of ports, or on a link aggregate.

```
sip-snooping {port chassis/slot/port[-port2] | linkagg agg_num} admin-state {enable | disable}
```

### Syntax Definitions

- `chassis/slot/port[-port2]` The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
- `agg_num` A link aggregate ID number.
- `enable` Enables SIP snooping to mirror all SIP PDU that ingress on that port.
- `disable` Disables SIP snooping and will not mirror SIP PDU that ingress on that port.

### Defaults

By default, SIP snooping is disabled on the switch.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use this command for port/linkagg level SIP Snooping configuration on the switch.
- SIP snooping must be enabled globally to activate port/linkagg level configuration.
- Even after SIP snooping is globally disabled, port/linkagg level configuration is saved. This configuration will be used when SIP snooping is enabled globally again.
- Port level configuration is not allowed on a member port of a linkagg.
- If a port joins a linkagg, port level configuration is overridden by the linkagg configuration. Port level configuration will be activated if the port leaves the linkagg.

### Examples

```
-> sip-snooping port 1/1/5-6 admin-state enable
-> sip-snooping linkagg 1 admin-state enable
```

### Release History

Release 8.1.1; command was introduced.
Related Commands

show sip-snooping ports  Shows the SIP snooping port level data.

MIB Objects

aluSIPSnoopingSlotPortIndex
  aluSIPSnoopingRowStatus
sip-snooping mode

Configures the SIP snooping mode for the specified port or link aggregate.

```
```

**Syntax Definitions**

- `chassis/slot/port[1-2]` The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
- `agg_num` The link aggregate ID number.
- `force-edge` Media TCAM entries to be created for dialogs that transverse the specific port.
- `force-non-edge` No Media TCAM entries for dialogs that transverse the specific port.
- `automatic` Sets to default mode. The port’s edge/non-edge mode is derived by the switch/router based on LLDP received or not on the port.

**Defaults**

By default, the SIP snooping mode is set to automatic.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use this command for port/linkagg level SIP Snooping configuration on the switch.
- Force-edge-port/force-non-edge port option to overwrite default port mode learned by either received or not received switch/router capability through LLDP.
- Port level configuration is not allowed on a member port of a linkagg.
- If a port joins a linkagg, port level configuration is overridden by linkagg configuration. Port level configuration will be activated if it leaves the linkagg.

**Examples**

- `-> sip-snooping port 1/1/5-6 mode force-edge`
- `-> sip-snooping linkagg 1 mode force-non-edge`
**Release History**

Release 8.1.1; command was introduced.

**Related Commands**

- `show sip-snooping ports` Shows the SIP snooping port level data.

**MIB Objects**

aluSIPSnoopingSlotPortIndex

aluSIPSnoopingPortConfigPortMode
**sip-snooping trusted server**

Configure the IP addresses of the trusted servers on a switch.

```
sip-snooping trusted-server [ip_address1 ip_address2 ip_address ...ip_address8]
```

```
no sip-snooping trusted-server {ip_address | all}
```

---

**Syntax Definitions**

- `ip_address1[-ip_address2]` The IP address of one or more trusted servers.
- `all` Specifies all the IP addresses.

**Defaults**

By default, no trusted servers are configured. All SIP based calls using any call server will be supported.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
<th>9900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command is used to configure the IP addresses of the trusted servers. If a trusted server is configured, then only the calls initiated through those servers will be supported.
- A maximum of 8 trusted servers can be configured.
- If no trust servers are configured, all SIP based calls using any call server will be supported.
- Use the `no` form of the command to remove any trusted IP or all trusted IP addresses.

**Examples**

- `-> sip-snooping trusted-server 192.254.32.22 192.254.32.33`
- `-> no sip-snooping trusted-server 192.254.32.22`
- `-> no sip-snooping trusted-server all`

**Release History**

Release 8.1.1; command was introduced.

**Related Commands**

- `show sip-snooping config` Shows the configuration done for SIP snooping.
**MIB Objects**

**sip-snooping sip-control**

Configures SIP control DSCP marking.

```
sip-snooping sip-control dscp num
sip-snooping sip-control no dscp
```

**Syntax Definitions**

`num` The DSCP number. The valid range is 1–4 Mbps.

**Defaults**

By default no marking/prioritizing or rate limit is performed.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

```
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

- This command is used for the SIP control DSCP marking. A built-in rate limiter of 1 Mbps is configured to rate limit SIP PDUs being marked by the switch.

- The packet gets its priority as normal packet, either from the QoS port configuration (trust the packet DSCP or untrusted) or from a user configured QoS policy.

- Use `no` form of the command is to set default mode.

**Examples**

```
-> sip-snooping sip-control dscp 40
-> sip-snooping sip-control no dscp
```

**Release History**

Release 8.1.1; command was introduced.
Related Commands

**show sip-snooping config**  
Shows the configuration done for SIP snooping.

MIB Objects

aluSIPSnoopingSIPControlDSCP
**sip-snooping sos-call number**

Configures the SOS call strings in SIP snooping.

