

Ready to unlock the superpowers of your communications platform?

From standardization to cloud and AI, Alcatel-Lucent Enterprise helps you modernize your business communications with winning transformation options.

Over the years, technological developments in communications and networking have enabled considerable progress in delivering more services to businesses, while reducing the complexity of their communications platform. Organizations that have followed this trend have been able to:

- Optimize their communications infrastructure
- Reduce maintenance costs
- Better integrate with their applications ecosystem

Winning transformation options

ALE's decades of experience in assisting our customers with their transformation projects has enabled us to highlight several proven winning options:

- 1. Standardization with IP (Internet Protocol) and SIP (Session Initiation Protocol)**, rationalizing the IP network and ensuring full interoperability.
- 2. Centralization**, relying on the IP network to bring together the management of all remote sites from a central communications platform installed in a main site.

3. Virtualization, installing multiple software applications on a single physical server to optimize hardware resources.

4. Connect to the cloud, extending on-premises system capabilities with cloud-based services.

5. Automate with Artificial Intelligence, handling routine communication and support tasks.

It's time to uncover what's possible for your platform

Modernizing the communications platform is not a single-lane highway. It's a strategic journey that must respect each organization's unique starting point, constraints and objectives. The winning options outlined in this flyer are like superpowers embedded within your communications platform.

And the best part about superpowers?

They make the impossible, possible!

Contact an ALE expert to assess your current landscape and co-design a phased plan — whether you start with IP/SIP standardization, centralization, virtualization or management automation — while considering the economical aspect of your project.
