Alcatel-Lucent Enterprise Rainbow Hospitality™

Rainbow Hospitality by Alcatel-Lucent Enterprise is a comprehensive middleware solution that creates a unified bridge between your OPERA Cloud Property Management System (PMS), third-party PMS platforms via API integration, and the Alcatel-Lucent Enterprise Rainbow HubTM telephony infrastructure — ensuring smooth hotel operations and uninterrupted service excellence for your guests.

Core solution components

Rainbow Hub: A secure, cloud-based communication platform by ALE that lies at the heart of Rainbow Hospitality. Its core component is a Cloud PBX that provides advanced voice services while acting as the central integration point for the hotel's digital ecosystem — including PMS (Property Management System), CAS (Call Accounting System), and other operational tools.

Cloud PBX: A modern phone system that facilitates voice-enabled guest services, call routing, wake-up call automation and room-based comunication management — all fully synchronized with your hotel's operational systems.

Hospitality management center: Your property's command center for system integration management. This centralized dashboard empowers your IT and operations teams to onboard new properties, configure operational system connections and maintain optimal integration performance across all hotel touchpoints.

Gateway service engine: The intelligent backbone that works behind the scenes to keep your hotel running flawlessly. This automated service continuously synchronizes guest profiles and room inventory data; provides instant updates for arrivals, departures, and room changes; and monitors all guest room communication activity to ensure superior service delivery.

Through this integrated approach, Rainbow Hospitality creates a cohesive operational environment that enhances both staff efficiency and guest satisfaction across your entire property.
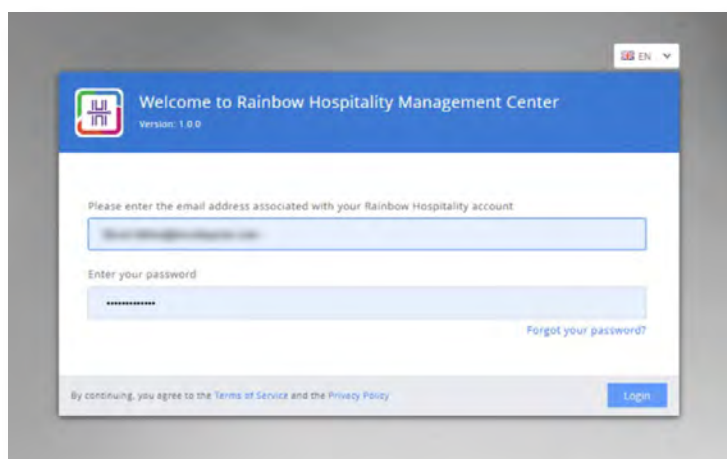

Check-In	Automatically triggers guest profile creation and room assignment in the system. Instantly updates the guest directory and activates telephony services for the room.
Check-Out	Deactivates room telephony services, clears guest data from the directory and triggers the export of call records for billing via the CAS.
Room Move (transfer)	Ensures all guest data, telephony settings, and active services are transferred in real time to the new room with no interruption in service or communication.
Phone Barring/Unbarring	Automatically enables or disables room telephony (internal or external calls) based on check-in status, credit control policies, or staff commands. Fully integrated with PMS triggers.
Wake-up Calls	Schedule, modify, or cancel automated wake-up calls directly through the PMS or Rainbow Hospitality interface. Wake-up alerts are logged and monitored for completion.
CDR for Call Accounting	Generates and exports detailed Call Detail Records (CDRs) for each guest room.
SIP certified endpoint and analog phones	Enable room-based telephony and guest services through supported hardware. Compatible with SIP certified endpoints, starting with Vtech phones. Reuse analog phones through a certified analog-to-SIP gateway.
Web chat widget	Integrate a real-time chat widget into your website or guest portal, allowing guests to interact with front desk or support teams directly via web.
WhatsApp connector	Enable guest communication via WhatsApp through an integrated connector, centralizing conversations within the Rainbow Hospitality platform and improving accessibility.
Staff call handling/collaboration	Provide staff with advanced call handling, internal messaging and group collaboration tools via Rainbow Hub—improving response time and operational coordination.

Hospitality-focused access management

Hospitality Management Center: A sophisticated role-based administration system designed specifically for hotel operational structures, delivering the right level of access to each team member while maintaining security and operational integrity.

Hotel Administrator Access: Tailored for IT directors and systems managers, this comprehensive administrative role provides complete oversight of all technical configurations and system integrations, including telephony management and infrastructure connectivity — ensuring your property's technology foundation remains robust and secure.

Hotel Manager Access: Perfect for front office managers, guest services supervisors and department heads, this operational role focuses on daily hospitality functions including performance dashboards, room device management and guest activity insights — without compromising sensitive system configurations.

This structured approach ensures your hospitality team can deliver exceptional service while maintaining the security and stability of your property's technology infrastructure.