```
sip-snooping sos-call number string1 string2 ... string4

no sip-snooping sos-call number {string | all}
```

**Syntax Definitions**

- `string1 ... string4`: Specifies the SOS call string.
- `all`: Specifies all the SOS call strings.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900</th>
<th>6900</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command is used for the configuration of the SOS call strings. A maximum of 4 SOS call strings can be configured for an exact match on the “to” URI (user part only).
- No support of regular expression. If no string is specified, no SOS call can be identified in the system.
- Use `no` form of this command to remove existing SOS call strings.

**Examples**

```
-> sip-snooping sos-call number "911" "2233"
-> no sip-snooping sos-call number "911"
-> no sip-snooping sos-call number all
```

**Release History**

Release 8.1.1; command was introduced.
Related Commands

`show sip-snooping config` Displays the SIP snooping configuration.

MIB Objects

aluSIPSnoopingSOSCallNumber1
aluSIPSnoopingSOSCallNumber2
aluSIPSnoopingSOSCallNumber3
aluSIPSnoopingSOSCallNumber4
sip-snooping sos-call dscp

Configures the SOS-Call RTP/RTCP DSCP marking.

**sip-snooping sos-call dscp num**

### Syntax Definitions

**num**

Specifies the DSCP number.

### Defaults

The default configuration is 46 EF.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<tr>
<td>Release 8.1.1; command was introduced.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

- This command is used for the configuration of the SOS-Call RTP/RTCP DSCP marking. A built-in rate limiter of 128 kbps is configured to rate limit a uni-direction media stream being marked by the switch.

- SOS calls are identified only for the Audio media type. All other media type calls are considered normal calls.

### Examples

-> sip-snooping sos-call dscp 56

### Release History

Release 8.1.1; command was introduced.

### Related Commands

**show sip-snooping config**

Displays the SIP snooping configuration for the switch.

### MIB Objects

aluSIPSnoopingSOSCallRTPDSCP
sip-snooping udp port

Configures the UDP port for SIP Snooping.

**sip-snooping udp-port** `udp-port1` `udp-port 2` ... `udp-port 8`

no sip-snooping udp-port `{udp-port | all}`

---

**Syntax Definitions**

- `udp-port 1` ... `udp-port 8`: Specifies the UDP port for SIP snooping.
- `all`: Specifies all the UDP ports designated for SIP snooping.

**Defaults**

By default no UDP ports and SIP mirroring is performed with the method name and SIP2.0 strings.

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- A maximum of 8 UDP ports can be configured on a switch.
- Use **no** form of this command to remove any UDP port configured earlier.

**Examples**

- `-> sip-snooping udp-port 5260 5060`
- `-> no sip-snooping udp-port 5260`
- `-> no sip-snooping udp-port all`

**Release History**

Release 8.1.1; command was introduced.

**Related Commands**

aluSIPSnoopingSIPUDPPort8
**sip-snooping tcp port**

Configures the Server listening TCP ports for SIP Snooping.

```
sip-snooping tcp-port tcp-port1 tcp-port2 ... tcp-port8
no sip-snooping tcp-port {tcp-port | all}
```

---

**Syntax Definitions**

```
tcp-port1 ... tcp-port8
all
```

- `tcp-port1 ... tcp-port8`: Specifies the TCP port for SIP snooping.
- `all`: Specifies all the SOS call strings.

---

**Defaults**

By default, TCP port is 5260.

---

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>No</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

- A maximum of 8 TCP ports can be configured on a switch.
- The default port will be overwritten if the user configures any other port.
- Use the `no` form of this command to remove any TCP port configured earlier.

---

**Examples**

```
-> sip-snooping tcp-port 5260 5060
-> no sip-snooping tcp-port 5260
-> no sip-snooping tcp-port all
```

---

**Release History**

Release 8.1.1; command was introduced.

---

aluSIPSnoopingSIPUDPPort8
**sip-snooping threshold**

Configure the various thresholds of SIP snooping.

```
sip-snooping threshold {audio | video | other} {jitter jitter_ms_num | packet-lost % num | round-trip-delay round_trip_delay_ms_num | r-factor rfactor_num | mos mos_num}
```

### Syntax Definitions

- `audio` Specify threshold for audio.
- `video` Specify threshold for video.
- `other` Specify threshold for other.
- `jitter_ms_num` Specify jitter in milliseconds. The valid range is 0–300.
- `% num` Specify packet lost in percentage. The valid range is 0–99%.
- `round_trip_delay_ms_num` Set round trip delay in milliseconds. The valid range is 0–500.
- `rfactor_num` Specify R-factor number. The valid range is 0–100.
- `mos_num` Specify MOS number. The valid range is 0–5.

### Defaults

<table>
<thead>
<tr>
<th>parameter</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RTCP monitoring</td>
<td>Enable</td>
</tr>
<tr>
<td>Jitter Threshold (audio/video/other)</td>

<tr>
<td>9900</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

Setting a threshold value to 0 disables threshold checking for that parameter.

### Examples

```
-> sip-snooping threshold audio jitter 50
```
-> sip-snooping threshold audio packet-lost 10
-> sip-snooping threshold video jitter 80
-> sip-snooping threshold video round-trip-delay 180

19 Automatic Fabric Commands

The Dynamic Auto-Fabric feature can be used to bring up AOS compatible devices by automating some tedious and complex steps including Link Aggregate formation, and SPB neighbor adjacency formation. Dynamic recognition of the neighboring elements will allow a quick, out-of-the box configuration. The focus area for this feature is data center but the feature is applicable in campus LAN environment to reduce administrative overhead.

Upon boot-up the system will automatically attempt auto discovery of LACP, SPB, MVRP, and IP connections if configuration files are not available in the device. The feature allows to build a true fabric when a device is plugged to the network and automates edge port configuration with profiles.

MIB information for the Auto Fabric commands is as follows:

- Filename: ALCATEL-IND1-AUTO-FABRIC-MIB.mib
- Module: alcatelIND1AUTOFABRICMIB

A summary of available commands is listed here:

```
auto-fabric admin-state
auto-fabric interface
auto-fabric discovery start
auto-fabric protocols
auto-fabric config-save interval
auto-fabric config-save admin-state
auto-fabric discovery-interval
auto-fabric protocols spb default-profile
auto-fabric protocols spb set-profile
show auto-fabric config
show auto-fabric config interface
```
**auto-fabric admin-state**

Enables or disables the Automatic Fabric functionality globally for the switch.

```bash
auto-fabric admin-state {enable | disable {remove-global-config | remove-vc-reload}}
```

### Syntax Definitions

- **enable**
  Enables Automatic Fabric functionality for the switch.

- **disable**
  Enables Automatic Fabric functionality for the switch. When disabled, the global configuration settings discovered for MVRP, SPB, and IP are removed.

- **remove-global-config**
  Disables Automatic Fabric functionality for the switch. This parameter option performs the same function as the **disable** parameter.

- **remove-vc-reload**
  Reboots a switch running in the Virtual Chassis (VC) of one mode to run in the standalone mode with Automatic Fabric discovery disabled. This parameter option is not supported on the OmniSwitch 6860 and OmniSwitch 6865.

### Defaults

By default, the Automatic Fabric operation is globally enabled for the switch and on all eligible interfaces when the switch boots up without a configuration file (such as boot.cfg) or the configuration file size is zero bytes.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th>Model</th>
<th>6360</th>
<th>6465</th>
<th>6560</th>
<th>6570M</th>
<th>6860</th>
<th>6860N</th>
<th>6865</th>
<th>6900</th>
<th>6900 V72/C32</th>
<th>6900 X48C6/T48C6</th>
<th>X48C4E/V48C8/C32E/T24C2</th>
<th>9900</th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When a switch boots up with an existing configuration file, the Automatic Fabric operation is based on the administrative status setting specified with this command.

- When Automatic Fabric is globally disabled for the switch, the following configuration settings are removed unless they were previously saved to the switch configuration file:
  - Spanning Tree is set back to the default 1x1 mode. This only occurs if there are no VLAN registrations on any port or link aggregate.
  - SPB is globally disabled, which removes BVLANs 4000-4003 and administratively disables SPB. This only occurs if there are no SPB adjacencies formed on any ports or link aggregates.
  - Automatic Fabric stops trying to learn IP routing protocols and neighbors on interfaces not already configured with a routing protocol. The configuration for IP interfaces on which routing protocols
were previously discovered is not removed.
  – For any other scenario, administrator intervention is needed to remove the configuration.

- The **remove-global-config** and **remove-vc-config** parameters are only used in combination with the **disable** option.

- The **remove-vc-config** parameter is only meant for use when a switch has booted up in a VC of one mode. Do not use this option if the switch boots up as part of a VC configuration, where the switch is connected to other switches in the VC.

- When this command is used with the **remove-vc-config** parameter, the following process is triggered:
  1. Any Automatic Fabric configuration is cleared.
  2. The Automatic Fabric feature is disabled.
  3. A **boot.cfg** file is created in the /flash/working directory.
  4. The switch is automatically rebooted in standalone mode with a configuration file and the automatic management features will no longer run.

**Examples**

- `-> auto-fabric admin-state enable`
- `-> auto-fabric admin-state disable`
- `-> auto-fabric admin-state disable remove-global-config`
- `-> auto-fabric admin-state disable remove-vc-reload`

**Release History**

Release 7.3.2; command introduced.
Release 7.3.4; **remove-global-config** and **remove-vc-reload** parameters added-

**Related Commands**

- **auto-fabric interface** Enables or disables Automatic Fabric discovery on one or more ports.
- **show auto-fabric config interface** Displays the Automatic Fabric configuration applied to switch ports.

**MIB Objects**

- alaAutoFabricGlobalStatus
- alaAutoFabricRemoveGlobalConfig
- alaAutoFabricRemoveVCReload
**auto-fabric interface**

Enables or disables the Automatic Fabric functionality for one or more switch ports.

```
auto-fabric interface chassis/slot/port[-port2] admin-state {enable | disable}
```

### Syntax Definitions

- **chassis**: The chassis identifier.
- **slot/port[-port2]**: The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
- **enable**: Enables Automatic Fabric functionality globally or on an interface.
- **disable**: Disables Automatic Fabric functionality on the specified interface. When disabled, the configuration settings discovered for MVRP, SPB, and IP are removed from the port.

### Defaults

By default, the Automatic Fabric operation is globally enabled for the switch and on all eligible interfaces when the switch boots up without a configuration file (such as boot.cfg) or the configuration file size is zero bytes.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When a switch boots up with an existing configuration file, the Automatic Fabric status for a port is based on the administrative status setting specified with this command.

- The Automatic Fabric status for a specific port takes precedence over the global Automatic Fabric status for the switch. For example, if Automatic Fabric is enabled for the switch but disabled on a port, then the discovery process is not run on the port.

### Examples

```
-> auto-fabric interface 1/1/1 admin-state disable
-> auto-fabric interface 1/1/5-10 admin-state enable
```

### Release History

Release 7.3.2; command introduced.
**Related Commands**

- **auto-fabric admin-state**
  Globally enables or disables Automatic Fabric for the switch.

- **show auto-fabric config interface**
  Displays the Automatic Fabric configuration applied to switch ports.

**MIB Objects**

- **alaAutoFabricPortConfigTable**
- **alaAutoFabricPortConfigStatus**
**auto-fabric discovery start**

Manually starts the Automatic Fabric discovery process.

```plaintext
auto-fabric discovery start
```

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>

</tr>
<tr>
<td>enable</td>
<td>Enables the discovery status for the selected protocol.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the discovery status for the selected protocol.</td>
</tr>
</tbody>
</table>

### Defaults

- Automatic Fabric discovery is globally enabled for all the protocols when the switch boots up without a configuration file.
- Automatic Fabric discovery is globally enabled for all protocols, except MVRP, when the switch boots up with an existing configuration file. In this case, the global default setting for MVRP is disabled.
- Automatic Fabric discovery is enabled for LACP, MVRP, and SPB on all eligible interfaces by default.
Platforms Supported

This command is supported on the following OmniSwitch platforms:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Usage Guidelines

- If no interface is specified with this command, the discovery status for the protocol is enabled or disabled globally for the switch.

- The `interface` and `chassis` parameters are only used in combination with the `lacp`, `mvrp`, and `spb` parameters.

- The interface setting for LACP, MVRP, and SPB discovery overrides the global setting. For example, if SPB discovery is globally enabled for the switch but disabled on port 2/1/1, then the port does not participate in the SPB discovery process.

Examples

- `auto-fabric protocols lacp admin-state disable`
- `auto-fabric protocols mvrp admin-state enable`
- `auto-fabric protocols spb interface 1/1/3 admin-state disable`
- `auto-fabric protocols loopback-detection admin-state disable`
- `auto-fabric protocols ip ospfv2 admin-state enable`
- `auto-fabric protocols ip ospfv3 admin-state disable`
- `auto-fabric protocols ip isis admin-state disable`

Release History

Release 7.3.2; command introduced.
Release 7.3.4; `loopback-detection` and `ip` parameters added.
Release 8.3.1; default setting for global MVRP discovery is disabled when switch boots up with an existing configuration file.

Related Commands

- `auto-fabric admin-state`: Enables or disables Automatic Fabric functionality.
- `show auto-fabric config interface`: Displays the Automatic Fabric configuration applied on interfaces.
- `show auto-fabric config`: Displays the global Automatic Fabric configuration.
